"So my son took, of his own will, and on no compulsion, to the course in which he can always, when it is his own pleasure, outstrip every competitor," she pursued. 'My son informs me, Mr. Copperfield, that you were quite devoted to him, and that when you met yesterday you made yourself known to him with tears of joy. I should be an affected woman if I had made any pretence of being suprised by my son's inspiring such emotions; but I cannot be indifferent to any one who is so sensible of his merits, and I am very glad to see you here, and can assure you that he feels an unusual friendship for you, aad that you may rely on his protection."

Miss Dartle played backgammon as eagerly as she did everything else. If I had seen her, first, at the board, I should have fancied that her figure had got thin, and her eyes had got large, over that pursuit, and no other in the world. But I am very much mistaken if she missed a word of this, or lost a look of mine as I received it with the utmost pleasure, and, honored by Mrs. Steerforth's confidence, felt older than I had done since I left Canterbury.

When the evening was pretty far spent, and a tray of glasses and decanters came in, Steerforth promised over the fire, that he would seriously think of going down into the country with me. There was no hurry, he said; a week hence would do; and his mother hospitably said the same. While we were talking, he more than once called me Daisy; which brought Miss Dartle out again.

"But really, Mr. Copperfield," she asked, "is it a nickname? And why does he give it you? Is it—eh? —because he thinks you young and innocent? I am so stupid in these things.

I colored in replying that I believe it was.

"Oh!" said Miss Dartle. "Now I am glad to know that! I ask for information, and I am glad to know it. He thinks you young and innocent; and so you are his friend? Well, that's quite delightful!"

She went to bed soon after this, and Mrs. Steerforth retired too. Steerforth and I, after lingering for half an hour over the fire, talking about Traddles and all the rest of them at old Salem House, went upstairs together. Steerforth's room was next to mine, and I went in to look at it. It was a picture of comfort, full of easy chairs cushions and footstools, worked by his mother's hand, and with no sort of thing omitted that could help to render it complete. Finally, her handsome features looked down on her darling from a portrait on the wall, as if it were even something to her that her

WOMAN WOULD NOT GIVE UP

Though Sick and Suffering; At Last Found Help in Lydia E. Pinkham's Vegetable Compound.

Richmond, Pa. — "When I started taking Lydia E. Pinkham's Vegetable Compound I was in a dreadfully rundown state of health, had internal troubles, and was so extremely nervous and prostrated that if I had given in to my feelings I would have been in bed. As it was I had hardly strength at times to be on my feet and what I did do was by a great effort. I could not sleep at night and of course felt very bad in the morning, and had a steady headache.

"After taking the second bottle I noticed that the headache was not so bad, I rested better, and my nerves were stronger. I continued its use until it made a new woman of me, and now I can hardly realize that I am able to do so much as I do. Whenever I know any woman in need of a good medicine I highly praise Lydia E. Pinkham's Vegetable Compound." — Mrs. FRANK CLARK, 3146 N. Tulip St., Richmond, Pa.

Women Have Been Telling Women

for forty years how Lydia E. Pinkham's Vegetable Compound has restored their health when suffering with female ills. This accounts for the enormous demand for it from coast to coast. If you are troubled with any ailment peculiar to women why don't you try Lydia E. Pinkham's Vegetable Compound? It will pay you to do so. Lydia E. Pinkham Medicine Co., Lynn, Mass.

likeness should watch him while he slept.

I found the fire burning clear enough in my room by this time, and the curtains drawn before the windows and round the bed, giving it a very snug appearance. I sat down in a great chair upon the hearth to meditate on my happiness, and had enjoyed the contemplation of it for some time, when I found a likeness of Miss Dartle looking eagerly at me from above the chimney-place.

It was a startling likeness and necessarily had a startling look. The painter hadn't made the scar, but I made it; and there it was, coming and going; now confined to the upper lip as I had seen it at dinner, and now showing the whole extent of the wound inflicted by the hammer, as I had seen it when she was passoniate.

I wondered peevishly why they couldn't put her anywhere else instead of quartering her on me. To get rid of her, I undressed quickly, extinguished my light, and went to bed. But, as I fell asleep, I could not forget that she was still there looking, "Is it really, though? I want to know;" and when I awoke in the night, I found that I was asking all sorts of people in my dreams whether it really was or not—without knowing what I meant.

CHAPTER XXI.

There was a servant in that house, a man who, I understood, was usually with Steerforth, and had come into his service at the University, who was in appearance a pattern of respectability. I believe there never existed in his station a more respectable looking man. He was taciturn, soft-footed, very quiet in his manner, deferential, observant, always at hand when wanted, and never near when not wanted; but his respectability. He had not a pliant face, but had rather a stiff neck, rather a tight smooth head with short great claim to consideration was his hair clinging to it at the sides, a soft way of speaking, with a peculiar habit of whispering the letter S so distinctly, that he seemed to use it oftener than any other man; but every peculiarity that he had he made it respectable. If his nose had been upside down, he would have made that respectable. He surrounded himself with an atmosphere of respectability, and walked secure in it. It would have been next to impossible to suspect him of any thing wrong, he was so thoroughly respectable. Nobody could have thought of putting him in a livery, he was so highly respectable. To have imposed any derogratory work upon him, would have been to inflict a wanton insult on the feelings of a most r?spectable man. And of this, I noticed the women-servants in the household were so intuitively conscious, that they always did such work themselves, and generally while he read the paper by the pnatry fire.

Such a self-contained man I never saw. But in that quality, as in every other he possessed, he only seemed to be more respectable. Even the fact that no one knew his Christian name seemed to form a part of his respecbility. Nothing could be objected against his surname, Littimer, by which he was known. Peter might have been hanged, or Tom transported; but Littimer was perfectly respectable.

It was occasioned, I suppose, by the reverend nature of respectability in the abstract, but I felt particularly young in this man's presence. How old he was himself, I could not guess And that again went to his credit on the same score: for in the calmness of respectability he might have numbered fifty years as well as thirty.

Littimer was in my room in the

HYSLOP BROTHERS, Limited
Dept. R TORONTO, Canada

morning before I was up, to bring me that reproachful shaving water, and to put out my clothes. When I undrew the curtains and looked out of bed, I saw him in an equable temperature of respectability, unaffected by the east wind of January, and not even breathing frostily, standing my boots right and left in the first dancing position, and blowing specks of dust off my coat as he laid it down like a baby.

I gave him good morning, and asked him what o'clock it was. He took out of his pocket the most respectable hunting watch I ever saw, and preventing the spring with his thumb from opening far, looked in at the face as if he were consulting an oracular oyster, snut it up again, and said, if I pleased, it was half-past eight.

"Mr. Steerforth will be glad to hear how you have rested, sir."

"Thank you," said I, "very well, indeed Is Mr. Steerforth quite well?"

"Thank you, sir, Mr. Steerforth is tolerably well." Another of his characteristics. No use of superlatives. A cool calm medium always.

"Is there anything more I can have the honor of doing for you, sir ? The Rarning bell will ring at nine; the family take breakfast at half-past nine."

"Nothing, I thank you."

"I thank you, sir, if you please;" and with that, and with a little inclination of his head when he passed the bedside, as an apology for correcting me, he went out, shutting the door as delicately as if I had just fallen into a sweet sleep on which my life depended.

Every morning we held exactly this conversation; never any more, and never any less; and yet, invariably, however far I might have been lifted out of myself over-night, and advanced towards maturer years by Steerforth's companionship or Mrs. Sterforth's confidence, or Miss Dartle's conversation, in the presence of this most respectable man I became as our smaller poets sing, "a boy again."

He got horses for us; and Steerforth, who knew everything, gave me lessons in riding. He provided foils for us, and Steerforth gave me lessons in fencing—gloves, and I began of the same master, to improve in boxing. It gave me no manner of concern that Steerforth should find me a novice in these sciences, but I never could bear to show my want of skill before the respectable Lattimer. I had no reason to believe that Lattimer understood such arts himself ; he never led me to suppose anything of the kind, by so much as the vibration of one of his respectable eyelashes; yet whenever he was by, while we were practising, I felt myself the greenest and most inexperienced of mortals.

I am particular about this man, because he made a particular effect on me at that time, and because of what took place thereafter.

(To be continued)

Kerosene oil and crude carbolic acid make an excellent and preventative of mites and chicken lice that annoy fowls on the roost and on their nests. This mixture has no special or fixed portions. A very good application calls for three parts kerosene oil and one part crude carbolic acid. to be used as spray on roosts and in nests. It cannot be commenced too soon, as a good thorough spraying once every two weeks will be found effectual, and no lice will be found during the season. In very hot weather the spraying should be given once a week for security, and the droppings carefully removed each day.

Peerless
Guaranteed Fencing

Strongly made and closely spaced—making it a complete barrier against large animals as well as small poultry. Top and bottom wires No. 9—intermediates No. 12 wire—made by the Open Hearth process which time and other tests have proven to be the best material made for the manufacture of wire fencing. Send for literature. Ask about our farm and ornamental fencing.

Agencies nearly everywhere. Live agents wanted in unassigned territory.

86 Pages of Personal Advice

Free To Any Man

MY DEAR READER:

In the handsomely printed little book or private pocket compendium for men (containing 8,000 words and 40 half-tone photo reproductions), which I publish and gladly forward by mail, free, sealed to any man anywhere in the world who sends me the free coupon below. I have included certain parts that contain some very important advice or suggestions of a strictly personal nature which, I believe, cannot be found in any of the Private Hygiene books for men that are now sold at high prices all over the country. It will thus be seen I have endeavored, through the medium of my free book, to give my readers absolutely free of cost some things that are really MORE, in some respects, than others offer and make a large charge for. All you have to do to get this free book of mine is to use the coupon below, or if in my neighborhood, I extend an invitation to you to call at my office. Please remember that this free offer involves absolutely no obligation on your part, and there is nothing whatsoever for you to pay and nothing whatsoever for you to buy in any way, unless you should decide at some time in the future that youwould like try one of my mechanical VITALIZERS (described below). but that rests entirely with yourself. Over a million of these little free books have now been sent to men who wrote for them as I want you to do, and who live in all parts of the globe. I publish this free book in English, Swedish, Danish, Finnish, German, French and Polish, bnt I always send the English edition of course, unless otherwise instructed. Kindly use the little coupon.

SANDEN, AUTHOR.

MANLY, VIGOROUS MEN RULE THE WORLD

In reference to manly strength, I believe it is now more generally acknowledged than ever before that the manly man stands back of all that makes for progress, development and achievement in the world, a truth which any of us can easily verify if we but look about us with impartial eyes.

As a matter of fact, the man who is debilitated, unstrung and enervated cannot, for perfectly obvious reasons, expect to approach those real and masterful attainments which seem but a natural and easy accomplishment for him whose nerve force, brain power and manly strength are perfectly normal. Hence, we acknowledge the debilitated, weakened man to be handicapped in every walk of life where real manhood counts, yet it would indeed be cruel of me to here so state the fact in public print were I not of the honest opinion that there is every hope for the unmanly man to restore himself to a state of health and vigor, if he but clear his mind of abnormal fear, and then make a fair, square effort to redeem himself.

There are two specimens of humanity for which I have no earthly use. One is the man who, though now strong and vital, yet plunges into dissipation and excess with the certain knowledge of his unmanly fate. The other is the man who, though knowingly debilitated and enervated, makes no effort to get away from his life of dissipation and wrong practices. As a matter of fact, there is no hope for either of these unfortunates But for him who acknowledges his errors, who may come to me and say, "I have paid the penalty of my past follies, but I am THROUGH with my life of dissipation, and I am going to make a manly effort to restore myself," to such a man, I carea not what his physical condition may be, I can say in all truthfulness, "You, my friend, are on the right road to new strength and new manhood", for he really is, and there is no doubt about it.

I make a little appliance that I call a VITALIZER, which I designed to aid just such men who seek manly strength. I am not offering this VITALIZER here for sale, but merely suggest that you, reader take this opportunity to learnall about what this little appliance is doing today everywhere throughout the world; then, if in the future you want to use one yourself and will so write me, I will gladly make some liberal proposition whereby you may have one to try. The VITALIZER is fully described in one section of the free book which the coupon below entitles you to.

The VITALIZER is made up in a very light form weighing only several ounces, and you wear it on your body all night. It generates a great, soft, pleasant FORCE which I call VIGOR, and which flows in a continuous stream into your nerves, organs, blood and muscles while you sleep. I am satisfied in my own mind that I have access to a great POWER in this little VITALIZER which in the future will be more and more relied upon all over the world in the treatment of debilities and nerve weaknesses.

With special attachments which carry the FORCE of the VITALIZER to any part of the body, it may be used by women as well as men for he treatment of rheumatism, kidney, liver, stomach, bladder, disorders, nervousness, lack of energy, etc. Therefore. please send for the book today, or if you happen to live in or near this city, I should be very glad to see you in person. Office hours, 9 to 6.

WHAT THE FREE BOOK TEACHES YOU

The little free illustrated book of special private information, referred to above, is meant really to be a self guide for all men through the years before and after marriage and onward to a ripe old age. It is written in perfectly plain language, entirely free from technical terms, so that any one may easily grasp the full power of its good advice from two or three careful readings. It attempts to point out a safe road to new manhood or new manly strength, and as such is dedicated to mankind generally. One part of this book fully describes my little VITALIZER referred to above.

Remember, as soon as the coupon below is received I agree to forward to you one copy of this illustrated booklet, absolutely free of charge and in a plain, sealed envelope, so that it will come to you privately, just as you receive any sealed mail.

DR. M. F. SANDEN CO.,

Secretary-Treasurers Report for May Meeting, Sussex Branch W. I.

Editor The Maritime Farmer:—

The newly organized branch of the Women's Institute held its second meeting on May 1st, at the Provincial Dairy, Sussex, with a membership of thirty-five. The meeting opened with a reading of the minutes by the secretary. The programme for the afternoon opened with a talk from our President, Mrs. N. W. Eveleigh, taking as her subject "Women in the Home." Mrs. Eveleigh emphasized the importance of Institute work so that women might have an opportunity of interchanging ideas. Women have many probems to deal with Training is just as necessary for the home maker as for the woman who intends following a profession. Women must know a great deal. Problems arise in the home which tax the wisest and most skilful. No knowledge once gained is ever wasted. Mrs. Eveleigh again emphasized the fact that in the home woman must be the financier dealing with problems of home economics.

Mrs. Horace Slipp then read a very helpful and suggestive paper which she had prepared; her subject being "Work in the Home." In speaking Mrs. Slipp strongly urged the necessity of women economizing their strength by labor-saving methods and appliances. For instance, never stand to work which can be well done while seated. Mrs. Slipp's paper brought forth some valuable discussions by the members present.

Mrs. Harry Wiles was then called upon to read a very humorous account of how a woman's club extended its usefulness by a resolution made and kept by each member. "To watch our own temper," never to do or say anything that would ruffle the temper of another.

The last number on the programme was an address by Mrs. J. Frank Roach on "The Stranger within the Gates." She spoke of the new settlers who are now making homes within our province. Many of these settlers are entirely ignorant of the conditions and methods of this country and have everything to learn. The speaker asked the women of the Women's Institute to hold out a helping hand to these new home makers while working against great odds.

In closing our programme, we find much has been said about the home. I wonder how many of us realize that the home is the greatest manufacturing plant in the world. In it are manufactured the bodies and brains of men and women. To become a wife is to become a member of the greatest profession. It calls for brains, study, training, and hard concentrated effort.

The secretary in closing urged her sister members of the Institute to let their object be in the future the uplifting of character, the betterment of our home life the forwarding of every good work for home and country. Truy a missionary work without a limit.

A few minutes were set aside for the purpose of exchanging ideas. The secretary then read her report, reading several letters received from the Department of Agriculture, together with the Treasurer's report.

Mrs. N. W. Eveleigh was appointed a delegate to attend the annual Women's Institute to be held in Fredericton on May 26th, 27th and 28th. Substitute apointed, Mrs. F. G. Lansdowne. The meeting then adjourned to meet June 5th at the Institute Rooms, Provincial Dairy, at three o'clock, sharp. —Mrs. F. G. Lansdowne, Sec'y Treas.

Prince Edward Island Women's Institute Notes.

During the month of April the Women's Institutes held their regular meetings, taking as their subjects, Gardening, Future Improvements of the School and Grounds, Future Work for the Institutes, Vegetable Coloring, Home Decoration, Short Cuts in Housekeeping, Events in Canadian History, etc.

Miss Helena Macdonald, of Montague, who has recently been appointed by the Government as Assistant Supervisor to Mrs. A. E. Dunbrack, who is now holding the position as Supervisor, took up her duties with the Department of Agriculture on the 28th April and will acompany Mrs. Dunbrack at the following meetings scheduled to be held during the months of May and June:—May 5th, Norbro; 12th, Georgetown, 13th, Montague; 27th, Harrington; 28th, York, 29th, Marshfield; 31st, New Haven; June 1st, Cornwall; 2nd, Meadowbank; 3rd, Clyde River; 4th, Kingston; 5th, East Wiltshire; 8th, New London; 9th, Stanley Bridge; 10th, New Glasgow; 11th, Springfield; 12th, Traveller's Rest; 15th, Kensington; 16th, Malpeque; 17th, Darnley; 18th, French River; 19th, Long River; 22nd, Middeton.

At these meetings practical demonstrations will be given along the lines of millinery and cooking of the various foodstuffs.

A WONDERFUL REMEDY

Orange Lily is daily curing the most obstinate cases of Female Disorders. Falling of the Womb, Leucorrhoea, Painful and Suppressed Menstruation, etc., etc., are all of them relieved from the start by its use, and a few weeks' or months' treatment accomplishes a complete cure. This remedy is a positive, scientific preparation, and is based on the discoveries of Pasteur and Lister. It is an applied treatment; that is, it is not taken internally, but is applied direct to the suffering parts, and it, therefore, acts with all the certainty of the known laws of chemical action. As it comes in direct contact with the diseased tissue, its antiseptic and nerve-food properties cannot help have a beneficent influence. I receive from 10 to 50 letters daily, speaking of the benefits and cures it is performing, and so sure am I that it will do what is claimed for it that I will send, absolutely free, a 25c box to every suffering woman who will write for it. Price, $1 per box, which is sufficient for one months' treatment. Address, MRS. FRANCES E. CURRAH, WINDSOR, ONT. 3

Nerves Were Unstrung.

WOULD ALMOST GO OUT OF HER MIND.

Many women become run down and worn out by household cares, and duties never ending, and sooner or later find themselves with shattered nerves and weak hearts.

On the first sign of any weakness of the heart or nerves you should avail yourself of a perfect cure by using Milburn's Heart and Nerve Pills.

Mrs. Archie Goodine, Tilley, N.B., writes:—"When I was troubled with my heart, two years ago, I was very bad. My nerves were so unstrung, sometimes I would almost be out of my mind. I doctored myself with everything I could get, until at last I got four boxes of Milburn's Heart and Nerve Pills, and they have cured me. I cannot speak too highly of this wonderful remedy, and will recommend it to all sufferers."

Milburn's Heart and Nerve Pills are 50c. per box, or 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

The Powdery Scab.

(Continued from 535

1. Free from Powdery Scab and other dangerous potato diseases.

2. Grown in areas known to be free from Powdery Scab or other dangerous potato diseases.

It is altogether likely, therefore that potatoes from disease-free districts can be shipped to Bermuda as heretofore. While we are not in a position at present to say whether similar arrangements can be made with the United States authorities, it is posible that this may eventually be done.

Under the provisions of the Destructive Insect, Pest and Plant Disease Act, 1911, regulations may be passed laying down certain quarantine lines within the Province, over which potatoes may not be shiped. If, therefore, the majority of the farmers of any county or district practically free from the disease, declare that for their own protection and to preserve their export trade, they desire to have the importation from outside points prohibited the provincial government would undertake to proclaim and establish such a quarantine. Those interested should take prompt action.

The administration of this act is in the hands of the undersigned, who will be glad to hear from anyone regarding this matter. In the meantime, the Department of Agriculture is wiling as far as their means permit, to inspect the seed potatoes of growers catering to the export trade, in order that they may be certain that only clean seed is planted. In the fall, inspection of export potatoes may be aranged for, though it may possibly be necesary that a small inspection fee be imposed to help cover the cost of this inspection. As the further distribution of this disease is likely to be atended by serious consequences, the growers are earnestly urged to take the following precautions:—

1. Use only clean, smooth-skined potatoes for planting. Reject all tubers showing disease of ony kind. Do not run the risk of infecting the land, even though you believe the disease to be only the comon scab.

2. Do not pick aparenntly clean "seed" out of a lot affected with Powdery Scab . It is impossible to detect this disease in its early stages and no seed treatment is known.

3. Never grow potatoes on land that has previously grown an affected crop. The disease may remain in the soil for years and the only treatment is to plant clean seed on disease free soil.

4. Use only locally grown potatoes for seed except in localities where disease has been found. If it is desired to buy from outside points, purchase only such as has been inspected and certified free from Powdery Scab by some recognized government official.

Whether we are to free ourselves from the disease or whether we are to become more and more affected and eventually lose our export trade, rests with the growers themselves. For the benefit of those who are not familiar with the appearance of Powdery Scab the following short account is given:—

Though in its early stages the disbears a close resemblance to the ordinary potato scab common everywhere they can usually be distinguished with a fair degree of accuracy by even a superficial examination. The "scabs" of the comon potato scab are flatter, more irregular in shape and tend to run together to a greater extent than with the Powdery Scab. In the case of the Powdery Scab, the affected areas are more raised, are regular in shape and, even where in bad cases of the disease they tend to run together they still retain their separate identity. The scab by areas on the surface are also filled with an abundant olive green powder, which gives the disease its name. In mild cases and in its early stages the Powdery Scab resembles quite closely the ordinary scab, but in severe cases the potatoes become gnarly or distorted and covered with deep sores. Such potatoes are not fit for human food. The disease exhibits those more objectionable symptoms, where affected potatoes are planted on land that has previously produced a crop affected with the disease.

The Dominion Division of Botany intends to publish a bulletin showing the different diseases of potatoes in their natural color. Meanwhile we wil be pleased to receive and report upon suspected samples.—William H. Brittain. Truro N. S.

Outdoors or in—this is the paint that gives satisfaction

Stands the test of Canada's trying weather as no other paint you have ever used. For barns and other buildings, for your implements and wagons, and for your home, both outside and in there is a Ramsay finish that is the best of its kind.
To the man who does his own painting the convenience and economy of Ramsay's Paint is self evident.
The man who hires painters to do his work for him will do well to specify Ramsay's paints—they wear so well and protect wood and metal so thoroughly from deterioration. The local Ramsay dealer will give you splendid service and suggestions. Or write direct to the factory. (3)

LOUDEN

Balance Grapple Fork

GIANT
Spreads when open 6 ft. 7 in. Tines go into hay 2 ft. Width of outside tines 25 in.
STANDARD
Spreads when open 4 ft. 10 in. Tines go into hay 2 ft. Width of outside tines 19 in.
TWO SIZES
Ready for Work

For All Kinds of Hay

IN alfalfa, timothy, loose grain or straw, there is nothing to equal it. There can be no disappointment to the user of a Louden Fork. Build your loads without special care, by hand or with a loader, it does not matter, this fork goes right after it, and handles it right.

Not difficult to work

Our Patent Arch Support insures a perfect balance, and swings the fork true open or closed. Handled as easily as a harpoon fork, and gives much better service.

REMEMBER, there is not another fork just as good. Insist upon a Louden. Write for catalogue covering our complete lines.

Poor appetite is a sure sign of impaired digestion. A few doses of Chamberlain's Stomach and Liver Tablets will strengthen your digestion and improve your apetite. Thousands have been benefited by taking these Tablets. Sold by all dealers.

The Farmers' Ideal Poultry House.

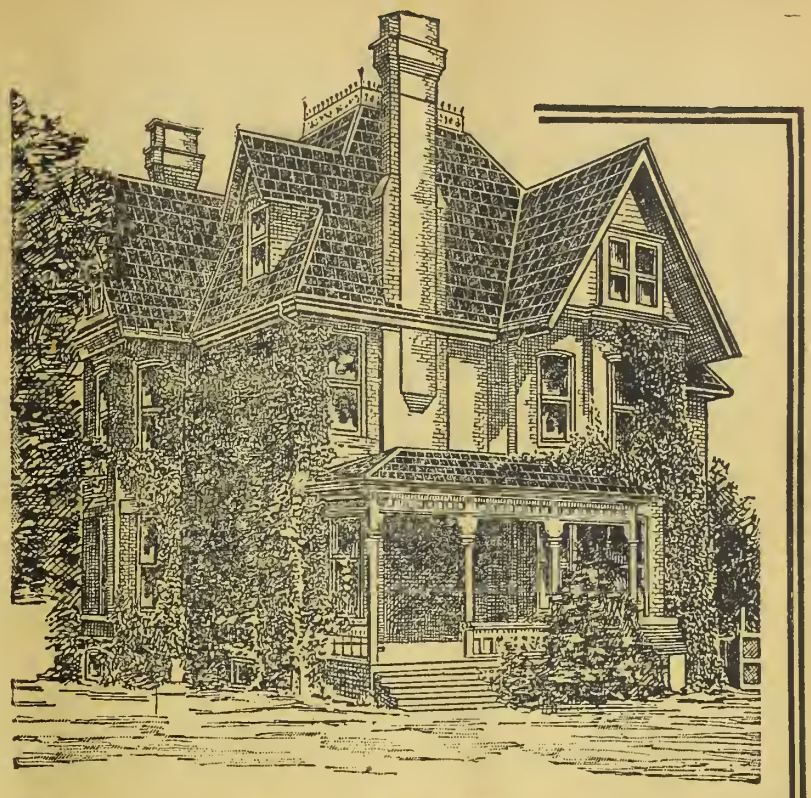
The greatest difficulty I experienced in my work was that of impressing the average farmer with the importance of the poultry branch of his farm. He believes that there might be money in it, but he neither likes poultry nor has time to bother with them. So he does nothing in this regard and does not give his wife and family a fair chance to do anything along this line. When he is told that every twenty-five well housed and well fed hens will yield more profit than the average cow, he always wants to change the subject and discusss fertilzers and other matters. On the other hand, many persons are found taking a keen interest in their poultry keeping, building cheap, up-to-date poultry houses and improving their stock. These persons express themselves pleased with the results obtained, aand they are extending their plants. There is a splendid oportunity for the farmers and others to increase their poultry plants and take advantage of the high prices prevaling for poultry and poultry products. Every farmer should keep at least 100 hens. The amount of labor entailed is not great, and with reasonable success the revenue obtainable, in proportion to the capital invested, is greater and more readily available than is the case in other branches of farm work.

I am more convinced than ever that the greatest need of the average farmer in New Brunswick is a proper poultry house. The usual hen house of the farm is "wonderfully and fearfully made," and 75 per cent. of the cause of non-production of eggs in winter can be laid at the door of the poultry house. These houses are constructed apparently without the slightest thought for the health and comfort for the flock. There is no consideration given to night ventilation, sunshine, fresh air and exercise, or to the convenience of the caretaker. Most of these so-called poultry houses are too small, resulting in over-crowding, which is preventative of good results. They are not properly ventilated and therefore they are damp and in cold weather become frost-coated on the inside, conditions which cause disease and bad health. These kind of quarters, scrub stock, hens over two years old, and late hatched pullets are some of the reasons why eggs are so scarce and expensive in winter and why so many farmers say that poultry don't pay.

Realizing the need of better poultry houses, I prepared a leaflet on "Poultry House Construction," giving plans for a modern poultry house. I have superintended the construction of several of these houses, and they are giving perfect satisfaction. The house contains three pens, each acommodating twenty-five hens. It is thirty-six feet long by twelve feet wide, giving a floor space to each pen of twelve feet square, or 144 square feet, just sufficient for twenty-five hens, allowing six square feet of room to each bird. The posts are six feet high, with an "A" shaped roof, making a loft above the plate. This is filled with straw supported on boards laid two inches apart, and thus absorbs the moisture arising from the pens. In the gable end there is an opening twenty-four inches square, which allows an abundant current of air to circulate over the straw, drying it out and suplying a constant supply of fresh air without creating a down draft, which is sure to result from a direct shaft ventilator through the roof. It will be noted in the illustration that he front is suplied with part glass and part cotton windows. One illustration shows the cotton window hooked up during the day to allow the direct rays of the sun to shine in on the floors of the pens, and free circulation of fresh air through the house which thoroughly airs and dries the interior of the whole building. I am convinced that no more satisfactory house than this can be used in our New Brunswick climate. These houses are plain, easy to construct, as cheap as the usual type of house, and at the same time they give the desired results.

Blue-prints of this house are being prepared, and may be obtained free of charge on application to the Department of Agriculture, Fredericton.

I invariably find that the men and wo men who take a certain pride in their poultry work are the ones that are making it sucessful. They have a practical house; also either pure-bred stock or high-class grade birds, which they are improving each year by introducing the good pure-bred male, always of the same breed, for crossing and breding from crosses only causes the stock to revert back to mongrels. It is only by systematic and intelligent work that we can make a success of all lines of farm work and especialy of poultry and live-stock.—Seth Jones, Poultry Supt. for New Brunswick in the 1913 Report.



Why not a Modern Roof?

The old wooden shingle has to go the way of all other unsatisfactory building material and is being rapidly replaced by the twentieth century *Brantford Asphalt Shingle.*

Everyone knows how the old-fashioned wood shingle was high in price but low in quality, would warp, curl, get loose, split and rot. The

Brantford Asphalt Shingle

will do none of these things. It is practically imperishable, although costing little more than wood shingles. Again, you save on the laying, as *Brantford Asphalt Shingles* are easier to lay and can be put on not only quicker, but more effectively. Quite fireproof too, therefore reduce insurance rates. Never need repainting, because colors are permanent and fadeless. *Brantford Asphalt Shingles* undoubtedly make a house warmer and more attractive in appearance. They are finished with a coating of crushed natural rock, in green, red and black. Artistic effects can be obtained without extra cost by using shingles of different colors. Write for free booklet to-day.

'Roof Leak'

For protecting tin, iron, wood or felt roofs. Makes any leak watertight and old roofs as good as new. Write for booklet.

MARKETS.

HALIFAX

GRAIN—Oats, 49c to 51c. bus., bagged, 52c. to 54c.; Peas, whole, $7.00 bbl.

FEEDSTUFFS—Bran, $29.00 to $30.00 ton; Shorts, $30.00 ton; Middlings, $30.00 to $31.00 ton; Linseed Meal, $37.00 to $39.00 ton; Gluten Feed, $32.00 to $34.00 ton; Corn Meal, $1.65 to $1.70

GRASS SEEDS—Timothy, 8c. to 11c. lb.; Com. Red Cover, 19c. to 24c. lb.; Mam. Red Clover, 20c. to 21c.; Alsike, 17c. to 20c. lb.

HORSES—Drafters, $250.00 to $275.00; Roadsters, $200.00 to $250.00; Carriage, $175.00 to $200.00.

DRESSED MEATS—Beef (carcass) 8c. to 13c. lb.; Mutton, 8c. to 9½c. lb.; Veal, 8c. to 10c.; Pork, 9c. to 12c.

DAIRY PRODUCTS—Creamery Butter, 30c. lb.; Dairy Butter, 24c. lb.; Cheese, 16c.

POULTRY AND POULTRY PRODUCTS—Eggs, 20c. doz.; Fowl, 15 to 18c. lb.; Ducks, 18 to 20 c. lb.; Geese, 17c. to 20c. lb.; Turkeys, 22c. to 23c. lb.

FRUIT—Apples, No. 1 Spy, $6.00 bbl.; No. 2 Spy, $5.00; No. 3 Spy, $3.00 No. 1 Nonpareil, $5.00; Strawberries, 40c. box.

MISCELLANEOUS—Hay, $16.00 to $17.00 ton; Wool 25c. to 27c. lb.; Beef Hides, 12c. to 13c. lb.; Calf Skins, 18c. to 20c. lb.; Sheep Skins, 75c. to $1.50 each.

VEGETABLES—Carots, $2.50 bbl.; Potatoes, $1.00 bag; Turnips, $1.25 bag; Parsnips, $2.00 bbl.; Cabbage, 2½ c. lb.; Tomatoes, $4.00 case; Cucumbers, $1.50 doz.

During the past week eggs have been acting better and the price has gone up from 18c. to 20c. per dozen, with the demand at the present time good. Cheese, which has been firm all through the winter, selling as high as 17½c. is now quoted at 16c. This falling off in price is due to the receipts of the new season's stock. Beef dressed is a little firmer, selling at 8c. to 13c. per lb. Tomatoes are beginning to become more plentiful. Two weeks ago they were quoted at $6.00 per case last week at $4.50 and today at $4.00. A case weighs about thirty pounds, so that at present prices they are very reasonable for this season of the year. It would seem that apples have struck their highest, since the supplies of Baldwins and Golden Russets have already gone off the market without any advance in price.

CHARLOTTETOWN

GRAIN—Wheat, 95c. to $1.50 bus.; Oats, White, 36c. Back, 40c. bus.; Barley, 60c. to 80c. bus.; Buckwheat, 75c. to 80c.

FEEDSTUFFS—Bran, $1.50 per 100 lbs.; Shorts, $1.50 per 100 lbs.; Middlings, $1.50 per 100 lbs.; Oil-Cake, $1.95 to $2.10 per 100 lbs.; Gluten Feed $1.85 per bag; Corn Meal, $1.95 per bag.

LIVE STOCK—Butchers Cattle, 6½ c. to 8c. live weight; Stockers, $25.00 to $40.00; Milch Cows, $40.00 to $65.00; Sheep, 5c. to 5¼c. lb.

DRESSED MEATS—Beef (carcass) 12c. to 14c. lb.; Beef (retail) 9c. to 20c. lb.; Mutton, 10c. to 16c. lb.; Veal, (carcass) 5c. to 5½c. lb.; Pork, (carcass) light and heavy, 8½c. to 10c., select, 11c.

HORSES—Drafters, Roadsters and Carriage, $175.00 to $250.00.

DAIRY PRODUCTS—Creamery Butter, 30c. to 32c. lb.; Dairy Butter, 24c. to 28c. lb.; Cheese, 15½c. to 16c. lb.

POULTRY AND POULTRY PRODUCTS—Eggs, 18c. to 20c. lb.; Fowl, 12c. to 14c.

FRUIT—Apples, $3.50 to $5.00 bbl.

MISCELLANEOUS—Hay, pressed, $12.00 to $12.50 ton; Straw, $6.00 to $7.00 ton; Wool, 24c. to 25c. lb.; Beef Hides, 12c. lb.; Calf Skins, 16c. lb.; Sheep Skins, 90c. to $1.25 each.

VEGETABLES—Carrots, 50c. to 60c. bus.; Potatoes, 35c. to 40c. bus.; Turnips, 16c. to 20c. bus.; Beets, 40c. to 50c. bus.; Parsnips, $1.25 to $1.50 per 100 lbs.

Little or no change since my last report. Roads have continued almost impassable and supply of farm produce offerng is very limited. Some few cars of potatoes loaded along the line of the P. E. I. R. R. have been shipped but very few have been brought in by teams. Oat market is steady but quiet. Vegetables are a very poor supply and prices quoted are more or less estimated value. Feeds are scarce, in fact, bran is not obtainable until new supply arrives. Eggs are in fine supply and prices hold steady. Buyers are paying more attention to quality than they did other years and it looks as if this will be the rule after this. Beef is still scarce and high but market is a little easier. Pork is firm and supply scarcely epual to demand. Butter is offered in quantities sufficient for demand for retail use.

SPRAY NOW!

The Early Sprayer Gets the Bugs

Style "G"

Because they lack vitality and spraying done now will be more effective than twice the work later on. If you have not begun spraying yet every days delay means loss and damage.

What make and style of Spray Pump shall I use? Is the question asked by nearly every farmer.

The Kant-Klog Sprayer, Style "G"

here illustrated sprays Trees, all kinds of Small Fruits and Garden Vegetables, also Disinfects, Whitewashes and has many other uses. It is fitted with "Kant-Klog" Nozzle that throws round sprays, flat sprays and solid streams. Three of each and all of different size, volume and fineness. The Spray Body is made of heavy polished brass or galvanized steel as required.

Each STYLE "G" SPRAYER is furnished complete with "Kant-Klog" Nozzle, thumb pressure Spring Hose Cock, Carrier Strap and Safety Valve.

Price with Galvanized Steel Body $4.00. Price with Polished Brass Body $6.75.

Junior No. 5 Spray and Force Pump

In this pump the objectionable foot-rest, clamps, leather suction, packing, etc., are entirely done away with. It requires no fastening of any kind, holds itself down and works anywhere and everywhere, All the operator need do is to press the plunger down. It rises of itself, the upward stroke being made by a brass spring forcing the cylinder apart. The All-Brass suction working with a brass cylinder with All-Brass Valves, does away entirely with leather, rubber or other packing. It is practically impossible for any part to get out of order.

The Junior No. 5 Pump will pump from a pail, barrel, tank, spring or creek and will do more kinds of work than any pump of its kind made. It will throw two solid streams, one of flat spray and one fine round spray. Has automatic mixer to keep solution stirred, pleases everybody and will last a lifetime.

Price of Junior No. 5 Pump complete with hose and 3 feet of brass tube to attach to hose for spraying trees $3.50.

Either of above Pumps sent freight paid to your nearest Railway Station or Boat Wharf on receipt of price. Prompt attention to all orders is assured you.

Green Food for Poultry

is esential as part of the winter ration When cabbage and beets are not available, sprouted oats can be easily fed. Soak the oats in a bucket for at least 24 hours and then place in a pile on the top shelf of the sprouter. On the third day spread them out and let them grow to a height of not over 2 inches, then feed them. Keep the oats in a room of moderate temperature and dampen every day.

To be a Successful Dairy Man You Should be Able to Answer Yes to Each of These Questions.

1. Do you weigh and test the milk from each cow and keep an accurate record of her product ?
2. Do you dispose of all cows that are not profitable?
3. Have you a pure bred dairy bull ?
4. Are you raising the heifer calves from the best cows ?
5. Are you feeding liberally and using a balanced ration ?
6. Have you a silo ?
7. Are you raising legum nous hay cowpeas, clover or alfalfa ?
8. Is the milk or cream you sell as clean as the food on your own table ?

ESSENTIALS FOR IMPROVEMENT OF DAIRY CATTLE.

1. Feed your cows liberally enough to allow the good ones to show up.
2. Weigh the milk of each cow regularly and test it monthly if possibly by the Babcock test.
3. Cull out those that do not make a profit and keep the best.
4. Use only a pure-bred bull of a strictly dairy breed and from the kind of a cow you want to raise. Keep accurate breeding records. Do not cross breeds.
5. Raise the heifer calves from the best cows with great care.

THE SIN OF OMISSION

It isn,t the thing you do, friend,
But the thing you leave undone
That gives you the bitter heartaches,
When the work of the year is done,
When apples are all worm eaten
And the taters blighted and small
When the use of a "PERFECT SPRAY PUMP"
Would have saved them one and all.

Oh, the appes you might have had, my friend,
If you'd only sprayed the same,
Oh, the taters you've thrown away, my friend,
That would have been clear gain.
These would have paid for your spray pump,
And have left you a happier man.
Then buy the best "A PERFECT,"
And save them while you can.
..THE "PERFECT SPRAY PUMPS are manufactured by R. B. WESTHAVER, MAHONE BAY, N. S.

Color of Yolk

The color of the yolk of the egg is affected by the food taken into the system An absence of green food is frequently shown by the paleness of the yolk.

Wood Ashes and Hen Manure

fight whenever put together. The result is always a loss of ammonia. Never mix them. Apply each separately to the garden. Sifted coal ashes don't quarrel with hen manure, and are therefore excellent to place under the roosts.

The Stallion Barrister.

In response to the request of several readers of the Maritime Farmer asking for information re the noted stallion, Barrister, we republish a portion of an article by Hon John Richards on Early Importations of Noted Horses to Prince Edward Island, which appeared in our issue of May 28, 1912,.

"Barrister" was brought to Prince Edward Island in the spring of 1881, when he was three years old. He was selected and purchased in the city of York, England, by C. C. Gardiner, Esq., who is recognized as one of the best judges of horses and no further proof of this is wanting than the selection of such a good horse as "Barrister" affords.

"It seems superflous to say much in these pages about the achievements of "Barrister" in the stud as these are well known to the majority of our readers in the Provinces who are at all interested in horse breeding. That he was a great sire, all will admit, indeed, it may not be too much to say, that his superior never crossed the Atlantic. His progeng for several generations won distinctions in the prize rings of Prince Edward Island and adjoining provinces, also in the State of Maine, to which many of them were

"Ideal Fence" Is a Permanent Investment

More miles of "Ideal Fence" are sold in Canada annually than any other make, which proves without a doubt that "Ideal Fence" offers the best investment to the successful farmers. They know when they buy "Ideal" they are gettting full value for their money. They insist on quality, service and protection, and get it in "Ideal". You need not experiment in buying fence, but profit by your neighbor's experience and buy "Ideal"

There may be many makes of Fence, but there is only one IDEAL FENCE, which means Quality, First, Last and Always.

You will no doubt be interested in our catalogue, which shows many different styles of Farm, Hog and Poultry Fence and other Ideal products, including Farm, Stock and Lawn Gates, Ornamental Lawn Fence, Flower Bed Guards, Vine Treillis, Window Guards, Stall Guards, Barb Wire, Coiled Wire, Post Hole Diggers, Stretchers, Staples and all Fence Supplies. THE T. EATON CO LIMITED
TORONTO CANADA

taken at long prices; and in the breeding ranks they were no less successful.

"Barrister" himself, was a frequent prize winner at the leading shows in the Old Country, as a yearling, and two-year-old, in competition with many of the best in the land, he was highly commended In this country, he never met defeat when in his prime. He was a bay in color, large, well-shaped feet, and with a set of legs that denoted both strength and quality of bone. His weight at three years old was about 1,700, and at five years, close upon a ton.

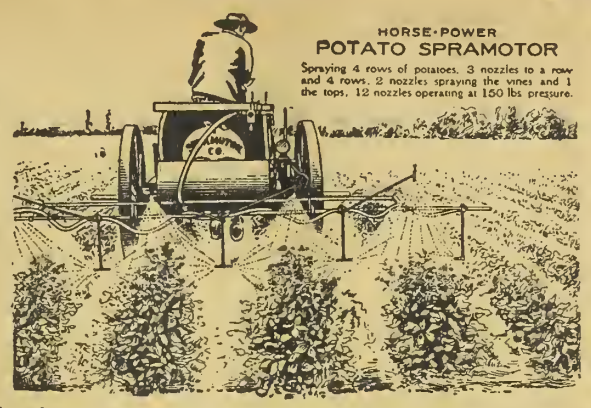
"Barister" was sired by Emperor 1155 Clydesdale Stud Book—a noted horse for which the high price of 600 guineas was paid. His dam, "Bounce" was by "Honest Tom", the greatest Shire horse England had produced, he having no less than six first prizes at the Royal Society Show "Bounce" was regarded as one of the best mares in the three kingdoms, in her day, and rarely met defeat in the show ring.

"It will be noticed in "Brrister's breeding that his sire was a Clydesdale and his dam was got by a Shire horse. It is well to state that before the inception of the draft horse stud books in England and Scotland, horses were frequently bred in these lines, and many of the best horses in Scotland, notably "Prince of Wales," "Darnley," and the superb show horse "Prince of Avondale," were evolved in this way, and are now regarded as among the great progenitors of the Clydesdale breed"

SPRAMOTOR--- BUILDER OF BANK ACCOUNTS

If you let pests, parasites and disease have their way with your crop every year, you lose thousands of dollars and you know it. Get after them with a *Spramotor* and transfer those dollars into your bank account.

Do you think the Canadian Government awarded first prize to the *Spramotor* because it was a "pretty good machine" or because it was *the best machine* out of the eleven that were entered? Why did the other ten makers go out of the spraying machine business right after that contest, for ten years? And how far behind are they now?



HORSE-POWER
POTATO SPRAMOTOR
Spraying 4 rows of potatoes, 3 nozzles to a row and 4 rows, 2 nozzles spraying the vines and 1 the tops, 12 nozzles operating at 150 lbs pressure.

These are questions you should ask when deciding which spraying machine to buy. Consider this fact:—We make a larger range and more styles of spraying machines than any other firm in the world. Did you know that you can buy an efficient hand *Spramotor* for as little as $6? From that price on we build hand-cart, horse-drawn, horse-operated and gasoline-power Spramotors up to $350, embracing dozens of different styles suitable to every purpose.

Buying a Spramotor, you get a machine embodying the valuable experience of twenty years in the manufacture of *spraying machines only.* We do not make a pump or an engine, then rig up a spraying apparatus and attach it in order to sell our pump or engine. We build *Spramotors* only—with the single idea of furnishing buyers with the best spraying outfit made. That is one reason why we can show over a hundred First Awards and Gold Medals won in different parts of the world.

We give you in the *Spramotor* over twenty distinct patented features that no other machine can have. Every point has been worked out, every obstacle overcome. Here's something to think about:

All Parts Made in our own Factory

We are not satisfied to accept fittings and small parts from some other maker. Everything about the *Spramotor* is manufactured right in our own factory, under strictest supervision, even down to the nozzles. We make a far better nozzle ourselves than we can buy anywhere in America, and the same applies to all fittings used We carefully inspect every part of every machine, then test each outfit under pressure, when it is ready to ship. Result—every *Spramotor* owner is a *Spramotor* booster. It pays!

FREE Write us some idea of what you could use a *Spramotor* for, and we will send you full particulars of an outfit that will fill your needs at the lowest possible cost. In addition, we will mail you our valuable illustrated treatise on Crop Diseases gratis, without obligating you in any way.

Will you write us today.

Prominent Grower Endorses *Spramotor*

JOHNSON BROS.

Fruit Growers, Shippers and Exporters

Forest, Ont., Dec. 26th, 1913

Messrs. Spramotor Co.,
London, Ont.

Dear Sirs:—

The Model C Power Spramotor that we purchased from you last spring has given us the best of satisfaction—much better than we expected. It was kept running constantly every day for some ten weeks, and proved itself first class in every way.

We were especially pleased with the automatic air regulator, which was a surprise to us, and far excels any other regulator that we have ever used or have ever seen.

The engine is strong and simple.

Yours truly,
(Signed) D. JOHNSON.

THE LONDON SPRAMOTOR, 1726 King St. E., London Can.

The Kierstead & Mersereau Fox and Fur Co.
LIMITED

Owners of the Celebrated Robert T. Oulton Silver Black Foxes, and Successors to Robert T. Oulton, Pioneer Silver Fox Rancher of the World

Capitalization: $1,000,000. Present Stock Issue: $700,000
Treasury Stock: $300,000, to be sold only for the purchase of additional animals

ASSETS Options on 28 pairs highest grade Silver Black Foxes, including 8 pairs of the famous Oulton Breeders and 5 pairs breeders of other standard strains; also 15 pairs young, all of standard strains. 3 pairs of above breeders include this year's young making a dividend probable this year.

We have a long lease of the Oulton ranch at Little Shemogue, N. B. and are negotiating for its purchase with large farm attached.

In addftion to foxes we have purchased 40 pairs Mink, 4 pairs Fisher, 3 pairs Martin, and shall add large numbers of other fur animals as they are available.

OFFICERS

Honorary President—General Superintendent, Robert T. Oulton, Esq. Little Shemogue, N. B. Pioneer Black Fox Rancher of the world.

ROSE COMB BROWN LEGHORNS for sale after June 15 to make room for young stock. Winners in show room and laying contests. Eggs for hatching $1.50 per 15. - Mating list free. ERNEST PRINGLE, Stanley, N. B.

Selecting Eggs For Hatching.

"The first consideration in hatching eggs is the seection of the egg itself." says Prof. F. S. Jacoby, of the College of Agriculture, Ohio State University. "Not every egg is desirable for hatching purposes. If possible eggs from only the best hens should be used. These may be obtained by the use of trap nests, or by having a small breeding pen separate from the main flock. Eggs for hatching should be put into the incubator or under the hens as soon as possible after being laid. Eggs may be kept ten days, or even two weeks, if they are kept in a cool, dry place and turned daily. However, the germ is not as strong in an egg two weeks old as in one a day old. The shape and color of the eggs should be considered. Only regular, medium-sized eggs, with a shell in accordance with the breed, will produce healthy vigorous chicks. Irregular, round, extremely large or extremely small eggs will not produce the best chicks."

Feeding Baby Chicks.

During the past two years we have tried several methods of starting baby chicks. If one is troubled with diarrhea of any kind, lack of vitality, or slow growth, or then try the following plan, which has been one of the most successful plans of feeding baby chicks that we have ever used.

We sprinkle a little clover chaff or fine cut straw or clean litter, free from must and mold, over the floor of the brooder or the hover before the chicks are placed in it. We provide a small fountain of pure water. The chicks are not fed for 48 hours, or more after they are hatched. We begin by feeding a mixture of two-thirds rolled oats and one-third wheat bran mixed with a small amount of charcoal. This is fed on a clean board or a paper four or five times a day and only a small quantity at a time. We remove the feeding board after the chicks are through eating. Clean sand is given about the time the first feed is given, and no grit is given before.

After the chicks are about a week old we commence to add a little commercial chick feed to the above mixture and gradually increase this until the rolled oats and the bran are eliminated from the first or grain feed. At this age we also begin to feed a dry mash, the mash being made by mixing one part each of wheat bran, corn meal, shorts, one-half part alfalfa meal and one-third part rolled oats or oatmeal.—T. E. Quisenberry, Missouri Experiment Station

BABY CHICKS

We can fill limited number of orders for B. P. Rock & W. Leghorn chicks this spring. Prices, April $20.-00 per 100. May, $15.00 per 100. Cash before shipment.

A COLD Developed Into BRONCHITIS.

However slight a cold you have, you should never neglect it. In all possibility, if you do not treat it in time it will develop into bronchitis, pneumonia, or some other serious throat or lung trouble.

Dr. Wood's Norway Pine Syrup is particularly adapted for all colds, coughs, bronchitis, pneumonia, asthma, whooping cough and all troubles of the throat and lungs. Three points in favour of Dr. Wood's Norway Pine Syrup are: 1. Its action is prompt. 2. It invigorates as well as heals, and soothes the throat and lungs. 3. It is pleasant, harmless and agreeable in taste.

Mrs. Albert Vait, Brockville, Ont., writes:—"Just a line to let you know about Dr. Wood's Norway Pine Syrup. Our oldest little girl is now six years old. When she was four months old she got a cold which developed into Bronchitis, and we tried everything we could think of and had two doctors attending her, but it was no good. One day I read in your almanac about Dr. Wood's Norway Pine Syrup, so I tried it, and before she had finished one bottle of it, the dry hacking cough had nearly all gone. There is nothing equal to it, and we are never without it in the house."

See that you get "Dr. Wood's" when you ask for it, as there are numerous imitations on the market. The genuine is manufactured by The T. Milburn Co., Limited, Toronto, Ont.

Price, 25c.; family size, 50c.

Bog Spavin

Cure the lameness and remove the bunch without scarring the horse—have the part looking just as it did before the blemish came.

Fleming's Spavin Cure (Liquid) is a special remedy for soft and semi-solid blemishes—Bog Spavin, Thoroughpin, Splint, Curb, Capped Hock, etc. It is neither a liniment nor a simple blister, but a remedy unlike any other—doesn't imitate and can't be imitated. Easy to use, only a little required, and your money back if it ever fails.

Fleming's Vest-Pocket Veterinary Adviser describes and illustrates all kinds of blemishes, and gives you the information you ought to have before ordering or buying any kind of a remedy. Mailed free if you write.

Middleton, N. S.

Proposed Assistance to Associations of Wool-Growers by the Live Stock Branch of the Dominion Department of Agriculture in the Marketing of their Wool Clips.

The Live Stock Branch of the Dominion Dept of Agriculture is prepared to offer practical asistance this year to Asociations of Wool Growers in the preparation and display of their wool clips for market. Associations, in order to receive this aid, must be organized in acordance with the regulations of the Branch and membership is limited to actual owners of sheep. West of Fort William an Association must contain at least 3.000 sheep, or sufficient to comprise one car-load of wool; east of there, a relative number. The services of expert wool classifers, who will take charge of and perform the grading, classification and preparation of the wool, will be provided.

This proposal represents much more than a mere continuation of the work undertaken last year, when two wool classifiers, in the employ of the Live Stock Branch, visited the Western Provinces and gave practical instructions aand advice to sheep-raisers upon wool growing. Rather it means the introduction of a definite scheme whereby wool producers may be actually assisted in preparing and presenting their wools upon the market in the most aceptable fashion and thus be in a position to cater more directly to the requirements of the market. Moreover, it should prove effective in development and improving the general status of sheep-raising and in creating an impetus to the production and preparation of an improved grade of wool and indirectly a better class of mutton.

The Branch will also provide the means for the establishment of a central bureau for the distribution of current information respecting domestic and foreign markets of wool, so that the Associations may be constantly in command of complete knowledge concerning the source of the demand and the ruling price of all grades. Reliable information of this nature will serve as an excellent asset to an association in directing its policy and placing it in closer relationship with the demands of the trade.

Sheep-raisers desirous of taking advantage of this offer and of forming an Association should write, for detailed information and aplication forms, to the Live Stock Commissioner, Ottawa.

There is Always a Demand for Goods of Quality.

More and more all the time progressive concerns believe in the value of making their wares better known, especially if their goods have real merit. A notable instance of this is the case of the Enterprise Foundry Co., Saskville, N. B., who are now running a series of ads in this paper, to which we have very great pleasure in drawing attention.

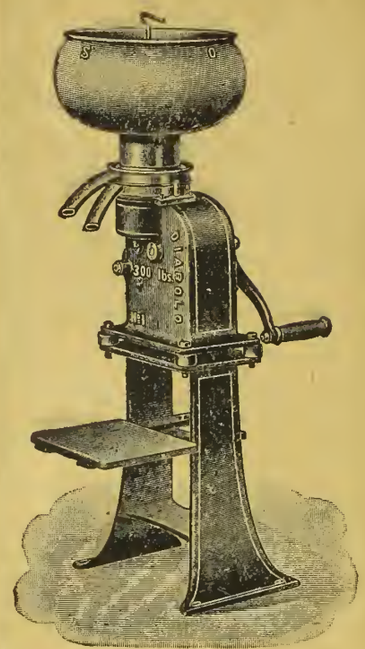
This concern is already well known and their goods are sold freely in every province of Canada.

As their President, Mr. W. S. Fisher writes us, their aim has been to make something beter than the average, feeling that there is a growing demand for the best that can be made and their efforts are concentrated on this.

The Enterprise Monarch Steel Range has become a household word on account or its very many special features of excellence and this is the article that they are now drawing special attention to.

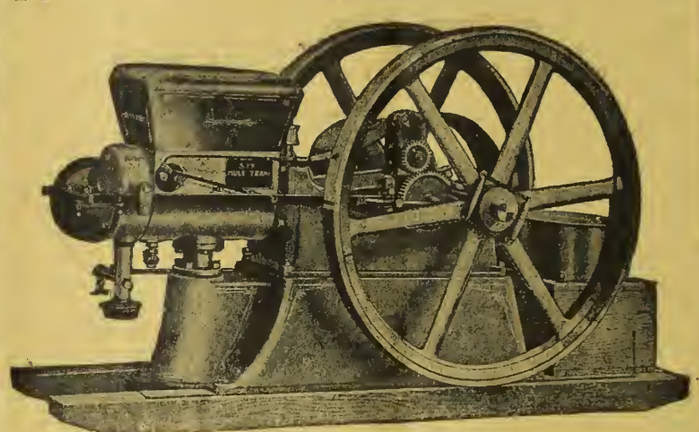
Later on they will have something to say about their Blazer Warm Air Furnace, which, like the Monarch Range, also possesses a number of features, that commend it to those who are seeking the best.

THE "DIABOLO" CREAM SEPARATOR



The "Diabolo" Separator is a high grade machine. Its record in skimming capacity has never been beaten. It is simple to handle, easy to clean and light to work. On account of its accurately machined parts it runs noiselessly and smoothly, while wear and friction are reduced to minimum. Fully guaranteed for ten years.

THE "ESCO" GASOLINE ENGINE



The acme of perfection in engine building

Full powered, smooth running, simple construction, reliable for steady work, long lived and low priced. Built by the world's largest makers. We guarantee every engine for a period of five years, and will replace, free of charge, any part which proves defective in material or workmanship during that time.

"RUTHLANDS"

Most Up-to-Date Methods, Latest Improvements, and Systematic Conductance of a Farm

Owned by Senator W. B. Ross

It is hardly possible to do justice, in a short article, to such an extensive, well-conducted, and model farm as "Ruthlands," but something of their improved way of working, conveniences, and labor-saving devices may be helpful to those working along the same line.

The above mentioned farm is situated at Middleton, Nova Scotia, in the centre of the Annapolis Valley, which is justly famed for its fertility, and lies between the North and South Mountain ranges: thus sheltered, it has justly earned the name of "The Garden of Nova Scotia."

Without a doubt this farm is one of the most up-to-date in the Maritime Provinces. It consists of seven hundred acres, five hundred under cultivation, the remainder in pasture and woodland.

It contains a variety of soil, suitable for all kinds of cereals, vegetables and fruit.

The Senator evidently is a strong believer in drainage, as he has put in twenty-six miles of drainage tile, ranging the size from three to eight inches.

There are three large, well finished modern barns on different parts of the farm, the largest is 90x45 feet, with an ell 30x40 feet. Four large, commodious dwelling houses are situated near each barn for the convenience of the workmen, with blacksmith shop, cooperage, large carriage house, machine and implement houses all lighted by electric lights and connected by a telephone system which runs to all parts of the farm.

The barns have cement and brick foundations, with 10 feet cellars the full size of the buildings, divided off in bins for each root crop; affording ample space for the storing of roots and feed.

All roots are run through a pulper and mixed with feed, each day as the stock requires it. A pipe runs along in front of the stalls, supplying each animal with a constant supply of fresh water. Hay and grain are supplied from above, by shoots to the different stalls, which is a great convenience and saving of labor. Trap doors are also supplied at the rear of each stall for the scraping in of refuse. And all doors are hung on weights, running in a groove; up and down, instead of on hinges. We can all see the convenience and advantage of this. There is no space monopolized by the swing of the door, and any size of opening may be had for ventilation without having the door made in two parts. I wish I had the opportunity of showing each farmer who reads this article, over this splendid farm; much of interest and profit could be seen, which, if touched in this article would require a lengthy description.

One of the Three Houses on "Ruthlands" Farm.

One of the Large Barns on "Ruthlands" Farm

Hospital stalls are supplied for sick animals, or those nearing foal, where they can be cared for, to the comfort of the animal, and very often to the profit of the owner.

The interior of the stables are finished in plained and matched lumber as well as all box stalls and partitions, thus preventing all drafts and colds.

From 60 to 85 head of cattle are kept on this farm; twelve horses, one stallion, and a pair of brood mares. At present there is a two-year-old Clydesdale which weighs 1,300 pounds.

Beef cattle was sold from this farm, girting 7 ft. 9 inches, weighing 4,000 pounds, live weight, dressed 2,250 pounds per pair.

Two 2-year-old steers were sold recently from this farm, weighing, alive, 2,400 pounds. Eighteen head of such cattle were sold from this fram during the winter, and thirty more are on hand for sale. These beeves sell for from $6.00 to $6.50 per cwt. This alone is a handsome income for the farmer, besides the benefit he is doing his farm by using the hay on the farm, and also making a profitable use of the undersized potatoes, and unmarketable vegetables.

From fifteen to twenty brood sows are always kept on this farm, also a Yorkshire and a Berkshire boar.

Two large hen houses, one 85x22 ft., the other 30x15 ft. are filled with four hundred laying hens. The incubator is not used on this farm; but instead, about eight feet is partioned off at one end of the henhouse for a hatchery. The walls are divided off in square boxes, or pigeon holes, with just space enough for the nest and an equal space for the hen to come off for her food. The setting hen is put into one of these boxes with her nest of eggs, and kept there until her time is up: her food being passed to her through the small door in front, in which is a small square of wire netting to allow of ventilation and light. In this way each hen is kept separate, and several dozens of nests occupies only a very small space. This arrangemnet is giving excellent satisfaction.

A passage-way runs from one end to the other of this long hen house, along which are the nests for the laying hens. The remaining space is divided up into twelve feet pens, by wire netting, keeping each flock by itself. Along the side opposite the passageway, is a space for a warm roosting place during night, which is one of the secrets of egg production. Cotton is used on the upper half of all windows. A Brahma hen was recently killed from this flock which weighed nine pounds, when dressed.

Eggs, beef, pork and cream, are shipped to the nearby market of Halifax, where highest market prices are always cheerfully paid. The income from cream alone, from nine milking cows, averages during the winter months, fifty-five dollars per month. One Ayrshire cow, while receiving no extra care, has produced fifty pounds of milk per day during the winter.

It is a curious fact, and one which the stock producer should keep in mind, that the benefits of cross-breeding is only really beneficial in the first generation; after which, further efforts in this line seems to result in only a lot of unprofitable scrub animals. The pure bred animal will always give a good account of itself. There are also two fine pure bred bulls on this farm, one splendid looking Ayrshire, the other a Shorthorn, the latter, an exceptionally fine looking animal, purchased in England for six hundred dollars.

From the orchard, an average of seven thousand barrels of apples are shipped to England, adding very materially to the income of this farm. In ten years, when the young trees come into full bearing, this orchard will produce twenty-five thousand barrels of choice apples.

Thorough cultivation, for weed killing and moisture-conservation, is prac-

Clean Barns Prevent Tuberculosis

Finding of the International Commission—Aspects of the Disease—Its Nature—Conditions Favorable to It—Precautionary Measures That Should be Taken to Prevent It.

Our farmers despise the crowded life, the filthy slums, and the multitude of unsanitary conditions that obtain in our large cities. They believe that human beings who are reared under these conditions cannot grow up strong, cannot attain the highest success in the battle of life. Our farmers uphold farm life—farm life, with its clean surroundings, clean food, healthy atmosphere, and abundant sunlight, as the seed-bed for the development of the highest type of manhood and womanhood.

And yet, there are actually farmers who deny to their stock those very sanitary conditions to which they attribute their own strength and welfare! They disparage city life, but they keep their cows in buildings filthier than the vilest of city slums. Nature does not except cattle from her laws. Cattle will not do well under this treatment, any more than men or women or children.

Progressive dairymen grasp the signifigance of this inconsistency, and in every Province of the Dominion are building modern, well-lighted, well-ventilated barns that are as clean and as easy to keep free from dirt as the kitchens in their own houses. These barns have cement floors and walls and are fitted with sanitary, steel stalls. They recognize that the additional outlay required to build a barn that will be healthful and comfortable for the cows, will quickly come back to them through better returns in the milk pail, through increased prices for their stock and dairy products, and by the prevention of diseases and losses among the stock.

In this conection, the report of the the International Commission of the control of Bovine Tuberculosis, published in 1911, and quoted below, is very interesting and should be thoroughly read by every former.

"Where did tuberculosois come from? We do not know. History records it from the earliest times.

"Over a century ago its contagious nature was suspected, and many facts were recorded to prove that it must be 'catching.' Doctors differed about it, and for a ong time the question was hotly disputed. Finally it was settled by Dr. Robert Koch, a distinguished German physician, who discovered the germ of the disease in the year 1882, and named it Bacillus Tuberculosis. He proved by experiment that the disease is produced by these germs, and without them the disease cannot be produced. It is now universally admitted that tuberculosis is a contagious disease, and may be transmitted from animal to man.

Aspects of the Disease

"The importance of tuberculosis may be considered from two points of view: first, the loss it entails upon the cattle owner, and second, the danger of communication to human beings.

"Consider first its effect upon the pocket of the owner of the cattle, whether farmer or breeder or dairyman. A serious percentage of the dairy cows of the continent are affected, and the disease is found in even a larger percentage of dairy herds.

"It is no uncommon thing to find as many as 70 per cent or 80 per cent of the cows in a herd diseased. These animals will be in various stages of the disease, some recently infected showing no sign of ill health, others badly diseased, but outwardly appearing healthy, while a few are evidently breaking down and wasting away.

"The loss to the owner is evident when a cow dies of the disease, or, when an apparently healthy cow is slaughtered for beef and found so badly affected as to be unfit for food.

"The calves in such a herd do not long remain healthy. They catch the disease before many months old, and are a source of loss instead of gain.

"Although the disease is most frequently found in herds that are more or less closely confined, such as dairy herds and pure bred cattle, other herds are by no means free from it. Even range cattle are sometimes affected, and the infection spreads in spite of the open-air life of the cattle.

"Tuberculosis is common among hogs. The public abattoirs report that a serious percentage of all hogs inspected is found to be tuberculous.

"The aggregate of these losses among cattle and hogs is enormous, amounting to millions of dollars every year, besides materially decreasing the food supply of the country.

"Turning to the other aspect of the case, the danger of infection of human beings with tuberculosis from cattle, we have only to consider a few facts, to realize its vital importance to every community.

"Milk is the staple food of infants and young children, and is usually taken in a raw state. If this milk is from a tuberculosis cow, it may contain millions of living tubercule germs. Young children fed on such milk often contract the disease, and it is a frequent cause of death among them.

Nature of the Disease

"The germ of tuberculosis, the tubercle bacillus, is a tiny, slender, rod-shaped body. Several thousands of them placed end to end would be needed to measure an inch, so that they are quite invisible to the naked eye.

"Once the bacillus has gained lodgment inside the body of an animal, it begins to grow and multiply. It gets longer, and when full grown, divides crosswise, making two out of one. Each of these goes through the same process, the two become four the four eight, the eight sixteen, and so on, indefinitely. This multiplication takes place quite rapidly when conditions are favorable, a few hours only being required for the birth of each generation.

"Tuberculosis is contagious or 'cachng'. It spreads from cow to cow in a herd until most of them are affected. This may not attract much notice from the owner, as a disease is slow to develop and a cow may be affected with it for several months, and sometimes for years, before any signs of ill health are seen.

"This slow development is the chief reason for the great loss it causes to the farmer. He does not suspect its presence in his herd until a large number are diseased. If the disease developed rapidly and caused death in a few days, the owner would soon take steps to check its progress and to protect the rest of his herd. Tuberculosis is slow and hidden in its course, and thus arouses no suspicion until great damage is done.

"The tubercle bacillus does not multiply outside the body of an animal. It can live a long time in favorable surroundings, such as dark and dirty stables. Sunlight soon destroys it. Freezing does not hurt it but it can only stand a moderate amount of heat; exposure to 149 degrees Fahrenheit for twenty minutes kills it. Protected by a layer of dried mucus such as is coughed up from the lungs, it withstands drying, light and ordinary disinfectants, but is really killed by steam or boiling water.

"Dark, dirty, crowded stables are favorable to tuberculosis. Under these conditions the disease spreads rapidly and is only kept out with difficulty.

Precautionary Measures to Prevent Tuberculosis

"Clean, airy, well-lighted stables, on the other hand, are unfavorable to the development of the disease. If brought into such a stable it does not spread so rapidly and is not so difficult to get rid of as in the first case.

"Light is very important. Direct sunlight is a great destroyer of germ life. Tubercle bacilli soon die if ex-

A New Agricultural School for New Brunswick

The first school of agriculture to be established in the Province of New Brunswick was opened during the past winter at Woodstock Previous to this the province had depended on the Nova Scotia Agricultural College at Truro, Macdonald College at St. Anne, Que., the Ontario Agricultural College at Guelph to provide agricultural instruction for its farmers and farmers' sons desiring it. Though quite a number took advantage of the faciities offered by these institutions, especially of the winter short course at Truro, it was felt that the time had come for the launching of a more aggressive policy, one which would reach hundreds and thousands instead of the forty or fifty students who annually sought instruction at outside institutions. The government accordingly decided to establish agricultural schools in two or three of the best agricultural centres of the Province.

R. NEWTON, B. S. A.

Director of Agricultural Instruction for the Province of New Brunswick. Principal of the Fisher Vocational School, Woodstock, N. B.

Through the beneficient will of the late Mr. L. P. Fisher, a resident of the town of Woodstock, in Carleton County, a fine, new school building was very opportunely placed at the disposal of the Department of Agriculture this year, free of cost to the Province, and this made it possible to open the first school at once. The present arrangement is that the first floor of the building shall be used for instruction in household science and manual training, under the management of the school board of the town of Woodstock, while the basement and second floor are to be used for classes in agriculture. The building is the property of the Department of Agriculture, and, as the work progresses, will probably be used for agricultural instruction solely, other accommodation to be provided for the classes in household science and manual training

The Building and its Equipment.

The building is 53x102 feet, very substantially built of brick, and very attractively finished throughout in cypress in the natural color. The first floor has two rooms suitable for offices, a few small storage rooms, and four class-rooms, equipped at present for cooking, sewing, laundry work, wood-working and draughting. The second floor has three offices, a room suitable for museum and library purposes, and four class-rooms, one of of which is equipped as a field crop laboratory, and a third as a lectnre room with tablet arm settees accommodating 70 students The fourth class-room has not yet been equipped, but will probably be fitted up as a biological laboratory.

In the basement, besides furnace room lavatories, there is a demonstration room, 34 feet square, with concrete floor and brick walls, suitable for purposes requiring the use of soil or other materials which would damage the polished woodwork of the class-rooms upstairs In the basement also is the live stock judging room, 34x51 feet, with a platform at one end, and seats accommodating over 100 students built in tiers along one side and one end of the room, leaving a large space vacant for live stock used in the judging demonstrations. This room is made to serve as well, an assembly room for large meetings, by placing folding assembly chairs in the space ordinarily reserved for the judging work In this way about 300 people can be comfortably seated.

The First Short Course.

The school was opened with a three weeks' course beginning March 9th. The first week was devoted to Horticulture and Bee-keeping, the second week to Field Crops and Soil Management and the third week to Live Stock, Dairying and Poultry. Students were encouraged to stay for the whole course, but the program was so arranged that those who could afford to stay only one week could get some part of the work complete in that time, and quite a number took advantage of this plan.

The program was planned to meet the needs of the average farmer, and to cover the problems met with in ordinary farm practice. Practical demonstrations and lantern lectures were features of the work.

The average attendance at the regular sessons during the day was about forty for the first week, fifty for the second week, and eighty for the third week. At the evening sessions the attendance was much arger, reaching as high as three hundred and fifty. A number of townspeople came in to these, in addition to a large number of farmers from the surrounding district who could not come in during the day. As this was the first agricultural short

INTERNATIONAL CONFERENCE ON CITY PLANNING DRAFT OF PROPOSED TOWN-PLANNING ACT.

That the town-planning movement in Canada has come to stay and will have to be reckoned with in future is demonstrated by the fact that it has already engaged the attention of several of our provincial legislatures. The year 1912 saw comprehensive town-planning acts passed in New Brunswick and Nova Scotia, and, last year, Alberta led the way for the Western Provinces. Ontario also has an act applicable to cities with a population of 50,000 and upwards.

At the forthcoming International Conference on City Planning, Toronto, May 25 --27, a draft town-planning act, which it is hoped will be a model for all Canadian provinces, will be submitted to the delegates present by a special committee appointed by the Commission of Conservation. Frank criticism and full discussion of this proposed act will be invited. After being amended in accordance with the resolutions of the Conference, copies will be sent to each provincial government. urging them to enact legislation along the lines proposed.

As now drafted, the Bill provides for the preparing and carrying-out of town-planning projects by a Local Board in each city or town, subject to the approval of a Central Town-planning Board for the whole province. Projects will apply chiefly to land likely to be used for building purposes, but may, in certain circumstances, include land already built upon or land unsuitable for building. Provision is made for compensation of private owners if injuriously affected and for the local authority recovering half of the unearned increment if property values are increased. The Central Board may act on its own initiative if the Local Board fails to do its duty or if no Local Board exists.

Under such an act, the growth of every town will be regulated so that streets may be of adequate width and in accord with the general plan of the town; housing congestion will not be permitted; sufficient open space will be reserved for parks, squares and other municipal purposes; and health, amenity and convenience will be given due consideration in all new building areas and, so far as possible, in old ones.

EDUCATION IN THE MARITIME PROVINCES.

At the time of taking the last Canadian Census, Prince Edward Island had one school to every 196 of the total population, Nova Scotia had one to every 185 and New Brunswick had one to every 186. For the eastern provinces, the highest percentage of schoool attendance, was made by Prince Edward Island with 84.60 per cent, Nova Scotia 82.86 per cent and New Brunswick with 80.05 per cent of the total population between seven and fourteen years. Viewing the question in another way, this shows that of the total number of children between seven and fourteen, Prince Edward Island had 154 children per 1,000, Nova Scotia 171 and New Brunswick 200, who were not attending school and whose education had been apparently neglected in the year 1910. In the year 1911 Prince Edward Island had one school to every 196 of the population, Nova Scotia one to every 186. Basing the Computations on the number of persons between the years of six to sixteen, Prince Edward Island had one teacher to every 39 children, Nova Scotia one to every 41, New Brunswick one to every 43. The Maritime Provinces show the greatest population attending school for, from 4 to 6 months out of the year.

WHAT IS A PROFITABLE COW?

The amount of milk given by different cows varies greatly, and one cannot tell exactly which are the most profitable by knowing the number of pounds of milk given. The quality of the milk varies almost as greatly as the quantity, and in butter making it frequently happens that the heaviest milkers are not the heaviest butter-fat producers.

As an actual indication of what cows do give, when careful count is taken, we extract the following paragraph from a letter from C. F. Whitely, who is in charge of cow testing work for the Dominion Dairy Division. Speaking of testing cows, he says:

"The general results as applied to a district are full of suggestions. In one lot of 422 cows belonging to 42 men the average yield last year was found to be 4,494 pounds of milk, the cost of feed $32.90; thus, simply taking the cost of feed into consideration, leaving a net profiot of $14.28. But a slight investigation showed that the 100 best cows produced milk to the value of $7,137.00, the 100 poorest cows produced only $3,200.00, or much less than half as $1.74 each. It thus is evident that each one of the 100 best cows made as clear profit on the milk produced as that given by eighteen of the poorest."

The general argument of Mr. Whitely's letter is evident, but our reason for quoting it here is to show what is an actual average milk yield on a large block of cows.

Let us do a little figuring: Average milk will test close around 4 per cent butter-fat. A cow giving 6,000 lbs. of 4 per cent milk, would thus yield 240 lbs. butter-fat. This, when made into butter, would run about 120 per cent of that weight (there is about 16 per cent of water, salt and curdy matter in butter). Thus our 240 lbs. butter-fat represents 288 lbs. butter. This, at 21 cents a pound, would realize $60.48; at 23 cents, $66.24.

There are many cows that produce more than this, but a great many more that give less. The 6,000 pound cow is a good standard. Try to bring all your cows up to it.

THE FARM STATIONERY.

Although there is a gradual increase in the number of farmers useing a regular printed envelope and letter head for correspondence, the majority do not ever think of this as one of the main points in business-like farming.

Every one knows that a letter written in a cramped hand on a sheet of lady's size writing paper and mailed in an envelope that doesn't fit, causes one to wonder what sort of a fellow put that together. On the outside there is nothing to aid the post office clerks in dealing with the letter in case the addressee cannot be located, and such a letter soon lands with the dead ones.

But when a letter comes with the envelope neatly printed with sender's name, address and route number in the corner, that letter and its sender are respected and the reply is written accordingly. Printed letterheads and envelopes always more than pay for themselves.

FOR HOME AND COUNTRY.

We have received so many requests to publish articles of common interest to the Women's Institute movement in Prince Edward Island, Nova Scotia and New Brunswick that we have decided to make a change in the heading of our Home Department.

"For Home and Country" the motto of the Women's Institutes in Canada has been selected as the new heading for the Home Department of the Maritime Farmer.

The Women's Institute movement is fast gaining ground in the Maritime Provinces under the efficient supervision of Miss Fraser, Miss Winter and Mrs. Dunback.

These ladies will contribute to the columns of the Maritime Farmer and thus help to bring the members of the Women's Institute of the Maritime Provinces in closer touch with each other. Through the columns of the Maritime Farmer they can interchange ideas. Send us short reports of your meetings and copies of best addresses read at your meetings. In this way the work of the Women's Institutes may be made more efficient and far reaching; it will reach the very class of women who will be benefited by all that the Institutes' motto, "For Home and Country," implies.

Before building a stable, study the ventilation question a little.

A number of the cities and towns of Canada are this year observing a "clean up" week. The idea is an excellent one. A little of the same leaven would be a good thing on some of our farms.

High Ridge, Medium Ridge, and Level Culture For Potatoes Compared

EXEPERIMENTS .IN .AROOSTOOK COUNTY, MAINE.

The methods of ridge culture is almost universally used by potato growers in Aroostook County. Probably over 90 per cent. of the farmers practice what might be called extreme ridge culture. The ridging begins at the time of planting. The planter most used has a plow constructed that it makes little more than a mark on the soil unless it is very light, instead of a furow, then the disks at the rear of the machine cover the seed by throwing up a ridge perhaps 4 inches high so that the seed at the very start is practically on a level with the surface between the rows. A few farmers make a practice of going over the field with a weeder and somewhat flattening the ridge but the number that do this is comparatively few. The method most usually followed is to go between the rows with the cultivator perhaps 8 to 10 days after the potatoes are planted and then as soon as they begin to break the ground go over with a horse-hoe and bury them up also burying the weeds at the same time and thereby raising the height of the ridge. This kind of cultivation is continued until the tops are too large to pass through without injury. By this time an A shaped ridge has been formed about 12 to 15 inches high and, of course, the surface between the rows has been dropped by the continual scraping up of the soil so that the tubers growing in the ridge are considerably above the surface in the rows.

It can be readily seen that in a dry season a field so handled must suffer considerably from lack of moisture. In the rather wet seasons usual to Aroostook County no lack of moisture is felt and the drains between the rows are an advantage rather than an injury, but in an extremely dry season it would seem that the drainage is too great. The ridges being high and narrow dry out very quickly and it would appear therefore the crop must suffer more from lack of moisture than it would if the roots of the plant were below the level as they are when modified level culture is practiced.

In the years 1907, 1908 and 1909 field experiments comparing the shallow planting and high ridge cultivation in Aroostook County with a deeper planting and a low, broad ridge were carried out at Houlton. The three seasons had an abundant water supply. Indeed in 1909 there was more rainfall than the crop needed. Because of the long continued, cold, wet weather and early frost the yield was reduced materially. The results as given in the following table show no practical advantage of one method over the other so far as yield is concerned.

NANCY F.

option of Aroostook County methods of potato growing all over the State. It seemed probable that the less rainfall and not infrequent droughs experienced in the more southern parts of the State might prove unfavorable to growing potatoes with the shallow planting high ridge method of cultiva- With the purchase of Highmoor Farm for the station an experiment comparing shallow planting with high ridge cultivation, somewhat deeper planting with a lower, broader ridge, and deep planting with as level cultivation as practicable, was begun. This has been continued through four years with two varieties of potatoes. The results of the experiment are here reported. The deep planted lots were planted at a depth of five inches, the medium at 3½ inches and the shallow at 2 inches.

Full data as to the planting, cultivation, spraying and harvesting of the crop were kept each season. But in an experiment of this type it does not seem wise to use space in reporting detail that, while they are important in showing that the crop is carefully

EXPERIMENTS IN KENNEBEC COUNTY, MAINE.

The successful growing of potatoes in Aroostook County has greatly stimulated the potato industry over the whole State. The great advance in value in land in Aroostook County has led farmers to sell and go to other parts of the State where land has less value. Both of these facts have led to the ad-

grown, have little agricultural significance beyond that fact.

The season of 1910 was favorable for a maximum crop as the rainfall was ample and the growing season greatly prolonged by frost keeping off until October. The seasons of 1911 and 1912 were not so favorable and 1913 was particularly unfavorable, although the rainfall in August was greater than the average and saved the crop from the damage that threatened from the dry July.

The time required for planting was the same on all the plots. The planting, spraying and harvesting were the same for all of the plots with the exception that on the deep planted it was necessary to use four horses on the digger. The deep planted required less hours of cultivation; the medium planted the most. A man and team for cultivating were on the deep plots 26 hours, on the medium 39 hours and on the shallow 35 hours per acre.

There was not much difference in the difficulties of digging between the shallow planted and the medium planted. The deep planted reyuired four horses instead of two on the digger, and a good deal of care was necessary to be sure that the digger was sufficiently deep in the ground to prevent cutting the tubers.

The yields of the four years are given in the table which follows:

Table showing comparison of deep planted, level culture, medium planted, medium ridge and shallow planted high ridge at Highmoor Farm (Kennebec County). Total area in experiments 16½ acres.

CONCLUSIONS.

In the three years experiments comparing the usual method practiced in Aroostook County with deeper planted seed and a lower, broader ridge than is commonly used there showed that so far as yield was concerned there is nothing to choose in that locality between the two methods.

The deep planted and medium planted gave practically the same yields at Highmoor Farm with the advantage (though within experimental error) in favor of the medium planted and medium ridge gave considerably better yields at Highmoor Farm than the shallow planted and high ridge. The medium ridge is cultivated as cheaply as the shallow ridge and is harvested nearly as easily. The deep planted are cultivated at less cost than either of the two other methods but are far more difficult to harvest.

The results indicate that for Aroostook County the shallow planted high ridge is well suited to the climatic conditions. And they also clearly indicate that for the lower counties in the State with their lesser rainfall during the growing season the medium planted with the broad low ridge cultivation is preferable to either of the others.

The Compost Heap.

It is natural that all growing plants require certain substances for their nourishment, and in order that any crop may grow successfully, the following plant food stuffs may be supplied: Phosphoric Acid, Potash, Nitrogen and Lime. The ordinary processes of cropping takes these plant food substances from the soil, and if we wish to maintain the productiveness of the soil, we must return these to the soil in some kind of manure. Barnyard manure is, by far, the cheapest and most suitable fertilizer for all kinds of crops, and to help this out, every farmer should make a special effort to make one or more compost heaps each year. If one is started, it is wonderful how material for it will present itself, which would otherwise go to waste. Most anything will make manures; sea-weed, kelp, etc., from the sea-shore, black mud and sods from the nearby bog, to which may be added oyster shells, straw, old paper, rags, sink water and slops, and a hundred and one other things which would be the better for the home to be gathered up, as well as a valuable source of profit to the farmer. If this were practised more, he would find he would not need so much artificial fertilizers, so called. Of course, some commercial fertilizers may be advantageously added as a

HORTICULTURE.

Picking, Packing and Grading Fruits for the Market.

Mr. President and Gentlemen:—

I am very glad to be present at this meeting and I trust I may be able to interest you in the subject of my address. On the presumption that the grower has done his best in the way of care and cultivation necessary to the production of the best fruits whether it be in the orchard or in the small fruit area, he is now at the harvest time, confronted with problems that require good judgment, constant care, and the nicest kind of management. The most particular part of the business of growing farm and garden products, and the marketing to advantage is their preparation for the market. To be sloven and careless in our work and acting on the presumption "that any thing will do" will surely discount the profits to a large extent, hence the necessity of doing our best to make them attractive. Taking up the first part of our subject, picking (or gathering, if you prefer the word) means much to the fruit grower.

Fruits of all varities are a production that must have careful handling, as they are perishable to a greater or lesser extent, according to their variety and hardiness. Their value is increased when in the hands of the consumer, by previous careful handling. Therefore, the picking should be done with great care. Some varieties of apples are so sensitive to touch that gloves should be worn when picking to prevent spots and bruises. Apples should be placed in barrels in the orchard carefully and drawn to the fruit house, there to remain open for four or five days to cool off before being finally packed and graded for market. Every fruit grower should have a packing table and on this table turn out the fruit carefully from the barrel. The packer will then be in a position to distinguish the size or a quality of the fruit more readily and quicker work can be done.

The packer must see that his packages are properly stenciled, with his name preceeded by the words "packed by", his post office address, the name of the variety of fruit he is packing, and the grade, whether it is Fancy, No. 1, No. 2 or No. 3.

If "Fancy" the fruit must be practically perfect, free from all defects, well grown specimens and of good color.

If marked No. 1, the packer must aim to discard every injured or defective fruit and not delibertly include ten per cent. of inferior specimens.

If marked No. 2, the fruit must be sound and clean, not less than medium size for the variety, and must not include culls.

In packing No. 3 fruit the packer is responsible if the face of the package is better than its contents. Overfacing is an offence against the "Act" which is severely dealt with by the courts. It is a good and safe practice to follow in packing all grades that the face of your package shall be of uniform size fruit for the grade, and not of the largest on the table. The large fruit should be distributed throughout the barrel and not in sight when the barrel is opened. You may ask why? My answer is that both a nice face of uniform size fruit the barrel opens attractively. The customer is satisfied with its appearance and when being used larger fruit is found which was hidden from view when the package was opened. Confidence in the packer is greatly strengthened and the future sale of his fruit is assurred. I am sure you will have no difficulty in anticipating the satisfaction this customer will feel under such conditions. In my judgment it is to just such methods and practices lies the success which the fruit growers of New Brunswick may have if they will. If I might be permitted to suggest a "slogan" for the fruit growers association it would be, "New Brunswick Fruit for Quality" and see to it that we live up to the stanrard We are already producing considerable fruit, but so far sales have been among our own people. Soon we shall have apples for an export trade. It may be small in the beginning, but if all goes well, in ten or fifteen years, we may be shipping from 150,000 to 200,000 barrels per year in competition with other fruit producing provinces of our Dominion in outside mrkets. I can scarcely find words to tell you how much I should like that New Brunswick should start out in this export trade with a name firmly established for our honesty of pack and high grade and quality of fruit. Such conditions may be ours if we will. How great would be the vantage ground ,carrying with it increased profits and quick sales absolutely secure.

The same conditions which insure successful apple culture applies with equal force to the picking, packing, grading and marketing of small fruits. It is an accepted fact and quite widely known that the New Brunswick production of cultivated small fruits are the equal of the best grown in any country and are sought after in outside markets, because of their high quality. Here again, quality in the market end of the business should concern us most. Do not forget that our own credit and that of the Province is at stake and will suffer by bad practice. All our small fruits, particularly strawberries, if well grown, nicely packed in full quart boxes and shipped under favorable conditions, not only find a ready market in our provincial markets, but are greatly appreciated in Montreal, Toronto, Halifax and Boston, where prices have so far been satis factory.

So far as my observations go, the octagon box is a favorite. Its cost may be a trifle more but it has proved a better carrier for ong distance and rough usage.

Question: What is the cost?

Ans: From $5.00 to $6.00 per thousand.

They are entirely a New Brunswick production, invented, I think, by the late D. P. Wetmore, of Clifton, Kings County, who, I may say, was the pioneer in small fruit growing in the province on a commercial basis.

The same conditions apply with the marketing of raspberries, blackberries, gooseberries and currants, of which considerable quantities are grown, with an inviting outlook for increased production.

In 1912, it was estimated that New Brunswick produced one and one-quarter million boxes of small fruits. Last season was not so good and possibly seven hundred and fifty thousand boxes would be a fair estimate. The business is a profitable one that admits of great extension, coming back to our orchard work and packing of their products. Allow me to suggest that the individual members of this Association ask the Fruit Division at Ottawa for a copy of the Fruit Marks Act including the Inspection and Sale Act as

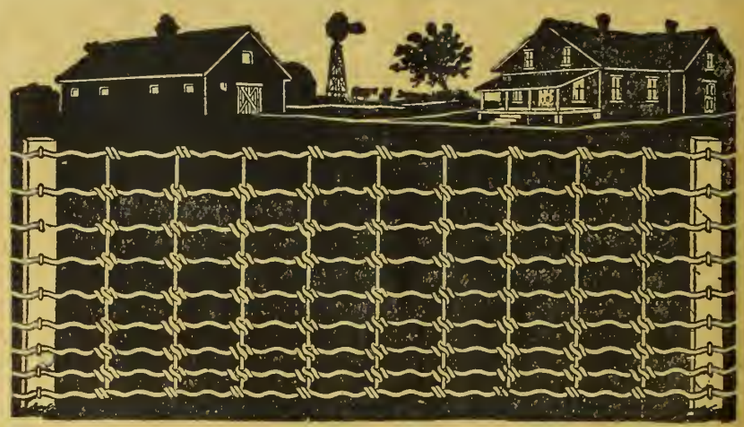
MAHONE BAY, - - - - NOVA SCOTIA



Take a Look at a Farm Fence Worth Building

Looks strong, doesn't it? It "is" strong. It's made to last. All made of No. 9 hard steel wires, both horizontals and uprights. Heaviest fence wire used. That's why "Ideal Fence" always stands erect, and resists all destructible elements.

"Ideal Fence" is easy to build, fits any surface, hilly or level.

IDEAL FENCE

May not be the cheapest Fence from a purchase point of view. No, but if you consider the cost of "Ideal Fence" from the point of view of the good material, perfect construction, a very long service, then certainly "Ideal Fence" is the cheapest.

Why is it the most economical Fence that can be bought?

1.—Because being built very strong, it requires less posts.
2.—Having less holes to dig, labor is saved and the entire cost of erection is reduced.
3.—With all this economy it will last longer than any inferior fence, and not cost half as much for its maintenance.

Only these three reasons would justify the preference to purchase "Ideal Fence" above all others, and yet there are many more reasons why.

Consider the safety of farm products, as well as cattle, etc. protected from without and within from the most reliable fence at medium prices.

"Ideal Fence" means Quality, Durability, Safety and Economy.

Send postal and receive our free booklet No. 11.

The McGREGOR BANWELL FENCE Co., Ltd.
60 McGILL ST., - - MONTREAL

amended. Then, when you have studied its provisions, and are living up with its requirements, it will mean greater profits and the building up of a reputattion which any people might well covet. We must not overlook the fact that it is quality that insures high prices and quick sales. I oftcn think while at my work of inspection, and permit me to give expression to the thought that it would be greatly in the interest of the fruit growers of the province if they would decide not to market a No. 3 or cullapple. In the first place I do not think it profitable to do so. In my observations I find that as a rule the prices obtained for this class of stock leaves no profit over and above the cost of package, packing, freight and commission. Secondly, no man can, with any degree of pride in himself, his county or his business place his name and post office address on a package of fruit, the quality of which is unfit for human consumption and that goes begging for a customer.

Would it not be better in every way that this fruit should go to the vinegar factory, there to be manufactured into a necessary product, essential and necessary in the interest of good housekeeping or fed to stock I invite your consideration to this matter, with the hope that something may be done to prevent this class of fruit from being placed on the market.

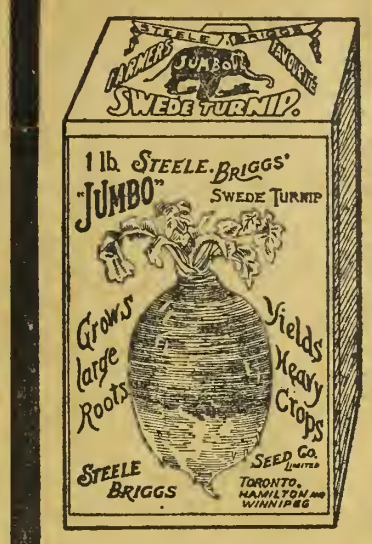
In conclusion, allow me to say for your encouragement that we can and do grow apples and all varieties of small fruits to great perfection in a very wide area in this Province. Shall we not then unite in co-operation work in closely looking after the market end of our business, which is summed up in tidy packages as a guarantee of honest work. This practice will surely crown our efforts with great success.—Synopsis of address by S. L. Peters, Dominion Fruit Inspector at the Annual Meeting of the New Brunswick Fruit Growers' Association, held in Fredericton, 1914.

$1.00 Per Apple.

Mr. Marshall, the business orchardist of Fitchburg, Mass., who this last year picked 4,000 boxes of choice apples, has had for years, a standing offer, posted on the walls of his packing house, of $1.00 to any man, visitor or laborer, who found a wormy apple on any tree or under a tree. The dollar is there yet, and the wormy apple has not been found. This simply tells of thoroughness in spraying. Men who complain about law, and that they must have a chance to dispose of their poor apples, want to realize that control of pests is largely in their hands, and that any large per cent of poor fruit tells of their failure to fertlize, prune and spray.

What we want to do is to get more out of our orchards by putting more into them. The man who gets 10 per cent. No. 2's has failed somewhere. Reduce this to three to five percent, very easily accomplished, and the dollars multiply for the grower. It costs too much to grow apples to allow them to grow themselves. In 1914 the one object should be to fertilize, prune and spray to increase size, improve color and minimize defective specimens. The man who fails has only himself to blame. The larger the per cent. of No. 1's the better for the pocket-book of the grower. It pays to spend ten dollars in spraying, when there is the certainty of getting back thirty to fifty. The penny wise and pound foolish man is still to be found among us, and probably will be to the end of the chapter, but this by no means proves that others must follow in the same track.

Let's get all that is possible, this year, out of every apple tree, by doing our best in fertilizing, pruning and spraying. It will pay. G. M. Twitchell, in Maine Farmer.



TURNIPS for FALL FEEDING

For satisfactory crops we confidently recommend the following selection of Turnip Seeds. **Steele, Briggs** test the growth and vitality of all seeds sent out, which are all selected varieties from the best growers.

Steele, Briggs' "Durham"
Steele, Briggs' "Select Purple Top"
Steele, Briggs' "Select Jumbo"
Steele, Briggs' "Unrivalled Canadian Gem"
Steele, Briggs' "Select Kangaroo"
Steele, Briggs' "Select Good Luck"

They produce bountiful crops of sound large roots, Sold only in sealed packages. Refuse substitutes—on others "just as good."

SPRAY NOW!

Style "G"

The Early Sprayer Gets the Bugs

Because they lack vitality and spraying done now will be more effective than twice the work later on. If you have not begun spraying yet every days delay means loss and damage.

What make and style of Spray Pump shall I use? Is the question asked by nearly every farmer.

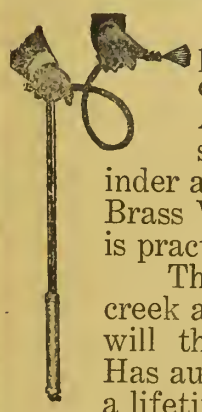
The Kant-Klog Sprayer, Style "G"

here illustrated sprays Trees, all kinds of Small Fruits and Garden Vegetables, also Disinfects, Whitewashes and has many other uses. It is fitted with "Kant-Klog" Nozzle that throws round sprays, flat sprays and solid streams. Three of each and all of different size, volume and fineness, The Spray Body is made of heavy polished brass or galvanized steel as required.

Each STYLE "G" SPRAYER is furnished complete with "Kant-Klog" Nozzle, thumb pressure Spring Hose Cock, Carrier Strap and Safety Valve.

Price with Galvanized Steel Body $4.00. Price with Polished Brass Body $6.75.

Junior No. 5 Spray and Force Pump



In this pump the objectionable foot-rest, clamps, leather suction, packing, etc., are entirely done away with. It requires no fastening of any kind, holds itself down and works anywhere and everywhere. All the operator need do is to press the plunger down. It rises of itself, the upward stroke being made by a brass spring forcing the cylinder apart. The All-Brass suction working with a brass cylinder with All-Brass Valves, does away entirely with leather, rubber or other packing. It is practically impossible for any part to get out of order.

The Junior No. 5 Pump will pump from a pail, barrel, tank, spring or creek and will do more kinds of work than any pump of its kind made. It will throw two solid streams, one flat spray and one fine round spray. Has automatic mixer to keep solution stirred, pleases everybody and will last a lifetime.

Price of Junior No. 5 Pump complete with hose and 3 feet of brass tube to attach to hose for spraying trees $3.50.

Either of above Pumps sent freight paid to your nearest Railway Station or Boat Wharf on receipt of price. Prompt attention to all orders is assured you.

Cheese Made with Windsor Cheese Salt brings best Prices

DAIRYING.

Is the Consumer Paying Too Much ?

Within the last few years there has much dissatisfaction among both milk producers and consumers. The dairy farmers claim that they are not receiving enough for their milk, while consumers claim that they are forced to pay exorbitant prices for the same article. It is apparent to anyone who has looked below the surface of this question, that many dairy farmers today are not receiving a price for their milk which will yield a fair profit. It is difficult to say just where the fault lies. The dairy farmer himself is not blameless. Sometimes his business is carried on in a wasteful, extravagant manner. Unprofitable cows are kept, and uneconomical methods of feeding are followed. It is unfair to ask the milk consuming public to pay him a profit on such a slipshod system, and yet that is what is often expected. On the other hand, in view of the increased cost of producing and handling milk and considering its high food value, consumers in many cities are paying a price which is much too low to allow a reasonable profit to the producer. The dairyman receives at his shipping station from about 2 cents to 5 cents per quart for his milk, dependnig upon the time of year and upon the city in which his milk is marketed. Probably the bulk of market milk in this country is sold by the farmers at about 3½ cents per quart, whereas the price to the consumer in the various cities ranges from about 6 cents to 10 cents per quart, depending upon the locality and upon whether the milk is sold 'lose' or bottled.

It is extremely doubtful if the dairy man in many cases received enough for his milk to pay for the bare cost of production at these prices. Bulletin 73, issued by the experiment station at Storrs, Conn., gives the cost of producing milk on the experimental farm for a period of five years. When the milk produced by the herd was figured as worth 4 cents a quart at the fram, the business was conducted at a loss every year out of five. Where the milk was figured at five cents a quart at the farm, the books showed a net profit four years out of five. Results similar to these have been obtained at several other stations.—Rural New Yorker.

Advice re Turning Cows to Pasture.

That, if cattle are turned to pasture in the spring before the field is dry and before the grass has attained a good start in its growth, there will be a degenerating effect on both the cow and the pasture, is the opinion expressed recently by Mr. D. D. Gray of the Central Experimental Farm.

Mr. Gray explains that cattle accustomed to dry hay cannot have their ration abruptly changed to soft green grass without a relaxation of the digestive organs, and purging, which is attended by a rapid loss of flesh. "An effect," he said, "will be exerted on the milk production and as a result the flow will not be as great."

Feeding cattle on dry forage during a week subsequent to their being turned to grass is offered as a method of eliminating difficulty from that source. "My experience," says Mr. Gray, "has shown that cattle are eager to get dry feed at this time of the year and, if hay is not available, straw should be fed because even it is greatly relished." A gradual change is strongly urged, because, under those circumstances the organs of the cow become accustomed to the new food without the danger that is encountered in a radical change and also the returns would be much greater.

Mr Gray explains the damage done the pasture as to the fact that too early grazing thwarts later growth because of the tender blades being cropped off too close to the roots. Also cattle on pasture trample the soft grass to such an extent that large amounts of grass are destroyed.

Mr. Gray favors the method of herding cattle in the spring in order that they may be caused to remain on the dry land which is less susceptible to damage.

Speaking of the system of feeding grain to cattle during the summer months, Mr. Gray places himself as being opposed to the practice ."From my experience," he says "there is a time in the year when the catte desire a rest from being fed grain, and I think that time is when they can get a good mouthful of grass. I have also found," he says, "that when cattle have been away from a grain ration for some time, upon its bein recommenced the results are much more pronounced and more extensive returns are received." The reason given for this is that, when the cow has been fed a continuous grain ration an equilibrium is set up and a steady supply of grain fails to produce any marked effect on the flow of milk, whereas, when the cow has been given a rest from grain, she will produce more milk from its nutriment when it is being fed

Mr. Gray would give the cattle a respite from being fed grain from the time good supplies of green grass are available until the grass begins to dry in the fall.

Help in the Dairy.

The future of dairying will be much influenced by the help which can be obtained to carry it on. The dairyman is more dependent upon labor than those engaged in some of the other lines of agricultural production. He needs help through all the year, whereas in other lines it will suffice to get it but for part of the year.

The dairymen of the future who are likely to be the most successful are those whose holdings are small, and who can, therefore, control their own help, by which is meant that they can supply it. It can come from within the home. The family will be able to grow the food, to milk the cows, to manufacture the product when necessary, and to dispose of the product. Persons thus situated are almost certain of success in their line.

The training which such work, especially milking, gives to both boys and girls, is very helpful to them. It teaches them the necessity of being punctual in this work, and the necessity for continuity in the same. It brings them into close touch with animal life, and thus begets in them a liking for working upon the farm

Of course, there is a difference in opinion as to whether girls should milk, as there is about many of the things that they ought to do. Some mammas seem to think that their daughters should not do any work. Those who marry them, come to think differently on this question. The mothers of the passing generation, almost without exception, knew how to milk. Was it a mistake in their education? Happy are the families who today are in a position to do all their own work.

Cost of Milk Production.

New Hampshire Experiment Station has recently issued bullletin No. 2, entitled "Cost of Milk Production." A test of 203 cows for a year was made to ascertain this cost. Eight of the number gave an average of over 10,000 pounds in the year; while 10 of the poorest gave an average of less than 4,000 pounds. Mr. Farmer, in which class are yours? If not in the 10,000-pound class, why not? Is it their fault or yours?

The eight 10,000-pound cows paid $106.82 profit each above cost of feed. The 10 below 4,000 pounds lacked $4.25 each of paying for feed. In other words the owner of each of these cows paid $4.25 cents for the privilege of Associating with a scrub; while the owner of each of the 10,000-pound cows not only had the satisfaction of better company, but received $106.82 to pay for the pleasure.

Each of the eight best cows paid the owner $2.21 for each dollar's worth of food eaten; while the cows in the 4,000 pound list only paid 93 cents for each dollar's worth.

It is interesting to note that the herd having the highest producer and best paying cow had also the lowest producer and least profitable cow. This shows cows in same herd with same care and treatment, with great difference in milking ability and profitable production.

How many Maritime dairymen know which of their cows are profit producers or mere dead-heads?

Farm Butter-Making Rules.

Cool the cream from the separator as soon as possible to 55 degrees Fahrenheit or lower

Never mix warm cream with cool cream.

Mix all the cream to be churned in one vat or can at least eighteen hours before churning.

Ripen at the temperature of 70 to 75 degrees Fahrenheit for from six to eight hours, stirring frequently during this period.

Cool cream to churning temperature as soon as ripe.

Let the cream stand eight hours or more (over night) at the churning temperature.

The temperature of churning should be such as to make the butter come in from thirty to forty-five minutes, usually 55 to 60 degrees Fahrenheit

If it is desired to use artificial coloring, it should be added to the cream just before churning.

Stop churning when the granules are about the size of peas, varying to wheat, and draw off the buttermilk.

Wash the butter once with pure water at the churning temperature, agitating three or four times, and drain.

"Melotte" CREAM SEPARATORS

The "Melotte" will increase your butter yield 25% besides improving the quality.

Saves time and labour, space and utensils.

Owing to its Suspended Bowl the "Melotte" is the simplest, most easy running and consequently the most durable cream separator made.

Write for Catalogue F.

About the most practical piece of machinery on our farms is the

SHARPLES MILKER

THIS voluntary endorsement is made by the secretary of a most progressive dairy farm, whose name we will be pleased to furnish on request. He says further:

"Before getting the SHARPLES MILKER we were milking 100 to 110 cows. It took ten hand-milkers four hours a day—two in the morning and two at night. We are now milking approximately 135 cows with the eight units. We use two men to operate the machine and two to do the stripping. It takes these four men just about the same time to milk these 135 cows as it took our ten men to milk 100 by hand."

THE SHARPLES TUBULAR CREAM SEPARATOR is a product that for thirty-three years has built character into dairy farming. For dairymen who desire to keep abreast of progress.

THE PLAYTIME

MAKES HAPPY HOMES

A great economist has said that the happy home is the very bone and sinew of our national life; but no home is as happy as it should be if the wife and mother is so utterly tired at night that she cannot be a cheerful companion in the family circle.

The greatest labor saver, the best conservator of health, strength and cheerfulness is the "Playtime" Washer. It takes the tired feeling out of wash-day. It is an efficient helpful servant that never tires and is always ready. As a power machine it is specially adapted for the country where gas, gasoline, steam engine or windmill power is available.

See the "Playtime" at your dealer's or send to us for full information.

Expense vs. Savings.

Here and there one finds a dairyman who hesitates about taking up cow-testing because of the initial expense of three dollars for the necessary outfit of scales and bottles

This would seem to be an extreme case of "Penny wise and pound foolish." So many examples are constantly cropping up of distinct saving through the small expenditure that they should be noted for the encouragement of these who still hesitate.

Cows have been bought at auction time after time, discarded by owners who were evidently absolutely ignorant of their high value as good producers After one or two months' test the new owners have often refused $50 and $100 on their bargains. That is a pretty quick return on the cow testing outfit expenditure. In fact, amongst such discards at auction were picked up one or two word's champions, worth thousands of dollars.

This vital fact should not be overlooked: Hundreds of poor cows are being kept today at huge expense of whose low value the owners are also probably ignorant Yet a three-dollar outfit would help discover them soon turning the present loss into distinct savings.

Then, thanks to that small expense, many dairymen are now making an additional income of three hundred dollars from twenty cows, because the poorest have been discarded. It will abundantly pay every dairyman to keep dairy records.—C. F. W.

Cost Reducers.

So many dairymen wonder what the factory is going to pay, so many salesmen fight for another sixteenth of a cent on the price of cheese, that some milk producers in thinking almost entirely of selling price, are apt to overlook cost.

The twin sisters of economical milk production are good cows and individual records. Cows may be fed right and fed alike, yet fail to produce milk economically, that is at low cost, because they were not built on dairy lines. But even with the average run of dairy cows that seem to produce just about the same quantity of milk, there are so many strange variations that the keeping of milk records is not only advisable from the business standpoint but becomes of facinating interest.

When a simple feed record is kept in addition to the milk record, the actual cost of milk as produced by each cow is ascertained easily, so that the owner may be assured that he is keeping only such cows as yield plenty of milk at a low cost. Can you tell offhand whether the milk of some of your cows costs 62 cents or 97 cents per 100 pounds? If your profit over cost of feed is now only $10.00 per cow, you cn make it twenty by keeping records. Send to the Dairy Commissioner, Ottawa, for milk and feed record forms, which are free. They are cost reducers.—C. F. W.

How to Treat Hardened Quarters.

1. Is saltpeter a benefit for hardened quarters?

2 Please let me know if tincture of opium and fluid extract of belladonna are liable to dry a cow up if applied to hardened quarters.—W. O. M.

1. A tablespoonful dose of saltpeter commonly is prescribed and beneficial in cases of garget (mammitis.) It is given once or twice daily according to the severity of the case.

2. Belladonna tends to dry up milk flow, as does camphor,, tincture of opium is less powerful in this effect and is used for pain. It is not commonly used for udder diseases.

If the butter is to go to the market, it should be put up in neat, attractive packages.

A handy pump for farmers

It is a direct lift pump that can be attached to wind mills, a Fairbanks-Morse Eclipse Engine, or operated by hand.

This is one of the least expensive and most efficient of our high grade farm pumps.

Adapted for lifts from 30 to 125 feet. Altogether an ideal pump for any farm—easy to operate—will keep in good repair for years.

Send for free catalogue of pumps and water systems. If you are interested in farm engines, spraying outfits, lighting systems, power and hand tools, scales or mechanical goods of any kind, full particulars will be sent to you on request. Address Dept. 44

LIVE STOCK.

Prevent Losses by Attention to the Food.

It is now generally recognized that diarrhoea among young calves is due to a bacterial infection. Several different kinds of bacteria have been found to cause the disease. The great majority of cases, however, are caused by various forms of the common coli bacteria, or by a nearly related species, the paracoli. These species of bacteria are found in the intestines of all healthy animals. Ordinarily they are perfectly harmless. Sometimes, because of improper feeding or other causes, a calf becomes so weakened that these bacteria are able to set up a severe inflammation in the alimentary canal. This produces the diarrhoea or scours, and usually results in the death of the calf. After passage through one or two such calves, these bacteria acquire a greatly increased virulence. They are then able to attack healthy calves and cause their death. When such a virulent strain is once established in a barn it is very difficult to get rid of it. The infected calves are daily passing billions of these bacteria with their droppings. These are carried about from one part of the barn to another on the shoes and clothing of the attendants, by the bedding and even by the dust in the air.

The caves may become infected in various ways. Infection through the naval cord happens occasionally, but this does not occur so frequently as is generally supposed. A much more frequent method of infection is through the mouth. The calf brings its nose and mouth in contact with the soiled bedding and the sides of the stall. In this way it may take in many of the virulent organisms. If the milk of the calf is not handled in a sanitary manner, this also is a frequent source of infection.

To Prevent Disease.

A knowledge of the cause of the disease renders methods of prevention much simpler. On farms where the disease is not serious it is only necessary to see that the calf is born in a clean stall and is kept well supplied with clean bedding. Such a stall should be thoroughly cleaned and disinfected each time before it is used. After the calf is weaned careful attention should be given to the milk. It is necessary that the milk should be handled in a cleanly manner. The milk must be fresh and should be warmed to 95 deg. F. It should be given in clean pails which are kept especially for that purpose After use these pails should then be thoroughly washed and scalded. It would be still better if all the milk used were pasteurized by heating barely to 140 degrees F. for twenty minutes. Such treatment will kill all diarrhoea and tuberculosis germs. Such precautions, if carefully carried out, will prevent the disease on farms where it is not a serious infection.

On farms where the infection has gained a strong hold, prevention is a much more difficult task. On such farms the virulent bacteria are spread throughout the barn and the young calves become infected through the straw or even the dust. At such places it might be possible entirely to isolate the young calves in a new stable, where with special attendants and a careful attention to details, the disease might be eradicated. Such methdos, however, are usually not practicable.

The Serum Treatment.

Dr. C. O. Jenson, Copenhagen, Denmark, has devoted a great amount of time to the study of calf diarrhoea. As a result of his work he is able to produce a serum or rather several serums against the different forms of this disease. The serum treatment is now used extensively and with excellent results in Denmark and in many parts of Germany.

The preparation of such serums requires a great amount of labor and care if they are to prove successful Since there are a number of different strains of both coli and paracoli bacteria which can cause the disease it is always necessary to examine calves from each farm in order to find out just which strain of these organisms is causing the disease. Then a serum which corresponds to this particular organism must be used. After a serum appropriate for a given form has been obtained it is only necessary to inject a small quantity of this under the skin of the calf immune to that partcular organism and usually no further trouble will be experienced. Dr. Jensen has carefully shown that such methods will both prevent and cure the disease.

It is clear that such serum production can only be undertaken by the different experiment stations. A commercial firm will not ordinarily take the trouble to examine calves from each individual farm. Without such examinations for each farm where the treatment is to be used its success cannot be certain. It would be to the interest of cattle breeders to urge their experiment stations to undertake investigations along these lines.—F. M. Surface in Breeders' Gazette.

The New Brunswick provincial ditch-ing machine is now operating at Flower Mills, Carleton Co.

Mr. W. B. Ford, a graduate of MacDonald College, St. Anne de Bellevue, P. Q., has been appointed Animal Husbandman for the Province of New Brunskick.

SUMMER SHOES FOR MEN WHO WORK

Here is something new in footwear specially suitable for farmers, woodsmen, millmen, trackmen, laborers—all those needing strong yet light, cool, easy shoes. These are made on good-fitting right and left lasts from our famous oil-tanned Skowhegan waterproof leather with waterproofed sole leather outsoles and solid insoles.

Palmer's "Moose Head Brand"
"SUMMER PACKS" and "HARVEST SHOES"

are light weight, comfortable, durable working shoes for spring, summer and fall wear. Sold by leading dealers everywhere. If your merchant does not carry them write us, giving his name and address, and we will see that they are placed within your reach. Made 4, 6 and 9 inches high. 19

Sample Free

THERE is a community near here that has found out all about Amatite. It began with a single farmer who wanted to roof a shed on his farm. He had heard that a new roofing had been invented which needed no painting. He found that its name was Amatite and he bought some and laid it. He found that it was just as easy to lay as the old-fashioned painted roofing, and it was sold in rolls with nails and cement supplies free as usual. And he found also that Amatite Roofing instead of costing more as might have been expected, actually cost less than other roofings of much less weight.

After the first winter, he noticed that the Amatite was exactly as good as ever, and after the second winter he was still unable to detect any change in it.

He has other roofings on his farm and he was accustomed to giving them a good heavy coat of paint every two years just as the manufacturers of those roofings urged him to do. He was glad that it was not necessary for him to paint the Amatite roof after the second year. It saved him money and trouble.

He began to tell his neighbors about Amatite, and the local dealer laid in a stock of it. Other farmers began buying it and had the same experience—the roofing gave faultless service year after year with no trouble whatever to the owners.

It is five years since the first Amatite Roofing was laid in that town. Now, Amatite is the principal roofing sold there. It has won its way on its merits.

If you would like to have a sample of Amatite Roofing just to see what the mineral surface is like, we will send it to you free of charge.

Foot-Rot in Sheep.

There are two forms of foot-rot, one contagious, one mechanical; the latter is due to injury of feet from decay, cuts or bruising, by which means soil and filth gain an entrance, and set up inflammation of the sensitive strictures of the foot, from which pus is usually discharged. The injury may be caused by long grazing on low-lying pastures or by the animal stepping on sharp or rough objects. This latter is the common form. It only affects comparatively few animals in the flock. The treatment for this form of foot-rot consists first in carefully trimming the foot or feet. If pus has formed, give an exit for it at the lower surface of the foot, and apply an antiseptic foot poultice, such as bread, upon which a weak solution of Jewes fluid has been sprinkled. The recovery is usually soon with attention.

The contagious form of foot-rot is quite different, and is far more serious, but it can be prevented, and is amenable to treatment. It is primarily due to the entrance of necrotic bacteria into soft structures of the foot. It spreads from sheep to sheep, causing lameness, loss of flesh and even death. It first shows itself as a small, moist, unhealthy sag between the toes. This rapidly extends from above downwords and may extend to two, three or even all four feet. The horn becomes broken, and the discharge attracts flies, eggs and larvae, which develop in the wound, or on the fleece which has come in contact with the discharge.

If noticed early, the disease should not get beyond control. Examine all fresh arrivals for lameness, isolate at once from the rest of the herd any animal showing the least sign of disease affecting the skin between toes. The shepherd should disinfect his hands, and also the sheepfold, and the manure and a few inches of surface soil should be removed and ploughed into the land and the pastures given a rest until a winter's frost has sweetened it. A foot bath is more effectual than a dressing. Even the apparently healthy sheep every second day should be put through a shallow bath, and this is to be continued for a fortnight after the last case is detected. After cleansing the affected foot, cut off all detached horn, so as to expose all the diseased tissue trimmings burn or bury deeply). If much has to be cut away, apply clean tow, saturated with a weak antiseptic lotion, keep it in position with a properly adjusted bandage to keep out filth and wet. Later on a dry dressing of one part of chinosol, one part of burnt alum, and six parts of powdered Fuller's earth, applied once daily on cotton wool, and protected with suitable coverings, will quickly effect a cure.

The directions for bath are as follows:—Make a bath of wood or concrete, 16 ft. long, 8 in. wide, sides sloping out, provided with cross pieces to prevent slipping, and side-fences boarded to admit sheep walking easily through.

The solution is made by dissolving one pound of powdered sulphate of copper to each gallon of water. Although somewhat slow of solution, stirring and using warm water in the first instance will hasten it (for prevention half this strength will suffice) Part the hoofs first, when necessary, so that the solution can come in direct contact with all the parts.

Choose a day when grass and soil are dry. Remember the bath is poisonous, and take care the stock cannot get access to it. If ewes are treated, put them trough the bath quietly, so that the teats are not splashed or wetted, as this is likely to make lambs ill. Do not hurry sheep through the bath. The object is ony to wet the feet. If the wool becomes damped with the solution it may discolor it. This bath repeated at frequent intervals will effect a cure. The sheep should remain in the bath for about five minutes.—Southern Vet. in English F. & H.

Teaching the Calf to Drink.

Oh to feed a new born calf
Is enough to make you laugh
  If it wasn't so pathetic and so sad.
When you try a little while
It is probable you will smile;
  But long before you're finished you'll be mad.

So you grab it by the ears
In a way to bring the tears
To the eyes of anyone who has a heart,
  And you ram its head down in
To the milk that's in the tin,
  While you swear the little beast is far from smart.

Soon you see that this is vain—
That your end you'll never gain—
  So you start to try the kindness game once more;
But its pointed little teeth
Cut your fingers from beneath
  'Till it seems no time at all 'till they are sore.

And yet this must be done,
If we want to make the "mon,"
  For our cattle raising is what pays us now;
So we may as well keep cool
As we watch it act the fool
  And with time and perseverance teach it how.

—O. P. in Nor' West Farmer.

THE HORSE.

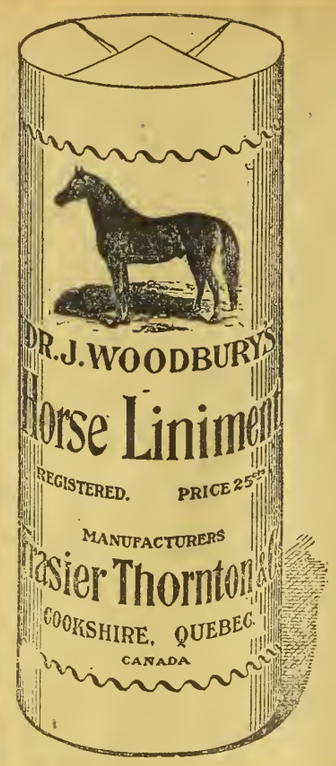
Spavins and Their Treatment.

There is no better known bone disease affecting the horse than spavin. Among the many different critical attitudes the prospective horse buyer assumes in looking the horse over, there is one which is never omitted (if the buyer is wise), and that is the one where the inside of the hock joints are the objects of critical scrutiny. "To err is human," and to forgive a horse dealer who palms off a horse on you which has a spavin would truly be divine. There are three kinds of spavin —bone, bog and blood spavin. Bone spavin is, of course, a bone disease; bog spavin is a distention of the hock joint by the swelling or bulging of the ligament which contains the synovia or joint oil, which lubricates the joint, while blood spavin is a swollen or varicose condition of the vein which passes over the region where spavin is usually found.

To detect spavin is not an altogether easy matter, because many horses have puffy, swollen hocks which, although very apt to be decorated by a spavin, are free from such a defect. The appearance of the sound, normal hock must be very clear to the mind of the horseman looking for this unsoundness.

As a general rule, before the bony lump is noticed, the horse may limp on the sore leg, but, again, no lameness may be noticed, the spavin developing so gradually.

There is no privileged class among horses with regard to spavin; all are liable to it, the fancy stepping hackney as well as the sober and slower-gaited draught horse.



Horsemen, Attention!

These are the Preparations which have helped to make Canadian horses famous.

They have many imitators but no equals.

How Spavins are Caused

Just as the tendency to have splints and ringbone is transmitted to the offspring of horses which have these bone diseases, so is the tendency to develop spavins handed down to the straight-pasterned, silty and weak-legged horse. Strains and continued concussion, or blows inflicted on the hock joint, will start the trouble.

Colts which are broken and put to work before they are fully developed and while their bone is still soft, will run a serious risk of straining the bones and thereby causing spavins to be thrown.

Hocks, even in a quite healthy conditioo, differ greatly with different horses, and the hocks on the same horse may differ also to a great extent.

It is generally taken as a fact among horsemen that a coarse hock is more susceptible to spavin than a clean, well-formed hock. This is true to a great extent, but it very often happens that the meaty, coarse hock may be the stronger. Here, of course, is room for controversy, because no one is courageous enough to differentiate clearly between coarseness and spavin, although again, the owner of a coarse-hocked animal would be highly incensed if he were told that his horse had a spavin.

How to Detect Spavin

A horse adorned with a spavin will generally go lame, especially when the spavin is forming. After the inflammation has disappeared the region becomes callous to a certain extent, and the lameless will very likely disappear, and nothing out of the ordinary may be noticed in the action of the horse till the spavin becomes so big that it interferes with the connecting ligaments, when the horse becomes very lame, especially when first moved.

When a horse is unfortunate enough to develop a spavin, his action is stiff, and the hock appears imperfectly flexed. Looked at when trotted away from the observer, the defective limb will be seen to drop, and the horse bears heavily on the other foot. By examining the shoe it may be noticed that the toe is more worn on the affected limb than on the healthy one.

What to do for Spavin

It is hardly necessary to state that a horse on which a spavin is detected should not be worked if a cure is anticipated. The joint should be bathed with a cooling lotion, and physic administered.

Continue bathing the affected part with cooling lotions for a few days, then blister repeatedly, if necessary. A good cooling lotion is composed of one part of red iodide of mercury to eight parts of lard or vaseline. It should be said that just after taking a horse from work, warm fomentations and hot bandages should be applied, before the limb is bathed with coolng lotions.

Spavins treated early, and in the above manner, generally become callous and set, and the surrounding parts adapt themselves gradually to the abnormal conformation, so that lameness usually disappears, and the action is very slightly changed.

It sometimes happens that all this treatment fails to bring about a cure, and firing in such cases may have to be resorted to, but when this drastic treatment is necessary, it can generally be accepted that the horse, as far

as selling value is concerned, is beyond redemption, although, if the pain and accompanying lameness is disposed of by this treatment the horse may continue to work very satisfactorily.

An Overfeed of Grain.

Some one left the oat bin door open, the horses were loose; and we all know the rest. The thing to do if the accident has been detected an hour or so after the grain has been eaten is to get a veterinarian as soon as possible and pump as much out of the stomach by the aid of a stomach tube as possible. Then administer a purgative and antiferments. It sometimes happens that expert help is not available. If such is the case, then the matured horses should receive from one and one-half to two quarts of raw linseed oil, and two ounces of turpentine. Many neglect a horse that has overeaten until the symptoms of colic appear and then call a veterinary who may have difficulty in saving the horse.

The same precautions should be taken when a cow has accidendly eaten a part of a sack of oats, wheat or corn. From one to three pounds of Epsom salts given to a cow immediately after such a large feed may save the cow's life and also prevent her being foundered. The thing to remember is to do something for the cow immediately after the accident has been discovered.—C. L. Barnes, Colorado Agricultural College.

Should Horses be Clipped.

If horses have been stabled all winter, they will have short hair, and clipping will be of very little advantage. If they have been run out a good deal, they will have long hair, and clipping may be of considerable advantage. This exposed horse has needed a long, warm coat during winter,, and nature has provided it; but it certainly does not need this coat when working on a hot day before a seed drill. Such a horse is much better clipped. But if, after clipping, the weather turns bad, the horse should be blanketed until he becomes accustomed to his short coat. A long haired horse, brought to a sweat and then allowed to stand and chill in its wet hair, is much more likely to contract colds than if it were clipped and then covered with a dry blanket when stood still. Also the clipped horse will work much easier and not be so hard to keep clean.

The Unequal Team.

Often some writers say that they have observed that the horse behind is always thinner and a harder keeper and so he does more work than his mate But does this prove anything? There is just as much difference in horses as in men. Some men are fat, work hard and eat little.

Did a lazy horse ever go in the lead? No, he has tried everything, and has found from experience where the easy place is.

In driving two horses on a wagon with a heavy load, if one horse is in advance the tongue will be inclined to move toward the rear horse, showing a side draft. Now the horse in the lead must be exerting a greater force to cause this draft.

Take a pair of balance scales and put a weight in one pan; of course this side will go down. The balance scale and the evener are the same, each is hung in the centre. So whichever horse will exert the greater force on an evener will be ahead and will remain there as long as he continues to exert the greater force.—Teamster.

POULTRY.

The Care of Young Chicks.

In no instance is a tenderly reared chicken as strong as one which has been taken care of only by assisting Nature. Mark that well, but—let us not be misunderstood. We do not advise that chickens which are hatched three or four months before the natural season should then be turned out to take their chance. It would be cruel, and could end only in death. They must be kept reasonably warm at night, and be well fed throughout the day. However, that does not mean hothouse rearing.

The Simple Life.

We are convinced from practical experience that fresh air is essential to chickens, that sun is as good as food to them, and that heat must be obtained from food rather than by stoves and hot water pipes. Our "fresh-air" chickens are clean and sturdy youngsters. They wander far from the coops and rearers. They scratch the earth wherever there appears hope of any result from it, and they turn over every leaf in search of insects.

When we appear with the food pail they run to meet us, and once the food is in the troughs they set to with a will Watch them on a fine day working on a bank. They turn up the fine earth, bury one side in the hole they have made and cover the other with dust. They raise their wings, stretch out their legs, and bask and grow in the glorious air and sunshine. It is a pleasure for us to watch them.

Contrast such birds with the hothouse chickens. Poor ittle creatures, they do not thrive. They die; but not in the common acceptation of the word. There is no illness, no struggle; they seem to perish of inanition. We have seen many such. They stand with their heads tucked under their wings, save when some excellent meal is placed before them. They then drowsily wake up and totter to their food.

Place them on free range and they are lost. Maybe they try to scratch, but their legs and feet refuse to lend themselves o such work. For a moment, maybe, they will pursue a heedless fly, but they soon give up the chase in despair. They have left their artificially heated house, and the fresh air has been too much for them. Out for half an hour and their days are ended. If chickens must be reared in hot-houses and such like places, they must be kept there until they are killed. Better get them used to roughing is from the shell, if they are to develop into fit breeders; but, best of all, use common sense by taking care of them only by assisting Nature.

Changing the Run.

No one who knows nything of poultry will dispute our assertion that the ideal way of rearing chickens is to have them on fresh land. It is the invariable plan with the pheasant rearers to bring their birds up on new grazing landeach season and twice on the same ground, we are assured, means utter ruin to the undertaking. If such be the case, there is, then, much difference between pheasants and fowls, and the ideal and the real are not always the same.

Some writers on poultry subjects have gone so far as to say that chickens will not thrive unless they can be brought up under the ideal conditions. From the theoretical point of view, and only from such, that is as it should be. But—we might have printed the word in very bold type—it has proved to be an utter fallacy when put to the test.

Admittedly, those poultry-keepers who are able to have the pick of a hundred acres or so will not be doing any harm by getting their young birds on the land that has never been used as a poultry range, or on that which has been allowed to lie fallow of fowls for a year or two By all means let them take full advantage of it and put their chickens "out to grass" as soon as possible.

It does happen, however, that every poultry keeper who goes in for rearing chickens and is successful at it cannot bring the birds up under the ideal conditions. In fact, the vast majority are debarred from "fresh fields and pastures new," and year after year they have to use the same chicken ground, while some even have to use a corner of the hen-pen as a chicken run.

The Ideal.

We feel convinced that in too many cases the term "fresh land" is taken in its literal sense. Let us admit "right here" that the ideal in everything is the goal for which to aim. However, when it cannot be attained there is no need to give up in despair. Very well, then. If we, as poultry keepers, cannot have the ideal chicken ground, we should never despair of rearing healthy stock.

It is hardly reasonable to expect robust off-spring from their thin-blooded and ill-cared for adults, or to imagine that healthy chickens will result from attempting to rear them on land that is already badly tainted by poultry. No matter whether the attempt be made in town or country, such fowls and conditions will never lead to success.

In a Garden.

It must be acknowledged that the chief advantage of a wide range and fresh rearing ground for chickens is that, on such places, the birds are able to find much nourishing food; and this, naturally enough, brings the cost of their rearing to the minimum. But, such being the case, it does not follow that fowls cannot be reared unless they are given a free run. Many broods of sturdy chickens are brought up each season in ordinary back gardens; and this we know from actual experience, not merely from hearsay.

Feeding.

Feeding in small places wants proper supervision. Care must be taken to provide the chickens with plenty of fresh young green food—it is one of the items they can and do procure when they are at large. Meat, too, in some form, will compensate for the animal life of the unlimited grass range. Trimmings of a liver well boiled and thoroughly minced never come amiss, while magots from a "worm" pit, allowed to cleanse themselves through earth, are always appreciated by the chickens, and do them a power of good.

Let us repeat that all soft food must be given from long and narrow troughs, and the same removed at the end of each meal. Grain and seeds are best scattered over and forked into the scratching material, and if a few seeds do germinate, all the better. Grit must not be overlooked, but do not place it before the chicks until they are three days old. It must not be mixed with the soft food, but put into a shallow tray so that the chickens can help themselves—Natnre teaches them to "go" for it.

The only essential is good management—which includes proper feeding. Granted this there should be room in the ordinary back garden for at least a couple of broods of chickens—and enough room and good soil to enable them to develop into the best of stock birds. Where the poultry quarters must necessarily be limited to a small area, a greater amount of care must be exercised than is the case when chickens are reared on the unlimited range. Nevertheless, to bring up your poultry in such circumstances is not a difficult undertaking.

Some Essentials.

The first essential is to keep the sleeping quarters clean by removing the droppings each morning and freshening the bedding whenever necessary. Then if the run is of grass, have it flicked over each evening with a besom. On a small earth plot "fresh land" can be provided in the form of garden mould or sweepings from flint road. A barrowload shot into a heap

Can you arrange the above sets of jumbled letters into the names of eight well known fruits. If so, YOU CAN SHARE IN THE DISTRIBUTION OF THE ABOVE PRIZE. It is no easy task. But by patience and perseverence you can probably make out 5 or 6 of them. To the person who can make out the largest number we will give the sum of One Hundred Dollars. To the person making out the second largest number the sum of Fifty Dollars. To the person making the third largest number the sum of Thirty Dollars. To the person making the fourth largest number the sum of Twenty Dollars, Should two persons send answers equally correct, the first two prizes will be divided between them, (each receiving $75.00) Should three send in equally correct answers, the first three prizes will have to be divided, (each receiving $60.00). Should four persons send equally correct answers, the whole sum of $200.00 will be equally divided (each receiving $50.00), and so on in like proportions, provided they comply with a simple condition about which we will write as soon as answers are received. WE DO NOT WANT A CENT OF YOUR MONEY WHEN YOU ANSWER THIS ADVERTISEMENT. If you can make out anything like a complete list, write us at once enclosing 2-cent stamp for our reply. DO NOT DELAY, WRITE AT ONCE, Address, CANADIAN MEDECINE CO., Dept. 8, MONTREAL, QUE.

An Income For the Farmer's Wife

THE wife of every farmer should have her own income and her own bank account.

And it does not matter how busy you are in the home, or how little time you have to devote to the raising of poultry we can show you how you can make a good income and build up a substantial bank account by poultry raising the Peerless Way.

We can show you how to be independent of the money your husband gets for his crops and other farm produce, so that when you wish to buy clothes, or take a shopping trip to town, you can just stop at the bank and draw all the money you will require.

The Peerless Way Makes Poultry Pay

If you know the right way to raise and keep poultry it requires very little outlay or money, and takes but very little of your time. The right way is the Peerless Way, that is, by hatching the eggs in a Peerless Incubator and rearing chickens in a Peerless Brooder.

SEND FOR BOOKLET.

We have prepared a book for you entitled "Money In Eggs," if you would be interested in learning how other women like you are making independent incomes from the sale of eggs and plump chickens. Experience is not essential. We are practical poultry raisers ourselves and will furnish you all the information necessary to make your chickens pay you handsome profits.

Fill in and send this coupon now for full particulars.

in the run once a month or so will prove beneficial. There is always something worth having in hillocks of these materials, and they keep chickens "on the go" for weeks on end.

We have the strongest belief in large quantities of vegetable produce for fowls kept in confinement, although we would cut old cabbage out of the list. We advise poultry-keepers to cultivate plenty of lettuces, at least those who have space, for the birds in the hot summer months. After the salads have been prepared for the house, all outer leaves, as well as plants which run to seed, make capital green food for fowls of all ages. Sunflower seeds could be sown now for the growing chickens in July and August. The seeds had better be sown in good soil, and the plants, when sufficiently forward, transplanted to where they are wanted to grow.

How to Tell the age of Hens and Pigeons.

There has been a great development of late years in the Canadian poultry industry. This development has been brought about by many factors, chief among which are the untiring and highly successful efforts of breeders; the experimental work carried on at the various poultry plants of the Dominion and Provincial Experimental farms and Agricultural Colleges, the information given out by these institutions, the poultry exhibits, in which the people of Canada are now taking a great interest, and, last but not least, the profits of the industry, little thought of in the past, but now well recognized and appreciated.

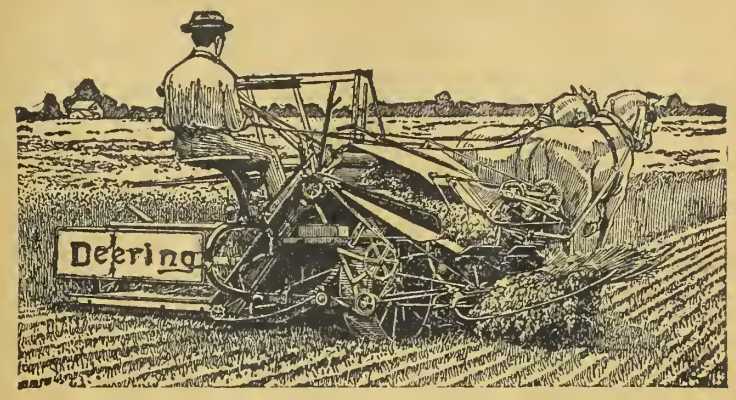
Production is increasing at an extraordinary rate while the quality of the product shows wonderful improvement. The value of the flock depends upon the production of the birds selected, but the productiveness of any bird decreases after a certain age is reached. It is very important, therefore, that the breeder be able to tell with some degree of certainty the age of the fowls which he desires to retain or purchase for breeding purposes, otherwise he will be exposed to the risk of having individuals that are past their prime and that do not pay for their keep.

Record books have been established for horses, cattle and many other animals, where information pertaining to pedigree, age, etc., are kept for reference, but it has remained to Victor Fortier, Assistant Dominion Poultry Husbandman, Central Experimental Farm, Ottawa, after much personal observation and study, to publish a method whereby the age of hens can be accurately estimated. This information, which is meant especially for the breeder and the judge, has been published under the direction of the Hon. Martin Burreell, in a profusely illustrated bulletin, which is No. 16 Second Series of the Central Experimental Farm. Copies will be mailed to those who apply for them at the Publications Branch, Department of Agriculture, Ottawa.

Rooster Day.

In the interest of the infertile egg, the poultry specialists of the Department of Agriculture have started a campaign for the elimination of the rooster among poultry flocks during the season between May 1 and December 1. In this connection, Saturday, May 16, has been set aside as rooster day in Kentucky and Tennessee, when every poultry dealer in these states has agreed to pay the same price for roosters as they do for hens and pullets. There is an enormous loss in eggs as the result of the fertile egg, especially during the summer and fall months, and it is for this reason the Department of Agriculture recommend that the rooster be kept away from the hens during these seasons. It is estimated that one third of the tremendous annual loss of eggs is due to the fertile egg.

Deering New Ideal Binder



A Deering New Ideal binder will go into any grain field and cut, bind and deliver all the grain in that field. Any Eastern Canadian farmer can prove this statement to his full satisfaction by studying Deering binder features and trying the machine.

The reel is adjustable for tall, short, down or tangled grain. The special T-shape cutter bar enables the operator to tilt the platform close to the ground when necessary. The bottoms of the guards are almost level with the bottom of the platform, preventing trash being pushed in front of the knife.

Either smooth section or serrated knives can be used. Three packers and three discharge arms aid in doing efficient work. The main frame is made of tough, strong steel bars, forming a unit which the hardest usage can not twist out of shape. Then there is the famous Deering knotter—simple, accurate, unfailing.

$1 O.K. CANADIAN COW STANCHIONS

Owing to the present low price of steel we are able to offer the famous *O.K. Canadian Cow Stanchions* at $1.00 each—f.o.b. Galt, cash with order.

These stanchions have hitherto always sold at $1.50. We were able to buy several carloads of steel at a low figure. Farmers will get the benefit of this purchase. They will go back to the regular price of $1.50 when this steel is used up.

The high hinge and the simple, secure lock make the *O.K. Canadian* undoubtedly the best stanchion on the market.

Act quickly, for this offer will be discontinued when our present supply of steel is all used.

Get them from your dealer or send your order direct to us. Do it now, because they won't last long at this price.

We will quote prices on complete metal stalls if you will tell us how many cows you keep. 30

Use it to the best advantage by sending us timely suggestions, short articles dealing with your experiences, and reports of your Institute meetings.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

The week passed away in a most delightful manner. It passed rapidly, as may be suposed, to one entertained as I was; and yet it gave me so many occasions for knowing Steerforth better, and admiring him more in a thousand respects, that at its cose I seemed to have been with him for a much longer time. A dashing way he had of treating me like a plaything, was more agreeable to me than any behaviour he could have adopted. It reminded me of our old acquaintance; it seemed the natural sequel of it; it showed me that it was unchanged;. it relieved me of any uneasiness I might have felt, in comparing my merits with his, and measuring my claims upon his friendship by an equal standard; above all, it was a familiar, unrestrained, affectionate demeanour that he used toward no one else. As he had treated me at school differently from all the rest, I joyfully believed that he treated me in life unlike any other friend he had. I believed that I was nearer to his heart than any other friend, and my own heart warmed with attachment to him.

He made up his mind to go with me into the country, and the day arrived for our departure. He had been doubtful at first wheter to take Littimer or not, but decided to leave him at home. The respectable creature, satisfied with his lot whatever it was, arranged our portmanteaus on the little carriage that was to take us to London, as if they were intended to defy the shocks of ages; and received my modestly proffered donation with perfect tranquillity.

We bade adieu to Mrs. Steerforth and Miss Dartle, with many thanks on my part, and much kindness on the devoted mother's. The last thing I saw was Littimer's unrued eye, fraught, as I fancied, with the silent conviction that I was very young indeed.

What I felt, in returning so auspiciously to the old familiar places, I shall not endeavour to describe. We went down by the mail. I was so concerned, I recollect, even for the honor of Yarmouth, that when Steerforth, said, as we drove through its dark streets to the inn,that, as well as he could make out, it was a good, queer, out-of-the-way kind of hole, I was highly pleased. We went to bed on our arrival (I observed a pair of dirty shoes and gaiters in connection with my old friend the Dolphin as we passed the door), and breakfasted late in the morning. Steerforth, who was in great spirits, had been strolling about the beach before I was up, and had made acquaintance, he said, with half the boatmen in the place. Moreover, he had seen, in the distance, what he was sure must be the identical house of Mr. Peggotty, with smoke coming out of the chimney; and had had a great mind, he told me, to walk in and swear he was myself grown out of knowledge.

"When do you propose to introduce me there, Daisy?" he said. "I am at your disposal. Make your own arrangements."

"Why, I was thinking that this evening would be a good time, Steerforth, when they are all sitting round the fire. I should like you to see it when its snug, its such a curious place."

"So be it," returned Steerforth. "This evening."

"I shall not give them any notice that we are here, you know," said I, delighted. "We must take them by surprise."

"Oh, of course! It's no fun," said Steerforth, "unless we take them by surprise. Let us see the natives in their aboriginal condition."

"Though they are that sort of people that you mentioned," I returned.

"Aha! What! you recollect my skirmishes with Rosa, do you?" he exclaimed with a quick look. "Confound the girl, I am half afraid of her. She's like a goblin to me. But never mind her. Now what are you going to do? You are going to see your nurse, I suppose!"

"Why yes," I said, "I must see Peggotty first of all."

"Well," replied Steerforth, looking at his watch, "suppose I deliver you up to be cried over for a couple of hours. Is that long enough?"

I answered, laughing, that I thought we might get through it in that time, but that he must come also; for he would find that his renown had preceded him, and that he was almost as great a personage as I was.

"I'll come anywhere you like," said Steerforth. "Or do anything you like. Tell me where to come to; and in two hours I'll produce myself in any state you please, sentimental or comical."

I gave him minute directions for finding the residence of Mr. Barkis, carrier to Blunderstone and elsewhere and, on this understanding, went out alone. There was a sharp bracing air; the ground was dry; the sea was crisp and clear; the sun was diffusing abundance of light, if not much warmth; and everything was fresh and lively. I was so fresh and lively myself, in the pleasure of being there, that I could have stopped the people in the streets and shaken hands with them.

The streets looked small, of course The streets that we have only seen as children always do, I believe, when we go back to them. But I had forgotten nothing in them, and found nothing changed, until I came to Mr. Omer's shop. Omer and Joram was now written up, where Omer used to be; but the inscription, Draper, Tailor, Haberdasher, Funeral Furnisher, &c., remained as it was.

My footsteps seemed to tend so naturally to the shop door, after I had read these words from over the way, that I went across the road and looked in. There was a pretty woman at the back of the shop, dancing a little child in her arms, while another little fellow clung to her apron. I had no difficulty in recognizing either Minnie or Minnie's children. The glass door of the parlor was not open; but in the work shop across the yard I could faintly hear the old tune playing, as if it had never left off.

"Is Mr. Omer at home?" said I, entering. "I should like to see him for a moment if he is."

"Oh yes, sir, he is at home," said Minnie "this weather don't suit his asthma out of doors. Joe, call your grandfather!"

The little fellow, who was holding her apron, gave such a lusty shout, that the sound of it made him bashful, and he buried his face in her skirts, to her great admiration. I heard a heavy puffing and blowing coming towards us and soon Mr. Omer, shorter-winded than of yore, but not much older-looking, stood before me.

"Servant, sir," said Mr. Omer. "What can I do for you, sir?"

"You can shake hands with me, Mr. Omer, if you please," said I, putting out my own. "You were good-natured to me once, when I was afraid I didn't show that I thought so."

"Was I though?" returned the old man. "I'm glad to hear it, but I don't remember when. Are you sure it was me?"

"Quite."

"I think my memory has got as short as my breath," said Mr. Omer, looking at me and shaking his head; "for I don't remember you."

"Don't you remember your coming to the coach to meet me, and my having breakfast here, and our riding out to Blunderstone together; you, and I, and Mrs. Joram, and Mr. Joram too—who wasn't her husband then?"

"Why, Lord bless my soul!" exclaimed Mr. Omer, after being thrown by his surprise into a fit of coughing, "you don't say so! Minnie, my dear, you recollect! Dear me, yes; the party was a lady, I think?"

"My mother," I rejoined.

"To—be—sure," said Mr. Omer, touching my waistcoat with his forefinger, "and there was a little child too! There were two parties. The little party was laid along with the other party. Over at Bluderstone it was, of course. Dear me! And how have you been since?"

Very well, I thanked him, as I hoped he had been too.

"Oh! nothing to grumble at, you know," said Mr. Omer. "I find my breath gets short, but it seldom gets longer as a man gets older. I take it as it comes, and make the most of itt. That's the best way, ain't it?"

Mr. Omer coughed again, in consequence of laughing, and was assisted out of his fit by his daughter, who now stood close beside us, dancing her smallest child on the counter.

"Dear me!" said Mr. Omer. "Yes, to be sure. Two parties! Why, in that very ride, if you'll believe me, the day was named for my Minnie to marry Joram? 'Do name it sir,' says Joram. 'Yes, do, father,' says Minnie. And now he's come into the business. And look here! The youngest!"

Minnie laughed, and stroked her banded hair upon her temples, as her father put one of his fat fingers into the hand of the child she was dancing on the counter.

"Two parties, of course!" said Mr. Omer, nodding his head retrospectively. "Exactly so! And Joram's at work at this minute, on the grey one with silver nails, not this measurement —the measurement of the dancing child upon the counter—by two inches. Will you take something?"

I thanked him but declined.

"Let me see," said Mr. Omer. "Barkis's the carrier's wife—Peggotty's the boatman's sister—she had something to do with your family? She was in service there, sure?"

My answering in the affirmative gave him great satisfaction.

"I believe my breath will get long next, my memory's getting so much so," said Mr. Omer. "Well, sir, we've got a young relation of hers here, under articles to us, that has as elegant a taste in the dressmaking-business—I assure you I don't believe there's a Duchess in England can touch her."

"Not little Em'ly?" said I, involuntarily.

"Em'ly her name," said Mr. Omer, "and she's little too. But if you'll believe me, she has such a face of her own that half the women in this town, are mad against her."

"Nonse father!" cried Minnie.

"My dear," said Mr. Omer, "I don't say it's the case with you," winking at me, "but I say half the women in Yarmouth, ah! and in five mile round, are mad against that girl."

"Then she should have kept to her own station in life, father," said Minnie, "and not have given them any hold to talk about her, and then they could not have done it."

"Couldn't have done it, my dear!" retorted Mr. Omer. "Couldn't have done it! Is that your knowledge of life? What is there that any woman couldn't do, that she shouldn't do—especially on the subject of another's good looks?"

I really thought it was all over with Mr. Omer, after he had uttered this libellous pleasantry. He coughed to that extent,, and his breath eluded all his attempts to recover it with that obstinacy, that I fully expected to see his head go down behind the counter, and his little black breeches, with the rusty little bunches of ribbons at the knees, come quivering up in a last ineffectual struggle. At length, however, though he still panted hard, and was so exhausted that he was obliged to sit on the stool of the shop-desk.

"You see," said he, wiping his head, and breathing with difficulty, "she has not taken much to any companions here; she hasn't taken kindly to any particular acquaintances and friends, not to mention sweethearts. In consequence, an ill-natured story got about, that Em'ly wanted to be a lady. Now, my opinion is, that it came into circulation principally on account of her sometimes saying at the school, that if she was a lady, she would like to do so-and-so for her uncle—don't you see!—and buy him such and such fine things."

"I assure you, Mr. Omer, she has said so to me," I returned eagerly, "when we were both children."

Mr. Omer nodded his head and rubbed his chin. "Just so. Then out of a very little, she could dress herself, you see, better than most others could out of a deal, and that made things unpleasant. Moreover, she was rather what might be called wayward. I'll go so far as to say what I shall call wayward myself," said Mr. Omer; "didn't

SUFFERED EVERYTHING

For Years, Restored To Health by Lydia E. Pinkham's Vegetable Compound.

Canadian women are continually writing us such letters as the two following, which are heartfelt expressions of gratitude for restored health:

Glanford Station, Ont.—"I have taken Lydia E. Pinkham's Vegetable Compound and never found any medicine to compare with it. I had ulcers and falling of womb and doctors did me no good. I suffered dreadfully for years until I began taking your medicine. I also recommend it for nervousness and indigestion." — Mrs. HENRY CLARK, Glanford Station. Ont.

Chesterville, Ont. — "I heard your medicines highly praised, and a year ago I began taking them for falling of womb and ovarian trouble.

"My left side pained me all the time and just before my periods which were irregular and painful it would be worse. To sit down caused me pain and suffering and I would be so nervous sometimes that I could not bear to see any one or hear any one speak. Little specks would float before my eyes and I was always constipated.

"I cannot say too much for Lydia E. Pinkham's Vegetable Compound and Liver Pills, for there are no medicines like them. I have taken them and I recommend them to all women. You may publish this testimonial." — Mrs. STEPHEN J. MARTIN, Chesterville, Ontario, Canada.

know her own mind quite; a little spoiled; and couldn't at first, exactly bind herself down. No more than that was ever said against her, Minnie?"

"No father," said Mrs. Joram. "that's the worst I believe."

"So when she got a situation," said Mr. Omer, "to keep a fractious old lady company, they didn't very well agree, and she didn't stop. At last she came here, apprenticed for three years Nearly two of them are over, and she has been as good a girl as ever was. Worth any six! Minnie, is she worth any six, now?"

"Yes, father," replied Minnie. "Never say I detracted from her!"

"Very good," said Mr. Omer. "That's right. And so, young gentleman," he added, after a few moments' further rubbing of his chin, "that you may not consider me long-winded as well as about it."

As they had spoken in a subdued tone, while speaking of Em'ly, I had no doubt that she was near. On my asking now, if that were not so, Mr. Omer nodded yes, and nodded towards the door of the parlor. My hurried inquiry if I might peep in, was answered with a free permission; and, looking through the glass, I saw her sitting at her work. I saw her, a most beautiful little creature, with the cloudless blue eyes, that had looked into my childish heart, turned laughingly upon another child of Minnie's who was playing near her; with enough of wilfulness in her bright face to justify what I had heard with much of the old capricious coyness lurking in it; but with nothing in her pretty looks, I am sure, but what was meant for goodness and for happiness, and what was on a good and happy course.

The tune across the yard had seemed as if it had never left off—alas! it was the tune that never does leave off—was beating, softly, all the while.

"Wouldn't you like to step in," said Mr. Omer, "and speak to her, sir? Make yourself at home!"

I was too bashful to do so then—I was afraid of confusing her, and I was no less afraid of confusing myself; but I informed myself of the hour at which she left of an evening, in order that our visit might be timed accordingly; and taking leave of Mr. Omer, and his pretty daughter, and her little children, went away to my dear old Peggoty's.

Here she was, in the tiled kitchen, cooking dinner! The moment I knocked at the door she opened it, and asked me what I pleased to want. I looked at her with a smile, but she gave me no smile in return. I had never ceased to write to her, but it must have been seven years since we had met.

"Is Mr. Barkis at home, ma'am?" I said, feigning to speak roughly to her.

"He's at home, sir," returned Peggotty, "but he's abed with the rheumatics."

"Don't he go over to Bunderstone, now?" I asked.

"When he's well he do," she answered.

"Do you ever go there, Mrs. Barkis?"

She looked at me more attentively, and I noticed a quick movement of her hands towards each other.

"Because I want to ask a question about a house there, that they call the—what is it?—the Rookery," said I.

She took a step backward, and put out her hands in an undecided frightened way' as if to keep me off.

"Peggotty!" I cried to her.

She cried, "My darling boy!" and we both burst into tears, and were locked in one another's arms.

What extravancies she committed; what aughing and crying over me; what pride she showed, what joy, what sorrow that she whose pride and joy I might have been, could never hold me in a fond embrace; I have not the heart to tell. I was troubled with no misgiving that it was young in me to respond to her emotions. I had never aughed and cried in all my life, I dare say, not even to her, more freely than I did that morning.

"Barkis will be so glad," said Peggotty, wiping her eyes with her apron, "that it'll do him more good than pints of liniment. May I go and tell him you are here? Will you come up and see him, my dear?"

Of course I would. But Peggotty could not get out of the room as easily as she meant to, for as often as she got to the door and looked round at me, she came back again to have another laugh and another cry over my shoulder. At last, to make the matter easier, I went up-stairs with her; and having waited outside for a minute, while she said a word of preparation to Mr. Barkis, presented myself before that invalid.

Supper ready "on the dot" when there's a Monarch in the kitchen

Late suppers are seldom served from a kitchen that has an

ENTERPRISE
Steel
Monarch Range

With ordinary ranges, it takes a great deal of time to get the dampers regulated and the oven hot, and to keep from scorching or burning something. The Monarch, however, is so perfectly made, and has so many time and labor-saving conveniences, that you can't waste time with it. It helps to make cooking easier in a dozen different ways. Daylight oven, heat economizer, anti-scorch cover, removable reservoir, oven thermometer,—these are only SOME of the many features that make the Monarch the best range made.

Our representative in your neighborhood will show you a Monarch and explain its conveniences. Write us for his name.

This Book free upon request.

RED ROSE TEA "is good tea"

SYNOPSIS OF CANADIAN NORTH-WEST LAND REGULATIONS.

THE sole head of a family, or any male over 18 years old, may homestead a quarter-section of available Dominion Land in Manitoba, Saskatchewan or Alberta. The applicant must appear in person at the Dominion Land Agency or Sub-Agency for the District. Entry by proxy may be made at the office of any Local Agent of Dominion Lands (not sub-agent), on certain conditions.

Duties—Six months residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres, on certain conditions. A habitable house is required in every case, except when residence is performed in the vicinity.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead Price $3.00 per acre.

Duties—Six months residence in each of six years from date of homestead entry (including the time required to earn homestead patent) and 50 acres extra cultivation.

A homesteader who has exhausted his homestead right and cannot obtain a pre-emption may take a purchased homestead in certain districts. Price $3.00 per acre.

Duties—Must reside six months in each of three years, cultivate 50 acres and erect a house worth $300.

The area of cultivation is subject to reduction in case of rough, scrubby or stoney land.

W. W. COREY,
Deputy of the Minister of the Interior.

N. B.—Unauthorized publication of this advertisement will not be paid for.—58783.

THE SIN OF OMISSION

It isn't the thing you do, friend,
But the thing you leave undone
That gives you the bitter heartaches
When the work of the year is done,
When apples are all worm eaten
And the taters blighted and small
When the use of a "PERFECT SPRAY PUMP"
Would have saved them one and all.

Oh, the apples you might have had, my friend,
If you'd only sprayed the same,
Oh, the taters you've thrown away, my friend,
That would have been clear gain
These would have paid for your spray pump,
And have left you a happier man
Then buy the best "A PERFECT,"
And save them while you can.

THE "PERFECT SPRAY PUMPS" are manufactured by R. B. WESTHAVER, MAHONE BAY, N. S.

Equipped Farm, Complete Sawmill.

This is surely the chance of a lifetime; good 160-acre farm; 30 acres rich machine-worked fields; brook watered pasture for 20 head; estimated 200,000 ft. timber; fifty sugar trees; variety fruit; house of 10 large rooms, 2 barns, 60 and 40 feet; sugar house; new mill, full line saws, clipper, planer, etc., 60 h. p.; for quick settlement of affairs everything goes, 4 cows, farm tools, etc.; all for only $2000, half cash, for complete details of this and many other bargains, see page 4, "Stsout's Spring List," choice selections of real bargains at wonderful low prices throughout many states; send todoy for your free copy, it will show you where to find just the farm you want at the price you wish to pay. E. A. STROUT, Farm Agency. Station 2612, 294 Washington St., Boston, Mass.

Widow Must Sell 200-Acre Farm, Live Stock, Machinery and Crops

R., it's valuable; 7-room house, piazza, water at sink; large stock barn with horsefork; poultry and tool houses; borders large stream; if taken now only $2100; easy terms; details of this and a money-making seashore farm of 60 acres fully equipped for only $1700, page 4, "Strout's Farm Bargains", choice selection of real bargains at wonderfully low prices throughout N. S. and N. E. States, send today for your free copy. Address FARM c/o Maritime Farmer Office.

There never was a time when people appreciated the real merits of Chamlain's Cough Remedy more than now. This is shown by the increase in sales and voluntary testimonials from persons who have been cured by it. If you or your children are troubled with a cough or a cold give it a trial and become acquainted with its good qualities. For sale by all dealers.

Home Discipline

Since learning that I was expected to write upon this subject, I have been trying to make up my mind as to what meaning to give to these two words, and I have chosen to consider it as "Home Education."

We speak of young men and young women finishing their education, but this education I speak of is never finished. As children we are subject to home dicipline, and I think you will agree with me, when I say that parents are also diciplined.

In seeking an education the student usually has some end in view; it may be a desire to write B. A., M. D., L. L. D., after his name. So in this home education we have an object in view, that is in the home where we have the children, and I take it, that it was of this dicipline our committee wished me to write. Who would be satisfied with anything less, than to have the child develop into a self-controlled, honest, honorable, industrious, truthful and obedient citizen.

Now who is to be the diciplinarian to secure all these qualities, and what the best methods to obtain such results.

First, I believe in the large majority of cases it is the mother who is the disciplinarian. The father must of necessity be outside the home a great deal, and thus has not the same opportunity with the young child as the mother has, and it is in the very early stages, shall I say as young as six months, that the corner stone must be laid.

I do not want to be understood as saying that the father has no responsibility in the matter of home discipline. If it be an ideal home the child will understand and that very early in life, that the father and mother are one in considering his welfare and advancement. Since then, the mother is captain of the home, so to speak, and in almost constant touch with the child it is very important that she possess the qualities she would see in the child, not only must she possess these qualities, but she must impart or teach them to the child, and here is where the best method to be employed can be discussed.

Probably we would all use a different method to teach our child self-control, but I think we would all agree, that a very necessary time to begin would be when we saw the little child kicking vigorously to have his own way, just after his mother has told him he must do her way. The different dispositions will require different treatment, and in all probability the mother herself will have learned a little more about self-control before the little one is taught

Then we would have these future citizens honest and truthful. Some teachers tell us that most children find it hard to be truthful. Others say that all children are truthful and that it is only because of wrong methods of punishment, for offences committed, that they become untruthful. I would like the meeting to discuss this part of the education.

Again, you will say that the home discipline that did not insist upon the boy or girl being taught to be very industrious would be very lax. Perhaps this would be best accomplished by having the child perform some light task every day and being made to assume the responsbility of that task, increasing the work and responsibility (but being careful not to over increase) as the child grows and develops. Another very necessary subject to be taught is obedience.

Without obedience at home the teacher in school will have a great deal added to his or her work, and perhaps the end will be disobedience to the laws of God and the land.

You have read a great deal on how to secure obedience. In a few words—do not nag; make few commands or threats; remember not to promise anything you cannot fulfill and to fulfill all you promise.

DURABLE--Fire grates are three-sided; last three times as long. Shaped in the

McClary's Sunshine Furnace

to grind up clinkers when "rocked". See the McClary dealer or write for booklet. 32

I have only named a few of the many things the home discipline must teach,—just started the foundation. You will all be able to add some other quality to be taught. I will just add that these things are only taught a little at a time, but when we consider the end an honest, industrious citizen, we must concude that to be a good disciplinarian is a worthy accomplishment and a well disciplined home a nice place in which to visit for a few days.—A paper read by Mrs. Thomas Wheaton at a meeting of the Upper Sackville Branch of the New Brunswick Women's Institute.

Health

Exercise for the Lungs.

In many cases the lungs lack proper exercise. If one wants to keep well and fit through the winter months begin by daily standing in front of an open window and taking thirty deep breaths. Test your breathing capacity by taking a deep breath, filling the lungs until it is necessary to raise the chest and shoulders. Then exhale until the lungs are quite empty. Do this systematically for the above mentioned number of times, and you will find that colds will be less frequent, your chest measurement increased, and, altogether, more full of vigor. Inhale slowly and deeply occasionally when you are out of doors.

Effect of Sugar Eeting.

The researches of Doctor Sherman, of Columbia University, have shown that the large use of sugar by the people of the United States has led to a condition of lime starvation which shows itself everywhere in the premature decay of the teeth. The free use of sugar not only robs the teeth of lime but irritates the stomach, gives rise to hyperacidity, overworks the liver, and doubtless encourages a tendency to diabetes, a disease which is rapidly increasing in recent years. The injuries resulting from the use of sugar have been pointed out by many scientific investigators. Brandl demonstrated by experiments upon dogs that sugar is highly irritating to the stomach. Laborde showed that the action of pepsin is much injured by the presence of sugar. Bunge, of Basle, Switzerland, attributes the bad teeth, pale faces, and the general malnurition of the larger portion of the children of the rising generation to the incrasing consumption of sugar. Bunge urged an increase in the sugar tax as one means of lessening the use of this article of food.

Permanent Cure of Corns.

It s a very simple but a sure cure for corns. After bathing your feet in warm water, pull off or out the hard skin of the corn, rub with a little saliva every morning and evening until the skin is like unto the other. If possible, have your boots made to measure. Do not use any boot polish that contains turpentine or its equivalent, or acids; these harden the leather; hence the pinching of the toe. I know

News to most women!

Oven-tested flour is for sale. Instead of buying ordinary flour you can buy flour whose baking ability has been proven in an oven:

A ten pound sample is taken from each shipment of wheat at the mill. This is ground into flour. The flour is baked into bread.

If this flour bakes into bread high in quality and large in quantity we keep the whole shipment of wheat and grind it. Otherwise we sell it.

More bread and better bread from this flour is a certainty!

it, and have known it until five years ago, when I began to use the leather-dressers' finish. This keeps the boot in perfect condition, soft, pliable, causing no friction on the foot. Perhaps some of the readers of this paper will know of one, if so, get it in preference to the ordinary creams, and benefit by the result, as I have done.—M. A. W. D.

Care of Milk in the House

Milk and cream readily absorb odours and collect bacteria and other impurities whenever they are exposed to the air or placed in utensils that are not scrupulously clean. If this fact is generally understood, it can easily be see why it is so objectionable to store uncovered milk in refrigerators or cellars where it comes in contact with the vegetable or other food products possessing strong odours. Milk is almost a perfect food for human beings. It is also a perfect medium for the development of certain bacteria which may gain access to it from the dust laden air, from flies, and from unclean utensils. Some of these bacteria may be the germs of contagious diseases; others may cause digestive disorders, especially in infants and young children whose diet is largely milk.

High Heels

"Women themselves hardly realize," said a member of the West End firm of shoemakers, "that the day of the high heel is passing. It is a sign of the times that women are becoming less anxious to squeeze their feet into shoes too small for them." The institution of half and quarted sizes, it is explained, has helped a revolution in women's footwear. Formerly a woman, rather than admit to herself that she "took 5's" would force her feet into 4's. In the case of walking shoes the heel may be only one inch in height, and the wearer gains not only comfort, but a graceful and natural carriage.

Poor appetite is a sure sign of impaired digestion. A few doses of Chamberlain's Stomach and Liver Tablets will strengthen your digestion and improve your apetite. Thousands have been benefited by taking these Tablets. Sold by all dealers.

The Sheep Measle Parasite

The sheep measle parasite has recently been found to be of common occurrence in the United States. It is of importance not only because of its more or less injurious effects upon sheep but also because of its location in the parts of the body used for human food, namely, the muscles. In cases of heavy infestation, this parasite is liable to cause the death of the affected animal, and under federal inspection carcasses which show more than a very slght infestation are excluded from use as food. Fortunately, cases of heavy infestation are rare and comparatively few sheep carcasses are condemned in their entirety on account of measles, the carcasses in most cases being fit for food after the removal of the affected portions.

It is a further fortunate circumstance that the sheep measle parasite has been conclusively proved by investigations in the Zoological Division of the Bureau of Animal Industry to be the intermediate stage of a dog tapeworm, and not the intermediate stage of the armed tapeworm of man, with which species it has generally been identified in the past. If it were the latter, public health considerations would require that even slightly infested carcasses should be excluded from use as food, and this would entail an enormous loss and a great reduction in the meat supply of the country, as available statistics indicate that at least one per cent and probably as many as five per cent of the sheep in the western United States are affected with the measle parasite.

Sheep become infected with the parasite as a result of swallowing its eggs which are scattered over the pasture in the excrement of dogs harboring tapeworms, and dogs in turn acquire the tapeworm as a result of eating the carcasses of infested sheep. The preventive measures are, first, the systematic treatment of dogs to keep them free from tapeworms, thus removing the source from which sheep become infected; and, second, the proper disposal of the carcasses of dead sheep and the complete prohibition of raw mutton as an article of food for dogs, thus preventing the possibility of the parasite reaching its canine host. The destruction of carcasses will laso reduce the chances of the transmission of the parasite to coyotes, which may also to some extent act as hosts, though these animals are probably much less important as carriers than the dogs which constantly accompany sheep on the range.—U. S. Dept. of Agr.

"After trying every flour on the market, I now use

REGAL FLOUR

exclusively because I have found that no other flour gives such invariably satisfactory results. With Regal I know I can make bread and pastry that will always excel. There isn't a doubt in a barrel of *Regal*. It's all good and always good. That's why I always use *Regal* and recommend it to other housewives. They take no risk in trying it for they can buy a barrel subject to the condition that if not satisfactory they can get their money back."

How to Teach Our Children Economy.

Economy is a frugal and judicious use of money and the taking care of what belongs to us so that nothing will be uselessly wasted.

It should be practiced and taught in every home, but care should be taken not to allow children to confuse economy with stinginess— while the former is to be encouraged, the latter is deplorable. Unselfishness cannot be too strongly urged upon in the training of children and there is ample scope for its practice in our own families. It tends to dispel all stinginess and to create a stronger charity towards our neighbors. On the other hand extravagance is to be condemned and we should strive to live within our means, no matter how small they may be. If we ourselves are extravagant the younger members of the household will copy our example and when they are called upon sooner or later to depend upon their own resources they will have great diffictulty to make ends meet.

It would be false economy to deprive our families of plenty of good nutritious food, as the growing child needs to be properly nourished to grow strong and healthy. If we are to economize in the food line, let it be with rich cakes and pastries, as these are luxuries and expensive and not very nutritious. I have heard of instances where parents were of the opinion that their children needed only light diet and would allow them to grow up on porridge, cakes, pancakes, etc. In these cases the health is very often sacrificed and a large amount of money spent on medicine.

Children should be taught to take care of their clothing, which is a very important branch of economy. Each child, boy or girl, should be taught to sew on buttons and mend small rents in their clothing, and also to keep their clothing clean. Children should be warmly and comfortably dressed, but expensive trimmings can be dispensed with. Their clothing should be worn at the right season—that is a child should not be allowed to wear heavy winter clothing in hot weather, as it is expensive and should be only worn when necessary and then the cheap cotton materials are much more comfortable.

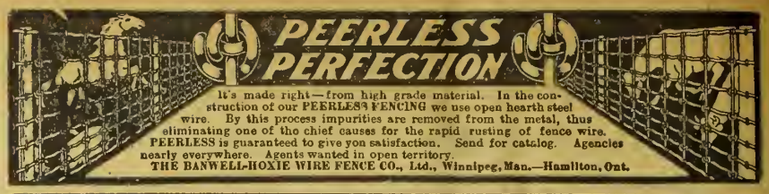
If all children knew how to take care of their clothing what a convenience it would be for them when they go among strangers to attend school or learn a trade. How much more economical it is to mend a small rent in our hose than go out and buy new ones, and to sew on our own buttons instead of hiring it done.

It is a wise plan to let each child have control of a small sum of money. At least let each have his own bank and encourage him to take care of his money. Let him do his own buying but under your advice.

They should be taught to do the work in their own sleeping rooms. This is economizing work for their elders and when they go to board with other families they will be a comfort rather than a nuisance in their temporal homes.

A child is very small when he or she cannot save steps for their parents, and a little praise goes a long way in encouraging a child to be useful. Of course, children must not be given too much work, as they need recreation, especially in the open air, in order to protect their health, but this like other things must be limited. Duty must be considered before pleasure. An industrious child usually grows up to be a useful citizen, while an indolent one turns out unhapvy.

It certainly needs strenuous effort on the part of parents or superiors to carry out these ideas, but they



It's made right—from high grade material. In the construction of our PEERLESS FENCING we use open hearth steel wire. By this process impurities are removed from the metal, thus eliminating one of the chief causes for the rapid rusting of fence wire. PEERLESS is guaranteed to give you satisfaction. Send for catalog. Special Advice For Men

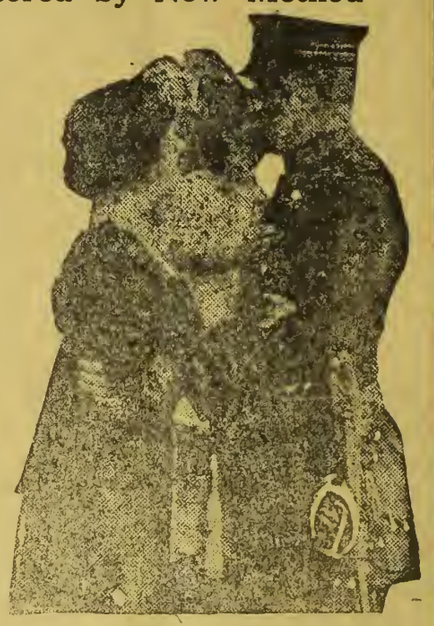
Vitality Restored by New Method



The attached coupon entitles you to one illustrated copy of my pocket compendium and guide for the self-restoration of lost strength. (See description below) Upon hearing from you, this valuable little book of private information for men will be sent by return mail in plain sealed envelope. Please call or write today.

There is a new and marvelous method for restoring lost manly strength, for renewing the vigor of youth, which every man should know of, a self-restorer which operates without the use of drugs or medicines, a new way to treat yourself and by which it is my firm belief any man anywhere who is content to lead a decent life, free from excesses and dissipations may be almost certain to restore his full manly vigor snd strength, if he but makes the little effort that is called for in connection with the use of a little vitalizing appliance which I have patented and am now distributing all over the world.

Please remember that a man is not one day older than he actually feels, and therefore no matter what your age, if you are young or elderly, married or single, large or small, if I can show you reader, how you can yourself actually add to your system, nerves and blood the very nerve force or vital vigor which may have been drained away, and which is necessary to make you strong, vigorous, and capable again, then I have shown you the real secret of perpetual youth, and how you can again be filled with vitality and again be just as powerful in your influence and just as thoroughly manly in your capacity as the biggest, fullest blooded, most successful fellow of your acquaintance.

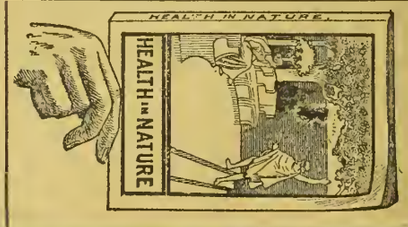
HEALTH IS HAPPINESS

I call my vitalizer a HEALTH BELT because it is worn around your body in the position of an ordinary belt. It sends a great, soft, strength-giving supply of a force I call vitality into your body nights while you sleep. I would like you to call or to write and get my free book, that you may know the whole wonderful account of what my HEALTH BELT is doing for others who were looking for a safe and sure means to restore vigorous health and to rid the body of pains, aches and weaknesses.

Note—My HEALTH BELT, with special attachment, is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, etc.

86-PAGE BOOK SENT FREE

My 86- page illustrated booklet (pocket size) was compiled by me to answer fully and correctly those questions which are asked privately by any man needing new strength and who seeks personal advice pertaining to the ailments and weaknesses he wisbes to overcome. The book, fully illustrated, with photo reproductions contains much that a single or married man should know. It also fully describes my HEALTH BELT and tells how you may secure one to use in your own case, should you decide you want to use one. Remember the book is sent absolutely free, in plain, sealed envelope. Why not write for a copy today?



DR. M. F. SANDEN.
140 Yonge St., Toronto, Ont.

Dear Sirs—Please forward me your book as advertised, free.

ADDRESS .....

12 Tumors Removed Without An Operation

Silver Lake, Ont., Sept. 20, 1909.

Dear Mrs. Currah,—I am enjoying better health than I have for eight years, and I think I am entirely cured. I have none of the old symptoms. I am very grateful for my present health, and think Orange Lily is the greatest treatment for women the world knows. Its use in my case caused 12 tumors or growths of some sort to be expelled. Some were as large as a hen's egg, and others smaller, down to the size of a walnut. You may use my case in your advertisement, for it is the solid truth, and pen cannot describe all the good it has done for me. Mrs. Louise E. Bolteridge.

This letter gives an indication of the positive benefits that always follow the use of Orange Lily. It is an applied treatment and comes in direct contact with the suffering organs. It produces results from the start in all cases of women's disorders, including painful periods, falling of womb, irregularities, leucorrhoea, etc.

I will send a sample box containing 10 days' treatment absolutely free to any suffering woman who has not yet tried it if she will send me her address. Enclose 3 stamps and address MRS. FRANCES E. CURRAH, Windsor, Ont. 4

FOR SALE BY LEADING DRUGGISTS EVERYWHERE

You Can Cure CONSTIPATION By The Use Of MILBURN'S LAXA-LIVER PILLS.

A free motion of the bowels daily should be the rule of every one, for if the bowels do not move daily constipation is sure to follow and bring in its train many other troubles when the bowels become clogged up. You get Headaches, Jaundice, Piles, Heartburn, Floating Specks before the Eyes, Catarrh of the Stomach, and those tired weary feelings which follow the wrong action of the liver.

Mrs. Elijah A. Ayer, Fawcett Hill, N.B., writes:—"I was troubled with constipation for many years, and about three years ago my husband wanted me to try Milburn's Laxa-Liver Pills as they had cured him. I got a vial, and took them, and by the time I had taken three vials I was cured. I always keep them on hand, and when I need a mild laxative I take one."

Milburn's Laxa-Liver Pills are 25c. a vial, 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

It would surprise you to know of the good that is being done by Chamberlain's Tablets. Darius Downey, of Newburg Junction, N. B., writes, "My wife has been using Chamberlain's Tablets and finds them very effectual and doing her lots of good." If you have any trouble with your stomach or bowels give them a trial. For sale by all dealers.

will eventually be repaid for their teaching, as children need constant guarding and training to bring them up properly.—A paper read by Miss Grace C. Fraser at a meeting of the Rexton Branch of the New Brunswick Women's Institute.

To Clean Straw Hats.

The following suggestions for cleaning straw hats, taken from the "Millinery Trade Review,' may be helpful to some who wish to remodel their last summer's hat.

The milan and rough straw braids in natural color may be cleaned by washing in a solution made by dissolving one tablespoon of oxalic acid in one pint of water.

To test the strength of a solution pour a little on a pine board. If it bubbles the solution is too strong, and more water must be added.

With small bristle brush scrub the hat quickly, beginning at the centre of the crown and working round until side, crown and brim have been washed. Rinse quickly in clear water. Place hat on end of a broom handle and whirl rapidly in the air or sunlight, so the straw will dry quickly.

When the hat is dry press in shape under a damp cloth. The acid will take off most of the gloss.

To clean the natural colored leghorn wash thoroughly with a paste made of the juice of one lemon and two tablespoonfuls of sulphur. After it has dried, brush the dry powder off

Little can be done for the white chip hat—that is sunburned and soiled, except to cover with gauze or other thin material.

A mixture of plaster of paris and gasoline made the consistency of thick paste may be covered over the soiled portions of the hat. When dry remove with a stiff brush. This will help to cover up the soil rather than to cleanse.—Charlotte E. Carpenter, Colorado Agricultural College.

Carpet Beating.

For carpet beating most of us have to fall back on the time-honored way of beating by sticks. A thorough cleaning can never be effected without some small damage to the fabric, but it certainly can be lessened if there is a solid surface underneath, and for this reason spreading on a grass plot and beating on both sides with ordinary stout canes is preferable to hanging on a line. When beaten, a carpet should be folded lengthways ready for relaying on a layer of felt, straw, or paper over the boards. To prevent undue wear in certain places the furniture should be rearranged or the carpet itself occasionally turned about. This is easily done with a square. In the case of a fitted carpet the seams may be unpicked (save at the edges) and the centre widths transposed, in the same way that sheets are turned sides to middle.

Home Hints.

To teach children truthful habits, always tell the truth yourself.

Every housekeeper should keep on hand a stock of asbestos mats; they cost only a trifle, and are almost indestructible. When put under pots and pans they will prevent food from burning; they are also excellent to put over things in the oven when there is danger of burning them.

When a baking dish gets burnt in the using it should not be scraped. Simply place a little water and ashes in it and the burnt surface will come off easily without injuring the dish.

When storing blankets wrap them in plenty of newspaper and lay slices of yellow soap in the folds. Moths dislike soap and printers' ink.

PIGS and calves thrive and grow fat when fed with warm, skim milk. You cannot get warm skim milk to feed them unless there is a cream separator on your farm. There is money enough in this one advantage to pay for a cream separator the first year. This is specially true if you buy a close skimming, durable International Harvester cream separator—Lily, Bluebell or Dairymaid.

These separators have all the points which make cream separators good. They have the balanced bowl, the self-adjusting neck bearing, the tool steel spindles, the bronze bushings, the spiral gears, the low supply can, the high skim milk spout, and the open, sanitary base, without which no separator can be satisfactory.

Some dealer near you handles I H C separators. If you do not know, write us and we will tell you who he is. We will also send you our cream separator book which tells you why it pays so well to buy an I H C separator.

PURE BRED SIRES

THE LIVE STOCK BRANCH

Dominion Department of Agriculture.

WILL PURCHASE during 1914, a number of CANADIAN BRED Stallions, Bulls, Boars and Rams.

Animals must be of right type, in good breeding condition and of the following ages.

Stallions, three to five years.
Bulls, not under one year.
Boars, not under six months.
Rams, not under six months.

All stallions will be purchased subject to veterinary inspection and bulls subject to the tuberculin test.

Breeders in Eastern Canada having CANADIAN BRED male animals for sale, filling the above requirements and registered or eligible for registration in the Canadian National Live Stock Records, are requested to communicate with the Live Stock Commissioner, Department of Agriculture, Ottawa.

The purchases of stallions and bulls will be made during the current spring months. The purchases of rams and boars will be deferred until the autumn.

Communications must state age and breeding of animals offered and price asked.—60271.

FLORICULTURE.

Correspondent wrtes rom St. Stephens, N. B.:—Please tell me the names of the plants from which leaves enclosed were cut; also if they are good house plants. What is the best plant for a cemetery grave that will flower all summer and when should it be planted? Will Nasturtiums planted as late as this be of any use this summer; also do they require sunny or shady places?

The leaf that looks like a spotted maple is Abutilon Saritzii The grass like leaf is Drecina Indivisa and the Geranium is Madame Tallerci—all good house plants. The best annual flowering plant for covering the surface of a grave is probably the dwarf Alyssum (Tom Thumb of Little Gem) They make a carpet of sweet smelling white flowers alll summer, should be planted the first of June, after all danger of frost is over. Nasturtiums planted the middle of June would be all right only a little late. They require a sunny situation to give best results as regards bloom.

L. T. T., Lancaster, N. S., writes:—Last year my hardy roses had hardly leaved out before the insects appeared. They turned the leaves all white, eating out all the green part. What can I do for them if they come this year.

The insect is the Rose Slug and it is most extraordinary to have them so early. Sprinkle them as soon as you find them with a solution of one large spoonful of hellibore to a gallon of water. This should be applied once a fortnight from the time the fist ones appear.

"Hyacinth" of St. John, writes:—Would you kindly give me a little information about a Weigalia shrub that grows on our lawn. It is quite an old bush and has grown to be very one-sided. There is a large number of new shoots coming from the bottom. It did not flower at all last year and the old plant does not seem very healthy. The back is covered with a sort of moss.

You had better cut out the old one-sided wood and select about ten of the strongest shoots. Cut out the others leaving your shoots in such shape in the fall. Give it a good mulch of strong manure. If the old wood did not bloom last season it is not likely to do so again especially if mossy, which indicates age and decay, so the sooner it is removed the better.

Amateur, Amherst, writes:—I have a fine bed of tulips just going out of bloom. I wish to plant the bed with scarlet Geraniums. As the bulbs are quite thick to gather it would probably be necessary to remove the bulbs. How should I do so without injuring the bulbs?

As soon as the Tulips are done blooming dig them up carefully (do not cut the leaves off), dig a hole in an out-of-the-way corner of the garden. Plant as close as you can pack them, covering so that the leaves are out of the ground. As soon as the leaves and stalks turn yellow and wither up—usually about the middle of July—dig them up and place in a dark, cool place. Packing in dry sand is excellent. Dry them in the shade before putting away. They will then be in good condition for replanting in October again. Another good way is to let them stay in this out of the way place until October, then dig them up and plant in beds.

Clean Barns Prevent Tuberculosis.

(Continued from page 568)

posed to sunlight. It is a disinfectant always ready to work without cost. Sunlight is also necessary to the health of animals. Man deprived of it for any length of time, as prisoners in jail, become pale, and lose the appearance of health. Cattle that are constantly confined in dark stables become lowered in vitality, and are ready to catch any disease with which they come in contact. For these reasons, the cow stables should have plenty of windows on two or more sides if possible, so that the sunlight can reach every part of the interior some part of the day.

"Pure air is also very important. In badly ventilated stables, the air is breathed over and over again, until it becomes more or less poisonous. Animals kept in such conditions become gradually reduced in vitality. This change may not be noticeable to the observer, but becomes apparent if the animal is exposed to disease. It readily contracts disease, and does not recover from it readily.

"Since the manure of tuberculous cattle often contains living tubercle germs in vast numbers, the importance of keeping it well cleaned out of the stable is readily seen. Such manure is not only dangerous to other cattle in the stable, but may be the means of conveying the disease to children. Often cows are seen with their flanks encrusted with dry dung. Parts often break off while the cow is milked, and some of it is likely to fall into the milk pail. The larger lumps are strained out, but the smaller particles remain, and also the tubercle germs which are small enough to pass through any strainer. These stay in the milk, and make it a fruitful cause of the disease in the young.

"Stables should be cleaned out often, and the manure put where it cannot be picked over by hogs or cattle. These animals are easily infected in that way. Cleanliness also includes keeping the walls and ceilings free from dirt, dust and cobwebs. These are all good resting places for disease germs.

"Whitewashing the interior of the stable at least twice a year is a great aid to cleanliness, and also has a distinct effect in destroying disease germs."

A New Agricultural School for New Brunswick.

(Continued from page 569)

course to be held in New Brunswick the attendance was very encouraging. A noticeable feature was its steady increase as the course progressed: those who attended one session remained if possble for the rest.

The Teaching Staff.

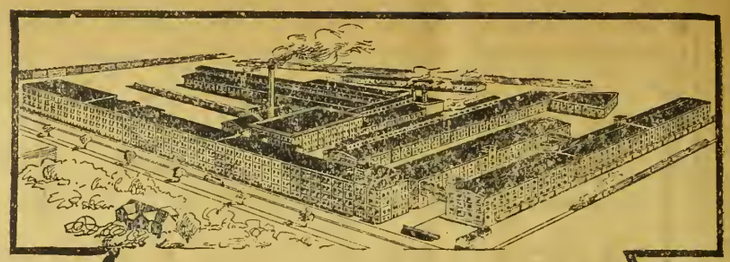
It is panned to have the men of the Provincial Department of Agriculture do the teaching in the schools of Agriculture, and the staff is now being strengthened for this purpose. At the short course this winter a large number of outside men of high standing were brought in to assist with special lines of work.

A Special Meeting

On Friday, March 27th, the last evening session of the short course took the form of a special meeting at which the speakers were Mr. R. Newton, the Principal, Mr. F. B. Carvell, Member of Parliament for Carleton County, in which the school is located; Mr. W. W. Hubbard, Superintendent of the Dominion Experimental Farm at Fredericton and the Hon. J. K. Flemming, Premier of the Province. Unfortunately, both the Minister of Agriculture, Hon. James A. Murray and the Secretary for Agriculture, Mr. J. B. Daggett, were compelled at the last moment to send messages regretting that circumstances prevented their attendance.

The Principal occupied the chair, and after welcoming the large assembly which packed the hall, spoke at some length on the function of an agricultural school. Referring to the modern problems of depletion of the rural population with consequent under production and high cost of living, he pointed out that farming must be made both more profitabe and more pleasant, and emphasized the right of the farmers' sons and daughters to special training in rural citizenship in order that they might make the most of their opportunities. Figures were quoted to show the need for and the possibilities of better farming, and some of the causes of under-production were discussed. It was shown that "better business" is the greatest need of modern agriculture, and, therefore, that courses in rural economics and business methods should be given a prominent place in the curriculum of an agricultural school.

Mr. Carvell, the next speaker, expressed the pleasure which it gave him to hear of the success of the first short course, and gave his hearty endorsation to the agricultural school work. He spoke of a visit to Denmark which he had made a short time ago, and of



Ask the Men Who Specify It!

The extensive Massey-Harris establishment shown above is only another instance where careful, foresighted business men insisted upon Brantford Roofing for their valuable plant. These immense premises represent a heavy investment. To protect their investment, the Company's officers specified the tried and tested

Brantford Roofing

Many of Canada's largest industrial plants are roofed with Brantford Roofing. The number of firms who choose Brantford Roofing in preference to all others is so large that it means more than mere coincidence. Ask yourself why the great plants of the Dominion are roofed with Brantford Roofing!

Can you do better than follow the example of Canada's shrewdest business men? Use Brantford Roofing and you can rest easy that your roof is proof against fire, heat, frost, rain, lightning, acids—in fact all the enemies of roofing. Brantford Roofing costs you no more than ordinary roofing material. Send a post card for big FREE book on roofing, and samples.

Our new patented appliance for laying Brantford Roofing is worth investigation. Positively prevents buckling or expansion.

THE T. EATON CO LIMITED
TORONTO - CANADA

the great possibilities in highly intensive farming, which that visit had demonstrated to him. The comparative neglect of live stock in New Brunswick was not due, he considered, to any lack of natural advantages for this kind of husbandry. With the introduction of better methods of farming he hoped to see greater production year by year of both live stock and field crops.

Mr. Hubbard spoke for some time with regard to the rural problem. As far as practical framing operations in this province were concerned, he considered the greatest need was for more and better live stock husbandry. The speaker made a very interesting comparison between the natural advantages of New Brunswick and the Prairie Provinces, showing that many young men who had gone west had failed to appreciate their opportunities at home. He also compared the cost of living of farm life with that of life in a town or city, using figures to draw attention to indirect revenues and large savings on the farm, with which it is not always credited. The speaker had given several addresses during the short course, and expressed his pleasure at being identified with the work.

The Premier's address was very enthusiastically received. He outlined the Government's policy with regard to the agriculture of the province, and for longer courses at Woodstock next winter. It must not be forgotten that about one-third of the people of New Brunswick were French Acadians, and an agricultural school with French instruction must be established. The aim was to work out a policy which would place agricultural instruction within the reach of every farmer's son in the province.

Lightning Rods.

A bulletin advocating the use of lightning rods on buildings has just been issued by the Ontario Department of Agriculture. Prof. W. H. Day, of the staff of the Ontario Agricultural College, is the author of this Bulletin, and he demonstrates, after a series of investigations cobering thirteen years, that lightning rods are the protection that science claims them to be. In Ontario in 1912 the efficiency of rods was 94½ per cent. From the reports of insurance companies Prof. Day found that in every 200 farm buildings insured, 42 were rodded, which is 21 per cent, but out of every 200 farm buildings struck by lightning only 3 were rodded. In this connection Prof. Day observes "we should have expected 42 if the rods were no good."

Lightning rods in Iowa are recorded as showing an efficiency of 98.7 per cent, and inspected rods in Michigan show an efficiency 99.9 per cent. Records in Iowa show that for the eight years 1905-1912 the average number of insurance companies carrying risks on rodded buildings was 55. The highest number of companies reporting in any one year was 68 and the lowest 46. The total lightning claims paid by all these companies for the whole eight years on rodded buildings was only $4,464.30—an average of $10.15 per company per year. On unrodded buildings they paid lightning claims amounting to the large sum of $341,065.32, which is an average of $775.15 per company per year, and the number of unrodded buildings was the same as the rodded ones.

In Michigan where a company insures only rodded buildings which have been inspected a risk of $55,172,075 was carried during four years and damage claims arising from the lightning during that time totalled only $32.

These and other proofs submitted by Prof. Day are practical demonstrations of the scientific fact that lightning rods properly installed are a protection. In giving directions for the proper rodding of buildings, the reader is reminded that lightning is electricity. Prof. Day asserts that rods should be in metallic connection with the building and that no insulators should be used. This method of attachment is directly opposite to that adopted when lightning rods were first used.

Parcel Post Hints.

Wrap and pack your parcels securely.

Most of the damage and losses are due to insecure packing.

Address your parcel correctly and plainly.

Write your own name and address in the upper left hand corner.

Packages containing eggs, should be marked "eggs."

Packages containing perishable matter should be marked "perishable."

Packages containing liquids, jellies, etc., should be marked "fragile"

Don't pack eggs, berries or similar product in a thin pasteboard box.

Eggs wrapped separately and surrounded in cotton or excelsior and packed in a strong corrugated wooden, pasteboard or metal box can be sent any distance.

Don't put any writing in the package unless it is a bill for the goods or a description of the contents of the package.

Do not send perishable matter so that it will arrive in the city on a Saturday evening or on Sunday — unless you use a special delivery stamp.

McCormick—The Binder of Satisfactory Service

HERE are some of the things that stand back of McCormick binder service. On a McCormick binder the reel has a wide range of adjustments and handles successfully, tall, short, down or tangled grain. A third packer assists in handling grain that is full of undergrowth or that is very short. The tops of the guards are nearly level with the top of the platform, allowing short grain to pass freely without obstructing the guards or knives.

The floating elevator on a McCormick binder handles grain in any quantity and does not clog. The cutter bar is built to use either smooth section or serrated knives. The improved McCormick knotter does good work without the usual close adjustments.

The McCormick local agent will explain these and other important features on the McCormick binders which are built especially to meet Western Canadian conditions. You can get catalogues from him, or, by writing the nearest branch house.

Consult your postmaster as to the best time for mailing country produce so as to reach the city at the best hour, the quickest time and in the best condition.

Frrge Clay Mixture.

Farmers who have a home blacksmith shop may sometimes need a forge-clay mixture. The following item on this question is by J. W. Lawrence, of the Colorado Agricultural College:—"The following mixture for building up around the hearth of a blacksmith forge will be found very serviceable; it dries hard and will resist heat in a very satisfactory manner. Take ten pounds of sal ammoniac and ten pounds of cast-iron turnings and mix together dry. After mixing thoroughly make the mixture into a mortar by adding water and then apply to the forge top at once."

It is claimed that uncooked fresh mutton fat is better than oil as a preservative against rust in tools.

If a saw, hammer, plane or other steel tool is damp, do not put it away in that condition. Lay it on the warm stove for a few minutes until the metal warms up enough to dry off.

In order that a brood mare may deliver a strong healthy foal, she must have plenty of exercise. Ordinary farm work is the very best kind of exercise for her. There is no reason why she should not pay her board bill in the harness. Exercise does not mean heavy lugging on rough or slippery ground; it does not mean fast driving and over-heating, but regular, everyday work in the field, even right up to the day of foaling Accompanied with this should be careful feeding and watering. Like all other questions of live stock management, it calls for the use of "common sense."

Lame back is usually caused by rheumatism of the muscles of the back for which you will find nothing better than Chamberlain's Liniment. For sale by all dealers.

You Can Dig 40-foot Wells Quickly Through Any Soil With Our Outfit At $12.00

Water-Proofing Concrete.

Concrete needs no waterproofing if properly mixed and laid. It is because the mass is porous that water leaks through. If we stop to consider the materials entering into concrete and the theory upon which its structure is based, this fact will become clear to us.

Concrete ordinarily contains sand, stone and cement. The stone alone would be extremely porous, for the spaces between the individual stones is quite marked. The theory is that the sand fills these spaces, yet even then there are spaces between the sand grains and water will pass quite readily. These spaces, however, are filled with the cement, the particles of which are so very much smaller than the grains of sand. The cement particles do more than merely fill the spaces between the sand grains; they cover the individual grains and cement them together, imbedding the stones within the whole mass.

It is apparent that if all the spaces are filled, water cannot leak through while if the mass is filled with tiny pores not only will water pass through but these pores or tubes will suck up water or absorb it from the ground and from the moisture which condenses from the atmosphere. Such will be the case if the concrete is 'lean,' that is, if it does not contain the proper proportions of materials or the proper sizes of particles In this case there are but two things to do in order to remedy the defect. Either the pores must be plugged up with some substance which is not porous to water, which is not dissolved by water, which may be easily and cheaply applied and which will not chemically attack the concrete, or a separate layer of waterproof material must be laid against the surface of the concrete, using the concrete merely for its strength and trusting entirely to this auxiliary layer to repel water.

The construction of waterproof concrete needs carefulness and thorough workmanship, but when we consider the difficulty of making a real lasting job of waterproofing after a wall has commemced to leak it will be seen that care in the mixing and laying is more than repaid. There are several good waterproofing proportions, differing but slightly but the 1-2-1-2-4-1-2 is most commonly used. This means one part of cement two and one-half parts of sand and four and one-half parts of stone. With these proportions four barrels of cement will make three cubic yards of concrete when mixed with sand and stone.

It is assumed that Portland cement is used. It may be purchased all ready for use. The sand and stone may be obtained anywhere. It is important, however, to have them clean with no mud or sediment clinging to them or mixed with them. To be sure of this they may be piled on boards laid with a sloping surface, and thoroughly drenched with water, turning them over several times in order to clean the bottom and interior layers. The sand must be coarse for the most economical results. The total spaces between the particles of fine sand are more and the total surface of the sand particles which the cement must coat, is greater with fine sand. Hence, the finer the sand the more cement must he used and the more expensive the concrete. Coarse sand with a small amount of fine sand mixed in gives the best results. It will often pay to buy sand of the proper character, rather than use a bank of fine sand already at hand.

Contrary to the prevalent idea, gravel makes a better concrete than broken stone. It is more dense and it id stronger after it is aged. Particularly is this true of quartz pebbles.

The concrete should be mixed a little wetter than is ordinarily done and the mixing must be thorough in order that the proportions may be properly intermingled. In laying, great care must be exercised not to separate the ingredients. cf the material is dropped from a wheelbarrow or poured from a bucket so that it drops several feet, the job may be spoiled because the stones will all fall together leaving the cement and sand stoneless. After laying, the concrete should be tamped slightly in order to drive out the air and fill the voids. Following this the surface layers should be spaded. That is, a spade placed in between the wall and the form and drawn up and down in order to slightly puddle the surface, driving back the gravel a little and leaving the surface with a grout as nearly airless and non porous as possible.

By following these suggestions, the concrete cannot be penetrated by water. But concrete that will not absorb moisture to some extent cannot be made. It is only possible by adding some waterproofing compound to the concrete when mixing or by the treatment of the concrete surface afterwards. The mixture laid under the conditions above given is dense, and close grained due to the excess of cement and is without air bubbles because of the excess water. It is filled with very tiny capillary tubes however, which although preventing the passage of water, will still absorb moisture just like brickwork. To prevent this absorption any one of the following methods may be adopted.

Here again we must consider whether or not it is old work or new work which we desire to protect. If old work, only surface coatings can be used and their object is a filling of the pores or tubes spoken about. Four substances are commonly used, namely, cement grout, asphaly, paraffine and an alum-soap compound.

One of the most effective waterproofings is known as the Sylvester used in waterproofing new work. A hot castile soap solution is made by dissolving three-fourths of a pound of soap in one gallon of hot water. An alum solution of half a pound of alum to four gallons of water is then prepared. The substances are thoroughly dissolved and alternately applied to the wall the latter being perfectly dry. The hot soap solution is first applied covering the work. A flat brush is recommended for this purpose by experts. After 24 hours a coating of the alum water is put on and allowed to dry for 24 hours. In this way alternate coatings to the extent desired may be used, allowing a full day to elapse between the coatings. There is a chemical process which takes place bteween the substances used, the resulting compound plugging up the pores in the cement. The cost of this process for two coatings of each material will be from 35 to 40c per square yard.

Paraffine, although rather expensive, is often used for small jobs. It may be melted and applied while hot the walls also being slightly warmed or it may be dissolved ia some liquid solvent sich as benzine.

Asphalt and other bituminous products are the easiest to handle and the surest of results in unskilled hands. They are applied as liquids, allowed to dry and a second coating given. Probably the cost for two coatings will not exceed 25 to 38c per square yard.

Cement grout is a mixture of cement and water very liquid and applied like paint. It is not very efficient on old surfaces, as it readily peels off after a time. For a temporary repair this or a "neat" cement coating—a mixture of cement, sand, and water or cement and water alone just plastic enough to handle with a trowel—is perhaps most universally used.

The surface coatings spoken of are as valuable for concrete blocks, brick and porous stone as for straight concrete work. Good brick needs very little attention although it will absorb three to five per cent. of its weight of water, but such brick is

A. RAMSAY & SON CO. (Established 1842) MONTREAL, Que.

Dominion Ammunition
TRADE MARK
Metallics and Shot Shells

What to look for when buying ammunition

Accuracy, uniformity and reliability are features that can be determined only after exhaustive tests, unless you profit by the experience of seasoned hunters and choose Dominion Ammunition. More Dominion Shells are used in Canada to-day than all other makes combined. Made entirely in Canada by Canadians, for Canadians. Look for the "D" with shell and cartridge. On every box of ammunition manufactured by

The Dominion Cartridge Co., Limited
818 Transportation Building, Montreal

Send 10c. (stamps or coin) for 16 beautiful colored pictures of Canadian game.

expensive and seldom met with in practice. The common brick used will often absorb 15 to 25 per cent. of its weight of water. Concrete blocks, especially, if made by the continuous tamping process, known also as the dry process are extremely porous.

While the above surface coatings appear to be satisfactory for simple work in large structures such as dams, reservoirs and sewers, much more care must be taken. Strong layers are used because of the heavy water pressure against them. Felt or burlap when saturated with tar or pitch, rolled in a continuous layer against the wall and held there, is not only a satisfactory water retainer but also prevents the leakage of foul gases which chemically attack the concrete.

A method, known as the integral method, is practical where it would be too expensive to use thorough workmanship on the concrete. This consists in the addition to the cement when mixed of some fine dry powder consisting of extremely small particles, usually alum and lime. These, because of their size may fill in the spaces between the cement and sand grains and make the whole structure more dense. Usually only the cement which lies near the surface is thus treated.

Still another treatment is to add some soap or oil emulsion to the mixture. This forms a jelly within the concrete and fills the pores.

Lastly, the well known Sylvester process spoken of above is used, Alum is added to the cement and castile soap is added to the water with which the mixture is made. Chemical action then goes on in the mass, forming a compound which, as before, fills the spaces.

Mnay other substances may be used. In fact, one farmer in waterproofing a cracked wall filled the cracks with cornstalk pith and wet it, causing it to swell and fill the cracks completely. The whole object of waterproofing is to fill all the holes, pores and cracks. Any method of doing this is entitled to consideration.—S. J. G.

New Spraying Possibilities.

Addressing the recent Maine farmers' week at the college Prof. B. S. Brown advanced the latest ideas on spraying. He said: A recent development in the use of insectticide is the introduction of zinc arsenite to take the place of arsenate of lead. Only a few years ago, paris green was the common source of arsenic for poisoning insects. Later it was found that there was so much free arsenia acid in paris green that it burned the foliage, and arsenate of lead was substituted. This first took the form of a paste, but later was used as a powder, and its strength was accordingly increased. Now zinc arsenite is being tried out as a substitute, in various places. It is much cheaper and contains a very considerably greater amount of arsenic, the poison principle. The arsenates of lead run 17 per cent. arsenc oxide, while the zinc arsenite runs 40 per cent. The latter will stay on the foliage equally as long as the other, and in many ways has been found superior. The one drawback so far is a tendency ofof the zinc arsenite to burn the more tender foliage. However, it has been found that if used with bordeaux or lime-sulphur, this injury is eliminated.

Another recent development in the use of spray mixtures is the gradual adandoning of the self-boiled lime and summer mixture for summer sprays, or foliage sprays. It has been found by various experiments that the regular stock solution of lime-sulphur spray, diluted to the proportion of about one to 40 gives just as good if not better results than the so-called self-boiled lime-sulphur mixture. The reason for this substitution is the cheapness of the strongly diluted mixture as compared with the self-boiled. Much less sulphur is wasted and the lime is much more consumed than in the self-boiled mixture. In addition to this, it does not deteriorate so easily, and can be made and applied at short notice. A dilution of 1 gallon of the regular solution of 31 degrees Baume to 40 gallons water is a safe mixture for all apple foliage. This is equally efficient for fungus troubles and for some of the more delicate insect pests.

Another of the more recent developments in spraying work is the substitution of the western method for the control of the coddling moth. The common practice in the east for its control is to spray the tree just after the petals fall and while the young apples are still standing erect, with a mixture of arsenate of lead, about four pounds to fifty galllons water, using the so-called mist of fine spray nozzle. The western method is to use zinc arsenite about one pound to fifty gallons water, using a high pressure power outfit and a course nozzle. The course spray, at high pressure, forces the poison directly into the open calyx. The results of various experiments have shown that one spraying, with the high pressure weaker solution and coarse nozzle gives a very considerably better result than the common eastern low-pressure mist spray does.

The West Virginia experiment station found 2 per cent. wormy apples where the high pressure was used, and 4 per cent. with the low pressure, and 30 per cent. wormy on the check plot. However, the high pressure was given only one spray while the low pressure had two. Hence, the saving in time and increased efficiency would warrant the trying of this experiment, under New England conditions.

In regard to spraying machinery, various changes have taken place in the last two or three years. For orchards of 1000 trees or more, power sprayers are much more efficient and more economcal than any other kind. A good power sprayer should hold not less than 200 gallons of mixture. The pump should maintain a constant pressure of 300 pounds to the square inch if necessary.—N. E. Homestead.

Mail it and get a free set of Catesbys' suit or overcoat patterns, and be convinced that it is possible to buy a better suit in London, England, for $13,25 than could be bought in Canada for $25.00.

You've heard that clothing is much cheaper and better in England—you know that English frbrics are the finest in the world.

Think, then, of the advantage of securing a suit made of the best English woolens, cut in the latest Canadian, New York or London style (whichever you prefer), and tailored to your individual measure, delivered to your door, all duty and carriage charges prepaid, for about half what you would have to pay if you bought it in Canada.

Isn't it worth while, then, to get your patterns and see what there is in this offer? You can't lose anything by it, but you may save a whole lot.

All you need to do is to fill in the coupon and mail it to our Toronto office. By return we'll send our latest Style Book, 72 pattern pieces of fine English suitings, a letter explaining our system of doing business, and a self-measurement chart that is so simple you can't go wrong in taking your own measure.

We will also send you testimonials from Canadians who at first were as sceptical as you may be, but who are now satisfied and regular patrons.

Write now. If you don't want to cut this paper, send a postcard or letter. We'll mail book and patterns anyway. But to get them you must mention the Maritime Farmer.

Had Salt Rheum.

Could Scarcely Do Work.

Skin diseases are invariably due to bad or impoverished blood, and while not usually attended with fatal results are nevertheless very distressing to the average person.

Among the most prevalent are: Salt Rheum, Eczema, Tetter, Rash, Boils, Pimples, and Itching Skin Eruptions.

Burdock Blood Bitters drives out all the humor from the blood, and makes it pure and rich.

Mrs. Ellwood Nesbitt, Apsley, Ont., writes:—"I had Salt Rheum so bad I could scarcely do my work. I took two treatments of doctor's medicine, but they did me no good. A friend told me his wife had had Salt Rheum, and that Burdock Blood Bitters had cured her, so I got a bottle, and before I had it all taken my hand was better."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Heaves

AND HOW TO CURE

—A Standard treatment with years of success back of it to guarantee results is

"Ruthlands"

(Contiued from page 567)

tised with disk harrow, with oxen because of their extra suitability for such work. About the first part of June a cover crop of vetches or clover is sown, and this plowed under in the fall. Fertilizing is done by using part barnyard manure, and part Slag, Potash, and Nitrate Soda. Pruning is practiced in all times of the year, except in frosty weather.

A nursery of 85,000 young trees is one of the industries of this farm, where clean stock can be had, guaranteed free from the insect pests of imported stock

A Pair of Oxen on "Ruthlands" Farm, weighing 4,000— A Ton each

Four, and sometimes five sprays of Lime-sulphur is used on the orchard. Two power sprayer are used for this, with a capacity of 300 and 500 gallons respectively. Each sprayer is supplied with a 2½ h. p. gasoline engine, for spray force. With this outfit considerable can be accomplished in a day.

While the young trees are growing, root crops are cultivated between the rows, such as potatoes, turnips, mangels and corn. Twelve hundred bushels of pottoes are grown each year, eight thousand bushels of turnips, fifteen hundred bushels of mangels, and one hundred and fifty tons of corn. These, with from 175 to 200 tons of hay is used on this farm each year.

The farm is run by a foreman, with an average, in summer, of from 20 to 25 hands, in winter this number is reduced to five hands.

A silo, 16 feet in diameter, and 34 ft. high, supplies considerable food for the cattle. The corn is hauled from the fields and cut up by a 15 h. p. gasoline engine, and blown through a pipe into the silo. Towards spring, when the vegetables are used up, the silo is opened, and it is wondeful with what relish the cattle enjoy it.—R. E. Caldwell, Annapolis Co., N. S.

The Compost Heap.

(Continued from page 571)

balancer, and the manure thus made to go farther.

The uselessness of commercial fertilizers on light, porous soil, is well known. On the other hand, the value of barnyard manure lies in retaining the moisture on the light soil, and the clay soil, on the other hand, is made more porous, and also provides a breeding and feeding ground for valuable bacteria.

If farmers have, of necessity, to purchase commercial fertilizers, they cannot be too careful in assuring themselves that they are securing a high-grade article, there are so many practically worthless "slags" on the market that farmers should protect themselves as much as possible by buying from reliable dealers.

Where the plowing under of clover, and other green crops are practised as a means of supplying the soil with valuable humus and nitrogen, with the addition of barnyard manure and the com post, very little, or no fertilizers will be necessary.—R. E. Caldwell, Annapolis Co., N. S.

Increase Your Dairy Profits

by giving your dairy herd the most comfortable quarters that can be built. Be your own dairy inspector and insure the absolute purity of your dairy products by building your stable and spring house of a material that insures sanitary conditions, and which, at the same time, is economical.

Build with Concrete

It is the most economical material for every kind of farm building, for it requires no repairs, never wears out and never needs painting. Dairy stables of concrete are clean and sanitary. They keep the herd warm and comfortable in winter, and tend to increase both the quantity and quality of the milk.

Whether you build a stable, silo, spring house or other farm building, concrete is the cheapest material to use.

"What the Farmer Can Do with Concrete" is the title of a beautifully illustrated free book that tells all about concrete farm buildings and how to build them to save money.

The Victoria County Seed Fair.

The Victoria County Seed Growers' Association held their Annual Seed Fair in Dionie's Sample Rooms, at Perth, N. B., on Thursday, March 26, 1914.

A fine day and good roads brought out a larger number than usual. Interest in the Seed Fair seems to be growing, judging by the larger number of exhibits. Mr. S. J. Moore, Gov. Seed Inspector, did the judging in a very satisfactory manner and pronounced the grain of excellent quality.

A number of the public spirited business men of Perth and Andover, kindly offered special prizes, which added much to the interest of the Seed Fair.

Following is a list of the prize winners:

Wheat, Red Fife—1, D. Innis; 2, J. W. Jamer; 3, Archie Smith.

Wheat, White Fife—1, D. Innis; 2, Archie Smith; 3, W. S. Phillip.

Wheat, White Russian—1, B. Bell 2, Alex. Phillip; 3, Archie Smith.

Oats, Banner—1, J. W. Stevenson; 2, J. R. Turner; 3, D. Innes; 4, Robert Henderson.

Oats, Russian—1, F. E. Henderson; 2 Robt. Henderson; 3, W. S. Phillip; 4, Alex Phillip.

Oats, Any Variety White— 1, Thos. Stevenson; 2, D. Innes; 3, J. W.

With good health at your back you can do anything.

If you are troubled with Headaches, Dyspepsia, Biliousness and kindred sickness you can't expect to accomplish much.

Dr. WILSON'S

Value of Skunks to Agriculture.

The skunk is an animal of great economic importance. Its food consists very largely of insects, mainly of those species which are very destructive to garden and forage crops. Field observations and laboratory examinations demonstrate that they destroy immense numbers of white grubs, grasshoppers, crickets, cutworms, hornets, wasps and other noxious forms. The alarming increase of the white grub in some localities is largely due to the extermination of this valuable animal.

Some of the most destructive insects in agriculture are such as do their work below ground and out of reach of any method that the farmer can apply, and it is against many of these that the skunk is an inveterate enemy. Notwithstanding all of this there is probably not an animal that is as ruthlessly slaughtered as is this one, whereas it is equally entitled to protection with, if not more so than some of our birds which enjoy this privilege—By U. S. Department of Agriculture.

"Yes sir; you will get more for your money in service and satisfaction, by using

Brandram-Henderson's "English" Paint

than you can get with other paint:

Longer Protection, because B-H "English" is primarily an endurance paint and will successfully withstand the effects of weather longer than others;

Greater Economy, because you will not have to repaint nearly as soon as with other paints; and

Greater Satisfaction, because B-H Paints retain their beauty and weather resistance for years.

The Reason, for this is that all B-H "English" Paints that can be made on a white base contain

70% Brandram's B. B. Genuine White Lead
30% Pure White Zinc.

A combination that produces paints unexcelled in covering capacity, beauty, brilliancy and durability. This formula is positively guaranteed by the makers."

GRASS SEEDS—Timothy, 8c. to 11c. lb.; Com. Red Clover, 19c. to 24c. lb.; Mam. Red Clover, 20c. to 21c. lb.; Alsike, 17c. to 20c. lb.

HORSES—Drafters, $250.00 to $275.00; Roadsters, $200.00 to $250.00; Carriage, $175.00 to $200.00.

DRESSED MEATS—Beef (carcass) 8c. to 13c. lb.; Mutton, 8c. to 9½c. lb.; Veal, 8c. to 10c. lb.; Pork, 9c. to 12c. lb.

DAIRY PRODUCTS—Creamery Butter, 28c. lb.; Dairy Butter, 24c. lb.; Cheese, 15c. lb.

POULTRY AND POULTRY PRODUCTS—Eggs, 20c. doz.; Fowl, 15c. to 18c. lb.; Ducks, 18c. to 20c. lb.; Geese, 17c. to 20c. lb.; Turkeys, 22c. to 23c. lb.; Turkey Gobblers, 15c. to 17c. lb.

FRUIT—No. 1 Nonpareil apples, $5.00; Strawberries, 25c. box.

MISCELLANEOUS—Hay, $16.00 to $17.00 ton; Wool, 25c. to 27c. lb.; Beef Hides, 12c. to 13c. lb.; Calf Skins, 18c. to 20c. lb..; Sheep Skins, 75c. to $1.50 each.

VEGETABLES—Potatoes, $1.25 bag; Turnips, $1.50 bag; Parsnips, $2.00 bbl.; Cabbage, crate, $3.75; Tomatoes, $4.00 case; Cucumbers, $1.20 doz.

LIVE STOCK—Lambs, $4.50 to $5.00; Steers, butcher, good, 7c. lb.; Steers, butcher, common, 6c.; Hogs, 125 to 200 lbs., 9c.

Strawberries are becoming quite plentiful on this market. When they first made their appearance about a month ago they were selling wholesale at 40cents, two weeks ago they dropped to 30 cents, and to-day they are selling at 25 cents.

The butter market is weak, a further decline in creamery prints to 28 cents has taken place, and although the demand is good, the price continues to sag. Eggs are firm at 20 cents per dozen. The receipts of the new season's considerably, this week's quotations supply has lowered the price of cheese being 15 cents for wholes and 15½ for twins.

In the vegetable trade, turnips are up from $1.50 to $2.00. American cabbage, and cucumbers are being freey offered at $1.20 per dozen.

GETTING PROFITABLE ADVERTISING RETURNS.

Mr. M. U. Freeman, Kempt, N. S., writes the Maritime Farmer to discontinue his advertising as he has sold his bull advertised in our columns. Mr. Freeman ran a small ad. in the Farmer which cost him a few cents and disposed with his animals without trouble. His experience has been that of hundreds of other users of condensed advertising in the Maritime Farmer. Although this advertising only costs one cent a word it does the work well and our experience is that the Maritime Farmer advertisers can always over sell their stock many times.

The Maritime Farmer has received a letter from a well known poultry dealer this week, stating that his advertisement in this paper has resulted in the sale of far more settings of eggs than he can supply. We can add nothing to these testimonials except to say that if you have anything at all to sell it will be most profitable for you to use the Maritime Farmer columns.

The Prince Edward Island Banner Oat Club.

A meeting of the Prince Edward Island Oat Club was held in Summerside on Wednesday, May 13th to settle up its business for the year. After the minutes of the previous meeting had been passed, the President, Rev. J. J. MacDonald, of Kinkora, called upon the Seretary for the Financial Statement, which was accepted as read, and on the Inspector for his report. Professor Davison, Instructor in Field Husbandry, who did the inspection work for the Banner Oat Club, gave the amount of oats that had been passed by him. A large amount contained some barley and some black oats, while some was off colour and some contained too large a percentage of small kernels. All this was rejected. Less than 2,000 bags came up to the standard and were allowed to go on the market with the quarantee of the Banner Oat Club. Prof. Davison in concluding his report said that he wished to express his appreciation of the assistance that had been rendered him in his inspection work by Joseph Read & Co.

Several of the members had something to say in regard to the inspection, but Prof. Davison was upheld in his rejection of everything that was not strictly first class, and he was given a very hearty vote of thanks for his thorough work, after his report had been accepted. A vote of appreciation was also given Joseph Read & Co. for their co-operation with the Inspector in his work. This Company bought the product of the members of the Banner Oat Club just as it came from the mill, and the loss arising from the grading, etc., etc., fell on them, but as the Inspector stated, they accepted without a complaint his rejection of oats, and graded to the standard he required.

A resolution was also passed appreciating the assistance that had been given by the Commissioner of Agriculture, after which the meeting adjourned to the call of the Chair.

This club is worthy of more than passing notice. It was organized in the autumn of 1912 for the purpose of encouraging the production of Banner Oats. Twenty competitors in the Fields of Standing Grain Competitions, who had entered Banner Oats, and who had been given the full score for Freedom from other Varieties and other Kinds of Grain, agreed to pool their oats and sell it together. It was to be graded to a certain standard and marketed at a certain price. It gave the best of satisfaction last year, but the difficulty of grading it was experienced by many members. Accordingly at the first meeting of the Club in the autumn of 1913 an offer was made by Jos. Read & Co., to buy the total output at 50 cents a bushel as it came from the mill, and was readily accepted. The Club, however, was to have control of the oats which was passed by its Inspector. The Department of Agriculture agreed to allow Professor Davison, Instructor in Field Husbandry, to do the Inspection. He found a lot of grain coming in with barley and black oats in it, and some of it contained such a large percentage of small oats that he felt it could not be properly graded for good seed. Accordingly, he rejected the greater part of what was offered and passed less than 2,000 bags. The Club feel that there is a great future ahead of it as many farmers have purchased seed with the intention of entering this year. This standard is high. The grain must be inspected in the fields and must score not less than 19½ points out of twenty for freedom from other varieties and other kinds of grain. It must again be inspected after it has been cleaned and graded ready for sale and must be of good color, giving germination test of not less than 90 per cent., contain not more than one kernel per pound of other varieties and other kinds of grain, be free from the seeds of noxious weeds and contain only a small amount of the seed of other weeds and not more than 20 per cent. of small oats. The Club feel that by adhering rigidly to this high standard they will put a quality of oats on the market that will ensure a ready sale at a good price.

The Celebrated WHITE CROSS Electric Vibrator

If you send this Maritime Farmer Advertisement to us.

Don't pay a high price for any Vibrator until you see our regular $20.00 Vibrator, of which we are selling 1,000 as an introductory offer at $10.00. Doctors, Nurses, and Medical Representatives are invited to see this wonderful instrument. We are agents for this and other medical instruments described in our books which are sent by mail 10c. each.

THERE WILL BE LESS PAIN

When the People are educated to know the full value of the Electric Vibrator. The X-Ray is a wonderful invention and has benefited thousands; The Finsen Light is a great discovery and is working wonders, but the Electrical Vibrator has done more than all other inventions combined in relieving pain and building up the system. This benefit will be multiplied many times with our machine, as it is now possible for Every Individual to Use One in His Own Home. Everyone who can read will be able to get full benefit of the machine with the aid of our Chart and Directions.

THE GUARANTEE

The Factory gives a written guarantee with each machine, guaranteeing the Vibrators for one year against any mechanical or electrical defects, and in case they should get out of order during that time they will repair them free of charge. For individual use, and with ordinary care, our Vibrators will last almost a lifetime.

Vibration is a great factor in many inventions of to-day. The vibration of the Violet Rays is about 100,000,000 per second. The vibration of the telephone receiver is about 6,000,000 per second. Wireless telegraphy is vibration. Vibration is one of the greatest stimulating agents ever discovered. and has been used where failures had been made in using other methods.

Blood circulates through the human body because of vibration. Without vibration man would cease to live; vibration in the human system, means vigor. The man or woman who has the most natural vibration is stronger and healthier. The keenest brain is the brain that vibrates the fastest. Tests have proved that the vibration of brains such as Webster's was from 10 to 50 times greater than the vibrations of the brains of the laborer...In every ray of light there is vibration; in every sound that comes to the ear there is vibration, and in every object we see there is vibration. Vibration is life, and he who has the most natural vibration is he who lives the longest.

The White Cross Electric Vibrator aids in supplying the life-giving vibration to those who do not have sufficient natural vibration.

WITH THIS INSTRUMENT YOU CAN TAKE

Body Massage
Facial Massage
Scalp Massage
Ear Massage
Eye Massage
Swedish Movement
Vibrating Chair Treatment
Electric Body Treatment
Combined Vibratory and Electric Treatments
Light Galvanic
Electric Baths in Your Own Tub
Electric Scalp Treatments
Electric Facial Treatments
Electric Light Examinations
Operating Electric Needle for Removing Moles, Warts, Superfluous Hair and other Facial Blemishes.

We furnish Charts and full Directions for taking Treatments, written by an Expert, with each machine.

BODY TREATMENT

The White Cross Electric Vibrator should be in every home. It is essential to health and happiness. There is nothing that will aid circulation and develop the muscles, put the bloom of health on the cheeks, produce a clear, beautiful and rosy complexion as vibration. It keeps you well and strong, which is so essential, especially to women, for they have not the privilege or opportunity a man has of obtaining sufficient exercise.

To be strong, beautiful and healthy use the White Cross Electric Vibrator.

Thousands of Electric vibrators have been sold in well-to-do families for medical purposes and have accomplished great results, while thousands for Lack of Money, have had to unnecessarily suffer from Rheumatism, Catarrh, Headaches, Neuralgia, Etc., Etc. Our complete line and low prices enable everybody to buy a vibrator, whether they have the electricity in the house or not.

A Vibrating Chair in every home is now possible with our machine. We make an attachment clamp to hold the vibrator and this clamp can be fastened to Any Chair by anyone in a minute. The Vibrating Chair is the finest thing out for General Stimulation and That Tired Feeling, as well as for treatment of the back, shoulder and neck.

Vibration and Electricity are the Most Natural Remedies known. Wth our patented Electric Vibrator you can concentrate two of the best curative powers known to the medical profession to one spot. For many cases it will not take but a few minutes before the patient is relieved.

AN ELECTRIC VIBRATING CHAIR

By means of a special clamp just brought out, the Lindstrom, Smith Company, Chicago, afford means of attaching their Vibrator to an ordinary wooden chair, thus transforming it into a vibrating chair. The clamp is fastened to the back of the chair with a thumb screw, and a little auxiliary clamp device surrounds the body of the Vibrator and holds it in the position shown. Sitting in the so equipped chair and leaning backwards imparts a general stimulation to the body.—Reprinted from the "Electrical Record."

WHAT PROMINENT PHYSICIANS SAY ABOUT VIBRATORY MASSAGE

Electro-vibratory massage causes absorption by contracting and dilating the capillaries and equalizing the circulation—Kellogg.

Vibratory massage reduces inflammation, stimulates muscles, removes pain, relieves congestion, and relieves a congested area and starts a general circulation.—Butler, "Internal Medicine."

It is recognized by the medical profession at large that pressure and massage causes absorption.—Osler.

In chronic constipation vibratory massage produces stools in from three to five minutes when used over the ascending transverse colons.—Mathews.

By vibratory massage the number of pulse beats may be regulated, the effect may be permanent after several treatments the rhythm of the heart may be influenced; there is increase of diuresis and diminution of Dyspnoea.—Journal Amer. Med. Assn.

Electro-vibratory massage produces at once the warm, prickling, burning, sensation, and the reaction is always pleasant and agreeable.—Herdman.

Take care of your skin. Massage is a wonderful help.—Prof. Hindhede.

Vibration or mechanical massage, as a placebo, is very good; as a stimulant in general I consider it good. The pneumatic vibration of the tympanic membrane Has Restored Good Hearing to Myself and many others.—"Massage in Trauma," by Fred Engelbrectson.

Carry Your Lantern in Your Pocket

Our Electric Flash Light Premium

Something Quite New

Given Away With Maritime Farmer Subscriptions

These lights are always ready for use. The only safe portable light for barns and outbuildings.

The Maritime Farmer one year and one of our 1½x6½ Tungsten barn lights, handsomely finished, for $1,30 (Light alone sells everywhere for $2.00).

The Maritime Farmer one year and one of our vest pocket lights complete for $1.25 (Light sells everywhere for $1.80).

We have other valuable flash light premiums which we will gladly furnish on application. We can supply them at about half-price, with the Maritime Farmer.

We have secured the agency for the Maritime Provinces for a leading house and can thus supply these premiums at these wonderfully low prices.

If interested write us.

The Maritime Farmer,

Sussex, :: New Brunswick

STOCK NOTES

J. Frank Roach, Sussex, has recently sold some very fine Ayrshire Heifers and Bulls to parties in Westmorland County.

Lea & Clark, Victoria, P. E. I., report:—We are running three heifers in the R. O. P. that are making splendid records. One three-year-old has finished with a record of 16,000 lbs. milk and 600 lbs. butter fat.

John Jackson, Sussex, purchased a setting of Silver Wyandotte eggs from The Magnolia Avenue Poultry Yards, Sussex, from which he was successful in getting a 100 per cent hatch.

George E. Fisher, of Chatham, N. B., has recently purchased from D. P. McArthur, of North Georgetown, Quebec, a very fine Ayrshire bull sired by the imported bull "Auchenbrain Starlight," one of the greatest producing strains of Ayrshire in Scotland. His dam "Eileen" holds the highest record in Canada for butter fat, 635 pounds in a year, and 13,825 pounds of milk in one year, being the third highest milk record. Mr. Fisher is to be congratulated on securing such a header for his herd.

We wish to call attention to the breeding of the Guernsey Bull advertised for sale in this issue, by W. H. Hodgson, Fredericton, N. B. His sire, Nonpareil of Glen View, combines the blood of "Hedwig's Nonpareil", which many of our readers will remember as the Grand Champion Guernsey male at all Maritime Fairs; Imp. Fairy of Seagrove, Imp. Jessica of Dentonia and the original Masher, on Guernsey. His dam, Glen View's Comely, combines the blood of Comely 3rd by Best Bower by Sheet Anchar, dam Imp. Belvidera and Imp. Comely.

This young bull is individually as good as his breeding and has all the coloring and quality a high class Guernsey should have and is offered for sale for the low price of $30.00.

On another page of this paper will be found the ad. of Logan Bros. They are offering a few exceptionally good Holstein bulls ready for service. One is 17 months old, from "Johanna Louise", whose dam made the highest score a few years ago that was ever made in the Maritime Winter Fair. She has several daughters with high official records. A sister of this bull made 18.3 lbs of butter in 7 days at 2 years and 8 days old, and his sire's dam and grand-dam have both made high official records the present year, going as high as 106 lbs. of milk in a day.

Another bull offered by them is a grandson of "Francie 3rd", the famous cow owned by D. C. Flatt & Son, Hamilton, Ontario. These bulls are large and exceptionally fine individuals and are offered at very reasonable prices.

They have a very fine yearling stallion "Homestead Marmion", that was a winner at the recent Horse Show, and would be a great bargain for a farmer wanting to start in the Clydesdale business.

A RECORD LAMB CROP—CAN YOU BEAT IT?

Jas. Tait, Jordon Mt., N. B., reports a 210 per cent lamb crop. From ten ewes he is rearing 21 lambs. Who can beat this record? Let us hear from sheep breeders who have been successful in getting big increases in their flocks.

YOU COULD MAKE DOZENS OF TASTY DISHES IF YOU HAD THIS

Maxwell

"HOME 65" FOOD CUTTER

A handle to turn—that's all. Cuts up meats, vegetables, foods of every kind quickly and without trouble.
Cap fits close, rendering the machine *perfectly watertight.* None of the food juices can escape, and you can open the cylinder after use and clean the machine quite easily. Four different cutting plates (or 3 plates and a nut grater) with every "Home 65."

A free "Food Chopper Cook Book" is given away with every "Home 65." Ask your Dealer.

Big Ben

They Say He's Worth 8 Million Dollars

Yes Sir! American farmers and business men, and their wives and children have said, "He's worth eight million dollars," for they've paid that much to 20,000 jewelers to get him to come to work in more than three and a quarter million homes (3,250,000).

Big Ben is only four years old, but he's made a bigger success for himself than any other clock alive.

You'll find him on all the big farms—helping to get the farm hands out on time—helping to get the bigger, better yields. You'll see him 'round the house telling the womenfolks the time all day so they can have the meals on time.

You'll see him in the parlor on the mantelpiece—7 inches tall, sturdy, handsome, triple nickel-plated, ticking quietly and *'tending to his knitting.*

In the bedrooms in the morning you'll hear him calling different people different ways—in "that" room, with one straight "hurry-up" five minute ring, and in "that other room," with ten short "reminder" calls lasting ten minutes. Tell him how you like your call—he'll accommodate you.

Call on Big Ben at your dealer's. His price is $3.00. Let him show you what he does. If your dealer hasn't Big Ben, a money order for $3.00 addressed to his makers—*Westclox, La Salle, Illinois*—will bring him to you anywhere in Canada duty charges prepaid.

FARMER ADS. BRING RESULTS.

Harrowing Growing Grain.

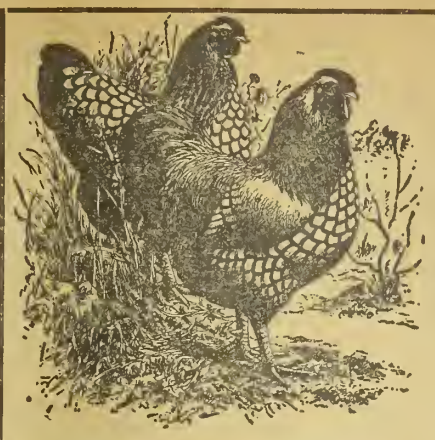
A much discussed question among farmers at this time of year is that of the use of the harrow on growing grain. That the practice is becoming more popular each year is shown by the fact that there are many more farmers who follow it, and fewer who condemn it than there were a few years ago.

In conversation with a group of farmers recently, the writer was impressed with the opinions of these men, in that all who had tried the harrow on young grain were loud in their praise of its merits as a destroyer of small annual weeds. No arguments were placed against it. One claimed that he had experimented in harrowing wheat, by leaving half the field untouched after harrowing the other half as soon as the grain was firmly rooted. The result was that he had raised the yield four bushels per acre on the harrowed portion of the field. A central Saskatchewan farmer claims that the portion of a wheat field which he harrowed after the wheat was up was the only part of the field that had ripened sufficiently to cut before fall frosts had arrived, although this latter is rather hard to account for. Good judgment must be used in the use of the harrow on growing grain. It is not a job to give a green hired man. Some of the directions to follow might be mentioned as follows: Before using the harrow, allow the wheat to become firmly rooted, unless thinning out is desired, as the small annual weeds root near the surface, and are easily torn out. Choose a bright, warm day for the job, and use a light harrow, going in the same direction as the field was sown.

The harrowing of grain is particularly to be recommended on old, weed infested soils. On new lands where loose sods cover the surface, such beneficial results would not be derived, and as fewer weeds are usually present on such lands this practice may not be considered. Disastrous results would also follow the use of the harrow on a crop growing on a wet field.—Nor' West Farmer.

Whitewash Used by C. P. R.

"Our specification for whitewashing surfaces exposed to the weather is as follows: Pour water over fresh burnt lime and stir it in liquid form until thoroughly slacked, dissolve and add separately to each half bushel of lime two pounds of coarse salt and two pounds sulphate of zinc (white vitriol). The quantity of water used should be sufficient to bring the mixture to the consistency of thick paint. Whitewash will adhere better if it is put on while it is still hot from slacking and should be prepared in as small lots as practicable. The addition of a small quantity of ultramarine blue will overcome any tendency for the wash to turn yellaw."—L. O. Genest, General Storekeeper, C. P. R.



"SILVER LACED WYANDOTTES"

Stock and Eggs for Hatching for Sale.

The Silver Laced Wyandottee is a breed combining quality and beauty, prolific layers, fine table fowl and rank high among breeders of poultry.

The Magnolia Poultry Yard's stock of Silver Laced Wyandottes were winners of first breeding pen at the Amherst Fair in 1913, among strong competition This is only one of the reasons why you should buy this stock. The work is personally supervised by the owner, and the stock this spring has never been in better condition.

Write for information and get your pick of the stock now.

Supplying the Farm Home With Fresh Meats

HOW to provide a suppy of fresh meat for summer consumption on the farm is a problem which is causing much concern in many farm homes. In the past salt or brine cured meat has been largely used, but this soon palls on the palate, and it is felt that some means of providing a regular supply of fresh meat must be found. In some of our rural comunities where the associative instinct has been developed this want has been satisfied through the establishment of Beef Rings, and the results obtained from these organizations have been so satisfactory that it is felt that the scheme is worthy of a trial in many other districts. This pamphlet has been prepared to aid parties desirous of organizing such rings.

Beef Rings are local organizations through which a number of farmers (usually 16 or 20) unite to provide fresh beef for their own tables. Each member supplies an animal in his turn, as determined by lot. One member is appointed butcher and under his direction an animal is slaughtered each week and the carcass is systematically divided among the members. The 20 member ring operating for twenty weeks, from May 1st or 15th, is usually the most satisfactory as it supplies meat through the harvest season, which is really the time when it is most needed.

For a 20 member ring the animals supplied should dress between 400 and 600 pounds, thus supplying each member with between 20 and 30 pounds of meat per week. If this quantity is too large for some families, two small families may take one share between them and supply only one animal. An exceptionally large household which could use a double quantity of meat could take two shares and supply two animals.

A fixed price per pound is usually set at the annual meeting. Each member is credited at that price with the dressed weight of the animal he supplies and charged at the same price for all meat he receives, settlement being usually made from the butcher's accounts at the close of each season. Some rings require that all animals supplied up to the end of the second week in June shall be stall fed. As it costs more to produce than the grass fed animals which will be suuplied during the rest of the season, a premum of two or three cents per pound over the regular price is paid and charged for this meat.

The animal to be slaughtered should be delivered to the butcher at least twelve hours before the time set for killing and should not be allowed o have any solid food for at least twenty-four hours prior to killing. Friday evening is the usual time selected for slaughtering. The carcass is allowed to cool over night and is cut up early Saturday morning. In the cutting up it is so divided that each member will receive a roast, a boiling piece and a steak. The members, or their representatives come to the butcher on Saturday morning and receive their allotted shares. Three or four farmers living close together may take turns in delivering the meat for the group and thus realize a considerable saving.

The financial outlay involved in the operation of a Beef Ring is small. For his services, in slaughtering the animal dividing the carcass and keeping account of the quantities of meat received and supplied, the butcher usually receives the hide and a set fee of one or two dollars per head. This fee is paid by the member supplying the animal at the time it is delivered for slaughter. In adition to this a small annual membership fee is charged, the funds from this source being invested in equipment, such as a derrick for raising the carcass, butcher knives, saws, meat hooks, etc. A frame shed in which the meat can be paced after it is cut up is often provided. The secretary requires a supply for stationery, the buutcher needs an account book, etc., these are all paid for from the annual membership fee.

Beef Rings have been successfully operated for several years in different parts of the province, and if reasonable care is exercised in selecting trustworthy members there is no reasson why similar success should not attend their inauguration in other districts. If you wish to organize such a ring in your locality talk the matter over with your neighbors, call a meeting of those interested, adopt a constituton and bylaws, elect your officers and get the scheme under way at once so that the members who may not have suitable animals on hand may have an opportunity to procure them before the season's operations begin.

The following constitution and bylaws are suggested as being suitable for the regulation of a Beef Ring.

Co-Operative Beef Rings

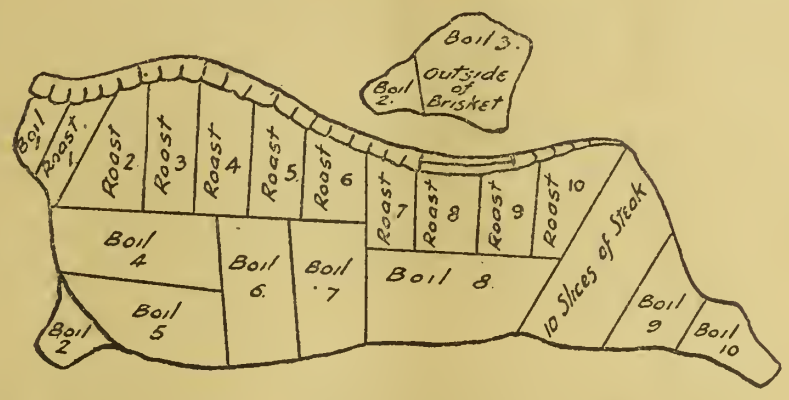

PLATE No. 1

Division of half carcass for twenty member ring.

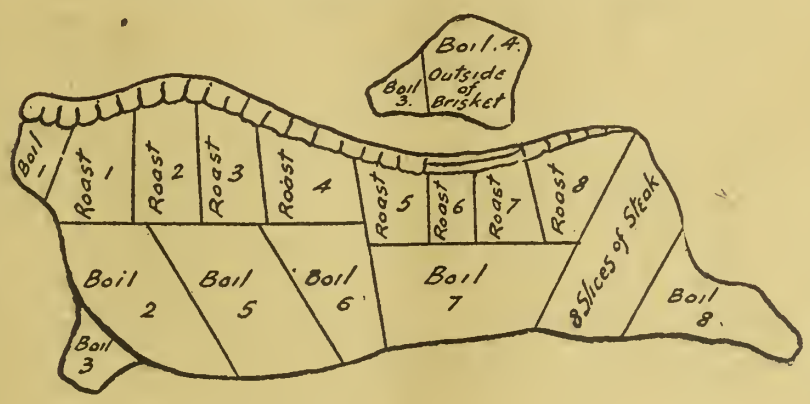

PLATE No. 2

Division of half carcass for sixteen member ring.

SUGGESTED CONSTITUTION FOR A BEEF RING

Name.

Article 1.—The name of this organization shall be The.....Co-operative Beef Ring.

Obect.

Article 2.—The object of the organization shall be to furnish the members with fresh beef at regular weekly intervals during the summer season.

Place.

Article 3.—The place of operation shall be in the vicinity of.....and all regular and special meetings shall be held at.....

Time.

Article 4.—The time over which this organization shall extend shall be indefinite (or state a number of years as may be desired).

Membership

rAticle 5.—Any person resident in the vicinity of.....may be admitted to membership in this Beef Ring upon payment of the annual membership fee of ($1.00 sugested) and subscribing to the constitution and bylaws.

Anual Meeting.

Article 6.—An annual meeting of this Beef Ring shall be held each year in the month of , at such time and place as may be determined by the officers.

Elections.

Article 7.—All elections shall be by secret ballot.

Officers.

Article 8.—The officers of the ring shall be a president, vice president and secretary-treasurer. These officers shall be elected annually by and from the members of the Ring at the annual meeting and, unless removed from office by a two-thirds vote of the members present at a duly called special meeting, they shall hold office for one year.

Duties of Officers.

Article 9.—The duties of the president, vice president nd secretary-treasurer shall be such as usually pertain to those offices.

Special Meeings.

Article 10.—The president may, when he deems necessary, and shall, upon receipt of a requisition in writing from five members, call a special meeting of the Ring.

Vacancies.

Article 11.—When a vacancy shall occur through any cause in any of the offices established by the constitution and bylaws of this Ring it shall be filled at the next regular or specal meeting of the Ring.

Audit.

Article 12.—The books of the ring shall be audited each year before the date of the annual meeting, and an auditor for the current year shall be elected at the annual meeting.

Amendments.

Article 13.—Amendments to this constitution may be made at any regular or special meeting by a two-thirds vote of the members present provided that

ten days' notice of the meeting, specifying the proposed change in the constitution has been given by announcement mailed to the members.

Bylaws.

Article 14.—Bylaws governing the operation of the Ring may be made from time to time in the manner prescribed for making amendments to the constitution.

Quorum.

Artice 15.—Seven members shall constitute a quorum and may transact any business which may properly come before the meeting.

SUGGESTED BYLAWS FOR A BEEF RING.

1. At the anual meeting a person qualified for the position shall be appointed butcher, and upon him the following duties shall devolve:

(a) He shall examine all animals suplied by members and may reject any animal which in his opinion does not conform with the regulations of the Ring, or is unsuited for the purpose, but such rejection shall be subject to an apeal to the officers of the Ring.

(b) He shall slaughter the animals supplied at the time appointed and shall weigh the carcass when dressed and credit the member supplying the animal with the weight.

(c) He shall divide the carcass among the members, according to the plan adopted, giving each member as nearly as he can judge an equal portion and keep strict account of the amount furnished each member.

(d) At the end of each season he shall furnish to the secretary-treasurer at least three weeks previos to the annual meeting, a statement in detail, showing the amount of meat received and delivered to each member.

2. For his services the butcher shall receive the hide of each animal slaughtered and the sum of dollars, which sum shall be paid to him by each member at the time when his animal is delivered o the butcher.

3. Each member shall furnish an animal for slaughter in his turn as determined by lot, or otherwise arranged, at the annual meeting.

4. Animals supplied for slaughter shal be such as will dress between 400 and 600 pounds and shall not be more than three years old in the case of females or four years old in the case of steers. Bulls shall not be accepted nor cows giving milk.

5. Each member shall deliver his animal at he place of slaughter at or before 9 a. m. on the day appointed for slaughter.

6. The member furnishing an animal shall be entitled to and receive the rough tallow, head, heart and liver of the same.

7 The season's operations shall com mence in the week in May and shall extend over weeks. Each week an animal shall be slaughtered on evening, and members shall come to the butcher for their meat before o'clock on the folowing morning.

8. All animals supplied up to the end of the second week in June shall be stall fed, and meat from these shall be valued, for purposes of settlement, at cents per pound. The meat from all other animals suppled shall be valued at cents per pound.

9. Each member shall leave with the butcher each week a bag plainly marked with the member's name; upon cutting up the carcass the butcher shall place each member's portion in his respective bag.

10. All Acounts with the Ring shall be settled at the annual meeting. Otherwise interest at per cent. per annum will be charged from that date until the date of payment.

11. No member shall have the privilege of withdrawing from the Ring without the consent of the majority of the members, and in o case will a member be allowed to withdraw until his acount with the Ring is settled in full.

DIVIDING THE CARCASS.

The carcass is first cut in two in the ordinary way by sawing lengthwise through the backbone. Each half is then cut up and divided among half of the members in the Ring. Plate No. 1 illustrates the method of dividing one-half of a carcass among ten members, e. g. one-half a twenty member Ring. Plate No. 2 shows how the division is made for a sixteen member Ring. On any given slaughter date, the member supplying the animal should receive share No. 1. The member whose turn it is to supply the next animal should get share No. 2, and so on through. In a twenty member ring shares No. 1 and No. 11 will be alike, one being cut from one-half of the carcass and the other being the same cuts, but from the other half of the carcass. In a sixteen member ring shares No. 1 and No 9 will likewise be alike.

The following is suggested as an equitable division for a twenty member ring. Of course the heaviness of fleshing will vary in different animals and the cuts will have to be varied accordingly, but by exercising care the butcher will soon be able to make a satisfactory division.

	Roast	Boil	
Members No. 1 and No. 11	1	5	1 slice of steak
Members No. 2 and No. 12	2	6	1 slice of steak
Members No. 3 and No. 13	3	7	1 slice of steak
Members No. 4 and No. 14	4	8	1 slice of steak
Members No. 5 and No. 15	5	9	1 slice of steak
Members No. 6 and No. 16	6	10	1 slice of steak
Members No. 7 and No. 17	7	1	1 slice of steak
Members No. 8 and No. 18	8	2	1 slice of steak
Members No. 9 and No. 19	9	3	1 slice of steak
Members No. 10 and No. 20	10	4	1 slice of steak

For a sixteen member ring the division could be made as follows:

	Roast	Boil	
Members No. 1 and No. 9	1	5	1 slice of steak
Members No. 2 and No. 10	2	6	1 slice of seak
Members No. 3 and No. 11	3	7	1 slice of steak
Members No. 4 and No. 12	4	8	1 slice of steak
Members No. 5 and No. 13	5	1	1 slice of steak
Members No. 6 and No. 14	6	2	1 slice of steak
Members No. 7 and No. 15	7	3	1 slice of steak
Members No. 8 and No.16	8	4	1 slice of steak

Bulletin of the Department of Agriculture, Regina, Saskatchewan.

Australian Method of Handling Wool

A Wonderful System Which Leads to High Wool Prices

An educational propaganda is now being conducted among the wool-growers of the State of Utah. President J. E. Cosgriff, of tthe Continental National Bank of Salt Lake City, has been instrumental in bringing from Australia the well-known wool-expert, W. F. Risch, formerly employed by the Dominion government of Canada, but later appointed as wool expert for Australia, extracts of which we publish for the benefit of our readers:

Shearing by Contract.

Nearly all of the shearing in Australia is done by shearing contractors who clip for so much per head. This contract system has developed scores of organizations of expert shearing crews and has reduced the shearing to an exact science.

The Australian flockmaster works for a clean, high grade clip of wool from the moment he begins to prepare for the shearing. His drive to the central shearing shed is made in easy stages, so as not to overheat the flock. This brings his sheep to the shearing shed with cleaner wool than would be possible if he drove hurriedly, thereby forcing excessive yolk up into the wool, where it catches and holds the dirt and dust stirred by the moving sheep. Upon arrival at the shearing shed the sheep are run into what is known as the "sweating" pens, where they are held over night under conditions that starts the yolk up into the fleece in just he right quantity.

Shearing.

The shearing pens are splendidly built and are mostly in the form of a T. The sheep of but one flockmaser are handled in the establishment at any one time. The flock is driven from the mustering pens to the sweating pens, and then to the feeding pens, where they are segregated—the ewes, rams, hoggets and wethers going into separate pens.

From these pens they go to the catching pens. These are pens arranged down he sides of the center of the building, and before each pen stands the man who does the shearing. The sheep are put into individual catching pens to obviate the custom practised by so many shearers in crews not properly organized of rushing about among the sheep to try and secure the easiest sheep to shear. This excites the sheep and keeps the shearing place in a constant turmoil. Under the Australian system of catching pens, each shearer knows exactly what sheep he is to clip, and he proceeds with his work accordingly.

The moment a sheep is shorn he is rushed through a chute that leads down under the shearing shed floor and thence into counting pens, where he is branded and counted and sent on his way to the rest of the flock.

Meanwhile, some very interesting things have been happening back in the main room. The shearer first clips the belly wool. The instant it falls to the floor—and that floor is as clean as a library table top—it is quickly but carefully gathered up and thrown into a basket provided for belly wool. The same process is performed with the hocks. These are inferior classes of wool and are kept separate.

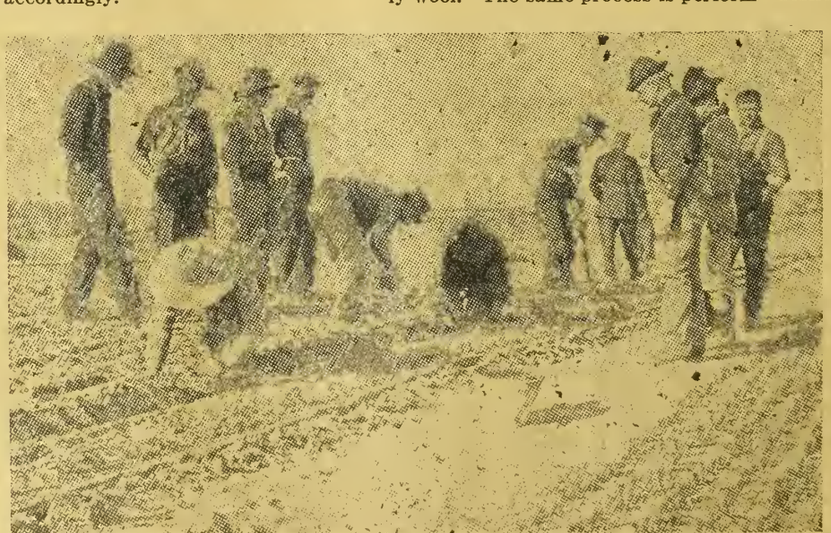
Then comes the main fleece, and it comes off in one piece. As it drops to the floor a boy who is expert in handling fleeces picks it up in such a way that it is not broken or greatly disturbed and spreads it on one of the rolling tables. The instant the shearing of the sheep has been completed, and the sheep sent down under the building, a boy sweeps up the space in which the shearer has worked and the latter is ready for another.

From the shearer the wool is taken direct to men known as skirters and rollers. Here the fleeces are spread out and skirted—or, in other words, trimmed of these portions which are desirable of retention with the entire fleece. Each portion trimmed off goes into a certain basket and is kept separate.

After the fleeces have been rolled and skirted they go to the wool classer's table. This man is one of the most importtant employees of a shearing organization. Under his eye is classed all the wool that goes through the shearing station. He is lightning quick in his judgment. Not only must he class all the main fleeces, but he supervises the classification of the inferior portions of the fleeces.

And right here it might be well to explain the distinction, as understood in Australia, between the classing and the grading of wool.

Grading is the placing of wool fleeces into different grades, according to their indication of breed and quality, while classing is the placing of skirted fleeces into different classes according to their length, quality, soundness, condition and tint.



Scene in Ontario Government Forest Nursery at St. Williams, Norfolk County, Showing Pine Seedlings Being Transplanted Into Nursery Rows From Seed Beds.

From the classer's table the fleeces go into different bins. The classer's table is always clean, as he works with tremendous rapidity and must make no mistatkes.

The men who assist him by classing the poorer parts of the fleeces all deposit their work in baskets from which they are later taken to be pressed by the baler. This is an ingenious machine that bales the wool in a wonderfully rapidd and precise manner. Then the bales are branded and sent through to the shipping platform outside the shearing station. The art of classing wool and supervising its baling and pressing calls for keen judgment. The moment the last of one flockmaster's sheep is shorn word is sent to the superintendent of the shearing station, and the work begins at once of clearing away every vestige of the clip just finished. When all of the shearing operations have been completed on a flock of sheep, the shearing station is as clean as a ballroom floor from one end to the other.

Those portions of each fleece which are apt to carry burrs and other foreign matter which adheres to wool, are picked clean by hand.

Great Care Taken

The method of handling the fleeces so that they are not broken is pretty nearly perfection. In the pressing and baling, the fleeces are so laid that they retain their form and as each bale comes out to the shipping department it is marked as to quality and grade, and with the owner's name.

From the shipping platform the owner carts away his wool to a railroad depot, and makes whatever other disposition of it that best suits his purpose or convenience for the time being. The only hands through which his wool will pass, however, before reaching he manufacturer, is that of the wool broker. There is no expensive, profit-making middleman in the Australian system. The wool brokers sell on a commission and the wool broking establishments are wonderful institutions in Australia and New Zealand. They have perfected a system for the expeditious handling of the wool that accomplishes the work of getting the wool from the grower to the manufacturer in a minimum period and at a minimum expense.

The secret of the success of the system lies almost wholly, of course, in he proper preparation of the wool for market, at its source. You see, the work of separating the wool into its different classes has already been done and the manufacturer, by inspecting samples of each class knows exactly what he is buying. The main porions of the fleeces, or in other words the best of each fleece, bring the price such wool can always command when it is segregated. The first and second pieces, the necks, the belly wool, the hocks and other wool of a lower grade bring lower prices, of course, but the higher price of the best of the fleece predominates.

Or let me illustrate it his way—he bulk of the fleece of a sheep is high grade wool that should bring anywhere from 24 to 28 cents a pound. The poorer portions of the fleece bring from 16 to 18 cents. When wool is properly shorn and prepared for market, the high grade portions of each fleece are segregated, and the grower therefore, receives from 24 to 28 cts a pound for his wool. This is the case in Australia, remember, and not in your western states here.

Intermountain sheepmen, on the contrary, receive the lower price of from 16 to 18 cents a pound for their wool, because their fleeces are poorly clipped to begin with; they are neither skirted, classed or picked; they are thrown promiscuously into bags and tramped by men in heavy boots, thereby breaking the fleeces and permanently injuring them so far as their market value is concerned, and finally, because the buyers have no means of knowing how much high grade wool is mixed with the lower grades of dirty wool. These buyers average the good with the bad, they hammer the price for the whole clip down to about the level the poorer portions of the clip should bring, alone, were they properly prepared.

The difference is so evident, and the superiority of the Australian system seems so obvious, that I hesitate to draw further comparisons.

Scene in Norfolk County, Ont., showing how the sand land, which formerly grew fine timber has proved useless for farming, and how the young pine trees recently set out are growing and holding the sand from blowing.

Weeds and Their Eradication.

Editor The Maritime Farmer:—

At this season of the year it behooves every farmer to guard against the introduction of weed seeds on his farm One of the greatest difficulties in the way of producing a more abundant supply of clean clover and grass seed, as well as seed grain, is the prevalence of weeds In order to produce the best quality of farm crops and seed grain, growers must be continually on the alert to keep the weeds on their farms in check and to prevent the introduction and spread of new varieties. In various ways weeds lower the yield, depreciate the quality and value of a crop and at the same time they add to the cost of production. They rob the soil of plant food and of moisture, and crowd out more useful plants, being hardier and more prolific. They increase the cost of every farm operation while they cause depreciation in the market value of the crops because of the presence of weeds in the hay, of weed seeds in the grain. The eradication of the worst weeds is costly in time, labor and wear of machinery. Most weeds are conspicious and all are unsighty on the farm. They depreciate the value of the land. Some of the weeds are harmful to stock and are injurious to the products of the farm. Weeds also attract noxious insects and harbor fungus diseases.

Grass, clover and other seeds, commercial feed stuffs, etc., often contain many weed seeds. New weeds are thus continually being introduced on the farm. They are spread from distric to district by means of various transportation facilities. The wind carries some weed seeds some long distances, not only in summer, but also over the snow in winter. Streams distribute them along their courses. Besides these different ways hey are also widely scattered by seed eating birds, and by the coats of cattle, sheep and other farm animals.

Weeds are classified according to the length of time they live. Thus, annuals are one-year plants; biennials, two-year plants; perennials, are many year plants, that is, they live on from year to year. In eradicating weeds it is most necessary to know under what head they come as the treatment best suited for the eradication of annuals is different to the best method of destroying biennials or perennials.

Annuals complete their growth in a year. As a rule, they have small fibrous roots and produce a large quantity of seed. Annuals may be eradicated from land, however badly infested it may be, though any method which will hasten the germination of the seed, and after the young plants have a start they may easily be destroyed.

Biennials require two seasons to complete their growth, the first being spent in collecting and storing up a supply of nourishment, which is used the second season to produce flowers and seeds. Biennias must be either plowed or cut down before the flower. Mowing at short intervals in the second year, so as to prevent the development of new seeds, will clear the land of this class of plants; but a single mowing will only induce them to send out later branches, which, if not cut, will mature many seeds.

Perennials are those plants which continue to grow for many years. They are propagated in many ways, but all produce seeds. The most troublesome perennials are those which extend long underground stems or rootstocks beneath the surface o f the ground. Among this class may be mentioned Canada thistle, Sow thistle, Bladder Campion, Field Bindweed and a few others.

Representatives of shallow rooted perennials are couch grass, yarrow and pasture sage. Some perennials extend slowly from the root, but produce large quantities of seed, examples of this class may be found in the Ox-eye Daisy, Dandelion and Goldenrod.

This class of weeds are by far the most troublesome of all. To insure their proper eradication they require rigorous treatment, and sometimes the cultivation of special crops. Imperfect treatment, such as shallow plowing often does more harm than good, by breaking up the roots and stimulating further growth.

The rootstocks of some perennial weeds are often very persistent. Some sections quickly taking after they are distributed by plowing or by cultivation. Most perennials will succumb, however to any system of cultivation that will prevent the growth of leaves. Plants take in most of their food through their leaves, perennials which have been established for many years have a supply of this food in their bulbs, and rhizomes. This is what makes this class of weeds so very hard to disestablish once they obtain a foothold on the soil. The first growth in spring is produced mainly by drawing on this supply, plants therefore are in their weakest condition immediately after they have completed their first growth in the spring. This, therefore, is the proper time to plow in order to most effectively clean the soil.

To keep farms free from weeds, few methods give such good results as a systematic, short rotation of crops with a seeding down to grass at short intervals. Weeds are most in evidence in districts where cereals are the chief crop. Thorough cultivation with a systematic rotation of crops, combined with the maintenance of as many sheep as can be kept to advantage, s a certain and profitable means of keeping weeds under control.

Lands foul with some kinds of weeds particularly annunals, may advantageously be seeded to grass for hay or pasture. The cltivation of hoed crops becomes too expensive a labor when the ground becomes pollutted with weeds. Grain crops may also be unprofitable because of weeds.

Seeding to grass and cutting the hay crop early will prevent most kinds of weeds from ripening only a small number of weeds.

Besides the classification of weeds as annuals, biennials and perennials, weeds are also divided into two general classes known as noxious and common weeds. The weeds known as noxious weeds aret ose which are of the most harmful nature. The limits of this class are not very clearly defined as a weed, which, although of common occurnce in one district, may be of such a harmful nature in another district as to warrant its being cassed in with other noxious weeds.

Among the most prevalent of noxious weeds may be mentioned the following:—

Curled Dock.—This is a perennial weed with a deep top-root. The stem is from two to three feet in height and terminates in a number of wandike racemes. The root leaves are six to twelve inches long and are oblong in shape with waved margins. This is a common weed in pastures and waste places. The seed resembles a miniature beechnut in shape. The seeds of cured dock are ery often found in Canadian-grown cover seed.

Field Bindweed.—This is a deep-rootd perennial with extensive, underrootstocks. The leaves are abou one inch long, heart shaped and on the end of very slender stalks. The flowers are pink in color and rather large be-

(Continued on page 634)

COST OF PRODUCTION OF FIELD CROPS.

In calculating net profits from the rotations, some interesting figures have been obtained regarding the cost of producing the various crops grown. In explanation of the rather high cost in some cases it may be explained that in 1913 some of the fields did not yield up to the average production for previous years. Corn and turnips were the chief sufferers.

Cost of Production of Field Crops, Nappan, N. S., 1913.

Crop	Yield per acre		Cost to Produce		
			Per acre	Per ton.	Per bushel.
	Tons. Lb.	Bush. Lb.	$ cts.	$ cts.	cts.

MAKING MONEY ON THE FARM.

Making money on the farm is made possible more by farm management than any qualities of soil or location of land. It is true that the quality of the land and the advantage of good, all-year markets have their influence and contribute greatly to the profitable operation of farming. All persons engaged in similar occupations are not money makers. The faculty of money making or business management is strongly developed in one person, while in another it may be scarcely perceptible.

This feature of adaptability to occupation, or lack of it, is a most pronounced condition in western farm life today, because of the land ownership craze that has prompted persons of all classes of education and training to become land occupants, through the inducements of homesteading the cheap government lands, and the very rapid advance in farm land values over the western farming country. There is nothing now so desirable in the estimation of the man of average intelligence as to be the owner of land, the owner of a good farm.

Thousands of persons have in recent years become land owners and land operators, assumed the occupation and management of farms without ever having had any farm training or experience in the management of farms, and are not making the farm pay. While this is true, there are other persons who use the farm as a basis of trading and dealing operations, and by shrewd management in this line of work are making money. The farmer who can see a bargain in what others produce and avail himself of opportunities of buying and developing, has an opportunity independent of the usual producing advantages of farm stock breeding.

We often hear of the young farmer who goes around among his neighbors and buys up a bunch of calves during the autumn season and winters them through on his cheap feed, and in the spring has a fine lot of yearlings that have attained, at little expense, 200 pounds or more of growth, and sold at a big profit. This is one of the ways that some of the farm business sense of a dealer is used in making the farm pay off other people's production. The farmer who is always on the lookout for something to buy in the line of live stock at a bargain is in the line of his opportunity of making money on the farm.

THE IDEAL PERMANENT HOME.

A recent issue of Farm and Dairy says:—

"We quite frequently hear or read of country communities where some of the older settlers who have worked long and faithfully now wish to retire and enjoy the fruits of their labors. In nine cases out of ten they move to the adjoining town or city, handing over the old homestead either to a son or married daughter.

"While we like to see the young people staying on the farm, and we need them as a part of the community, we also need the older members of the families who have been standbys for many years. And does it not seem reasonable that the ideal place for the silver-haired people to spend their latter days should be in the country, which they have learned to love during the years that they have toiled in order to secure the cnmpetence that now ensures their comfort.

"We have all heard similar expressions to that made by a young man recently to the effect that he liked nothing better than to have a good chat with some of the old residents around his home and get their ideas and experiences on the problems which every young man has to confront. Thus we need the older folks in a community to act as an inspiration to the young life.

"Why not then, when the time comes for father and mother to retire from active work, plan to build a home for them on the farm—an ideal permanent home? It is quite possible to do this nowadays when we have the facilities for installing such conveniences as light, water, heat, the telephone and rural mail delivery. Then, too, the nearest neighbors of father and mother will be their own sons and daughters.

"In order to keep both young and old in the country, however, and have them contented, it is the duty of every one in a community to put their shoulder to the wheel and strive to make their community more nearly ideal. To do this we must use brains as well as hands in order to get best results. We should also strive to have everything around the farm as comfortable and neat as possible and cultivate refinement and progressiveness. If we have these conditions, need we look elsewhere for an ideal permanent home?"

THE EDUCATED FARMER.

There are some discussions as to the value of education to the farmer. The farmer with a high school education is believed by many to be better fitted for the successful management and operation of the farm than the man with less school training. The habit of study and investigation acquired by application in school and class work fits the farmer for carrying on his investigations and labors on the farm, and therefore aids in developing an inclination for scientific agriculture, which must prevail sooner or later.

The extension work of the agricultural college, with the farm demonstrator and the various helps that will be added to the opportunities of farm training through this means of education, will all be available to the farmer within a very short time. The trend of education is now toward getting a knowledge of the land and the growing of its crops. The educated farmer need have no fears of being handicapped through the influence of his superior school training, unless he has delayed too long in taking up the work of farming. The best farmers are those that took up the work in their young manhood or boyhood and have given careful attention to the acquiring of a knowledge of right principles and the enforcement of this in all their farm operations.

ARE YOU TAKING ADVANTAGE OF YOUR OPPORTUNITIES?

The time is coming when it will be a humiliating confession to acknowledge that the farm is poor. Science is showing us how to build up our farms and society is demanding that we produce more at less expense. If we fail to meet our opportunities as producers we will be forced to give up the farm to those who know how.

Agricultural Colleges and Schools, Farmers' Institutes and other sources for Agricultural education is at your very doors. Are you making the best use of them?

EFFICIENT FARM MANAGEMENT.

No system of farm management is satisfactory that does not provide for the future as well as the present. A crop this year and a failure next year is not economical unless the manager expects to leave the farm before the next crop is planted. It should be the desire of the manager to conserve fertility constituents and vegetable matter in such a way that the income will increase as the years pass, rather than diminish. A regular but an increasing income is better than soil deterioration, even though the first year's crop be large.

Every rotation should be planted so that one or more legumes will occupy the land one or more times during four years. The legume will enrich the soil in nitrogen and make it produce a larger crop of non-legumes such as roots, oats, wheat and grass.

Not all the surplus income from the farm should be returned to it in buildings, fences, wells, improved machinery, etc. The home should have its share of improvements, which may be termed an investment. These are an investment, because they bring in dividends in human happiness as a result of comfortable living.

Little is gained by selecting large, stocky trees instead of small, well-developed trees for transplanting. Nurserymen know that small or medium-sized trees are better than large, over-grown trees, but as so many customers demand the large, they must be catalogued and kept on hand. Smaller trees live better, grow faster and make a more symmetrical tree. This rule holds true with both shade and fruit trees.

Another Prosperous Young Farmer, or How a Young Man Became Independent.

Mr. C. W. Daniels is a very wide-awake, prosperous young farmer, and if the story of his life were written, it would surpass many a novel hero tale.

There are experts in every walk of life, and on the other hand, there are those who, through lack of industry, application and thrift, often make a sad failure of it.

In the lure of the "West" the young man sees the "green field afar off" which often looks blue when he gets there, overlooking the more remunerative attractions at home; the possibilities and opportunities lying at his very feet, where he could start a bank account, while enjoying the advantages of an intelligent community to mingle with, all the comforts, and convenience of home life; a nearby market offering good prices for all he can produce; and avoiding all the discomforts, and privations which invariably follow a life in the West.

These advantages are certainly worthy of grave consideration by the young man beginning life—for one has only one life to live, and it is one's duty and privilege to make the most of it.

Such was the conclusion Mr. Daniels arrived at when he closed the bargain for 150 acres of what promised to be fairly good soil for mixed farming, in the vicinity of Middleton, Nova Scotia, in the centre of the fertile Annapolis Valley, for which he agreed to pay $1,400. Mr. Daniels only had a small part of this amount, and had he been like many a young man, he would have been very reluctant to take this step. But with full confidence in himself, ad the farming industry, he went forward. He felt by close attention and careful management, he could, in a few years, clear the farm of debt, and at the same time make profitable and permanent improvements.

Going to work with this end in view, he purchased five cows, and a few necessary farming implements. He soon found a ready market for his butter, as it proved to be of extra good quality, and he received ten cents per opund more for it than the curent market price. He has supplied a Halifax firm with it for several years, whose customers will use no other brand, and are willing to pay the extra price for it, which repays Mr. Daniels in encouragement, as well as being a valuable source of profit.

Mr. Daniels finds the Jersey-Durham cow the most profitable for butter yield; eight milking cows have averaged him, during the winter months, 80 pounds of butter per week. He derives the main source of profit off the farm, from butter and pork. It is always profitable to keep swine on the farm where cows are kept, to use up the skim milk and buttermilk which would otherwise go to waste. And Mr. Daniels has not failed to see the advantage of this, for he always uses his milk in this way.

From a litter of twelve pigs fed on skm milk and buttermilk with some vegetables, and a little corn meal a short time before marketing, averaged 150 pounds each, when four and one-half months old, which brought the handsome sum of $234.00. He finds this the most profitable way to handle pigs for profit; bringing them up quickly to about 150 pounds, which weight, comands the highest market price, and thus avoids the expense of keeping them a prolonged period of time, which when marketed, does not command as much per pound as the 150 pound pig. Mr. Daniels has another litter which he is bringing along the same way.

Of course, this milk may be fed to calves, with equally good, if not more profitable returns, and perhaps with less labour than is required for the raising of pork. Never was the market price for beef cattle so high as at the present time, a great opening and excelent returns are offered in this line for al who care to take advantage of it.

Some farmers in this vicinity already see the possibilities of this, and have gone into the raising of beef cattle quite extensively.

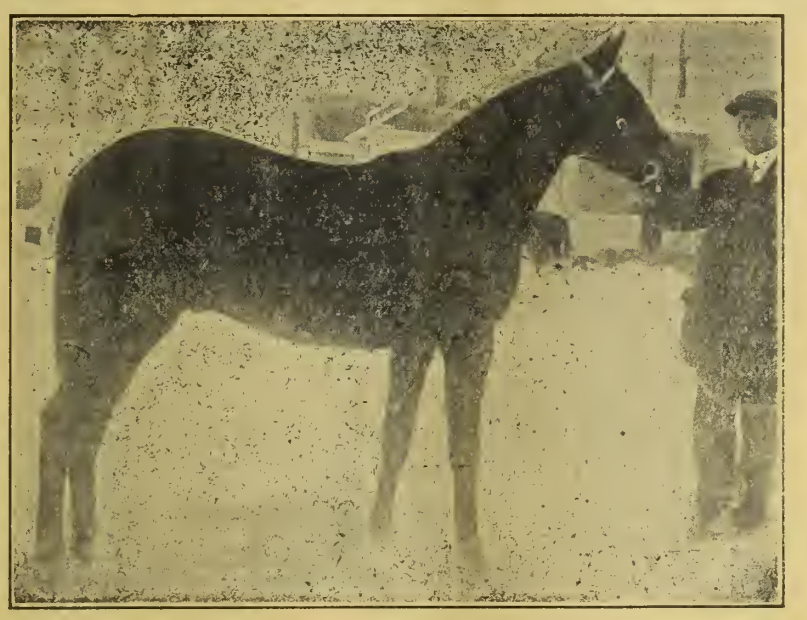
Mr. Daniels always aims at raising on the farm all the vegetables and grain required for his stock, and thus avoids the necessity of having to purchase, but very itttle imported feed. Hay, as well, is fed on the farm, thus avoiding the necessity of purchasing commercial fertilizers, which he claims forces everything out of the soil in a few years and leaves it in an impoverished condition, which is not so with the use of barnyard manure and compost.

Working along these lines, in thirteen years, he paid off the balance of debt on the farm, stocked it with up-to-date farming implements, a pair of team horses, twenty head of cattle, and built a modern, up-to-date barn, 50x80 ft. costing $2,000. All clear of debt, and now, hardly a month goes by without addding fifty dollars to his bank account.

There is about 100 acres of fruit trees on his farm, mostly apples and pears. The apples are shipped to England, which average him $2.50 per barrel clear ;but finds a local market for the pears, which brings a handsome return. But Mr. Daniels does not rely on the income from his fruit as the most profitable; he believes in mixed farming, and if one crop fails, the others make good. He finds if manure is spread on the snow, or in early spring, is inducive of good crops, in fact, really necessary. Thus spread, on fall ploughed ground, with five or six harrowings, thoroughly mixes it with the soil and puts it in good condition to be taken up by the growing crop.

Several of Mr. Daniels' neighboring farmers have taken courage by his success, and have gone into the butter industry, and are doing well.

These are the kind of young men Canada needs to-day. We often hear of pioneering in the Canadian West, but the oportunities which Eastern Canada offers should not be overlooked which often proves to be the more "all around" country in which to live.—Robert E. Caldwell.



ABBOTT KIP

A Prize Winner at the recent Maritime Horse Show. Abbott Kip is by Rudy Kip out of the Handsome Mare Grace Abbott. Bred and owned by A. E. Trites, Salisbury, N. B.

Rape for Pork Production.

High prices for all grain feeds and the failure of clover on many farms have caused a large number of feeders of hogs to look for forage crops, which with a light grain ration, will produce fairly rapid gains at a moderate cost. Investigations at the Ohio Experiment Station have shown rape to be one of the very best crops for this use if clover is not available.

Six pigs, weighing about 45 pounds each at the beginning of the test, were kept on slightly less than one-quarter of an acre of rape for eleven weeks. During this time the pigs received 825 pounds of a mixture of nine parts by weight, of ground corn to one part tankage, and gained 369 pounds in weight. Another plot, more fertile than this one, yielded an even more luxuriant growt of rape, and showed a larger carying capacity.

The rape from the better plot showed a replacement value of over $48 per acre when the grains produced and concentrates consumed by pigs, some receiving corn alone and some receiving corn and tankage on the rape, and by similar pigs fed corn and tankage in dry lot, were compared. In this calculation corn was valued at 56 cents per bushel, and tankage (60 per cent. crude protein) at $48 per ton.

If wet, rank rape is pastured, soreness of the skin, particularly about the **ears, is ocasionally developed. This** may be avoied to some extent by keeping pigs from the rape while very wet, or if it occurs may be relieved by the application of lard, oil, or other similar material.

Dwarf Essex rape is the variety best suited for forage. It may be sown broadcast or drilled solid at the rate of five to seven pounds of seed per acre or drilled in rows at the rate of three to four pounds of seed per acre, at any time from May 1 to July 15. Rape will do well in ordinary seasons in any part of the Maritime Provinces, if provided with a good seed bed, in fertile, well-drained soil.

On weedy land there is an advantage in drilling in rows far enough apart to permit cultivation; besides, there is likely to be less damage to the rape from tramping.

Under favorable conditions, rape should be ready for pasture in six to eight weeks from time of seeding. It will continue to grow until late fall. It may be pastured with a moderate number of pigs continuously or may be fed down rather cosely and then allowed to grow up again, whichever plan is most convenient.

Look the Farm in the Face.

It's a good thing at least once a year for every farmer to stand aside and look at his place as if it belonged to some other fellow, and pick out all the things this other fellow has left undone. Sticking too close to the work sometimes narrows a man's vision and makes him overlook important things. By going past a pile of rubbish four or five times a day you finally may come to think it belongs there, just as a man will sometimes plow around an old stump year after year as if it were established by divine mandate. There are precious few farmers who don't know that an old cobbled up gate loses them enough time and energy in a year to build half a dozen new ones, but still a lot of them never get started at the job of building new ones.

So it is to remember a lot of these little bothersome things that the whole family, from grandfather to little sister, ought to sail in for a week or two in the spring and clean up the place. There will be plenty to do. All of the chicken coops and sheds need cleaning up, as well as the barns. Paint and whitewash will work some marvelous changes in them. Usually there will be some brush to pile and burn. Where the wood pile was left last fall there will be a lot of chips and fragments scattered, and a little work will improve its appearance. Perhaps some few posts have rotted out so that the fence sags, and if so it is a good time to haul out some new ones and straighten up.

Soil Texture and Soil Moisture.

The term texture when applied to the soil refers to the size of the soil particles. Generally speaking there are three main classes of soil based on texture, sand, silt and clay, and all productive soils are, as a rule, composed of combinations of the above classes.

The amount of movement and the rate of movement of soil moisture are governed to quite an extent by texture. In sand we find that the action is rapid, but lasts only a short time. On the other hand, the movement in clay is very slow, but the water travels through a much greater distance. In soils of medium texture the action is intermediate throughout. In the average soil movement of water is confined to a few feet, but in some of the fine textured soils it may travel a considerable distance.—James D. Marshall.

Field Husbandry Experiments

The Experimental Farm at Ottawa and the Branch Farms and Stations make field husbandry investigations a very prominent part of their work. For the information of those who are interested the more important results of last season's work over the entire system have been summarized and issued in Bulletin No. 75 of the Expermental Farms. It takes up the question of rotation, cultivation, fertilizers, rates of seeding, cost of production, weed eradication and other points connected with field agriculture. The informa tion is presented by Farms and Stations and is, therefore, easily available for study. This bulletin is for free distribution at the Publications Branch of the Department of Agriculture at Ottawa.

Publications on Agriculture.

The Department of Agriculture at Ottawa has available for free distribution upwards of two hundred publications including repors, bulletins, and circulars. These have been issued, from time to time, by the several Branches and deal with almost every phase of agricultural science and pracice. A list of these has been printed in pamphlet form giving the title, author, and date of each. This ist is for free distribution and may be procured on application to the Publications Branch of the Department of Agriculture at Ottawa.

Formalin as Milk Preservative.

Tests with formalin as a preservative in composite milk and cream samples in an Ontario experiment show that about one-half the cubic centimeter of formalin will preserve a pint sample of milk or cream in good condiion for testing for a month.

HORTICULTURE.

New Fruit Commissioner.

Mr. D. Johnson, of Forest, Ont., whose appointment as Dominion Fruit Commissioner, a new position, has been announced recently, was born on a fruit farm at Forest, Ont., thirty-six years ago. He took charge of the orchards when only sixteen years of age, and for ten years served as foreman of the spraying, cultivation, picking and packing of the fruit. Ten years ago he became interested in the co-operative movement and took a leadng part in the organization of the Forest Fruit Growers' and Forwarding Association, one of the first and largest Associations established in Ontario, and was for six years its president and manager.

Four years ago Mr. Johnson withdrew from the Forest Association to devote all his time to Johnson Bros., fruit growers, shippers, and exporters, of which he was a half owner. This firm desired to cut out the wholesaler and sent its own salesman to the West who sold in car lots during the fall months. The firm's output last season from its own farm was six thousand seven hundred boxes of apples, wrapped and tiered, thirteen thousand eleven-quart baskets of peaches, eleven thousand baskets of plums, and ninety-five thousand seven hundred pounds of dried fruit. In 1912 their output was over four thousand barrels of apples.

In Mr. Johnson's orchards spraying is done with power sprayers. They make their own lime-sulphur, barrels and boxes. Their peaches and plums are sold largely by their own mail order system. All their apples are now packed in boxes. The lower grades of apples are worked into evaporated apple rings by their own plant in the orchard, and shipped in carloads to Europe and the West. The peelings and cores are dried and shipped to Germany. Arrangements are being made to convert the lower grades of tender fruit into jam.

Mr. Johnson was for some years on the executive board of the Ontario Fruit Growers' Association, and was for two years president. He was also president of the Co-operative Fruit Growers of Ontario for two years, and is now president of the Lambton Fruit and Vegetable Growers' Association, an organization composed of fifteen active co-operative fruit and vegetable associations in Lambton. Mr. Johnson was a delegate to the last Dominion Fruit Conference.

Thinning the Apple Orchard.

In the course of an address before the N. S. F. G. A. last winter, J. M. Robinson, Assistant Horticulturist at Kentville, N. S., said:—

"Thinning should always go hand in hand with spraying. The folowing table shows results obtained from twenty of the most careful sprayers in ten companies of the United Fruit Companies of Nova Scotia, giving the percent. of number of trees obtained. The percentage of poor fruit could have been greatly reduced by thinning, as can be seen by the figures taken from thined apples from very large trees at Kingsport. This is not necessarily a correct comparison but is given to show that the per cent. of number threes can be cut down by thinning:

	1912 pc. No. 3	1913 p.c. No. 3
Gravenstein, 20 best sprayers	36	35
Blenheim, 20 best sprayers.	15	28
King, 20 best sprayers	22	36
Ribston, 20 best sprayers ..	25	32
Gravenstein, thinned (1913) .		19
Blenheim, thinned (1913) ..		12
Ribston, thinned (1913) ...		16

"These figures show that although thorough spraying is done we often have fifteen per cent. or more of scabby and defective fruit on the trees. Often, too, a great man varieties set so full that it is impossible to get a high percentage of number one fruit and consequently the percentage of number threes is high, which generally gives poor markets. In each of these cases it will pay the grower well to thin.

"In paying visits to a number of orchards last season I was very much impressed by this fact. Blenheim and Ribston bore heavily generally and tough free from scab would not give good satisfaction in packing on account of the great number of small and poorly colored specimens. If from twenty to thirty per cent. of these apples had been removed a surprising difference would have resulted in the grade obtained.

"Again, the percentage of number three and cull grade is often nearly proportional to the percentage of scabby and defective fruit on the trees, and by thinning off sometimes fifteen to twenty per cent of this part of our crop the grade will be raised greatly and the yield not materially decreased. The expense of thinning moreover is not great and the work is easily done. In Kingsport last season trees bearing eight to ten barrels, were thinned in three-quarters to one hour each, or at a cost of approximately two cents a barrel, calculating labor at twenty cents an hour. The extra expense in grading unthinned fruit easily offsets this and the gain in grade is from thirty-five cents to fifty cents a barrel tree run.

"I consider thinning of great importance as it aids greatly in appearance, which is our weakest feature in fruit growing in the Annapolis Valley. Greater profits for money expended may also be had from thinning than from any other orchard operation."

Annapolis Valley Notes.

The season still continues cold, and is probably the latest on record, the leaf buds of apple trees just beginning to unfold by the twentieth of May. Readers will remember that in August of 1912 the Nova Scotia Government by special orders in Council passed a regulation prohibiting the importation of nursery stock from countries known to be infested with San Jose Scale unless such stock bore a certificate from Government officials that the nursery from which it came was free from this scale.

Under this regulation, no stock from Ontario was admitted into this province in 1913. But the Nova Scotia market for apple trees is very profitable for our Ontario friends, and consequently their nurseries received in homely parlance, "a lick and a promise," which was enough, however, to obtain the desired certificate from stock to be marketed in 1914.

When this stock began to come to Truro and Digby, the Nova Scotia ports of entry, this spring, it had to undergo a different kind of examination and was found to be pretty generally infected with living scale, and was, of course, rejected. The United Fruit Companies had taken large orders among their members, all of which had to be cancelled at the last moment. Because of this careful work, the Provincial Entomologist, Prof. W. H. Brittain, received a vote of thanks from the executive of the Nova Scotia Fruit Growers' Association that met at Kentville on May 5th, where the following resolution was passed:

Whereas, nursery stock, coming from points in the United States and Canada have been found to be infected with the San Jose Scale; and

Whereas, by prompt action and a great expense, this pest has been practically exterminated from Nova Scotia, after having been introduced on nursery stock from Ontario and the United States, and,

Whereas, the introdution of the San Jose Scale into Nova Scotia would seriously jeodardise the fruit growing industry of the province;

Therefore resolved, that the Executive of the Fruit Growers' Association, here assembled, petition the Nova Scotia Government to refuse entrance to all stock found bearing scale, whether from Ontario or from the United States.—M. K. Ells, in June Canadian Horticulturist.

Sprayed Fruit

The following letter has been going the round of the daily press:—

Sir,—Samples of imported apples of excellent quality and flavor were brought to me to-day in my professional capacity, with an inquiry concerning what was described as a peculiar green mildew near the stalk. It proved on analysis to be, not a mildew, but a deposit of copper sulphate (blue vitriol), with some admixture of lime, and was evidently left behind in spraying the fruit against parasites. The presence in apreciable quantity of rank poison, and this of a partially cumulative character, in fruit largely eaten by children is so grave a public danger that I urgently ask your assistance in calling attention to it. Apples having any sign of green deposit in the stalk cavity should not be eaten unless peeled. But surely some step should be taken to stop the importation of fruit thus dangerously contaminated.

M. S. Salamon B.Sc., F. C. S.
79, Mark Lane, E. C., March 21st, 191.4

The statements in Mr. Salamon's letter were of a nature to cause considerable alarm among fruit-eaters, and the "Standard" did good service in obtaining the opinion of the chief chemist of

the Royal Agricultural Society, Dr. J. Augustus Voelcker, who told a representative that twenty years of experiments on the Woburn farms and in the laboratories of the Royal Agricultural Society had proved, so far as proof was possible, that the spraying of potato plants with blue vitriol and lime never left any trace of copper on the potatoes themselves.

"It was used," he said, "to fight potato disease before it was found to be remarkably efficeient in killing down other diseases of plants. It is not perfect either as a preventive or as a cure, but it seems to be the most efficient we possess. Tomatoes, grapes, apples, pears, wheat, almost every highly specialized plant you can think of, may suffer from this set of troubles, but I have never heard of any intelligent person spraying ripe fruit with the mixture. Plants and fruit trees get their dose long before the fruit is formed. Potato tops that get it are very far from the underground tubers, and seed which is treated with it before being sown has not shown any signs of growing plants that contain any trace of copper in their fruit."

Dr. Voelcker mentioned that experiments have been conducted lately showing the results of various metalic sprays on soils. These are now nearly completed, and will then be officially communicated by the Royal Agricultural Society. Dr. Voelcker added that he knew nothing of poisonous effects of copper on the human body. The dean of one of the London medical schools explained that soluble copper salts taken in any quantitty acted as an emetic, and were refused by the stomach. In very small quantities there was some evidence that they might produce deleterious effects. He had never known a case of copper sickness due to the presence of mineral poison on the skins of fruit.

Potato Disease.

There has been issued by the Department of Agriculture at Ottawa a remarkably well executed folder, Farmers Circular No. 4, entitled "Potato diseases transmitted by the use of unsound tubers," showing in natural colors, representations of specimens of diseased potatoes. Diseases and other blemishes represented are potato canker, powdery scab, hollow potato, internal brown streak, little potato disease, dry rot, wet rot, common potato scab, and stem and rot. Special reference is made to potato canker and powdery scab, the latter of which occurs already in Canada and should be carefully avoided. The folder points out that, under the destructive Insect and Pest Act of Canada, any person using for seed potatoes infected by potato canker or powdery scab is liable to prosecution. Potato growers who suspect the presence of either of the latter diseases are requested to send specimens to the Dominion Botanist, Central Experimental Farm, Ottawa. This folder, prepared by Mr. H. T. Gussow, Dominion Botanist, will be sent free to those who apply for it to the Publications Branch of the Department of Agriculture at Ottawa.

How Often and When to Spray.

It is difficult for one who has not lived in Nova Scotia to advise Nova Scotia growers how often and when to spray. We shall, I believe, all agree on at least two of the applications, namely one just before the blossoms burst, beginning with the earliest varieties, and then going right on with the later, and the other just after the blossoms have nearly all fallen, say eighty to ninety per cent. of them off. Without these two in a wet, cold May or June, no one need hope to control apple scab. One of these is almost as important as the other.

There will be a difference of opinion as to the other sprayings necessary. I think you should carefully test the value of one earlier application. Try it on at least one-third of the orchard and continue it for at least four or five years, as one year's results are often quite inconclusive. When this application should be put on is a debatable question. If you have oyster shell scale, blister mite or much canker to combat it should be before the buds burst or just as they are ready to burst. If these things are not troublesome I should feel like suggesting that the spraying be done not before but as the buds are bursting, or just after they burst, so that the unfolding leaves may be covered with the spray mixture and protected against scab until the application just before the blossoms open can be given.

As for any later sprays one must be guided by the weather. I think it probable that it will pay to spray again about ten days after the codling moth spray. It seems to me that better results will be got by not waiting for two weeks as ordinarily recommended, be cause each week after the blossoms fall the danger of apple scab begins to grow rapidly less and the all important thing is to get the apples safely through June because there is seldom danger in July.

All are aware that two years ago the injury by apple scab was done chiefly in the latter part of August and September. This injury could have been largely prevented by an application of spray mixture the last week in August, suplemented perhaps by another about two weeks later.—Prof. L. Caesar, before the recent N. S. F. G. A.

No Danger in Killing Live Stock by Spraying.

There seems to be considerable anxiety over the probability of injury to live stock from the poisoned spray that falls on the grass in the orchard. In most cases, each animal would need to eat about a wagon load of grass at a meal to get enough poison to cause injury. With the exception of hogs, live stock should not be allowed to pasture in the orchard. This is not on account of probable injury to the live stock but to the trees. If the orchard is in sod the grass should be removed and allowed to remain on the ground as a mulch to prevent the loss of moisture. Hogs may be very useful in an orchard by way of keeping the soil loosened up and by destroying the insect-infested apples that fall to the ground.

There is sometimes danger in poisoning poultry in an orchard, not from the fowls eating the poisoned grass, but from eating large quantities of worms that have been poisoned by the spray. Beneficial birds are also frequently poisoned in this way. In commercial orchards where the spraying is done early in the season, the insects are killed while very small and therefore do not contain enough poison to cause injury. The chief danger comes from spryng trees badly infested with full-grown insects of the canker worm type.—C. D. Jarvis, Director of the extension service, Connecticut, U. S. A.

Destroy the Tent Caterpillar.

The Tent Caterpilar has hatched and is feeding on the leaves of the trees. The tent or nest is usually located in the crotch of a limb. A very common method of destroying these nests is by burning them with a kerosene torch or rags attached to a pole and soaked with oil. This injures the bark of the fruit trees and may even kill some of the limbs and in some instances bad fires have occurred when this method was used. A quicker, better and safer way of destroying these nests is by wiping the nests from the tree with the hand, either with or without a glove or mitten on, or by tying a bunch of rags or burlap on a pole and wiping the nests out with this and then crushing the nest with the foot or dipping it in kerosene. In the case of fruit trees that are sprayed with arsenate of lead or paris green, there will be no need of the handwork.—S. P. Hollister.

This Vast Collection of The World's Best Merchandise

can be placed before you, to serve you at your leisure—there is no long drive to town—no crowding—no jostling—no purchases hastily and unsatisfactorily made. Through a Scroggie Catalogue your purchasing is quietly and comfortably done; with the aid and advice of every member of your family, and the goods delivered to you the quickest possible way, by parcel post if the shipment weighs under eleven pounds.

DAIRYING.

Veal Calves Give Skimmilk a Value of $1.64 Per 100 Pounds.

For several years past there have from time to time appeared articles in the various agricultural newspapers of the country, upon the utilizing of skimmilk as a by-product of the dairy farm. The subject is, however, far from exhaustion. Until few months there are no calves to feed and the surplus must be rendered valuable by feeding it to poultry and pigs. This necessitated at least two classes of calves to be fed in the manner best adapted to each, to say nothing of those fed for rearing as heifers.

It was found that the young calves, that were to be turned off as veals at or before they were five weeks old, gave the greatest profit for the skimmilk they consumed. Careful account was kept with each calf. He was charged with the money paid for him or his value at birth when born on farm and for the butterfat consumed, as nearly as it could be estimated, by weighing the whole milk fed. It was found that the gain on the veal ran from 90 cents to $1.50 per 100 pounds of skimmilk consumed, but very rarely below one dollar.

Our former methods of feeding veals were entirely changed. We used to change from new to skimmilk during the second and third week, substituting cooked middlings, oil meal, and corn meal for the whole milk, changing to coarse, cracked, or whole corn as soon as the calf would eat them; and then turned off the calves as veals at from six to eight weeks of age. We found that by this method the growth would be checked when the whole milk was changed for skimmilk and that a week or more time would be lost in growth.

We now feed the young calf four pounds fresh whole milk twice per day. This whole milk fed is maintained until the calf is turned off as a good veal. When four to six days old the quantity of feed is gradually and steadily increased by adding skimmilk each day, until by the time it is three or more weeks old it is receivig from eight to ten pounds mixed milk twice per day. For a healthy, vigorous, large calf this amount is sometimes slightly increased. In this the feeder must use his eyes and brains, for some calves will not stand over fourteen pounds per day. Each calf should be watched and fed acording to his capacity. At the slightest indication of bowel disturbance or indigestion the feed must be cut down from a quarter to a half, as needed. If care is taken, there need be no difficuty in one case in a dozen and prepared dried blood will quickly check that. The eight pounds daily of new milk will keep the calves steadily growing. We have found our calves so raised were nearly or quite equal to those of our neighbors fed on whole milk or allowed to run with the cows for the same period. As soon as the calves will eat coarse, cracked, or whole corn they are alowed all they will eat, also all the hay they will consume.

As the calf season begins to close and it becomes difficult to get enough of them to consume the skim milk, the whole milk is not fed after the third week and corn is substituted for it as son as the calves will eat the corn. They are alowed all the corn they will eat until they are seven or eight weeks old. About a week before marketing the feeding of new milk is renewed, feeding one-half new and one-half skimmed milk.

The mik is always fed warm. The temperature is raised to about 100 degrees by the adition of hot water well stirred in. It is highy important that at all times the feeding be uniform, especially in amount. We weigh all milk fed to calves, giving a regular amount at each feed. Weighing is as rapid as measuring and more accurate. At all periods due allowance must be made for age, size, and digestive ability.

The moisture added in warming the milk will be acceptable to the calf. In case of bowel disturbance, indicated by general appearance, loosening of bowels, diminished apetite, etc., from one to three teaspoonfuls of dried blood, prepared and sold by the packing establishment for feeding to cattle, will generally stop the difficulty after two or three doses. The quantity of milk is cut down one-half, and when the difficulty is stopped the feed is gradually returned to full feed.

At thirty days the account of the calf will stand about as follows:

Credit	
Average selling price	$14.00
Debit	
Cost of calf at birth	2.00
9.6 lbs. fat in the 240 lbs whole milk feed @ 35c. per lb.	3.36
Corn	.50
Hay	.25
Total cost	$6.11
To balance	7.89
	$14.00

As there are 480 pounds skimmilk fed during 30 days and the net return is $7.89, the skimmilk is worth $1.64 per 100 pounds.

It will be noted that the butterfat in whole milk is charged to the calf, placing the new milk on basis of skimmilk.

A good cow furnishes milk for two calves, making the skimmilk profit from each cow per month $15.78.

We average for the season about six calves per cow, therefore the proceeds of skimmilk are $7.89x6 or $47.34 per cow, a pretty good start for the income of one cow in one year, to say nothing of the skimmilk fed to pigs and poultry during the balance of the year.

The securing of calves is the farmer's job; if he gets them, the cow and feeder can do the rest. Of course, these figures are approximate, as calves differ in capacity and feeders differ in care, judgment, etc.—C. L. Peck, in Hoard's Dairyman.

Suggestions on Milking the Dairy Heifer.

Let us have foresight in preparing our dairy heifers for their first milking period. Handle the udder and teats so as to develop the udder. Do this at least twice a week for six weeks before calving. The heifer will then be quiet and gentle, and will not be afraid when her udder is touched after she has calved. You will also find the udder developed so that it will almost resemble a cow's udder.

It is natural for the cow to stand while being milked; consequently the heifer knows nothing about kicking until hurt or frightened into it. It is a good plan to halter break every heifer when they are young; be careful not to hurt or frighten them. If by accident you should, and they kick do not punish them for it. Kindness and gentle handling is the only remedy. Let your reasoning for the cause be based upon the principle that she never kicked until she was injured, and the remedy will at once suggest itself.

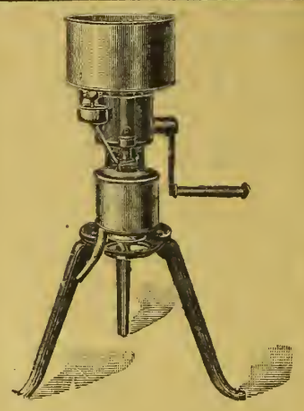
No cow was ever broken of kicking by striking with the stool or other weapon; this practice only puts the cow on her guard, and as you come near her with the stool she uses Nature's defence and kicks. Handle her gently; a sweet temper is to the dairy cow what sunshine is to trees and flowers. If her teats are sore, she is quite iable to kick or walk off, and you must have patience until they are healed. In my experience, I have never found a kicker in a yard where kindness was a characteristic of the family who handled the dairy; on the contrary, I have found plenty of them where loud words and general bad temper prevailed.

Give the cow some kind of food just before you comence to milk as the process of mastication will take her attention from the milker's operation, and she will not hold up the milk. The udder and flanks should be brushed or wiped with warm water in winter and

The New Champion Butter-Producer of the World

This is May Rilma, the great Guernsey cow owned by Chesterbrook Farm, Beruyn, Pennsylvania. In 365 days May Rilma prcduced 19,639.5 lbs. of milk containing 1,059.59 lbs. of butter fat. This is the greatest production in the world to-day, and was made by steady, persistent milking; in fact, May Rilma is making more butter in her thirteenth month than she did in her first.

"Melotte" CREAM SEPARATORS



The "Melotte" will increase your butter yield 25% besides improving the quality.

Saves time and labour, space and utensils.

Owing to its Suspended Bowl the "Melotte" is the simplest, most easy running and consequently the most durable cream separator made.

cold water in summer to remove the loose hair or fine particles of dust or filth as these are usually laden with undesirable germs, which would otherwise fall into the pail.

Heifers do not like unnecessary noise or delay, and show their dislike by diminished quantities of milk. Commence milking the heifer at the same hour night and morning, and milk her in the same order. The first streams of milk should go into a separate dish; they contain many objectionable bacteria. Do not wet the hands wih milk. A practice I would recommend is to rub a little vaseline on the hands. This keeps the teats in nice condition, and overcomes the desire to wet the hands. The miker should be clean, kind and sympathetic, and free from any contagious diseases. He should not set off at a distance, like a coward, but his left arm should be in close contact with the leg of the heifer, so that she cannot kick. If she makes the attempt he will only get a push instead of a blow.

The milking should be done quietly, and in the quickest possible time, and the heifer should be milked clean and dry; otherwise the heifer will be ruined as a milker, besides losing the richest and most valuable part of the milk. —Philip Fockler in Farm and Dairy.

Individual Fair Play.

In a herd of 12 cows the average yield last year was 3,780 pounds of milk and pounds of fat. The 10 best cows in the district averaged 6,293 pounds of milk and 221 pounds of fat, while the 10 poorest gave only 2,818 pounds of milk and 107 pounds of fat.

When it is seen that the difference in the average of these two groups of 10 cows is 3,475 pounds of milk, while between the best and poorest individual cow there was actually a difference of 6,195 pounds of milk, it is quite evident that figuring out just a cold, dead, machine-like "average" is quite unsuitable and unfair when it comes to dealing with a living, nervous, sensitive cow.

That difference of $61.95 between the earning power of two individual cows indicates the cow's natural rebellion against mere mechanical treatment. Being an animated and complex bundle of nerves and tissues she needs study of her particular likes and dislikes, then her best results will be cheerfully given. She is not simply one of a team. but an individual whose peculiarities are well worth studying to ensure development.

The average may be used in giving due justice to each cow only when all in the herd are equally good. Just as long as these remarkable differences exist between individual cows, there will also remain the need for a record of cost of feed and production of milk of each one separately. Then the herd can be built up on the definite system of each one contribuing a good measure of profit, otherwise the deficiencies of several poor cows add to the heavy burden shouldered by two or three star workers of the team that do make large profits. Dairy records give fair play to each cow and help in judging individual merit.—C. F. W.

Milk Per Acre.

If it may be assumed that the farm of the average factory patron is fairly well adapted to dairying, that the patron himself is inclined towards dairying, rather than, let us say, fruit growing, and that his cows are fairly good, then it will be of interest to note how the farm is made to respond to this dairy inclination.

There are frequently noticed yields as low as 250 pounds of milk per acre cultivated including pasture, but some good patrons obtain 750 and 800 pounds per acre. Even this is little enough, for there are plenty of authentic records of 1,100 and 2,100 pounds of milk per acre. It should not be extremely difficult to obtain more than this, even 2,500 or 3,000 pounds.

This later figure is a long, long way ahead of the yields already mentionedd of only 250 pounds which may be found on many a so-called dairy farm in Canada, and is indicative of the possibilities in reach of the factory patron who is really anxious to attain first rank.

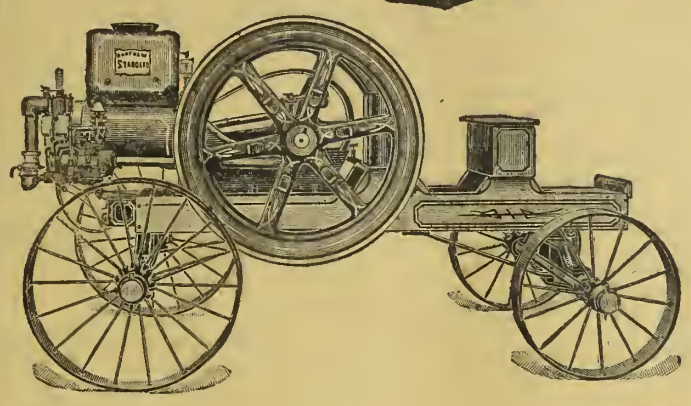
It is questionable if the average yield per acre is much more than 600 pounds of milk. If loyal, wholehearted support is given to the local factory and to our national industry of dairying, the farm of the dairy herd will be made far more productive. Great help will be derived by keeping individual records of each cow, because the old-established, complacent "average" cow has no intention whatever of assisting the average patron to get 3,000 pounds of milk from the average acre. The first necessary step is to know how for certain that each cow is a good producer, then one may aim with more hope at $30 or $40 per acre. —C. W. F.

Two cows that are kept in order to do the work of one would ordinarily do inevitably mean a loss.

Weed seed and small grain will never produce a profitable crop when run through the seeder. Look out for your seed before sowing.

The dairy cow deserves the very best water that can be had. Do not make her depend upon pools, running streams and sloughs for her drink.

Renfrew Standard Big Three

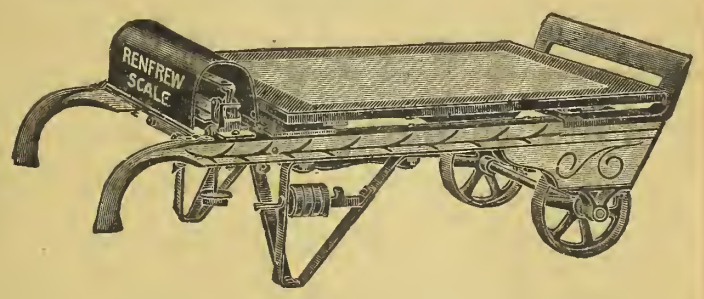


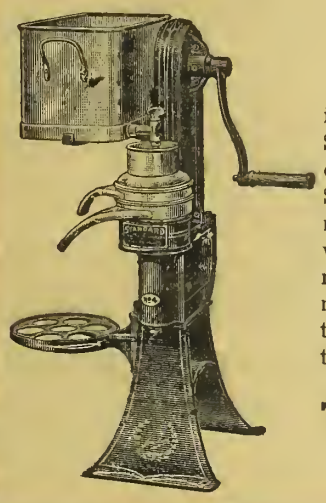
"Nothing Succeeds Like Success"

That old saying has proved true in the case of the Renfrew Standard gasoline engine. As soon as the Renfrew Standard proved itself a success, there seemed to be a multitude of people wanting to own "the engine that starts without cranking." Some times last year we were hard pressed to fill orders. This year the demand grows larger and larger. If you are about to buy an engine, you will be wise to get particulars about this remarkably successful engine. Booklet free. All styles and sizes from 2½ to 60 h. p. Also the "Little Renfrew," 1½ h. p.

The Only Way

to prove to you that you literally must have a Renfrew Handy Two Wheel Truck Scale is to show you how much money it will make for you and save for you. This we have done in our scale booklet, which also shows how handy and how durable the Renfrew Truck Scale is. Write for your copy.





Put One of These Money Makers

in your creamery and make each cow worth $15.00 more to you each year. The Standard cream separator skims down to .01 per cent. It gets all the butter fat but one-tenth of a pound in every 1000 pounds of milk skimmed. You cannot beat the Standard for close skimming. And it will give rich cream with either cold or warm milk. It turns easy. Automatically oils itself. Absolutely sanitary. Gives cream without a taint in hot weather. No other separator so fully meets all the requirements of the Canadian dairymen. The demand for the Standard separator is now more than double what it was three years ago, proving that Canadians know a good thing when they see it. Write for our new separator catalog. It's different and interesting.

Running water on the farm

A Fairbanks-Morse Pneumatic Water System like the one pictured here, can be quickly and easily installed on any farm.

It will furnish you with an abundance of running water for the bathroom, kitchen, laundry, stables, creamery, and for sprinkling the lawn and garden. At the same time it affords you ample protection from fire.

Can be inexpensively operated by hand, motor or small oil engine.

The "Handy" force pump which is a part of this system is easy to operate and will last for years. Tanks are made of boiler steel tested to a pressure of 125 pounds. Any size from 220 gallons up. Send for free booklet, "Fairbanks-Morse Water Systems."

We can supply you with farm engines from 1 h.p. up, sprayers, lighting systems, farm scales, hand and power tools, etc. Particulars on request. Address Dept. 44

LIVE STOCK.

Annual Meeting Pictou County Dairy Co., Ltd.

The second annual meeting of the Pictou County Dairy Co., Ltd. was held in Stellerton on Friday afternoon, April 19th. This company, although only incorporated in Aug. 22nd., 1913, and held their first general meeting about that time; but due to the provisions of the Nova Scotia companies and their articles of Associations, they have to hold their annual meeting in the spring of each year make it necessary for this meeting to be held.

The reports of the different offices, which showed the progress of the business to be in a very flourishing condition, were all favorably received, and adopted as read.

The election of directors resulted in William Craigie, Merigomish, being re-elected, and the new directors are Wm. McDonald, Lorne; George Milne, Woodburn, Auditor; B. Gravestock, Pictou.

The Directors reported that the $10,000 of stock offered was oversubscribed and that farmers still wanted some stock in the business, so it was voted that $5,000 additional stock be offered, about $2,000 of this was taken up during the day.

The Company now consists of over 300 good, practical farmers banded together in this co-operative association for the manufacturing of their Dairy products, and other business. The new creamery is now nearly completed and will be a credit to that part of the Province. An immense territory is available for the source of supply and no doubt the opening of the creamery, which will take place about the middle of May, will be one worthy of record.

The Manager, Mr. Harold Falconer, has lately returned from the Q. A. C. Dairy School, where he took the dairy course, passing with honors, as third in a class of forty-seven, and is now busy getting everything in shape.

If enthusiasm is what is wanted to make the Dairy business a success then it is evident that this business must go, from the enthusiasm that was displayed at this large meeting represented by the best farmers of a country almost one hundred miles wide.

W. A. McKay, Provincial Dairy Superintendent was present and assured the Company of the hearty co-operation between the Local Dept. of Agriculture and the Company, and also of the valuable asistance being rendered by the Federal Dept. in having a cow testing record centre established with this creamery as the main centre.

Everything points towards success at the present time and the people are justly proud of the splendid work they are undertaking.

A the meeting of the Directors afterwards, the officers appointed were Dan McDonald, Sylvester, President; Harold Falconer, Secretary-Treasurer and Manager, and Geo. Thompson, Warden of Pictou Co., Vice President.

This is but another evidence of the renewal of interest in the Dairy business in Nova Scotia.

It Pays to Spray

Not only for protection from bugs and blight but to increase the yield. Practical farmers and experiment stations have clearly proven that the yield is increased enough with every spraying to pay for solutions, time and labor many times over.

IRON AGE

Traction Sprayers

Have capacity, power and adjustment to suit every need and pumps with the least slippage of any in use on any sprayer.

They are made with single or double acting pumps, 55 or 100 gallon wood tanks, wood or steel wheels regular or wide spray bars, combination pole and thills, or either separate.

There are special spray bars for many different crops, potatoes, tomatoes, pickles, cantaloupe, grain, cotton, tobacco, etc. This list includes a new one with drop nozzles that cover the underside of the

leaves as well as the top. A six-row bar enables potato growers to cover large acreages thoroughly and in less time.

An orchard attachment increases the value of these machines to the man who also owns an orchard.

See them at your dealers and write for "Spray" book showing full line of Hand, Knapsack, Bucket, Barrel, Traction and Power Sprayers.

"Big Knees" of Cattle.

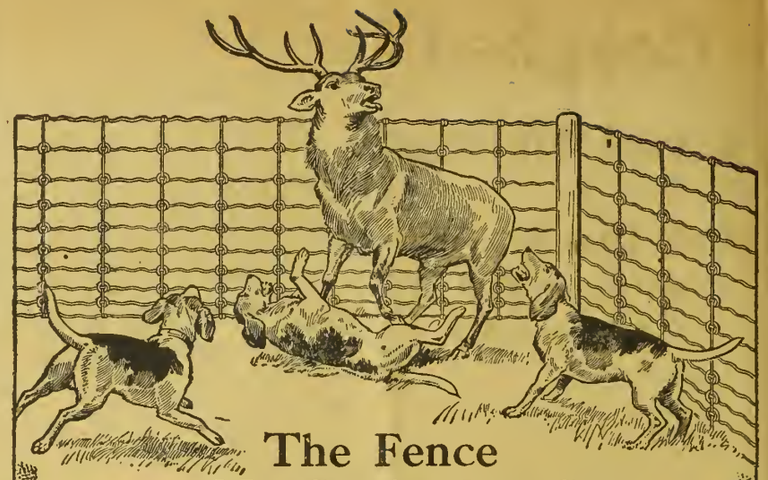
The big knees of cattle are, for all practical purposes, the same kind of swelling with which we are familiar in the human subject as "house-maid's knee." The housemaid suffers from an acute inflammation of the bursa that intervenes between the patella and the skin from kneeling on hard, damp stones, and in cattle the swelling arises from bruising of the knees in getting up and down, and, to some extent, perhaps, from lying on hard floors.

Causes.

Those accustomed to the management of stock know the extent to which the knees are employed in both lying down and getting up by cattle. When about to resume the recumbent position the cow first plumps down on her knees, and in the case of a heavy animal the force with which she comes to the ground is considerable. In getting up, the knees are also employed, and temporarily sustain the whole weight of the body in front. When the animal is heavy, and the pavement hard and sparsely covered with bedding, bruising results, and the frequency of "big knees" from bursal distension in cattle, as compared with horses, can be easily undersood. Horses are usually much more abundantly supplied with bedding, and when they suffer from "capped knee," as they sometimes do, it is enerally the result of bruising, or the entrance of thorns while jumping fences or hedges, in hunting, or in breaking out of pasture. The primary cause, then, of synovial swellings in front of the knee, is bursal distension, or the formation of a serous cyst under the skin, brought about by bruising or pressure. The swelling is superficial—that is, not connected with the articulation, and is generally diffused over the whole of the anterior aspect of the joint. It is very little affected by flexion or extension, and is rarely a cause of pain or lameness, in this respect differing very materially from other enlargements in which the articulation is involved, for these are generally a cause of great and painful lameness. If the swelling is prasped with the hand and manipulated, it will be found easily movable on the surface of the knee, and soft and fluctuating to the touch, reminding one—on a larger scale, of course—of the windgalls, bog spavins, and capped hocks of horses. The swelling is, indeed, of a similar character, though generally possessed of thicker walls, and it contains a pale yellow, alkaline, and viscid fluid. The enlargement is very rarely a cause of actual lameness, but the distension sometimes attains enormous proportions, and greatly hampers the animal's movements. It is also an eyesore, and though of no serious moment, since a cow with a big knee gives as much milk as any other, it affects the commercial value of the animal if offered for sale.

How to Prevent Big Knees.

Prevention obviously lies in the avoidance of the cause. In a few cases cattle may bruise their knees on hard ground when at pasture in seasons of prolonged drought, but the majority of cases are found among heavy milking cows kept indoors, or fattening bullocks tied up in stalls. Faulty construction of stalls, by paving them with brick or stone—very often rough stone—right up to the manger, is the most fertile cause of bruising. Beaten earth of a binding character forms the best flooring under the floor extremities, but the stalls should be paved for half their length from the channel behind, in order to facilitate cleaning. There is, of course, no objection to fully-paved stalls where the supply of bedding is bountiful; but since grain-growing became unprofitable less straw is produced than formerly, and it is also much more appreciated as a food. In purely pastoral districts, where there is little or no straw available, other than what is brought, a suf-



The Fence No Strain Can Sag

Maritime Fence remains taut and trim after years and years of hard usage. It simply cannot sag or get out of shape. Made from extra-heavy imported hard-drawn steel wire, thicker, stronger, and galvanized so it is peel-proof.

Maritime Fences are tested rigidly before leaving our factory. We know they will withstand far greater strains than any they are likely to endure. The simple lock with the bull-dog grip—never lets go.

Our Fencing is made from Standard Gauge Wire. Other makers use SCANT WIRE. WE DON'T. Full weight, full measure, 16 oz. to the pound in every case.

It would pay you to act as our agent.

Coughed Almost All Night

With That Dry Tickling Sensation in the Throat.

A bad cough, accompanied by that distressing, tickling sensation in the throat is most aggravating.

Dr. Wood's Norway pine syrup heals the mucous surface, relives oppression and tightness of the chest, removes accumulated mucous or phlegm, quiets even the most obstinate and distressing coughs, securing sleep and rest at night, not only to the sufferer, but to others whose rest would otherwise be broken.

Mrs. Duel Marshall, Basswood Ridge N. B., writes:—"Just a few lines to let you know what Dr. Wood's Norway Pine Syrup did for me. I took a severe cold, coughed almost all night with that dry, tickling sensation in my throat. The first bottle did me so much good, I thought I would try a second one, which I am pleased to say resulted in a complete cure. I can strongly recommend it to anyone suffering with a cough or any throat irritation."

The price of Dr. Wood's Norway Pine Syrup is 25 c. a bottle; the large, family size, 50c.

It is put up in a yellow wrapper; three pine trees the trade mark, and is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

ficient bed for covering a hard pavement is very rarely seen, while moss litter, or other substitute of straw is used sparingly.

Treatment.

The treatment of a bruised knee depends a great deal upon the stage at which it is undertaken. When the cow is first found with a swollen knee, free fomentation with hot water, hand-rubbing, and the prevention of further injury may result in its disappearance. A thick flannel bandage may be put on after fomentation to protect the front of the joint, and the allowance of litter should be increased. If the swelling does not disappear, but, on the contrary, the fluid effused increases in quantity and the tumor in size, it suggests that there is a continuance of the bruising. Should there be no fluctuations in size, an attempt may be made to excite absorption by blistering, which may need to be several times repeated, or the prolonged use of iodine may be tried. The hair over the swelling may be saturated twice a week with the tincture of iodine, or the liniment of iodine, which is much stronger, may be used, but a little less freely. Another plan is friction with iodine ointment, for which the following is the formula:—Resublimed iodine, 1 drachm; iodide of potassium, 20 grains; lard, 1 oz. A piece of the size of a hazel nut may be rubbed in once or twice a week, but those who adopt this treatment are warned against expecting immediate results, for the action of iodine in promotion absorption is slow. When a blister is employed its effects are to produce an exudation of lymph into the distended sac, converting the soft, fluctuating swelling into a hardish, indurated mass, which is gradually removed by absorption. This is facilitated by bandaging after the soreness of the blister has passed away. It is unfortunate that this method of treatment is both slow and uncertain, and if it fails there is nothing but either put up with the swelling (which, though unsightly, does not detract from the usefulness of the animal,) or to proceed to evacuate the swelling. There are severeal ways of doing this, but they come rather within the province of the veterinary surgeon, who will alone possess the proper instruments. In many cases, however, the sac fills again, and the same thing results when the owner tries to puncture with his penknife, unless the orifice is kept open for some time and the fluid allowed to drain away until adhesion between the walls of the sac has been obtained. The late Professor Williams recommended that " the puncture should be made at the lowest margin of the swelling, and upon its inner side, by a transverse incision, in order to blemish as little as possible. After the puncture is made, and the fluid pressed out, the walls of the sac must be kept in opposition by means of a flannel bandage, rolled round the knee from above downwards, until they become united by the adhesive inflammation. The bandage should not be disturbed for five or six days if no inconvenience is caused to he patient; but if any signs of pain are manifested it should be readjusted. The puncture in the skin should be kept open (and the best way of doing this is to insert a small piece of tow or lint into its orifice, allowing it to remain for several hours) in order to permit the escape of any fluid that may collect in the sac. The bandage is placed so as not to cover the wound. There is no danger to be apprehended from opening this bursa. I have done it repeatedly, and always with success, and sufficient inflammation is excited without injecting iodine or other irritant." About the best plan in cases where there is an enormously large fluctuating swelling is the insertion of a tape seton right through the body of it, allowing it to remain in three of four weeks, the knee being in the meantime protected from further injury by a good thick bed, or by a thick flannel bandage wrapped around it in such a manner as to allow the most dependent orifice to drain.—Veteran.

STOVE ECONOMY

Following is a list of the amounts of prizes captured by New Brunswick exhibitors at the 1914 Maritime Horse Show:

H. W. D. Armstrong, Fredericton	$30
Geo. Carvill, St. John	15
W. A. Humphrey, St. John	64
D. S. Mann, Petitcodiac	10
G. W. McAnn, Peticodiac	8
Geo. McAvity, St. John	82
Hugh. McMonagle, Sussex	18
Geo. Phinney, Sackvile	12
Mrs. Harry Prescott, Baie Verte..	6
Wm. Prescott	10
J. A. Reid, Fredericton	24
Roderique Horse Co., Petitcodiac	15
H. W. Ryan, Petitcodiac	27
R. A. Snowball, Chatham	153
A. E. Trites, Salisbury	14
	$488

Total amount of prize money paid out, $2122.05.

"Blind Staggers" in Horses.

In past years horses have died by the thousands in Texes, Ohio, Kansas and Nebraska from a disease affecting the nervous system, popularly known as blind staggers or forage posoning. The Department of Agriculture has received urgent requests for help against this disease from sixteen different States, and as a result it publishes a bulletin containing definite instructions for combating this disease.

Bad Forage the Cause.

Investigators have practcally established that this horse disease can be controlled effectively only by a total change of feed and forage. It is quite obvious that there is a direct connection between the green forage, exposed pasturage and newly-cut hay or fodder which the horses eat, and this cerebro-spinal meningetis, as the disease is known to scientists. In fact, eating of such forage when contaminated is undoubtedly the most important cause. Over 95 p. c. of cases of ths disease in Kansas and Nebraska during the outbreak of 1912 were maintained under such conditions. Bad pasturage is also to be guarded against. Many horses have died from blind staggers caused by eating mouldy baled hay. As soon as the hay was eliminated the disease ceased. Other horses in the vicinity not fed upon this hay failed to contract this disease. Later some of the mouldy bales were opened and exposed to the sun for three or four weeks. After this the hay wes fed to horses without producing any ill effect. Forage poisoning, therefore, seems not to be an infection but rather what is called "auto-intoxication"—that is, it is due to certain chemical poisons or toxins formed by the activity of internal organisms. These poisons may be present when the forage is taken into the body, or may be formed in the stomach. The nature of this poison is still unknown.

Characteristic Symptoms.

When the horse is taken with the blind staggers it usually exhibits a disturbance of the appetite, depression and weakness, while there is trouble in swallowing, drooping of the head and sleepiness which may give way to excitement and atacks of dizziness. The vision is impaired, which results in the staggering gait tat gives the disease its popular name. Certain muscles of the neck and flanks are cramped, and there is a grinding of the teeth. Sometimes the animal has pains as though it were afflicted with colic. The animal will walk strangely as if in an open space, and will try to push through any obstacle it encounters. In the stable he will press his head against the stall or rest it on the manger. Sometimes he will crowd into a corner. The temperature at the beginning of the disease ranges from 103 to 107 deg. Fahr., but within twenty-four hours the temperature falls and eventually becomes sub-normal. The animal is often down on the second or third day, and may or may not get up when urged. Death usually ocurs in from four to eight days, although it may follow within ten hours of the first symptoms, while chronic cases have been known to last for three weeks. About 90 per cent. of the affected animals die.

Treatment.

While medical treatment in the vast majority of cases has not brought results, nevertheless, if it is used at all, it must be prompt, and before the disease has h adtime to run. The digestive tract should be cleaned out tnoroughly at once. Active and concentrated remedies should be given. Afflicted animals, however, have great difficulty in swallowing immediately after being taken, so that these remedies must generally be given by injecion. Arecolin in one-half grain doses, subcutaneously, has given good results as a purgative. Early in the disease urotropin in doses of 25 grains dissolved in water and given by the mouth every two hours, apears to have been responsible for the recovery of some cases of the malady.

After the animal has been purged, the treatment varies acording to the symptoms. The following measures have been recomended. The first and most important: Feed only clean, well-cured forage and grain, and pure water. Calomel, salol and salicylic acid, to disinfect intestines. Mild antiseptic mouth washes are advisable. Copious cold water injections, if the temperature is high, give better results than antipyretics. An ice pack applied to the head is beneficial in the case of marked nervous disorder. One-ounce doses of chloral hydrate per rectum should be given if the patient is violent or muscular spasms are severe. If the temperature becomes sub-normal, the animal should be warmly blanketed. If much weakness is shown this should be combated with stimulants, such as strychnine, camphor, alcohol, atropin or aromatic spirits of ammonia. During the period of convalescence the usual tonic treatment is recommended.

Sulphur and Methylene Blue in the Stable.

The various powders used upon open wounds and wire cuts often provoke a horse to gnaw and make the parts raw, smearing his nose and lips with blood and presenting a most annoying problem. The veterinarian will advise tying-up and powdering lightly. There is a better way. Take a pinch of sulphur and sprinkle the wound until all the moist surface is colored yellow. Repeat from time to time as seems needful. My experience is that the horse will not touch the wound after the first aplication of sulphur and that it will heal beautifully.

For many years I have found iodine the most effective aplication for naval ill. But there is a modern chemical which I find equally effective and much cheaper. An ounce of methylene blue costs but a trifle and does the work of many times its cost in iodine. A teaspoonful of methylene blue in a pint bottle of rain water makes a lotion of sufficient strength. Wrap the end of a stick with soft cloth, pour out some of the lotion in a cup and swab the naval freely. The effect is magical and entitles the remedy to high rank for the

SUMMER SHOES FOR MEN WHO WORK

Here is something new in footwear specially suitable for farmers, woodsmen, millmen, trackmen, laborers—all those needing strong yet light, cool, easy shoes. These are made on good-fitting right and left lasts from our famous oil-tanned Skowhegan waterproof leather with waterproofed sole leather outsoles and solid insoles.

Palmer's "Moose Head Brand"
"SUMMER PACKS" and "HARVEST SHOES"

are light weight, comfortable, durable working shoes for spring, summer and fall wear. Sold by leading dealers everywhere. If your merchant does not carry them write us, giving his name and address, and we will see that they are placed within your reach. Made 4, 6 and 9 inches high. 19

JOHN PALMER COMPANY, LIMITED
Fredericton, N. B. - - Canada

purpose. Methylene is safe; it is administered to people in capsules and is also injected into the circulation as a destroyer of germs in blood diseases. Indeed, it was this qualitty which suggested its use to me for naval ill. The lotion is valuable for sore necks and shoulders and for collar boils. I suspect that methylene enters into the composition of some of the high-priced proprietary remedies for these ailments.—Breeders' Gazette.

The Suffolk Breed.

A Farmer reader inquires about the characteristics of the Suffolk breed.

The folowing description appeared in a recent isue of one of our Engish exchanges:—

"Developed from the noted old Suffolk Punch stock, which originated as a separate breed centuries ago, the modern Suffolks continue to hold extensive sway in their native country, and enjoy favor also in Essex and Norfolk, their breeding being confined to these three eastern countries, so that they are essentially a local breed. They have, however, become firmly established in Australia, while they find some vogue also in other colonial and foreign countries, and the export trade is an important factor in promoting the breed's prosperity. In its appearance the Suffolk horse offers a strong contrast to the Shire and Cydesdale. It is a clean-limbed cart-horse, there being a complete absense of long hair on the legs. The type bears a close resemblance to that of the Western Continental cart breeds of Femish blood, and there is no doubt that the Flemish cross played a great part in the evolution of the Suffolk Punch. Standing upon short legs, the Suffolks are very wide and thick, or "punchy" shape, with a broad back and short, thick neck, their conformation plainly indicating that they possess strong powers of draught. While of a heavy type, they are unrivalled in point of weight, size, and power by the more massive Shires, and as compared with these they exemplify a more active and medium sized stamp of the draught horse As a prominent breed point of the Suffok there is to be noted the characteristic configuration of the head, which is relatively short as from the forehead to the muzze, and very full and deep in the jowl, differing esentially from the more ruged and biger head typical of the Shire. A highly distitnctive note is struck also in regard to the colour, this being uniformly chestnut, though of varying shade. No other colour occurs in the Suffolk. In recent times the breed has undergone progressive improvement, and among the points that are being particularly studied by its suporters are to breed horses with good legs and feet, and that stand correctly upon their joints, and to get true-moving action, while weightiness of type has also been kept steadily in the forefront.

"The Suffolks are characterized by great activity, and they make desirable farm horses and prove most useful for draught work on the streets and the road, finding a ready demand for the latter puropse in the towns of the counties where they are bred and in adjacent parts, while there is a certain call for Suffolk geldings of weighty proportions in London. Much valuable work has been acomplished by the Suffolk Horse Society in promoting the welfare of the breed. Thus it has instituted a special scheme for assisting smaller farmers in the Suffolk's home district to become possessed of good brood mares, and it has allots a number of free nominations to leading stallions for the benefit of small breeders.

"There are several important and extensive studs of Suffolks to be found in their native county. Among the most noted are the Bawdsey Manor Stud, at Woodbridge, owned by Sir Cuthbert Quilter, where that great horse, Bawdsey Harvester, is located one of the best stallions of the present day, and Mr. Kenneth M. Clark's Sudbourne Stud, at Orford. Other leading breeders include Mr. Carlyle Smith, of Ashmoor; Mr. Pratt, of the Morston Hall Stud, at Trimley; Messrs. Catchpole, owners of the Darsham Stud; Mr. Woodgate of Framlingham; and the Marquis of Graham, at Easton Park, Wickham Market."

CLEAN---No dust or flying ashes. Ash chutes guide all ashes into convenient pan.

POULTRY.

Feeding Young Chicks.

A few suggestions given by the Poultry Division, Experimental Farm Ottawa.

Do not feed too soon. When the chick is hatched it has a sufficient supply of nourishment in the yolk of the egg to last it for several days. What the chick requires for the first few days is not feed but warmth and rest.

A little sand or grit first. When the chicks are removed to their brooding quarters there should be some coarse sand or fine chick grit scattered where they can have free access to it. They should then be some coarse sand or fine chick grit scattered where they can have free access to it. They should then be left until they show positive signs of hunger which would be between the 2nd and 3rd day after hatching. They may then be given some bread crumbs that have been very slightly moistened with milk; this may be scattered on clean sand or chick grit. If being brooded by a hen she will see that no food is allowed to lie around but if in a brooder that part of the food that the chicks do not pick up in a few minutes should be removed as nothing in feeding causes so much trouble as leaving food of that nature around until it is sour.

Feed for the first 10 or 12 days.—The following daily ration of five feeds given about two and a half hours apart and continued from the time the chicks are two to three days out of the shell until 10 or 12 days of age may be altered or adopted to suit conditions:

First feed— Dry bread crumbs, slightly moistened with milk.

Second feed—Finely cracked mixed grains or commercial chick feed.

Third feed—Rolled oats.

Fourth feed—Dry bread crumbs, moistened with milk.

Fifth feed—Finely cracked mixed grains.

In addition to the above give the chicks daily a little green food such as grass, lettuce, sprouted oats, etc. Do not have the moistened bread sloppy but in a crumbly state and during this period let the chicks onto fresh soil or grass every day if possible.

Feed after 10 or 12 days— After the chicks are ten days to two weeks old, coarser foods may be allowed. The infertile eggs may be boiled and mixed with the mash food and the bread and milk discontinued. Hoppers in which is put cracked grains and dry mash or rolled oats may be placed where the chicks can have free access to them. As soon as they become accustomed to the hoppers all hand feeding except the mash may be discontinued. If the chicks are on range it w ll be found that after a time they will get careless about coming when called, at which time the mash may be dropped and dependence placed entirely on the hopper feeding.

Place grit and water, also a dish of sour milk if possible where the chicks will have free access to them. Nothing provides animal food in better form than does milk, the chicks like it and thrive on it.

Feeding Young Turkeys.

Young turkeys require more than ordinary care during the first few weeks after being hatched. As the termination of the twenty-eight day hatching period approaches the eggs should be carefully watched, and as soon as the young poults hatch care should be taken that they have dry quarters. Any wet or damp place must be avoided, and the young poults should not be allowed a free run through wet grass for a few weeks. Young turkeys should not be out in heavy showers until their backs are well covered with feathers. If they get wet they may die from chill, unless put in a warm room to dry. Black or red pepper and ginger in the food or drinking water will aid them to overcome a chill, and are of great value on cold or damp days and a preventative of bowel trouble in both old and young turkeys. During the warmer parts of the day for the first few weeks they may be given the run of short grass or cultivated land. It is usual to keep the turkey hen in a large, airy coop and allow the poults to run at large during the day on a dry place. The coop should be moved frequently so as to give the youngsters run over fresh ground.

Feed the Foults

The first food should be soft and easily digestible. Hard boiled eggs, chopped fine may be used, although this food is not universally recommended. Green food is their chief need, and if plenty of green grass pasturage is available little else will be needful. Some cracked grain, stale bread dipped in milk and fed in a fairly dry crumbly state is good, and when the young birds are a couple of weeks old scalded bran and ground oats thoroughly soaked, fed as a dry crumbly mash, can be fed to advantage. Sour milk or curd may be very profitably used at any time mixed with the food. Keep the poults in dry, clean quarters, feed food in a crumbly condition, not sloppy; always have plenty of charcoal and grit where it can be easily used by the birds and give them range over as much green feed as possible. Reasonable results may be expected if these instructions are carried out.

Galvanized Stall Equipment.

That Steel Cow Stalls are a great improvement over the unsanitary wood type, is granted by every farmer who has used the steel. There has been one objection to it, however. It rusted. Little scales of rust formed beneath the paint and fell off bringing the paint with them so that the appearance of the steel outfit was spoiled, and the surface was not so easily kept clean.

This has been remedied this year by Beatty Bros., of Fergus and Winnipeg, makers of the well-known BT Steel Equipment. They are galvanizing their stalls and of course, the galvanized steel never rusts. No extra charge is being made for galvanizing.

Your stable equipment is much exposed to stable acids and moisture. When you buy steel stabling see that it is galvanized to stand this exposure.

Drawbacks on the Practical Farm.

While many farmers believe they make money on their poultry flocks it might prove an unpleasant surprise to them if they would keep a strict account of the cost of production in this line, and compare it with the amount received from the sales of poultry products.

We are assuming that the man gives his fowls good care, shelter and feed. Of course the fellow who lets his fowls go on the "root-hog-or-die" plan, hustling their own living, and making their roosting places in the barn, on the fences and among the trees, is not to be considered; he either keeps a very small flock at a low margin of profit, or a large flock at a big loss.

Peerless
Guaranteed Fencing
Strongly made and closely spaced—making it a complete barrier against large animals as well as small poultry. Top and bottom wires No. 9—intermediates No. 12 wire—made by the Open Hearth process which time and other tests have proven to be the best material made for the manufacture of wire fencing. Send for literature. Ask about our farm and ornamental fencing.
Agencies nearly everywhere. Live agents wanted in unassigned territory.

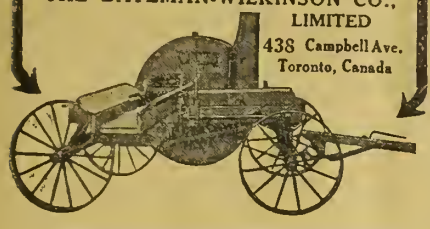
Ensilage and Straw Cutter

Our "B" machine, built especially for the farmer. A combination machine—it will cut and deliver green corn into the highest silo or dry straw or hay into the mow. 12-inch throat, rolls raise 6 inches and set close to knives—solid, compact cutting surface. Can change cut without stopping. Can be reversed instantly. Direct pneumatic delivery. Knife wheel carries fans. No lodging, everything cut, wheel always in balance. Steel fan case.

Made in two styles—mounted or unmounted. We also make larger type machine for custom work.

Ask your dealer about this well-known machine and write us for new catalog showing all styles.

THE BATEMAN-WILKINSON CO., LIMITED
438 Campbell Ave.
Toronto, Canada



The absence of pure bred fowls is one of the greatest drawbacks with many farmers in poultrying— at least, the lack of pure bred males to head the flocks, and no further cross breeding than the first cross. Some will say that this counts for little, but we must remember that a mongrel fowl cannot transmit the qualities of any particular strain to his offspring with any degree of certainty; they are as apt to be of one blood as another; while the pure bred transmits but one blood, his offspring thus being more likely to be strong, vigorous and possessing the same prepotency for pure breeding. Thus, considering that the sire is the better one-half of the flock, his selection is really of more importance than that of the females. With strong pure bred specimens of each sex, the extent of one's success with the lowls is almost limitless.

The Poultry Flock.

Roosters should be separated from the flock just as soon as hot weather begins; nests should be kept clean; eggs should be gathered twice a day; the eggs, while held, should be kept in a cool, sweet fairly dry place, where the temperature runs say from 45 degrees to 60 degrees.

One cause of loss in eggs is due to the shells becoming dirty. A hen walks over a dirty yard to a nest with four or five eggs in it, and when she gets off all the eggs are dirty but the one just laid. This can be avoided by scattering plenty of litter in front of the nests. The hen's feet will clean themselves on this as she approaches the nest.

The size of the egg is largely controlled by breeding and feeding, scrubs will produce small eggs. Select your best pullets for keeping and feed them well. You must have a strong healthy hen to produce a large egg.

Disinfectant for Poultry Houses.

In a clean five-gallon stone crock pour 3½ quarts of raw linseed oil. Then dissolve one to six ounces commercial lye in just enough water to dissolve it half a pint is usually sufficient. Allow the lye solution to stand a few hours until cold. Then pour it very slowly, constantly stirring, into the crock of oil. Take four or five minutes in adding the lye solution to the oil. Continue stirring for 20 to 30 minutes until a smooth, thick, soft soap is formed. Then stir in 8½ quarts commercial cresol, which will dilute and blend with the soap to form a clear, red-brown liquid. A 3 per cent mixture of the above stock solution is strong enough for all ordinary disinfection, as cresol is extremely powerful in its action. When diluted in this way a thin, milky liquid results, which can be applied with brush or spray pump The latter is best, because with it the disinfectant can be forced into every crack and crevice, thus insuring a perfect job.

No Lice in Henhouse.

I'm in the poultry business for the money I can make from eggs. I have 12,000 laying hens and 800 pullets, but I don't have any lice on the place. I can't afford then, said O. L. Freisinn, who long ago hung two by 4's by wires from the ceiling of each roosting house and laid the roosts on them to avoid the vermin. He even had a tin cone insulator put on the wires in some of the houses, to fill with oil. But these are now unused. A thorough spray of salted whitewash at 80 to 100 pounds pressure on the outside of every building scarcely whitens the places along the cracks and about the knots where penetrating spray used inside, a mixture of distillate oil 98 p. c. and ol pure carbolic acid 2 p. c. has been absorbed through the boards.

If you want to bring back crows every few hours, just throw the eggs that have not hatched out on the ground anywhere.

The day-old chick business does not stop when the average breeding time is over; it continues until later.

If you want to tempt cats to eat young chicks, just toss in their way all the dead chicks you come across.

Don't throw out spoiled meat of any kind to chickens. Many a case of "limber neck" has been caused by a spoonful of bad meat.

A Real Lever Simulation
GOLD WATCH FREE.

A straightforward generous offer from an established firm. We are giving away Watches to thousands of people all over the world as a huge advertisement. Now is your chance to obtain one. **Write now**, enclosing 25 cents for one of our fashionable Ladies' Long Guards, or Gents' Alberts, sent carriage paid to wear with the watch, which will be given Free (these watches are guaranteed five years), should you take advantage of our marvellous offer. Brantford Asphalt Shingles

have every known roofing virtue!

They can be laid wherever wood, slate or tile shingles can be used. Being pliable they lay to better advantage than any other kind and can be made to conform to any corner, curve or angle. Being absolutely fadeless they never become weather-stained and ugly with age. Being fireproof in the highest degree they are a protection to your property and a means of reducing insurance premiums. Being free from any tendency to split, warp or decay, they cost in the end much less than perishable wood shingles.

'Roof Leak'

For protecting tin, iron, wood or felt roofs. Makes any leak watertight and old roofs as good as new. Write for booklet.

Brantford Asphalt Shingles are made in three permanent colors, viz.: green, red and black, finished with a coating of crushed rock. They make a warm house and an attractive house. Although little higher in cost than wood shingles, they are practically everlasting.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

He received me with absolute enthusiasm. He was too rheumatic to be shaken hands with, but he begged me to shake the tassel on the top of his night-cap, which I did most cordially. When I sat down by the side of the bed, she said that it did him a world of good to feel as if he was driving me on the Blunderstone road again. As he lay in bed, face upward, and so covered, with that exception, that he seemed to be nothing but a face—like a conventional cherubim— he looked the queerest object I ever beheld.

"What name was it I wrote up in the cart, sir?" said Mr. Barkis, with a slow rheumatic smile.

"Ah! Mr. Barkis, we had some grave talks about the matter, hadn't we?"

"I was willin' a long time, sir?" said Mr. Barkis.

"A long time," said I

"And I don't regret it," said Mr. Barkis. "Do you remember what you told me once, about her making all the apple parsties and doing all the cooking?"

"Yes, very well," I returned.

"It was as true," said Mr. Barkis, "as turnips is. It was as true," said Mr. Barkis, nodding his nightcap, which was his onIy means of emphasis, "as taxes is. And nothing's truer than them."

Mr. Barkis turned his eyes upon me, as if for my assent to this result tof his reflections in bed; and I gave it.

"Nothing's truer than them," repeated Mr. Barkis; "a man as poor as I am, finds that out in his mind when he's ard up. I'm a very poor man, sir?"

"I am sorry to hear it, Mr. Barkis."

"A very poor man, indeed I am," said Mr. Barkis.

Here his right hand came sowly and feebly from under the bedclothes, and with a purposeless uncertain grasp took hold of a stick which was loosely tied to the side of the bed. After some poking about with this instrument, in the course of which his face assumed a variety of distracted expressions, Mr. Barkis poked it against a box, an end of which had been visibe to me all the time. Then his face became composed.

"Old clothes," said Mr. Barkis.

"Oh!" said I.

"I wish it was money, sir," said Mr. Barkis.

"I wish it was, indeed," said I.

"But it ain't," said Mr. Barkis, opening his eyes as wide as he could.

I expressed myself quite sure of that and Mr. Barkis, turning his eyes more gently to his wife, said:

"She's the usefullest and best of women, C. P. Barkis. All the praise that anyone can give to C. P. Barkis she deserves, and more! My dear, you'll get a dinner to-day, for company; something good to eat and drink, will you?"

I should have protested against this unnecessary demonstration in my honor, but that I saw Peggotty, on the opposite side of the bed, extremely anxious I should not So I held my peace.

"I have got a trifle of money somewhere about me, my dear," said Mr. Barkis, "but I'm a little tired. If you and Mr. David will leave me for a short nap, I'll try and find it when I wake."

We left the room in compliance with his request. When we got outside the door, Peggotty informed me that Mr. Barkis, being now a "ittle nearer" than he used to be, always resorted to this same device before extracting a single coin from his store; and that he endured unheard of agonies in crawling out of bed alone, and taking it from that unlucky box. In effect, we presently heard him uttering suppressed groans of the most dismal nature, as this magpie proceeding racked him in every joint; but while Peggotty's eyes were full of compassion for him, she said his generous impulse would do him good, and it was better not to check it. So he groaned on, until he had got into bed again, suffering, I have no doubt, a martyrdom; and then called us in, pretending to have just woke up from a refreshing sleep, and to produce a guinea from under his pillow. His satisfaction in which happy imposition on us, and in having preserved the impenetrable secret of the box, appeared to be a sufficient compensation to him for all his tortures.

I prepared Peggotty for Steerforth's arrival, and it was not long before he came. I am persuaded she knew no difference between his having been a personal benefactor of hers and a kind friend to me, and that she would have received him with the utmost gratitude and deveotion in any case. But his easy, spirited, good humor; his genial manner, his handsome looks, his natural gift of adapting himself to whomsoever he pleased, and making direct, when he cared to do it, to the main point of interest in anybody's heart; bound her to him wholly in five minutes. His manner to me, alone, would have won her. But, through all these cases combined, I sincerey believe she had a kind of adoration for him before he left the house that night.

He stayed there with me to dinner—if I were to say willingly, I should not half express how readily and gaily. He went to Mr. Barkis' room like light and air, brightening and refreshing it as if he were healthy weather. There was no noise, no effort, no consciousness, in anything he did; but in everything an indescribabe lightness, a seeming impossibility of doing anything else, or doing anything better, which was so graceful, so natural, and agreeable, that it overcomes me, even now, in the remembrance.

We made merry in the little parlor, where the book of martyrs, unthumbed since my time, was laid out upon the desk as of old, and where I now turned over its terrific pictures, remembering the old sensations they had awakened, but not feeling them. When Peggotty spoke of what she called my room, and of its being ready for me at night, and of her hoping I would occupy it, before I could as much as look at Steerforth, hesitating, he was possessed of the whole case.

"Of course," he said. "You'll sleep here while we stay, and I'll sleep at the hotel."

"But to bring you so far," I returned, "and to separate, seems bad companionship, Steerforth."

"Why in the name of Heaven, where do you naturally belong!" he said. "What is 'seems' compared to that!" It was settled at once.

He maintained all his delightful qualities to the last, until we started forth, at eight o'clock, for Mr. Peggotty's boat. Indeed, they were more and more brightly exhibited as the hours went on; for I thought even then, and I have no doubt now, that the consciousness of success in his determination to please, inspired him with a new delicacy of perception, and made it, subtle as it was, more easy to him. If any one had told me, then, that all this was a brilliant game, played for the excitement of the moment, for the employment of high spirits, in the thoughtless love for superiority, in a mere wasteful careless course of winning what was worthless to him, and next minute thrown away; I say, If any one had told me such a lie that night, I wonder in what manner of receiving it my indignation would have found a vent.!

Probably only in an increase, had that been possible, of the romantic feelings of fidelity and friendship with which I walked beside him, over the dark wintry sands towards the old boat; the wind sighing around us even more mournfully than it had sighed and moaned upon the night when I first darkened Mr. Peggotty's door."

"This is a wild kind of place, Steerforth, is it not?"

"Dismal enough in the dark," he said: "and the sea roars as if it were hungry for us. Is that the boat, where I see a light yonder?"

"That's the boat," said I.

"And its the same I saw this morning," he returned. "I came straight to it, by instinct, I suppose."

We said no more as we approached the light, but made softly for the door. I laid my hand upon the latch; and whispering Steerforth to keep close to me, went in.

A murmur of voices had been audible on the outside, and, at the moment of our entrance, a clapping of hands: which latter noise, I was surprised to see, proceeded from the generally disconsolate Mrs. Gummidge. But Mrs. Gummidge was not the only person there who was unusually excited. Mr. Peggotty, his face lighted up with uncommon satisfaction, and laughing with all his might, held his rough arms wide open, as if for little Em'ly to run into them; Ham, with a mixed expression on his face of admiration, exultation, and a lumbering sort of bashfulness that sat upon him very well, held little Em'ly by the hand, as if he were presenting her to Mr. Peggotty; little Em'ly herself, blushing and shy, but delighted with Mr. Peggotty's delight as her joyous eyes expressed, was stopped by our entrance (for she saw us first) in the very act of springing from Ham to nestle in Mr. Peggotty's embrace. In the first glimpse we had of them all, and at the moment of our passing from the dark cold night into the warm light room, this was the way in which they were all employed; Mrs. Gummidge in the background, clapping her hands like a mad woman.

The little picture was so instantaneously dissolved by our going in, that one might have doubted whether it had ever been. I was in the midst of the astonished famiy, face to face with Mr. Peggotty, and holding out my hand to him, when Ham shouted:

"Mas'r Davy! It's Mas'r Davy!"

In a moment we were all shaking hands with one another, and asking one another how we did, and telling one another how glad we were to meet, and all talking at once. Mr. Peggotty was so proud and so overjoyed to see us, that he did not know what to say or do, but kept over and over again shaking hands with me, and then with Steerforth, and then with me, and then ruffling his shaggy hair all over his head, and laughing with such glee and triumph, that it was a treat to see him.

"Why, that you two gentlemen—gentlemen growd—should come to this here roof to-night, of all nights in my life," sid Mr Peggotty, "is such a thing as never happened afore, I do rightly believe! Em'ly my darling, come here Come here, my little witch! There's Mas'r Davy's friend, my dear! There's the gentlemen as you heard on, Em'ly. He comes to see you, along with Mas'r Davy, on the brightest night of your uncle's life as ever will be, Gorm the t'other one, and horroar for it!"

After delivering this speech all in a breath, and with extraordinary animation and pleasure, Mr. Peggotty put one of his large hands raptrously on each side of his niece's face, and kissing it a dozen times, laid it with a gentle pride and love on his broad chest, and patted it as if his hand had been a lady's. Then he let her go; and as she ran into the little chamber where I used to sleep, looked round upon us, quite hot and out of breath with his uncommon satisfaction.

"If you two gentemen—gentlemen growd now, and such gentlemen—" said Mr. Peggotty.

"So th' are, so th' are!" cried Ham. "Well said! So th' are. Mas'r Davy bor—gentlemen growd—so th' are."

"If you two gentlemen, gentlemen growed," said Mr. Peggotty, "don't excuse me for being in a state of mind, when you understand matters, I'll arks your pardon. Em'ly, my dear!—she knows I am a going to tell," here his delight broke out again, "and has made off. Would you be so good as to look arter her, Mawther, for a minute?"

Mrs. Gummidge nodded and disappeared.

"If this ain't," said Mr. Peggotty, sitting down among us by the fire, " the brightest night of my life, I'm a shellfish—bright too—and more I can't say. This here little Em'ly, Sir," in a low voice to Steerforth, "—her as you see a blushing here just now—"

Steerforth only nodded, but with such a pleased expression of interest and of participation in Mr. Peggotty's feelings, that the latter answered him as if he had spoken.

AILING WOMEN OF MIDDLE AGE

Mrs. Doucette Tells of her Distressing Symptoms During Change of Life and How She Found Relief.

Belleville, Nova Scotia, Can.—"Three years ago I was suffering badly with what the doctors called Change of Life. I was so bad that I had to stay in bed. Some friends told me to take Lydia E. Pinkham's Vegetable Compound and it helped me from the first. It is the only medicine I took that did help me and I recommend it. You don't know how thankful and grateful I am. I give you permission to publish what your good medicine has done for me."—Mrs. Simon Doucette, Belleville, Yarmouth Co., Nova Scotia, Canada.

Such warning symptoms as sense of suffocation, hot flashes, headaches, backaches, dread of impending evil, timidity, sounds in the ears, palpitation of the heart, sparks before the eyes, irregularities, constipation, variable appetite, weakness and inquietude, and dizziness, are promptly heeded by intelligent women who are approaching the period in life when woman's great change may be expected.

Lydia E. Pinkham's Vegetable Compound invigorates and strengthens the female organism and builds up the weakened nervous system. It has carried many women safely through this crisis.

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman, and held in strict confidence.

The right to wear a Clean Collar

Every man can have a clean collar if it's a Challenge Waterproof Collar. Best to wear at work or for dressing up after work. Not shiny, but look just like linen. Always neat and comfortable and are cleaned with soap and water.

Sold at all Gents' Furnishing and Dry Goods Shops, or send 25c. for Sample Collar.

SUMMER SCHOOL
JULY and AUGUST 22

G. Y. CHOWN, Registrar, Kingston, Ont.

"To be sure," said Mr. Peggotty, "that's her, and so she is. Thankee, sir."

Ham noded to me several times, as if he would have said so too.

"This here little Em'ly of ours," said Mr. Peggotty, "has been, in our house, what I supose (I'm a ignorant man, but that's my belief) no one but a little bright eyed creetur can be in a house. She ain't my child; I never had one; but I couldn't love her more. You understand! I couldn't do it!"

"I quite understand," said Steerforth

"I know you do sir," returned Mr. Peggotty, "and thankee again. Mas'r Davy, he can remember what she was; you may judge for your own self what she is; but neither of you can't fully know what she has been, is, and will be, to my loving heart. I am rough, sir," said Mr. Peggotty, "I am as rough as a Sea Porkypine; but no one, unless, mayhap, it is a woman, can know I think, what our little Em'ly is to me. And betwixt ourselves," sinking his voice lower yet, "that woman's name ain't Missis Gummidge nether, thouugh she has a word of merit."

Mr. Peggotty ruffled his hair again with both hands, as a further preparation for what he was going to say, and went on, with a hand upon each of his knees:

"There was a certain person as had know'd our Em'y, from the time when her father was drowned, as he had seen her constant; when a babby, when a young gal, when a woman. Not much of a person to look at, he warn't," said Mr. Peggotty, "something of my own build—rough—a good deal of the sou'-wester in him—wery salt—but, on the whole, a honest sort of chap with his heart in the place."

I thought I had never seen Ham grin to anything like the extent to which he sat grinning at us now.

"What does this here blessed tarpaulin go and do," said Mr. Peggotty, with his face one high noon of enjoyment, "but he loses that there heart of his to our little Em'ly. He follers her about, he makes hiself a sort of servant to her, he loses in a great measure his relish for his wittles, and in the long run he makes it clear to me what's amiss. Now I could wish myself, you see, that our little Em'ly was in a fair way of being married. I could wish to see her, at all events, under articles to an honest man as had a right to defend her. I don't know how long I may live, or how soon I may die; but I know that if I was capsized, any night, in a gale of wind in Yarmouh Roads here, and was to see the town lights shining for the last time over the rollers as I couldn't make no head against, I could go down quieter for thinking 'There's a man ashore there, iron-true to my little Em'ly God bless her, and no wrong can touch my little Em'ly while so be as that man lives'."

Mr. Peggotty, in simple earnestness, waved his right arm, as if he were waving it at the town lights for the last time, and then, exhanging a nod with Ham, whose eye he caught, proceeded as before:

"Well! I counsels him to speak to Em'ly. He's big enough, but he's bashfuller than a litttle un, and he don't like. So I speak. 'What! Him!' says Em'ly. 'Him that I've know'd so intimate so many years, and like so much. Oh, Uncle! I never can have him. He's such a good fellow!' I gives her a kiss, and I says no more to her than 'My dear, you're right to speak out, you're to chose for yoursef, you're as free as a little bird.' Then I aways to him, and I says, 'I wish it could have been so, but it can't But you can both be as you was, and wot I say to you is, be as you was with her, like a man.' He says to me, a shaking of my hand, 'I will he says. And he was—honorable and manful—for two year going on, and we was just the same here as afore."

Mr. Peggotty's face, which had varied in its expression with the various stages of his narrative, now resumed all its former triumphant delight, as he

FOUNDRY CO. SACKVILLE N.B.

laid a hand upon my knee, and a hand upon Steerforth's (previously wetting them both, for the greater emphasis of the acton), and divided the following speech between us:

"All of a sudden, one evening—as it might be tonight—comes little Em'ly from her work, and him with her! There ain't so much in that, you'll say. No, because he takes care of her, like a brother, arter dark, and indeed afore-dark, and at all times. But this tarpaulin chap, he takes hold of her hand and he cries out to me, joyful, 'Look here! This is to be my little wife!' And she says, half bold and half shy, and half a laughing and half a crying, 'Yes, Uncle! If you please'—If I please!" cried Mr. Peggotty, rolling his head in ecstacy at the idea; "Lord, as if I should do anything else!—'If you please, I am steadier now, and I have thought better of it, and I'll be as good a little wife as I can to him, for he's a dear good fellow!" Then Missis Gummidge, she claps her hands like a play, and you come in. There the murder's out!" said Mr. Peggotty—"You come in! It took place this here present hour; and here's the man'll that'll marry her, the minute she's out of her time."

Ham staggered, as well he might, under the blow Mr. Peggottty dealt him in his unbounded joy, as a mark of con fidence and friendship; but feeling called upon to say something to us, he said, with much faltering and great difficulty:

"She warn't no higher than you was, Mas'r Davy—when you first come—when I thought what she'd grow up to be. I see her grow up—gentlemen—like a flower. I'd lay down my life for her—Mas'r Davy—Oh! most content and cheerful! She's more to me—gentlemen— than—she's all to me that ever I can want, and more than ever I—than ever I could say. I—I love her true. There ain't a gentleman in all the land—nor yet sailing upon the sea—that can love his lady more than I can love her, though there's many a common man—would say better—what he meant."

I thought it affecting to see such a sturdy fellow as Ham was now, trembling in the strength of what he felt for the pretty little creature who had won his heart. I thought the simple confidence reposed in us by Mr. Peggotty and himself, was, in itself, affecting. I was affected by the story altogether. How far my emotions were influenced by the recollections of my childhood, I don't know. Whether I had come there with any lingering fancy that I was still in love with little Em'ly, I don't know. I know that I was filled with pleasure by all this; but, at first, with an indescribably sensitive pleasure, that a very little would have changed to pain.

Therefore, if it had depended upon me to touch the prevailing cord among them with any skill, I should have

made a poor hand of it. But it depended upon Steerforth; and he did it with such address, that in a few minutes we were all as easy and as happy as it was possible to be.

"Mr. Peggotty," he sad, "you are a thoroughly good fellow, and deserve to be as happy as you are tonight. My hand upon it! Ham, I give you joy, my boy. My hand upon that, too! Daisy, stir the fire, and make it a brisk one! and Mr. Peggotty, unless you can induce your gentle niece to come back (for whom I vacate this seat in the corner), I shall go. Any gap at your fireside on such a night—such a gap least of all I wouldn't make, for the wealth of the Indies!"

So Mr. Peggotty went into my old room to fetch little Em'ly. At first, little Em'ly didn't like to come, and then Ham went. Presently they brought her to the fireside, very much confused and very shy—but she soon became more assured when she found how gently and respectfully Steerforth spoke to her; how skillfully he avoided anything that would embarrass her; how he talked to Mr. Peggotty of boats, and ships, and tides, and fish; how he referred to me about the time when he had seen Mr. Peggotty at Salem House how delighted he was with the boat and all belonging to it; how lightly and easy he carred on, until he brought us, by degrees, into a charmed circle, and we were all talking away without any reserve.

Em'ly, indeed, said little all the evening; but she looked and listened, and her face got animated, and she was charming. Steerforth told a story of a dismal shipwreck (which arose out of his talk with Mr. Peggotty- as if he saw it all before him—and little Em'ly's eyes were fastened on him all the time, as if she saw it too. He told us a merry adventure of his own, as a relief to that, with as much gaiety as if the narrative were as fresh to him as it was to us—and little Em'ly laughed until the boat rang with the musical sounds, and we all laughed (Seeerforth too), in irresistible sympathy with what was so pleasant and light-hearted; He got Mr. Peggotty to sing, or rather to roar, "When the stormy winds do bow, do blow, do blow;" and he sang a sailor's song himself, so pathetically and beautifully, that I could have almost fancied that the real wind creeping sorrowfully round he house, and murmuring low through our unbroken silence, was there to listen.

As to Mrs. Gummidge, he roused that victim of despondency with a success never attained by anyone else (so Mr. Peggotty informed me,- since the decease of the old one. He left her so little leisure for being miserable, that she said next day she thought she must have been bewitched. But he set up no monopoly of the general attention, or the conversation. When little Em'ly grew more courageous and talked (but still bashful) across the fire to me, of our old wanderings upon the beach, to pick up shells and pebbles; and when I asked her if she recollected how I used to be devoted to her; and when we both laughed and reddened, casting these looks back on pleasant old times, so unreal to look at now; he was silent and attentive, and observed us thoughtfully. She sat at this time, and all the evening, on the old locker in her old corner by he fire, with Ham beside her, where I used to sit. I could not satisfy myself whether it was in her own little tormenting way, or in a maidenly reserve before us, hat she kept quite close to the wall, and away from him; but I observed that she did so all the evening.

As I remember, it was almost midnight when we took our leave. We had had some biscuit and dried fish for supper, and Steerforth had produced from his pocket a full flask of Hollands which we men (I may say we men, now, without a blush- had emptied. We parted merrily; and as they all stood crowded round the door to light us as far as they could upon our road, I saw the sweet blue eyes of little Em'ly peeping after us, from behind Ham, and heard her soft voice calling to us us to be careful how we went.

"A most engaging little beauty!" said Steerforth, taking my arm. "Well! it's a quaint place, and they are quaint company; and it's quite a new sensation to mix with them."

"How fortunate we are, too," I returned, "to have arrived to witness their happiness in that intended marriage! I never saw people so happy. How delightful to see it, and to be made the sharers in their honest joy, as we have been!"

"That's rather a chuckle-headed fellow for the girl; isn't he?" said Steerforth.

He had been so heraty with him, and with them all, that I felt a shock in this unexpected and cold reply. But turning quickly upon him, and seeing a laugh in his eyes, I answered, much relieved:

"Ah, Steerforth! It's well for you to joke about the poor! You may skirmish with Miss Dartle, or try to hide your sympathies in jest from me, but I know better. When I see how perfectly you understand them, how exquisiely you can enter into happiness like his plain fisherman's, or humor a love like my old nurse's, I know that there is not a joy or sorrow, not an emotion, of such people, that can be indifferent to you. And I admire and love you for it, Steerforth, twenty times he more!"

He stopped, and looking into my face, said: "Daisy, I believe you are in earnest, and are good. I wish we all were!" Next moment he was gaily singing Mr. Peggotty's song, as we walked at a round pace back to Yarmouth.

THE END

P. E. I. Women's Institutes.

Mrs. Dunbrack and Miss McDonald met the ladies of Georgetown, on the evening of the 12th ult in the C. M. B. Hall, and discussed with them the different lines of work which are undertaken by the Women's Institutes in the Dominion. Those present were strongly in favor of organizing an Institute in their section and a meeting for that purpose will be held in a few days.

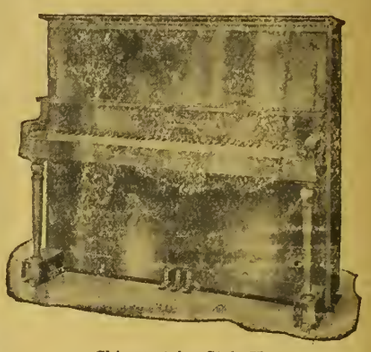
A large number of the ladies of Montague met in the public hall on Wednesday afternoon at 2.30 o'clock, for the purpose of hearing Mrs. Dunbrack explain fully the object, aim and work of the Women's Institute Movement, as has been inaugurated in this province a little over a year. Both Mrs. Dunbrack and her assistant, Miss Helena McDonald, received a hearty welcome. Mrs. Wright ably filled the chair, with Mrs. J. A. G. Ellis, as secretary pro tem. After considerable discussion along the lines af work carried on by the Women's Institutes, which included among other phases taken up, the beautifying of the school grounds; furnishings, renovating and decorating the interior of the school house, which would include the desks, floor, walls, windows and window shades, ceiling, etc., supplying sanitary covered drinking fountains with individual drinking cups for the pupils; the furnishing by the mothers, of two towels to each child which she had attending school, the same to be used during the school hours and replenished once a week; the placing of a sanitary wash basin, made of white enamel with a five gallon tank connecting with the basin which had a plug, and which emptied its contents in the same manner as a modern bathroom fixture, into a receptacle holding the same quantity of water as the tank, and which supports the basin and is easily removed and emptied each day and cleaned. Rural

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write today to Mrs. M. Summers. Box P. 309 Windsor, Ont.

Sherlock-Manning Instruments

Sold Ten Years Ago Are As Good As Ever



Chippendale—Style 75.

Everything is there to make them last and retain their superb singing tone. The action is the famous Otto Higel Double Repeating Action, the wires are the Finest Imported Poehlmann Wire, the hammers are from the celebrated house of Weickert — all these quality features are found only in high-grade pianos, and are standard parts of proven excellence.

A piano takes fully six months to go through our works from start to finish, and is carefully inspected all the way. By installthe most modern machinery and the newest time and labor-saving devices we are able to economize at every step in the building process. That is why we can offer you in the **Sherlock-Manning 20th Century Piano**

"Canada's Biggest Piano Value"

Every piano we sell is guaranteed for ten years. There is not a better instrument made in the country than the **Sherlock-Manning**, although in many cases you are asked to pay a hundred more. We give you the value-equal of any strictly high-grade make and sell it to you for fully $100 less. Write Dept. 6 for our handsome art catalogue J and see the various styles illustrated.

JAMES GILCHRIST,

Superintendent of Immigration

ST. JOHN, - - - N. B.

school sanitation, inside and outside the school building; medical inspection in the schools; the school nurse, who would work among the schools, making regular visits, and examining each child and reporting the same to the mothers and medical authority, the examination to include the general health and condition of the teeth, also the sanitary condition of the school surroundings; purpose and value of the school gardens, rural school fairs pointing out the benefit of these fairs to the younger members of the community; the value of a practical course in Household Economy in the schools; school and institute libraries, explaining the system of travelling libraries which the University of McGill is offering to all Institutes, individuals or communities which have no advantage of literary privileges. Mrs. Dunbrack said that she would only be too glad to assist anyone in securing one of these libraries and to send them the rules and regulations governing the loan of the McGill. offer.

The subject of cleaning up back yards was discussed, also the advisability of offering a prize this coming fall for the best kept back yard during the coming summer; cleaning up vacant lots in a neighborhood and making them beauty spots instead of eyesores, which is the case in many instances. It was suggested that the section or village interested be divided into four parts and one or more vacant lots be secured in each section or division and the work of preparation of the soil, planting and caring for flower or vegetable garden be given to the boys and girls of that particular section in which they live, then opening up competition for the encouragement of the same. The school garden work could easily be arranged. The co-operation of the P. E. I. Floral Society was also spoken of, and the speaker advised that as many as could do so, should become members of the society and reap the benefits accruing therefrom. The membership for the year is fifty cents and entitles the members to many privileges along the lines of floriculture, civic improvement, etc., and would greatly assist the teachers and parents of the children in the rural sections in furthering the good work of beautifying their school and home grounds. The speaker was given a hearty vote of thanks for her instructive address, after which the ladies organized a Women's Institute with over forty members enrolled, placing in office the following ladies:

President—Mrs. Wright.

Vice-Pres.—Mrs. Thompson.

Secy-Treas—Mrs. Gordon Ives.

Directors—Mrs. J. A. G. Ellis, Miss Jessie Campbell and the President, and Vice-President.

Auditors—Miss Flossie Kelley and Mrs. John Beer.

All those accompanied by Mrs. Dunbrack and Miss McDonald paid a visit to the school rooms, and it was the unanimous voice that the most necessary work in Montague towards civic improvement was that of the school house and its surroundings.

The first meeting of the Montague Women's Institute will be held in the Guild Room next Friday, when the future work of the Institute will be taken up. It is hoped that all the ladies of the community will attend this meeting and help those already organized in carrying on their good work.

A Word on the N. S. Institutes.

The work of the Institutes in Nova Scotia goes on apace and it is very interesting to note the different interests that appeal to the different institutes. In each community it is without doubt "the cause that needs assistance" that procures the attention of the Institute. They all follow the good scriptural injunction, "Whatsoever thy hand findeth to do, do it with thy might," and strange to say, while their interests are many and diversified there is one cause that makes a strong, probably strongest would be best—appeal to all—the cause of the children, and nearly all the Institutes are looking into the school conditions of their districts. In some places the conditions are good, in other the school has been neglected, but the trustees, rather than resenting the co-operation of the Institutes, are welcoming their suggestions and offers of substantial aid. In a future issue, the work taken up by each Institute in its various stages will be discussed.

Outside the actual work done, the monthly meetings are decidedly interesting and worth while and if no work was ever accomplished by our Institutes, we would feel amply recompensed for their establishment by the enjoyment the members obtain from the social intercourse. The many papers prepared and read show what our women are capable of, and they are not carelessly written, but much thought, work and time given to their preparation. Just to show what can be done we will publish in future issues timely papers prepared by Institute members in various sections of the province. Here is one on "Sociability", which was prepared and ready by Miss Margaret Trenholm, of Martock and Windsor Forks, Hants Co. Institute and it seems to touch right at the root of the most of our young people—Jennie A. Fraser.

Sociability.

Many have asked, and are spectulating on the motive of our Women's Institute. In general, to help and stimulate the public interest in the home in particular, is the point we would like to discuss today—Sociability.

Living as we are in the country, simple and peaceful lives our pleasures must originate among ourselves. The home, the place that should be most sacred is what we should consider first. Some of the finest traits may grow in public—enthusiasm, generosity, patriotism, and the like—but the inner characteristics which proceed from the heart in its quieter hours are best nourished at the hearthstone.

Particularly in the country are we thrown back upon our homes for amusement and instead of wishing for what is miles away from us, let us try rather to develop the tender seeds planted in our own rich soil.

I read in a magazine this paragraph:—"Many fortunate women instead of rejoicing in what they have are themselves very unhappy by dwelling on what they have not." It is so easy for us to envy the beauty and luxury in other homes that are denied to ours. I fear women are more prone to envy than are men. Sir Thomas Moore had found the secret of happiness when he wrote in his diary "I make it my business to wish as little as I can, except that I were wiser and better." He had the viewpoint of Saint Paul, who said: "And having food and raiment let us therewith be content.

If we can, in our society, combine our efforts to make our homes brighter and the place in which we live more attractive to those growing up in it, so that they may see the advantages and opportunities of their own beautiful country, then they will stay with us and do credit to their homeland. Then again, there are always housekeeping problems, which, if our members would bring before that society might be unravelled very deftly by some other, who has had more experience; thus benefiting the seeker and indirectly the whole Institute.

Let us then, as members of the Institute try to help each other in little every day things that in the end count so much. Let us always have a kind word and pleasant smile for everyone. Let us not forget that charity begins at home and then will each member be a link in the chain which will bind the people of Martock and Windsor Forks into one great family.

A sprained ankle may as a rule be cured in from three to four days by applying Chamberlain's Liniment and observing the directions with each bottle. For sale by all dealers.

High Quality Builds Big Telephone Business

This business was organized to manufacture telephone equipment for independent local and municipal systems. Right from the start our equipment made records for efficiency, It did not take long for our goods to acquire a reputation for quality and reliability. As a result, our business has grown by leaps and bounds.

It is a well-known fact that we have been securing over 80 per cent. of the new telephone business in Ontario. The business, too, has been secured with less effort than the business secured by competitors. The satisfaction our telephones and equipment have given under all conditions have paved the way for easy business getting.

To judge how fast our business is growing, you'll remember in a previous announcement that our business last year doubled that of the year before. Well, this year the fiirst two months' sales total more than twice the 1912 sales for the same period. More and more is it being recognized by those in the local telephone business, that we are the legitimate people to deal with. There are those in the telephone business who are interested in depreciating the success of the independent telephone movement and the development of the municipal systems, On the other hand, our business lies wholly and directly with the independent telephone systems and it is to your own best interests to look after those systems well, as on their success depends the growth of our business.

If you would like a list of the large independent telephone systems built in Ontario during the last twelve months, just drop us a line. We would be glad to send you a list of the systems with the make of telephones they are using. In fact, if you'll name over the large independent systems built during the last year in Western, Northern and Eastern Ontario you'll find that nine out of every ten are using our telephones and equipment.

You are absolutely safe in equipping your system with our telephones. We guarantee them as regards material and workmanship. In fact, we guarantee all our equipment and materials. And in addition we offer to send your telephones for ***Free Trial,*** so you can test and compare them with others right on your own lines before risking a dollar.

Ask for No. 3 Bulletin—containing the latest information about building telephone lines.—Also No. 4, describing our magnetic telephones, is free on request.

Send for a copy.

Let us quote you on your year's supply of Dry Cell Batteries.

Canadian Independent Telephone Co., Ltd.

"Also Manufacturing Agents for the Magnaphone Co. under Mr. George R. Webbs' Canodion Potents No. 123363, No. 124537, No. 131145."

SYNOPSIS OF CANADIAN NORTH-WEST LAND REGULATIONS.

THE sole head of a family, or any male over 18 years old, may homestead a quarter-section of available Dominion Land in Manitoba, Saskatchewan or Alberta. The applicant must appear in person at the Dominion Land Agency or Sub-Agency for the District. Entry by proxy may be made at the office of any Local Agent of Dominion Lands (not sub-agent), on certain conditions.

Duties—Six months residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres, on certain conditions. A habitable house is required in every case, except when residence is performed in the vicinity.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead Price $3.00 per acre.

Duties—Six months residence in each of six years from date of homestead entry (including the time required to earn homestead patent) and 50 acres extra cultivation.

A homesteader who has exhausted his homestead right and cannot obtain a pre-emption may take a purchased homestead in certain districts. Price $3.00 per acre.

Duties—Must reside six months in each of three years, cultivate 50 acres and erect a house worth $300.

The area of cultivation is subject to reduction in case of rough, scrubby or stoney land.

W. W. COREY,
Deputy of the Minister of the Interior.

Caring for Heavy Hair.

My hair has been the wonder of all who have seen it for so long that I hape grown quite used to exclamations about it and questions as to how I made it grow so long and thick and glossy. The questions are easily answered; the process is simple and I think anyone who follows it will have beautiful hair.

When I was a young girl I had typhoid fever and my hair fell out until my head was bald in spots. A hair brush seemed an odd gift just then, but a good, soft wire hair-brush was given me and I used it, very gently, two or three times a day all the while my hair was coming in again. It came wavy, and I believe as a result of the frequent stimulating brushings, very thick and heavy.

I continued the use of the wire brush in place of a comb for years, though now I use, too, a heavy comb with long teeth set well apart. I do this because the comb is easier to use and my hair is heavy enough without more stimulating. There has been a great deal said against the wire brush, but I am firmly condinced that the swift and continued growtn of my hair was due solely to the stimulation the roots received, the increased amount of blood drawn to the scalp and the impossibility of dandruff formation, caused by the gentle action of the wire brush.

Of course this must be gentle. Harsh brushiog of the scalp or a snapping motion of the brush in the hair would be ruinous. But patient steady use of a soft wire brush will st art the oil on dry, lifeless hair, cure dandruff and make the hair grow soft and glossy. I have never used the first bit of any sort of preparation on hair or scalp, relying on cleanliness and care—and they have certainly proved enough: nor can poor health be sufficient excuse for poor hair, for I was a nervous invalid for years, doctoring all the time, yet my hair continued growing and kept its thickness and brilliance through it all.

Having always cared for my hair myself, brushing, dressing and shampooing it, I have learned by experience methods as easy for heavy hair and certainly as effective as any. The hair should be shampooed only once a month if it is protected by a cap when doing dusty work. Nothing is more disgusting or more injurious to the hair than to let it become so oily that it strings down flat to the head; or to see fluffy hair so dusty as to suggest a chalk mill.

The dry shampoo so much advert sed, I believe to be very harmful. They have been proved so, and it stands to reason that any powder strong enough in alkali to cut the dirty oil from hair and scalp could not be good for either, when one remembers that the scalp is even more sensitive than the face. Egg shampoos may do for thin hair, but very hot water is necessary to rinse out the egg and getting bits of cooked egg out of very heavy hair is no joke.

Having what is called a "tender head," I have learned to take a shampoo without pulling my hair, making my scalp sore for days, taking cold or leaving the job half done —and "here's how:" Into a foot tub or large wash bowl put plenty of soft, comfortable hot water and a teaspoon of baking soda. If the hair lacks oil omit the soda. Make a strong suds of good tar or castile soap, but put no soap directly on the hair. It is too strong and hard to rinse out. The stringy, lifeless condition of much freshly washed hair is caused by soap in it.

Comb all the tangles out of the hair and draw it over the face loosely, not tight enough to strain the roots the wrong way and make the scalp sore. Bend well over the tub and wet all the hair, then dash handfuls of suds upon the scalp and rub each handful in thoroughly, but gently, with the rounding tips of the fingers, not letting the nails irritate the scalp. Be sure each part of the scalp gets scrubbed—the sides and back are apt to be slighted while the crown and front are rubbed till sore. When the scalp is clean, rub the hair in both hands as you would wash a towel, keeping it under water as much as possible. Wring lightly, and put into clean, soft water as hot as you can bear. Repeat the scrubbing process to clean the soap from the scalp, constantly shaking the head to separate the strands and wash the soap all out of it. A second rinsing in cool water follows, and if this rinsing is thoroughly done, both hair and scalp will be clean.

Wipe face, neck and scalp a little, and throw the hair back over the shoulders at once—if it drys over the face the roots are stretched the wrong way and the scalp becomes sore. Fine linen towels or old linen cloth are best to dry the scalp, as they give off less lint than any other Much drying with towels is not best. When the scalp is comfortably "dry-scrubbed" sit in a low chair, rest the head on a cushion on the chair arm, and lay the hair on the radiator to dry, placing a towel under it. Shake it out every few minutes and it will soon dry in much better shape than if fanned dry, nor will you have that sick, exhausted feeling that fanning often gives. If no radiator is available, dry before an open oven. In summer, choose a breezy day and keep the hair well shaken while the wind and sun dry it for you.

Never try to comb the tangles out until the hair is thoroughly dry. Then a soft bristle brush, a wide-spaced comb and gentle work will soon dismiss the snarls. With the cheap, sharp, narrow spaced, short-toothed combs that most women use I do not see how they can expect to have nice hair. Fifty cents will buy a heavy, black comb with long, dull, teeth, widely spaced, that can be easily kept clean and will never break the hair. They are very durable and good economy in the end. Brushes and combs should be cleaned once a week, or they will work dust and grease into the hair. I find gasoline cleans them best and quickest, with least damage.

Wire hairpins are responsible for broken hair and for injured hair follicles by pressure of their hard, sharp ends. Bone or celluloid hairpins should be used—nor are they more expensive than the wire, in the long run, for the wire ones are so easily bent and lost.

As for the pads and puffs so severely condemned, I have worn as many as I liked and always dressed my hair in the prevailing fashion, and I cannot see that the pads have hurt it in the least. But I am sure they would have hurt it if they had not been removed and my hair combed and braided every night. What comfort would nice hair give it one could not wear it becomingly and modishly dressed? But what must one expect who keeps her scalp padded and puffed, or even leaves her own hair coiled upon it night and day? Let your hair "rest," lightly braided, all night and don't worry about a pad or two in the daytime. —Elizabeth Laverne.

New Brunswick Women's Institutes.

DEBATES IN INSTITUTES

Sometime ago I was asked the question, "Do you approve of debates in Institutes," and the reply I gave was, "Yes, I do, if not held too often.

A debate once or twice during the year arouses a great deal of interest and is a splendid thing, but the subjects chosen should be ones which could not possibly stir up friction. Whether debaters are on the affirmative or negative side their greatest ambition is that their side shall win, and very often members who are the greatest of friends before a debate begins, have anything but kindly feelings towards one another when it is finished, therefore it is well to avoid local questions on which members may become divided.

DEBATEABLE SUBJECTS.

The following subjects may be debated upon and many interesting and instructive points could be brought out, making the debates very educative:—

1. Do women on the farm work harder than tne men.
2. Should a wife understand her husband's business.
4. Does the housewife work harder
3. Can a woman be too economical than the professional woman.
5. Will better education tend to turn the boys and girls away from the farm.
6 Shall the wife have an allowance.
7. Which are the grestest labor-savers in the home, hardwood floors or carpets.
8. Which has the greater influence over one's life, heredity or environment.
9. Should children have an allowance.
10. Is Agricultdre the greatest of professions.
11. Are the girls of today as competent to take charge of a home as the girls of a quarter of a century ago.
12. Has the home of today as great an influence over our boys and girls as the home of twenty-five years ago.
13. Shall girls share equally with boys.

DEBATE BY MEMBERS OF THE CENTRAL NAPAN INSTITUTE

Recently the members of the Central Napan Branch debated upon: "Resolved that Agriculture is the Greatest of Professions." We shall publish one of their papers in favor of agriculture and one against it as being the greatest of professions. These papers show careful thought and study on the part of members debating and the points are strong on both sides.

RESOLVED THAT AGRICULTURE IS THE GREATEST OF PROFESSIONS.

Agriculture is the art which has for its object the production of plants and animals, or of food for man and beast. IT IS THE FIRST OF THE PROFESSIONS. In the Creation, God made man an agriculturist, thus above all other professions it has the approval of the Creator and in no other walk of life is man so dependent on God who sendeth the sunshine and the rain, and maketh the earth to bring forth her increase; and to no other worker has God given such a promise as is found in Prov. 12:01. "He that tilleth his land shall be satisfied with bread."

AGRICULTURE IS THE MOST HEALTHFUL OF THE PROFESSIONS.—In no other walk of life is there so great a chance for physical

WILSON'S
FLY PAD.
POISON

Every ten cent packet will kill more flies than $8.00 worth of any sticky fly killer. **Refuse substitutes, which are most unsatisfactory.**

developments, and our governments realizing this, look to the country to supply recruits to army and navy. Not only do country bred boys and girls develop sound bodies, but strong minds as well, as can be proved by looking over our college reports.

AGRICULTURE IS THE MOST INDEPENDENT OF THE PROFESSIONS.—The farmer is accountable to no man, his time is his own and if used wisely in research for best methods and application of same, success is sure to crown his efforts, as is evidenced by looking over the properous farm homes of Canada today which were not so very long ago an unbroken wilderness.

This walk in life, as in no other, can be shared in by all the family; its branches are so varied there must be some of its duties of pleasure and interest to all.

IT IS THE MOST BEAUTIFUL OF THE PROFESSIONS.—The changing seasons are ever spreading out a panorama, far more beautiful than the greatest artist can produce. What can match an orchard in the blossom time; a field spread with daisies and wild-flowers; lambs sporting on the hillside; and over all a beautiful sunset such as residents in cities never dreamed of.

I AM SURE ALL WILL ADMIT IT IS THE MOST NECESSARY PROFESSION.—Some will tell you we could not live without the doctor. Where does the doctor get his herbs and medicines? He is dependent largely on the agriculturist. Even the minister gets his most beautiful illustrations from the fields, as "consider the lilies," "the lost sheep" and the many others we might quote.

Our opponents will write up the many other professions in a masterly style I am sure, but can make no points to compare with those in favor of Agriculture.

The whole matter can be summed up in one statement—Do away with agriculture and you will have no means of supporting the human race, therefore no need for any other profession.

"Give fools their gold and knaves their power
Let fortune's bubbles rise and fall;
Who sows a field or trains a flower
Or plants a tree is more than all."

—Written by Mrs. A. G. Dickson, Chatham, N. B.

RESOLVED THAT AGRICULTURE IS NOT THE GREATEST OF PRPFESSIONS.

Ladies,—What is a profession? Webster tells us "the occupation to which one devotes one's self. Why should agriculture be the greatest of occupations? Is it superior or more admirable than the other professions or greater in the number of its followers?

For a profession to be truly great, it must tend to ennoble those engaged in it and must do the greatest good to their fellowmen.

"Howe'er it be it seems to be
'Tis only noble to be good;
Kind hearts are more than cornets,
And simple faith than Norman blood."

And although a good man may ennoble any profession, be it cobbler or the builder or designer of our finest structures, still, some professions have a gceater tendency to uplift than others. Now, is agriculture the greatest in this respect? I say, "No." A profession that ensures the making of wealth does not, we know, mean greatness. Kipling has truly said:

"And no one shall work for money
And no one shall work for fame,
But each for the joy of working
And each in his separate star,
Shall do the thing as he sees it,
For the God of things as they are."

Speaking in general terms, our farmers lead a busy and useful life and work hard; in some cases they are successful financially, but the average farmer has little money to spare, and with all the farmer's "boasted independence" there is little time for holidays or pleasure seeking. Other professions bring their annual holiday but to the farmer an occasional "stormy" day is very often his only rest from work.

Can we read Ian McLaren's "Beside the Bonnie Brier Bush" and not be fascinated, enthused, with the life of Dr. McLure. He who spent his days and many of his nights in relieving the sick, not for the gain in money, but for love of the little children and the men and women he attended. That picture of the old Scotch doctor and his faithful mare "Jess" stands for many in the same profession.

Can agriculture to whatever perfection it may be brought, compare with that of the skilful doctor and surgeon, healing the sick and bringing back life to the worn bodied?

Then the ministry, that healing of souls instead of bodies. Can the profession of agriculture be greater than that? With the life of such a man as Doctor Robertson, the great superintendent of Home Missions in Western Canada, as an example, the good which he has done, the love the people gave him, how his work lived after him, and how that grave in the cemetery in old Kildman has inspired others, we feel that no profession can be greater than his.

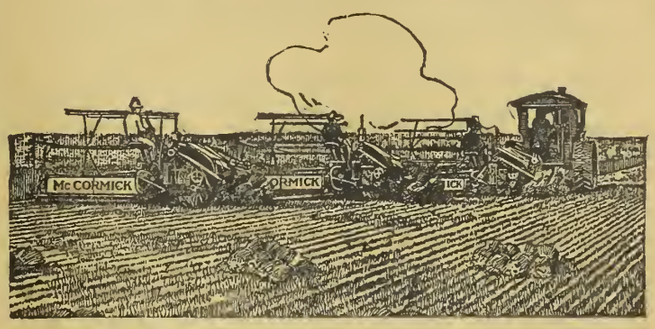
Can any farmer in any department of agriculture, no matter how successful, gain the love of his fellowmen, the honor and reverence after life is over, that we give to Livingstone, the great missionary explorer, or our Dr. Grenfell, the missionary doctor of Labrador? As our missionaries in foreign lands, what of their lives,—men like Dr. McKay, of Formosa; Dr. Geddie, and the men at work in our mission fields today. Can we say the profession of the man who has fields of waving grain; orchards, bending with their weight of fruit; herds of prize cattle, and horses; can his profession be "greater" than that of the missionary?

Then the doctor or minister coming daily in contact with so many people, their sympathies are awakened, their interests aroused and their minds broadened. The farmer, owing to environment, usually moves in a narrower groove. Interest in crops and in cattle, horses or sheep does not give the broadening outlook that constant human association does.

Ladies, I have only touched on a few of the professions, but in most of them we have our great men; those whose names are household words; "who leave footprints on the sands of time." Wellington, the great soldier; Nelson, the great sailor; Pitt the great statesman—and the great men of the profession of agriculture, where are they?

Can there be any doubt that agriculture is not the greatest of professions?—Written by Miss Lena A. MacLean, Centre Napan.

McCormick Binders



MANY years of McCormick binder experience have brought out the strong points of the machine and enabled the builders to devise features that make the machine still more efficient and satisfactory. There are a number of such features that insure a complete harvest of the grain, whether it be short, tall, standing, down, tangled or full of green undergrowth.

For Western Canadian fields the McCormick binder is built with a floating elevator which handles varying quantities of grain with equal facility. A third packer assists in the handling of grain that is very short or full of undergrowth. The improved knotter has only two moving parts. The tops of the guards are almost level with the platform canvas, leaving no ledge where short grain might accumulate.

For these and other reasons the McCormick binder is efficient in Western Canadian fields. See the McCormick local agent for full information, or, write the nearest branch house.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience**, we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. If you suffer from **pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid**, to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured**, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—**young or old.** To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, write **for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask for the free treatment to-day**, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309, WINDSOR, ONTARIO

TRY STEELS TEN DAYS FREE

It tells How to Keep Your Feet in Good Condition; Tireless, Powder-dry and Comfortable, How "steels" save your feet, your health, your money. Read my free book, "The Sole of Steel"—SEE and TRY my "steels" before buying workshoes.

O. M. RUTHSTEIN, The Steel Shoe Man, Dept. 62, TORONTO, CAN.

A Plea for Trees.

Most of my life as a teacher has been passed in country sections, and my home for many years was a farm —if a small one.

I chanced to hold schools in sections where there was very beautiful scenery. Varied influences caused me to take up, whole-heartedly, Nature Study, as we term it in our school curriculum. Fast following the nature student period, one finds oneself a nature lover, and to be a nature lover denotes real interest, a fondness for flowers, for bird, for forest habitant; for every babbling brook and placid lake, and for tree.

A few verses of a poem aptly express some enjoyment of the nature lover. To quote:

"Tis you shall have a golden throne
and laurels
and laurels in your hair,
And castled courts—but let me keep,
My leafy haunts, where woods are
deep,
For golden crest and black cap and
hermit thrush sing there,
And the willow-warblers plaintive
notes,
Make music in the air."
Great Kings shall bear you shoulder
high,
And poets praise your worth;
But leave to me my orchard stead,
With green boughs crossing over-
head,
The squirrel in the pine tree, the
wood-owls mellow mirth,
The rare things, the shy things, the
little things of earth."

The latter terms of my service in the country, I lost no opportunity to impress upon my pupils the wisdom of conserving our forests. Outside of school I placed a plea—as chance offered, and at public examinations, I always gave a lesson on trees. But all this was little. One may say, I myself was but awakening to the importance of the subject. Besides I had no technical knowledge of the great principles of forestry—trimming, culling and replanting. Then there was lacking the great spirit of co-operation to produce any results.

Now, I think this Institute could, and should place some enthusiasm in the preservation of our woodlands. And why should our association be interested?

Because, scarcely a better medium could be found to influence the rising generation of land owners, than the women of the farms, and the rural school teachers. Constantly the press sends out warnings of the dire consequences following a destruction of the forests. It is an oft-repeated lesson to state that forests are a prevention of destructive winds, irregular rain falls, loss of renewing soil, terrible floods and so on.

The value of forests in relation to water supply is not that they cause precipitation, but that they provide natural reservoirs for the storage of water after it has fallen, and that by giving it out gradually, they regulate and equalize the flow of streams.

Clearing the land about the sources and upper reaches of a river has a disasterous effect upon the river. It is a principle of nature—no forests—no waterways. Floods in China and in treeless districts of Europe and the United States afford striking examples.

Our neighbors in the United States is keenly feeling the result of the vandalism that swept their country, where the misuse of this great natural product has resulted in all sorts of losses.

Latest stastics prove, also, that the productive possibilities of much of their farming lands, has been ruined by the loss of surface springs, following the destruction of forests. This loss of surface springs brings it very close to everyday farming. Scientific farming primarily entails that knowledge which can combat conditions arising from this fatal error, this wantoness of the early settlers.

Present day farming with its schemes of tillage subsoiling and irrigation, delay the loss of production on account of the disappearance of this invaluable circulating system. But the great remedy remains—afforestation.

Frequently an alarm cry goes forth through the pages of some magazine or newspaper that should teach Canadians to check the ruthless onslaught of the axe and the saw.

But these warnings are received by most much as the little child accepts the terrors of the bug-a-boos— very dreadful—but, perhaps nothing in it.

Canadians should conserve their wonderful forests, a source of great wealth. It is said that the comparative value of Canadian forests is three times all its mineral wealth, and ten times its gold and silver out put alone. The wondrous uses to which wood is applied forces it ever in immense quantities upon the market.

In the Drexel Institute of Philadelphia, one may see a curious bit of clay stamped with strange characters, one of the earliest, so-called leaves of a book, read by the ancient Babylonians. Beside it is a massive scroll of skin bearing Hebrew text, and nearby is a fragment of Egyptian papyrus, telling its ancient story

In the evolution of printing material it is a far cry from the first use of plant life, the papyrus—to the present use of a spruce tree. And since those first pulpmakers, the wasps, taught some ingenious mind the possibilities of tree for printing material, probably there is no greater drain upon our forests than this call for pulp wood.

England alone imports 350,000 tons of ready-prepared pulp for newspapers only. And it takes for one day for newspapers for the city of London about 400 tons of white paper, made from pulp which denotes some hundred cords of wood per day—that in turn denoting an average weekly destruction of very many acres of the forests.

It is a lamentable fact that, to disseminate the knowledge that the forests are a source of great wealth, seems but to implant a spirit of greed which is the direct influence leading to their destruction.

But why kill the goose that lays the golden eggs? The farmer must learn the great principles of trimming and culling his trees and also the necessity of reforesting and afforesting. He must look upon the wood lots as first aid to preservation of soil, in short, as the assurance of his livelihood and that of his heirs.

"ROSS" Cadet Rifle

THIS NEW ROSS RIFLE SELLS AT $12.00

The Ross Cadet Rifle is a new .22 calibre rifle, made specially strong, and accurate, and absolutely safe, to meet the Government's requirements.

It fills with delight the heart of every youth who owns one and is quite good enough for any man to take with him on camp or trail, unless he is after big game—for which of course the other models of "Ross" should be secured.

The Ross Cadet Rifle shoots .22 shorts or longs, or 22 long-rifle cartridge and with its novel adjustable peep and globe sights, for which no extra charge is made, secures an accuracy quite beyond that of other 22 calibre rifles.

The price is only $12.00, If your dealer cannot show one, write for illustrated catalogue. We send it free.

THE ROSS RIFLE CO., QUEBEC

Something New for Men

Restore Your Own Strength--No Drugs

The free illustrated pocket compendium of private advice for all men, whether young or elderly, single or married, whether well or ailing (explained be ow), not only contains a great fund of necessary information upon certain avoided private subjects, telling you what to avoid, what to do and what not to do, but also fully describes a new small mechanical appliance called a VITALIZER which generates a natural force and which is now being worn by men all over the world who seek new manly vigor. You, yourself, no matter where you live, may easily have one of these little VITALIZERS to try out in your own case. Therefore, please use the coupon below and get this free pocket compendium by return mail. SANDEN. AUTHOR.

How would YOU, reader, like to be strong, vigorous, vital and manly once more, without an ache, pain or weakness? If you really seek and want this new vigor, this rugged manly strength, then please call at my office or write today and get my free book that you may know the whole wonderful story of this great, drugless, self-treatment, this marvellous little VITALIZER of my invention, which you wear comfortably on your body, and which sends its steady gentle, silent supply of FORCE into your nerves, blood and organism while you sleep,

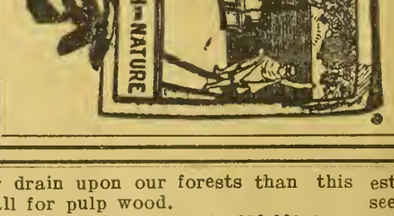
Real manhood with a perfect manly strength is not only nature's own gift, but, according to my belief, may easily be within the reach of practically any man. Of course, we all know that if is the husky, vigorous, vital fellow who attracts both women and men to him, and it is he, also, who is ever sought out and who achieves the really big things of life. Sturdy, vital manhood is, without doubt, the one great, silent universal power which fascinates us all, no matter how we may argue to the contrary. Therefore, reader, I care not what may be your age, nationality or creed, whether you are married or single, whether you are a bank president or work on the farm or in the shop, nor do I care how unstrung or nervous you may feel, or what past acts may have left you debilitated and enervated, I say to you in all seriousness, if I can show you an easy, drugless way by which you may treat yourself with the object of bringing back full vigor to your organism, then I will show you the road to new hope and new manhood. A man may be small in stature, yet as strong and attractive as a giant, or he may be big in stature, yet unstrung, nervous and unmanly. It is all a question of your own vigorous strength. Therefore, let me suggest that you call or write at once, then, after reading my book, if you decide you want to try out my little vitalizer in your own case, and will write to me sayingso, I will reply to your letter and guarantee to make an easy proposition which should enable you to have one of the vitalizers at once. At all events, you need the knowledge that my little book contains, whether you ever get a vitalizer or not, so please call or fill in and send the coupon.

Manly Men Fascinate the Whole World

NOTE—With special attachments my VITALIZER is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, nervousness and general ill health.

Free Self-Help Book For Men

I publish a little illustrated pocket compendium in booklet form, as mentioned above, which is meant to guide both single and married men along the road of Vigorous Health and Moral Rectitude, so they may be as vigorous and strong as the best, and may live to a ripe, healthy old age. There is a lot in this little compendium which every young or elderly man should know and can refer to from time to time with great profit to his own physical health. The booklet in one part fully describes my new VITALIZER, the great drugless self-treatment. If it is not convenient or if you are too far away to call, please write for this booklet today. It will come to you in plain, sealed envelope by return mail. Please use coupon. Office hours, 9 to 6.



Dr. M. F. SANDEN, CO.,
140 Yonge St., Toronto; Ont.

Dear Sirs—Please forward me your book, as advertised, free, sealed.

NAME.....

Address.....

The young of the rural districts should be trained in the fine distinctions of the value of a stripped wood lot and a conserved wood-lot. The first has a worth that it but for a time, while the other with judgment can last for generations.

The government of Sweden owns and cares for 18,000,000 acres of forest land. The proceeds from this state property pay for all workers in it, for the forestry schools, and a large portion of the public school expenses. This latter expenditure is no mean amount when it is considered that Swedish schools are splendidly equipped and education is so extensive that Sweden has the least percentage of illiterate inhabitants of any of the European nations.

In Norway and Germany all forest lands are maintained for public appropriations.

Each of these countries reap a high profit from its forest holdings, and more than that it is found that these lands are better today than they were at the organization of the system.

If it is thus a financial success in great con(erns, why not for the individual farmer ?

In wishing to reach a point upon which it may found an interest in trees, I will enumerare the general uses of forests: They furnish fuel and lumber; they regulate and promote, to a degree, rainfall; they protect the country from destructive winds; they hold water in the soil, thus preventing floods; they promote health by using poisonous gases and give off life-sustaining oxygen; in the decay of their fallen leaves and branches they furnish soil; they are the upkeep of a circulatory system through which surface springs are retained ; they are the breeding places of animals and of birds, those able but unrecognized farmer's friends. And lastly, they add beauty to the scenery. What we love we will preserve.

The members of this Institute could each do a share to implant in the young mind, the beauty and comfort of trees—then the profit.

A property that is beautifully set admist trees, is an addition to the community. Many, or most of the rural homes of our country stand devoid of these natural adornments. all rural school grounds lack them. Frequently lengthy roadways to a home subject one to unprotected heat in summer and bleak winds in winter.

With all the beauties nature has so generously lapished upon us, how little we are retaining !

Parts of our country become less and less lovely as the years pass by. Roads that should have been left as avenues, pleasurably to travel, have been ruined by cutting down all border trees. Lakes are fringed with ugly stump lands, none left for cattle shade, nor for beautifying the margin of water.

Now there's a profit in natural beauty. I have been told and I have read that England holds in its rural districts, much that is charming that the tourist finds vast enjoyment in their paths, roads and boating in and about their small towns and rural districts.

It is a fact that American cities and towns reveal more pride in trees than does the actual country. Bridgewater, I think, evinces generally, a more pleasing appearance in its residental quarters, solely through the care of trees than some portions of the surrounding sections do with all their better chances. Care for the trees you have! Plant new ones. Keep alive the spirit of forestry.

I will close with two thoughts of Ruskin:

First—It is the law of economy to make the best of everything.

Secondly—Everyone is intended to find an exquisite happiness in one's own least efforts.

The foregoing paper by Miss E. Bowers, a member of the Bridgewater, N. S., Institute, and read by her at their March meeting shows what can be done in the line of preparing an address for our Women's Institutes.

The Luscious Strawberry.

Old-Fashioned Strawberry Shortcake.—One and one-half pints of flour two rounding teaspoons of baking powder, one-half teaspoon of salt, butter size of an English watnut, one egg, two tablespoons of sugar, sweet milk to make soft dough, soft as can be rolled. Much nicer baked in small cakes. Prepare berries an hour or more before using by washing, slice and cover with cream.

Strawberry Cream.— One large tablespoon of butter beaten to a cream, add gradually one and a half cups powdered sugar and the beaten white of one egg. Beat till very light Just before serving add one pint of crushed strawberries.

Strawberry Pie—Make a crust same as for any pie and take one quart of fresh strawberries, select one pint and put on plate and sprinkle three tablespoons of sugar on them and one tablespoon of dry flour, then the other pint of berries, and three more of flour, roll out top crust, not too thin, and take a thimble and cut holes in crust about one inch apart. Be sure to get both edges of the crust on good and tight so juice will not run out.

Strawberry Blanc Mange— Dissolve one-fourth cup of cornstarch in one-fourth cup of cold milk and add to it one and three-fourths cups of sugar and cook over hot water, until the mixture thickens, then cover, cook fifteen minutes, stirring well. Remove from fire, stir in a cup of strawberries, and a few drops of vanilla. Turn into a large mold and set aside to chill. Serve with whipped cream and berries to garnish.

Strawberry Sherbet —Take the juice of a quart of strawberries, one pint of sugar, one quart of water, tablespoonful of gelatine. Soak gelatine in a little water and later add it to one cupful of the water, which has been boiled. Mix ingredients together and freeze. Fine with sponge cake.

Strawberry Rolls. —Cut biscuit dough in even pieces. Roll each a long narrow strip about one-half an inch thick. Place two rolls of strawberries on each strip, sprinkle with sugar and bits of butter on top also one teaspoon of hot water on each, bake quickly and serve hot.

Strawberry Whips—Sweeten and mash half a box of strawberries previously washed; add one cup of medium cream beaten until thick. Chill before serving.

Strawberry Layer—Make a medium size plain cake, using yoke of two eggs, teablespoon of butter, one cup of sugar, one cup of milk, cup of flour, two teaspoons of baking powder. Cream butter and sugar, add yolks of eggs, then milk, flour and baking powder which has been sifted togetber. Bake in thin plates. Layer —Mash two cups of strawberries, mash fine, add one cup powdered sugar, beaten whites of two eggs. Beat all until stiff and pile between pie and on top.

Baked Strawberry Rolls—Roll biscuit dough, thin, cut it in squares, and spread with berries, roll up the crust and put the rolls in dripping pan, just a little apart, put a piece of butter on each roll, spice it if you like, strew over a large handful of sugar, a little hot water. Set in oven and bake. Serve with sweet sauce.

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—

IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvellous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvellous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it towards the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyne, whether new or renewal subscription. When sending in money state which size you want. Send today.

We guarantee these burners to do as represented or money refunded. Extra burners 35c. each.

The Maritime Farmer

SUSSEX, N. B.

We are exclusive agents for these burners in the Maritime Provinces. We want agents for exclusive territory.

Household Pests.

Editor The Maritime Farmer:—

The following is a treatise on a few of the most common pests found in the household.

Housefly.

We are all familiar with the housefly. It is only within the short period of the last few years that people have become acquainted with the dangerous character of this insect, and only within the last two years has the public, generally, been awakened to the danger of the creature and the necessity of fighting it.

When the adult fly issues from its pupal sheath ts first impulse is to feed. Its sense of smell must be very keen for it knows the odours of cooking and it will fly imediately to the nearest kitchen. The mouth parts of the fly are so constructed that its food must be in liquid form. When it alights upon a solid a plentiful supply of saliva enables it to make some slight impression and to gain some sustenance. It prefers semi-liquids to liquids and solids. Thus custard pie is a typical food with the pest, the custard being of a semi-fluid consistency. The fly has been termed as persistet. This is true enough for we all know if we are unfortunate in having to eat a meal in a room where flies are abundant, we have to fight for every mouthful. Then again can we not recall the nuisance in the early morning when its persistency is evidenced in returning again and again to our faces while we are trying to sleep, in spite of the many slaps from us. After its rest during the darkened hours of the night the pest is thirsty and hungry and is attracted by perdspiration on the sleeper.

The housefly is not especially fond of bright sunlight. Therefore one sitting in bright sunlight is not so apt to be disturbed, but it revels in the shady porch and in the houses away from the rays. It flies into stables in search of a place on which to lay its eggs—the manure heap being the best breeding place for the ordinary housefly, although it is safe to say that it will breed in almost any fermenting organic matter. Thus, under ordinary city and town conditions a large percentage of the flies found in houses come from horse stables or their vicinitty. The fly which breeds on fermenting vegetable refuse from the kitchen is not the ordinary housefly but the so-called stable fly. This is an important point as the housefly is rarely found in houses and on food and is therefore not an important carrier of disease. Flies are great feeders. When there is an abundance of food they will suck at it incessantly, or at very brief intervals.

On account of the simplicity of its digestive processes, pathogenic bacteria and other micro-organisms pass through the alimentary canal unchanged. Therefore the question of fly specks is an important one. Every casual observer knows they are laid with great frequency and when flies are abundant the specks are found everywhere. The domestic fly has the reputation of being a dangerous enemy to human health. A certain speces of mosquito is the cause of yellow wfever, while the housefly is charged with being an agency in distributing typhoid fever, summer complaint, cholera infantum, etc.

The fly visits everywhere under the sun. It is impossible to keep it out of kitchens, dining rooms, cow stables and milk rooms. Flies walk over food and are the cause of one of the worst contaminations that could ocur from the standpoint of cleanliness and the danger attending the spreading of disease germs.

Certain authorities claim that owing to the frequency of the passing of its excrement there is greater danger from disease germs that pass through the fly's body than from those that are suposed to be carried on its feet. To avoid only the danger from flies you must destroy or protect from them all substances in which would be contained disease germs. To avoid the nuisance of ies it is necessary to get rid of them and in so doing obviate the danger.

The simplest way to attack the fly problem is to prevent them from breeding by abolishing all places where they can breed. By alowing them to breed in countless numbers and then to try keeping them out of the buildings, or killing them after they have entered, seems to be working the wrong way around. The second method is sometimes the only resort where, for instance, in cities and towns individuals are not able to have the co-operation of the Board of Health or the city authorities in the campaign. In the rural districts the hoseholder should care for his own surroundings in ways that will free himself from flies, but in city comunities this might not be effective as it needs the help and co-operation of all stable keepers in the neighborhood in the work. If the school children in every community were taught the dangers and habits, together with preventatives of the fly, the knowledge diseminated would be beneficial where sufficient interest were manifested.

Many devices have been invented for destroying these invaders, all of which are good. Caution should be exercised in the use of poisonous fly pads and liquids where there are young children, cats and dogs. A 10 per cent solution of Formaldehyde, sweetened, placed in saucers about the rooms where flies are found is an exterminator and is non-poisonous. All garbage and kitchen refuse should be burnt or buried within a few days, but at once if possible. All refuse should be covered and sprinkled with chloride of lime until disposed of. Windows and doors should be tightly screened during the summer. Milk, fruit and other foods should be covered with muslin.

Mosquitoes

The anoyance of the mosqito has been endured for many centuries without any effort being made to prevent it except in he use of smudges, skin applications and removing from localities where the pest is abundant. It has only been within a very few years that the discovery as a carrier of disease has been made, and consequently people have been awakened to its dangers to human life. As has been mentioned the mosquito is a carrier of the germs of malaria and of yellow fever. Malaria has been called by medical men a country disease. The malaria mosquito breeds in swampy regions, open streams with side pools of still water and more or less permanent but small accumulations of water. These places are not as a rule found in cities, or, at all events, only in the suburbs, whereas they are commonly found in the country. The rain barrel which catches the water from the roofs of our houses is another breeding place for mosquitoes. It can be plainly seen that the malarial insect does not accommodate itself to city conditions, but is found almost everywhere in the country, except in very dry localities and at certain high elevations. Where land is irrigated the ditches are proli fic breeding places for the mosquito.

Public interest has been so intensified to the danger of the mosquito as a disease carrier that antimosquito work has been extensively carried on in all countries, particularly in the United States.

First in importance is proper and thorough drainage and the complete abolition of breeding haunts. Numerous substances have been used to rub on the skin or to put near the bed as a protection against the mosquito. Oil of pennyroyal and spirits of camphor rubbed upon the face and hands or a few drops on the pillow at night, will keep away mosquitoes for a time. Oil of peppermint, lemon juice and vinegar, as well as oil of tar have all been mentioned and recommended as preventives of mosquito bites.

One of the most effective lotions is composed or ½ oz. oil of citronella, 1 oz. spirits of camphor. As a rule, a few drops on a towel hung over the head of the bed will keep the pests away for a whole night. Failing this method if the mixture is applied to the hands and face a few drops will suffice. This method is effective against all mosquitoes excepting the yellow fever germ carrier. This mosquito begins to trouble the sleeper at daybreak, by which time the efficiency of the above mixture is lost, and one is in his soundest sleep. If, however, one awakens and aplies a fresh supply of the lotion the result will be as effective with this last named mosquito as with those invaders of the night. A good mixture for use in the woods against mosquitoes and black flies will be found in mixing 2½ pounds of strained mutton tallow (while hot), ½ pound black tar

Ventilation In Your Barn

Too many farmers are content to overlook the important question of proper ventilation in their barns, yet nothing is more essential to the health of their live stock and the preservation of their crops and buildings.

Pedlar's "Superior" Barn Ventilator

is especially adapted for ventilating barns and large buildings.

It provides a constant upward current without any down draught, working continuously and most efficiently. It is priced much lower than other ventilators not nearly so satisfactory. Fully protected from the bird nuisance.

Get our Folder on "Barn Ventilation."

For Roofing your Barns, the big "George" Shingle (24 in. x 24 in.), with its positive four-side interlocking device, affords ideal protection against fire, wind, snow, and rain.

And for your dwellings and out-houses the "Oshawa" Shingle (16 in. x 20 in.), of identical quality and design, is equally effective. Get our Shingle booklet.

Best grade Corrugated Siding, and a variety of Sheet Metal products always in stock at all our branches.

Dr. Morse's Indian Root Pills

exactly meet the need which so often arises in every family for a medicine to open up and regulate the bowels. Not only are they effective in all cases of Constipation, but they help greatly in breaking up a Cold or La Grippe by cleaning out the system and purifying the blood. In the same way they relieve or cure Biliousness, Indigestion, Sick Headaches, Rheumatism and other common ailments. In the fullest sense of the words Dr. Morse's Indian Root Pills are 47

A Household Remedy

(Canadian tar). Allow to cool, but just before quite cold stir in three ounces of citronella and 1½ ounces of pennyroyal.

In considering the abolition of the breeding we must consider the habits of the different mosquitoes, but the breeding places of the most common household mosquitoes have been mentioned above and therefore all receptacles of water about the place must be done away with. Where it is necessary to have the rain barrel or tank they should be properly screened. In New Orleans and other Southern cities the Boards of Health are now enforcing such methods. Care should be taken in screening. A fine wire mesh should be used and fitted perfectly, leaving no possible crevice for the mosquito to enter. The premises about the house should be rid of tin cans, bottles and wooden or tin boxes in which water can accululate. The gutters on the roof should be examined frequently to make sure there is no clogging, thus allowing water to accumulate. Pans in the poultry yard, domestic animal water troughs, the water cup of the grindstone, all are places in which the mosquito will breed, and in them water should not be allowed to remain over forty-eight hours. The house mosquito will breed in many places which might be overlooked. Take for instance water standing in flower vases, water pitchers in unused guest chambers, in the tanks in water closets where those are not in frequent use. In sewers in dry weather they will breed and emerge through the entrance on the surface. Cess pools, unless perfectly tight with cement will breed these minute insects. A little kerosene will put a stop to this.

Remedies for Mosquitoes.

The degree of swelling and irritation resulting from mosquito bites varies with the different species of the insects, and in fact different idividuals of the same species vary in their effect. Household ammonia has been found to give relief as has also the application of alcohol while others have found glycerine to be most effectual. Touch the bite with glycerine and the soreness disappears in a few minutes. Indigo is another application which has been known to bring relief even after a lapse of a day or two. If a piece of ordinary toilet soap is moistened and applied to the bite the irritation ceases speedily.

Cockroaches

The roaches which abound in houses are to be found in kitchens and pantries, especially in the neighborhood of fireplaces as they are fond of heat. This accounts for them inhabiting the oven rooms of bakeries. During the daytime they hide behind the baseboards, furniture and places away from the light. Their bodies being at and thin, they are able to squeeze into small cracks or spaces where they would not be suspected of hiding. Unless midnight patrols are made the housewife often is not aware of the pest being in the house. The sudden entrance into a pantry or kitchen and the appearance of a light will start these pests on a flight for cases of concealment. Coskroaches feed on almost anything, being destructive to furniture, clothes and food. The greatest of care should be taken of dishes and pantry shelves where the pest has been discovered, as the roach leaves in its tracks a very penetrating, disagreeable and nauseating odor. Hot water and soap seems to be the only remedy for its extinction. There are two redeeming traits in the cockroaches character, namely they feed on and will be of actual service in removing dead animal matter and prey on that grievous insect, the bedbug. The spread of cockroaches from house to house can often be traced to being introduced with laundry, supplies, furniture, etc.

An effective and simple way of exterminating one's premises of the cockroach is found in fumigating with hydrocyanic gas, which gas is extremely poisonous to human beings, but can be supplied with safety by observing the proper precautions. Borax scattered along the water pipes in kitchens and bathrooms, on baseboards and in crevices of woodwork where the roach is known to exist often is effectual of ridding a place of these pests.

The Bedbug.

In spite of the best of care and the adoption of all reasonable precautions the bedbug may often gain access to a house. Its presence is not always a sign of neglect or uncleanliness. It will find its ways into trunks and traveling bags and thus be carried to a new abode. If these pests have been in a house previous to its being vacated by human beings, they will escape through the windows, pass along water pipes or gutters and thus gain entrance to an adjoining house in search of their usual source of food. A closely allied species is found in nests of the common barn swallow and it often hapens that these nests are fairly aive with those vermin. This speci often gains access to houses. In England there are at least three species all resembling very closely the bedbug On of these will be found in pigeon cotes, another in the nest of the English martin, while a third follows the frequented places of the bat. The true bedbug occurs occasionally in poultry houses.

The most characteristic feature of the bedbug is the pungent and disagreeable odour which it exhales, which is a great assistance in detecting its presence. The bedbug thrives mostly in filthy houses or old buildings which are full of crevices. In these crevices they are enabled to hide during the day. The bedbug is only active at night leaving the bed on the approach of daylight. They crawl into the cracks of wooden beds, or under loose wall paper. The eradication of this pest has been greatly facilitated by the use of iron and brass bedsteads, replacing the wooden ones.

To some persons the bites of the bedbugs are poisonous. Hydrocyanic gas as a fumigator is advised as its fumes reach the hiding places of the insects and immediately kill them. The application of benzine or kerosene to wooden bedsteads, introducing the liquid liberally by means of a brush or feather is the most practical method. The use of hot water, corrosive sublimate or oil of turpentine may be used in the same way.

The Woolen Moth (Tinea tapetzella).

This clothes moth is abundant in houses and does considerable damage to clothing and furs. The eggs are laid in summer and autumn upon woolen goods upon which the larvae feed; and as they grow they form cases to live in, and these often unite the folds in cloth and sacks into masses, when undisturbed. The caterpillars sometimes injure beans, peas and other seeds when stored in damp places. They are about ½ inch long, very active, fleshy and yellowish-white with long hairs scattered over the body. Furs may be preserved from the ravages of this moth by the simple expedient of storing them during the summer in paper parcels containing a few drops of gasoline, benzine or pepper sprinkled over them. These parcels should be carefully gummed up so as to close all apertures.—Mrs. A. Ethel Dunbrack, Supt. P. E. I. Women's Institutes.

Deering New Ideal
A Money Saving Binder

THESE Deering binder features appeal to the farmer. The elevator, open at the rear, delivers the grain properly to the binding attachment. Because the elevator projects ahead of the knife it delivers grain to the binder deck straight. A third packer reaches up close to the top of the elevator and delivers the grain to the other two packers. A third discharge arm keeps the bound sheaves free from unbound grain.

The T-shaped cutter bar is almost level with the bottom of the platform and allows the machine to be tilted close to the ground to pick up down and tangled grain without pushing trash in front of the knife. Either smooth section or serrated knives can be used. The Deering knotter surely needs no recommendation.

The Deering local agent will show why Deering New Ideal binders are the standard of binder construction. See him, or, write to the nearest branch house for a catalogue.

The Gold Dust Twins' Philosophy

THE floors and doors appear to wait until the dust germs congregate; the housewife hails each dawning day with grim and harrowing dismay. Says she: "My work will NEVER end; o'er dusty stretches I must bend, until, with aching back and hands I finish what the day demands."

The "Floor-and-Door-a" Girl

Then Mrs. Jones, one afternoon, dropped in, at time most opportune. An optimist, she knew the wiles of household work—its sighs and smiles. She told of how she polished floors and woodwork and the endless doors, until when Hubby saw them, too, reflections said: "Why, howdy-do!"

"The Gold Dust Twins," said she, "I find, help leave the woes of dust behind. Each mark of sticky hands on doors, each tread of muddy feet on floors, all fade before the slightest touch of Gold Dust, and the work is such that, when the woodwork has been done, I find said work was only fun." This line of reasoning must show that those who've tried it OUGHT to know. If you, in one day's duties, find that there's a Grouch in ev'ry Grind, invite the Gold Dust Twins to share such tasks as tire and fret and wear.

From kitchen floor to bedroom suite, these tireless little chaps make neat, and best of all, the sum expense is measured up in meager cents. They put both dust and dirt to rout and run the last old microbe out.

The Gold Dust Twins

Was Badly Run Down.

Milburn's Heart and Nerve Pills Built Her Up.

Mrs. Frank Blough, Sarnia, Ont., writes:—"I embrace the opportunity to write you saying that I have used Milburn's Heart and Nerve Pills, and found them very helpful to me. I was very badly run down, and was taking doctor's medicine. My son, out West, wrote me saying, 'Mother! you use the Milburn's Heart and Nerve Pills, they will be better for you than doctor's medicine.' This I did with good results. I often recommend them to other people. My doctor did not know I was using them, he used to say 'Why! I never saw any one's heart gain up like yours has. You do not need any more medicine.'"

Milburn's Heart and Nerve Pills are 50c. per box, 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Molasses as Dairy Feed.

Many inquiries reach his office asking for information pertaining to the feeding value of molasses.

In he south where molasses is plentiful and cheap it is fed in large amounts by intelligent feeders to all classes of live stock. In view of the fact that it contains a very large amount of carbohydrates in proportion to the protein, it acts as a fattener much as does corn and other carbonaceous foods.

Where it is given for the feeding nutrients it contains, it is considered almost equal pound to pound for corn. In the northern states where it is less plentiful and more expensive it is fed with, rather than in substitution of, other foodstuffs which are, as a rule, more economical.

Molasses is exceptionally valuable in giving palatability to other foods. In this connection it is useful for mixing with foods which are inexpensive but unpalatable, although they contain useful feeding nutrients. By mixing with them a small amount of molasses they are rendered palatable and consumed by animals with avidity. In this manner molasses becomes very useful and lessens the daily cost of rations.

Because of its palatability it is also useful in inducing cattle, that are being specially fed, to consume larger amounts of feed. Expert fitters of cattle for the show yard or sale ring recognize that tey can more quickly put their animals in condition by the use of molasses than without. Those who are feeding for large records of milk and butter-fat very often resort to the use of molasses and as a result are able to stimulate animals to consume approximately one-fourth more feed and thereby produce one-third more butter-fat than they would without the use of it.

Animals that eat molasses take on excellent codition and a shiny coat. This evidences the fact that molasses is very healthful to the digestive apparatus rendering it strong and efficient. It is reasonable to believe thereby that molasses aids digestion to the extent that the animal secures more nourishment from other foods consumed. It is a very valuable food when not overfed, but should be fed mixed with warm water and at the rate of not to exceed two or three pounds daily over a long period.

There is no real need of anyone being troubled with constipation. Chamberlain's Tablets will cause an agreeable movement of the bowels without any unpleasant effect. Give them a trial. For sale by all dealers.

FLORICULTURE.

Carnation, Truro, writes:—Some large plants of pink and white carnations that were taken up last fall and planted in a box in the cellar seem to be growing rapidly and turning white. Their foliage seems to be wilted and soft. These plants have been kept fairly dry and the cellar has been without any heat all winter; it is somewhat damp. The bottoms of the Carnation plants seem to be moldy. Should they be moved to the light and how should they be watered.

These plants are evidently affected by the long spell of mild weather past and have started growth to such an extent that it will be necessary to bring them to the light as soon as possible in order to save the plants. Try and get as cool a place as possible with sun-light only part of the day. Water moderately and spray the foliage frequently. The fungus will probably disappear after they are brought out of the damp cellar.

Amateur, Hillsboro writes:—I took up some roots of Spirea last fall and planted them in tubs with good drainage. They at once began to grow but they look spindly and weak. Some few branches are in bud but they are small and seem wilted. What is the matter? They have had plenty of light and a warm room.

The proper way to grow this plant is to dig it up just before the ground freezse and place it in a dark shed or out building, where it will freeze and remain frozen for about a month. Then if pulled it will generally come well. It should have plenty of sunlight and a cool room. The trouble with yours is that the roots have not had their period of rest before replanting. They have probably been grown in too warm a room. The only thing that I could advise would be to keep in as cool a place as possible with plenty of sunlight and be a little sparing of water but do not allow them to get dry. We grow hundreds of them at the green house in this way. The white heads make a very pretty show for Easter in churches, etc., etc.

Woodstock Correspondent writes:—Please advise me what to do with an Oleander that is becoming infested with brown bugs. They do not seem to grow but are spreading rapidly. It is also covered with a sticky stuff that seems to come out of the leaves. What shall I do for this? Also, it is hard to wash off.

The sticky substance is the result of the presence of the insects which can be removed by washing the plant with kerosene emulsion made by thoroughly mixing one part of kerosene oil with one half pint of sour milk. Stir thoroughly until a batter is formed of this. Take one part to fifteen parts of water stir frequently and apply with a cloth or sponge. Two applications will usually free a plant of these pests from the foliage leaving the plant clean and healthy. You had better put a clean cloth over the soil while working about the top as it is not desirable to get too much oil in the earth. This is good for ferns or any other tough-leaved plant that I have yet seen.

Time to plant Sweet Peas. As soon as one can get the frost out long enough to get them in for early bloom ing. Among the few bright colors that I try are the Black Knght (Spencer), Galdys Urwin, charming pale rose pink, King Edward Spencer, crimson-scarlet; Nora Urwin, a magnificent white; Primrose Spencer, primrose or creamy yellow; Prima Donna, deep pink; Fine Lady Grisel, Hamilton, pale lavendar—called the Orchid flowered Sweet Pea.

Value of a Pound of Butter Fat.

Acording to market conditions just at the present time a pound of butter-fat is worth probably less than 30c. Yet there are cases in which these figures hardly prevail as a true measure of value.

MONTREAL
Build a Better Silo and Save Money
BUILD the kind that will keep your ensilage always at its best. Build the kind of silo that does not have to be repaired or painted every other year. Your dairy herd will show its appreciation in the additional quantity of milk it gives. The best silo, by keeping ensilage perfect, increases output and soon pays for itself.
A Concrete Silo
is the dairyman's surest dividend payer. It keeps ensilage in just the right condition and does not permit it to dry out or get mouldy. A concrete silo cannot leak, rot, rust or dry out. It has no hoops to replace. Requires no paint and needs no repairs during an ordinary lifetime.
Send to-day for this free book "What the Farmer Can do With Concrete." It tells how to build a concrete silo and many other things on the farm that will save you many dollars.
Farmers' Information Bureau
Canada Cement Company Limited
709 Herald Building, Montreal
THE FARMER CAN DO WITH CONCRETE

Take for example the Guernsey cow May Rilma that has just completed a year's test making 1,073 pounds of fat. This is the production that she has given in twelve months. It exceeds the former world's record by about 15 ponds. Here is a comparatively small amount of butter-fat, but it is worth decidedly more than $4.50. It is this 15 pounds that made his cow the leader of all dairy breeds. The world is glad to honor phenomenal successes whether they be man's or beast's. When a horse makes a speed record, when a man does some great feat of value to the human race, when a cow is successful in producing more food for the human family and producing that food at a lower price, then the world collectively and the leaders individually are glad to honor these successes

The difference between the work of May Rilma and her nearest competitor a Holstein-Friesian cow Banostine Belle De Kol, is 15 pounds of fat. It is this small margin that has put a value on the Guernsey cow that can scarcely be measured by monetary figures. This amount of butter-fat has estabished a standard that marks May Rilma as Queen of the dairy world. Just what this honor is worth can hardly be estimated, yet it is the price of the 15 pounds of butter-fat.

This, of course, is a striking illusration that stands out from the large majority of cows that are being milked throughout the United States. Yet the same thing holds true in a measure in every dairy herd whether it consists of five cows or five hundred. Whether they be pure breds or grades. Whether they be kept in the ordinary farm stable or in he most elaborate cow palace that could be imaginedd. It all reverts back to the one question of weighing and testing, of measuring the value of the cow by means of the Babcock test and the milk scale.

The dairy farmer must invariably take this means to determine the true value of his cows if he would measure their worth. There is no other scale by which this measure can be ascertained and there may be May Rilmas in your herd—not May Rilmas that will compare with the present world's leader but those that will stand out in contrast with the other cows—here may be cows here that are making a handsome profit while others are causing you a loss every day. The only way to determine this is to weigh the test, to secure a definite understandng of each cow in the herd. Test and find them if you would make the best profit.—Kimball's Dairy Farmer.

Each age of our lives has its joys. Old people should be happy, and they will be if Chamberlain's Tablets are taken to strengthen the digestion and keep the bowels regular. The Tablets are mild and gentle in their action and especially suitable for people of middle age and older. For sale by all dealers.

Number of Bushels in a Bin.

During the past few weeks we have received a number of requests that we figure out the contents of bins of various sizes. So many of these have come to hand that we again republish from our issue of Jan. 20, 1905, an article and table on this very subject, as follows:

One of our subscribers asks us to publish a table showing the number of bushels in bins of various sizes. As the information asked for is of considerable interest, we have worked out the figures for any sized bin from 3 feet square up to 10 feet square. The exact measurement for an imperial bushel is 2,218.192 cubic inches. The number of bushels given for each measurement of bin is about as nearly correct as ordinary vulgar fractions will indicate.

In all cases the measurements are given on a basis of 1 foot deep.

When one of the dimensions of the bin is more than 10 feet, the contents may be ascertained by taking the measurements of two bins equalling the size to be considered. As, for instance, if it were desired to find the number of bushels in a bin 18 feet long, 7 feet wide and 5 feet deep, one would add the figures for a bin 7 x 10 to those for a bin 7 x 8; then multiply by 5. One foot deep in a bin 7 x 10 equals 54½ bushels; 1 foot deep in a bin 7 x 8 equals 43½. These added make 98 bushels in 1 foot deep in a bin 7 x 18 feet. Multiply 98 by 5 (490) and we have the number of bushels in a bin of the size stated.

Of course, when grain weighs either more or less than the standard weight, its measurements by weight will be somewhat different.

This table should be of considerable value, and might well be cut out and pasted in the granary.

Both A
Bread Flour
And A
Pastry Flour

"A woman always wants a reason, but never gives one".

So we are going to tell you just why "Beaver" Flour is a bread flour and a pastry flour —as good for one as for the other—*and best for both.*

Ontario Fall Wheat is the most nutritious wheat in the world — rich in flesh and strength building qualities and with a full rich flavor and splendid pastry making qualities.

Manitoba Spring Wheat has more strength than Ontario Fall Wheat—but is not so good for pastry.

Naturally, *the perfect flour* is the one that combines the good qualities of *both* Ontario and Manitoba wheat. *This is exactly what* "Beaver" Flour *does.* It is a *blend* of Ontario Fall Wheat and Western Spring Wheat. It contains *exact quantities of each.* "Beaver" Flour has the real home made flavor that a Western Wheat flour lacks—it makes deliciously light, tasty Cakes, Pies and Fancy Pastry.

135

Order "Beaver" Flour

for your next baking day. Put it to the test. Try it for *both* Bread and Pastry—and see for yourself the convenience and economy of using a true blended Flour. Dealers—Write us for prices on Feed, Coarse Grains and Cereals.

On Lightning Rods.

The protection of buildings from lightning is undoubtedly as important as the projection of transmission lines, still it is a matter to which little attention has been given. Where protection for buildings is provided at all, it is usually inadequate, and in many cases the danger is increased rather than diminished. The following are thought to be correct answers to some of the questions usually asked about lightning rods:

1. Should buildings in cities have lightning protectors?

Ans. No. On account of the increasing number of steel buildings, and overhead wires, city buildings are reasonably safe. Contrary to the general belief, telephone and power lines are splendid protection against lightning.

2. How many rods should be provided?

Ans.—The more the better. Four rods and four ground connections should be satisfactory for a building 40 by 75 feet.

4. What kind of material should be used?

Ans. Probably copper is a better material where the air is full of gas and smoke. There seems to be no advantage in having a stranded cable. A solid rod is as efficient and is cheaper. In the country galvanized iron rods or even galvanized iron pipe would be entirely satisfactory. The claim frequently made that copper should be used on account of its high electrical conductivity is not correct since the actual ohmic resistance of the material use has little to do with the efficiency of the rod.

4. What should be the shape and size of the rods?

Ans. Round rods or pipe are preferable. Sharp bends should be avoided as far as possible. The rods should terminate in a number of points five or six feet above the top of the roof. There is very little advantage in expensive sharp pointed polished points.

5. How should ground connections be made?

Ans. In the majority of cases a galvanized iron pipe driven a few feet into the ground is entirely satisfactory.

6. Is it safe to stand near a lightning rod during a storm?

Ans. No.

7. Is it safe to stand in a draft during a storm?

Ans. No.

Home Made Ice Box.

A cheap substitute for a refrigerator consists of nothing more than a box in a box with insulation between. This insulation should be about three or four inches of sawdust. The outside of the inner box and the inside of the outer box may be further insulated with heavy paper. Both boxes may be of rought lumber and each provided with a lid, or one lid may be constructed to fit both boxes and have a dead air space or insulation between. The inside of the inner box should be finished with galvanized iron to make it more sanitary and be provided with a drain to drain off the water from the ice. Into this inner compartment the ice is placed and may contain a rack for the things to be kept cool. A disadvantage of this box is that everything goes into one compartment. If, however, a large box is constructed, a partition may be placed in and one compartment used for ice and the others for vegetables, meats, etc.

If no boxes are available, one inch material with two by four inch material to give the space for sawdust, may be used. The object of having the layer of sawdust surrounding the inner box is to make it a non-conductor of heat, so that the ice will keep longer. If the joints are tight, and the box painted, this ice box will have a good appearance and be economical of ice and serve as a very useful article about the house on hot summer days.

When your child has whooping cough be careful to keep the cough loose and expectoration easy by giving Chamberlain's Cough Remedy as may be required. This remedy will also liquify the tough mucus and make it easier to expectorate. It has been used successfully in many epidemics and is safe and sure. For sale by all dealers..

Amatite

The Roofing that Needs No Painting

WHEN your roof is covered with Amatite, there is an end to the roof painting nuisance. Amatite has a real mineral surface and needs no painting. You don't have to get up on the roof every two years and paint it.

The mineral surface makes this unnecessary and it will stand rain and hail and wind and snow, for years without attention.

When you paint the old-fashioned roofings you are practically trying to keep them from getting wet. Amatite is made to get wet, for water won't hurt it a bit. Next time your old-fashioned roofs need painting, cover them with Amatite.

A sample of Amatite and booklet about it will be sent free on request. Address nearest office.

Electrical Treatment of Milk.

Professor J. M. Beatie, the Liverpool city bacteriologist, has presented his report upon the operations of the Earle Road Milk Depot, where, for some months past, experiments have been conducted in the electrical treatment of milk for the purpose of destroying bacteria. The professor's conclusions are that the electrical treatment of milk will destroy disease-producing bacteria. The main milk-souring bacteria are either completely destroyed or may be neglected as far as the keeping power of the milk is concerned for ordinary household use. The milk is not sterilized in the strictest sense of the word, but there is a reduction in the total number of bacteria by 99.93 per cent. over a series of 15 daily examinations.

The milk will keep perfectly sweet for at least three or four days after treatment, a period long enough to cover distribution and household use. The chemical constitution of the milk seems to be unimpaired and the taste is not altered in any way. In two cases in which the control supply was tuberculosis the electrically treated milk was non-tuberculous. The bacteria which remain both in their number and in their nature are not harmful and the milk is perfectly satisfactory as a food for infants.

Ayrshire Record Work.

The official testing of Ayrshire cows for advanced registry is having a wonderful influence on bringing the Ayrshire breed of cattle to the attention of all clases of dairymen.

The Ayrshire cow is proving her ability to make good on a poor pasture and scant fodder, and return to her owner a fair profit, and aso is showing that with the other extreme, she can give a coresponding return for the most abundant food supply and the best of care.

She is showing that marvelous ability to adapt herself to any and all conditions and to enrich her owner in just that proportion for which he has provided.

The Record of Performance Test proves this in the varied manner in which it is conducted, and from the thrifty dairy farmer's ordinary husbandry to the fancy farmer's scientific feeding at the hands of an expert.

The returns all along the line seem to be just in accord with the outlay, fair, good, excellent or phenomenal just as she may have had a chance for

"Maritime Farmer-" Coupon No. 3

LOOK HERE, SIR!

If you can get a suit valued at $25.00 in Canada for $12.50 from Catesbys in London---Will you buy it?

We undertake to prove to you that you can—if you buy from us.

You've heard that clothing is cheaper and better in London. You know, also, that you can't beat the quality of the genuine English fabrics.

When, therefore, we guarantee to sell you a suit made of fine English cloth, cut in the best Canadian, New York or London style (as you prefer) laid down at your door, all duty and carriage charges prepaid, for a price about one half of what you would have to pay in Canada, isn't that worth looking into? Of course it is.

Then sit down right now, fill out the above coupon, mail it to our Toronto office, and get our latest Style Book and patterns. With this book is a letter explaining our system of doing business and a self-measurement form which is so simple that you can't go wrong in using it. We'll also send testimonials from many satisfied Canadians who regularly buy from us.

Get Style Book and Patterns Now and Be Convinced

If you don't want to cut this paper, write a postal or letter, and we'll send the patterns any way, but to get them you must mention The Maritime Farmer.

herself, but always profitable.

Her wonderful beauty appeals to the fancy farmer and her wonderful money returns appeals to the dairymen trying to pay off his mortgage.

NOTE: We regret that in our last report the owner of "Selwood Milkmaid" 33429, was given as A. Hume & Co. It should have read, J. L. Stansell, Straffordville, Ont.—W. F. Stephen, Secretary Canadian Ayrshire Breeders' Association.

Cutworms—Some Timely Hints

Cutworms are very injurious this sprng. Reports of their destructiveness have come in from various quarters.

It has been found that poisoned bait made of bran mash, sweetened with cheap sugar or molasses, and made decidedly green with a liberal application of Paris green to be a very good remedy in the garden. A tablespoonful of this should be put oa frequent intervals among the plants subject to attacks, not, however, nearer than 12 inches to the plant; for in case of rain, the Paris green might be washed against the roots and would injure or kill the plants. Thorough cultivation is an aid. Pieces of shingle or board placed at intervals over the garden, serve as traps under which the cutworms hide toward morning, and where they can be found and killed. Frequently the depredators will be found within an inch or so of the plant cut, buried an inch under the soil. Young plants, like cabbage, cauliflower, etc., when first set out in a small garden, should be protected by paper or tin, or a barrier of some sort, which should extend into the ground an inch or so, and two or three inches above the surface. This can be removed when the plane becomes tough enough not to invite attack from the cut worm. On large acreages, fall plowing and thorough cultivation is perhaps the most practical treatment.

Suggestions and Reminders.

Watch carefully how your cultivator shovels are set. Don't go through the field and leave a fringe of weeds along the row. Tear up or cover all the ground.

Take an hour off once in a while, and, with one horse and a small cultivator, help the good wife cultivate the garden. You can do more in an hour in this way than she can in a day. Be sure, she will appreciate it, and you will actually think more of yourself if you will do this.

You like a pinch of salt in your soup, on your potatoes and meat. Don't you think the hogs would like the slop a little better if you would put in just salt enough to season it? Try it.

If you haven't attended to getting that self-waterer for your hogs in shape, don't delay it another day. Hogs must have good, clear, pure, water to do well.

It won't be long until the weeds along the fence on the public highway need mowing. Mow them while they are young and tender. An extra mowing or two during the summer doesn't take much time, and your place will be benefited in more ways than one and to an extent much greater than the outlay.

The first rainy day you had better look over the mower; see that all the sections on he sickle are tight; get the sickles all ground; examine the plates on the guards and see that they are tight. If the plates are dull, sharpen them; you can't get a decent job with dull plates. The rake should be gone over; see to it that all the bolts are in place and tight. If it is short any teeth, don't wait to put in new ones until the day you are ready to cut. Look the pitcher over carefully; see if your rope is all there and in good shape. You know how hard it is on your temper to start pitching and then have the old rope pull in two the first load. Don't put these matters off until the day we begin to hay.

Weeds and Their Eradication.

(Continued from page 607)

ing funnel-shaped. The seed is about one eighth of an inch in length, pear-shaped and dark brown in color. This weed has been introduced from Europe and in some sections of the Dominion has become very troublesome.

Wild Mustard is an annual weed found throughout the length and breadth of the Dominion. The stem is erect, from one to three feet in height; flowers are fragrant and bright yellow in color; seed is contained in a pod which, when ripe, splits open and the seeds fall out. This is a very troublesome weed in grain crops, particularly oats.

The Ox-eye Daisy is a very abundant weed, having been introduced from Europe and is now quite general. It is a shallow-rooted perennial, with stems one foot in height. The flowers are conspicious, being white with a golden-yellow centre. This weed seed is very abundant in timothy seed.

Canada Thistle has been introduced from Europe. It is a perennial with deep-running rootstocks. The stems are from two to three feet in height and erect. The stems and eaves are covered with a great number of prickly points. The flowers range from purple to an almost white in color. The flower heads are about an inch in diameter. The seeds are numerous and each has a number of long filmsy hairs attached to it, which enables the wind to blow the seeds about the country. These are frequently found in grass and clover seed, sometimes also in grain.

Perennial Sow Thisle, as it's name indicates, is a deep-rooted perennial. It has spread from the Atlantic seaboard westward to Manitoba and is also found in the more western provinces. The flowers are bright yellow and one to two inches across. The stem is generally about two feet high and hollow. The whole plan is filled with a bitter, white juice. The seeds are about an eight of an inch in length and resemble the seed of the Canada Thistle.

The above weeds may be taken as general representatives of the most common noxious weedsd. There are others that are classed as noxious in one province and as common in another province. Among the latter class may be mentioned the following:

Couch Grass.—This is a very common seed found in all kinds of soil. The roots extend under the ground and form a matted bed which interferes with cultivation. The flowers are inconspicious, being borne in spiklets of 3 to 7 flowers. The seeds are seldom found in commercial grains.

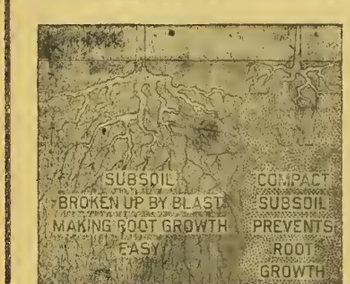
Sheep Sorrel has been introduced from Europe and is now common in all parts of the country. t is perennial and very hard to eradicate as its long fleshy roots extend far underground. The stems are slender about twelve inches high. The leaves are 1 to 4 inches long and arrow-headed in shape. The seed is nearly round and about 1-20 of an inch in diameter. This is one of the most common impurities in alsike clover seed. It is also very often found in the other commercial seeds.

Tall Buttercup.—This is a very common seed in moist lands. It is a perennial with fibrous roots. The stem is erect, 8 to 18 inches high. The flowers are bright yellow and the whole plant contains a slightly poisonous, acrid juice. The seeds are about an eighth of an inch ong, rouge in color from a greenish brown to black.

Common Ragwort.—This has been introduced from Europe and is quite common in Antigonish and Pictou counties, N. S. It is also found in a few isolated places in P. E. Island, Quebec and Ontario. This weed, owing to its non-prevalence in most parts of the Dominion is not generally known as a noxious weed, nevertheless, it is the cause of a strange and fatal disease of he liver in cattle. This disease was known as the Pictou cattle disease. For a time this disease was the foundation of much conjecture as to its origin, finally it was traced to this weed. The stem is sttiff and is about 2½ feet high. The flowers are yellow in colour and very showy. The seeds are creamy white in colour and about one-tweth of an inch in length. They are very seldom found in commercial samples.

Common Dandelion is a very well known pest in all well settled districts. It is a very common pest in lawns. The flower stalks are hollow, and, as the season advances, they grow longer. The flowers are yellow and very conspicuous. The seed is furnished with a hairy pappus by which the seed is spread by the wind. This pappus breaks off and is not present on seeds in commercial samples. This weed is very hard to eradicate when it obtains a foothold. The root is a tap-shaped root something like a carrot.

The above is a short description of a few of the most common weeds of the country. The most of these are very hard to eradicate when once well established. In the case of weeds, like every other farm pest the old adage of "an ounce of prevention, etct.," still holds good. A very good way to prevent the introduction of new weeds is to test all seed and grain and those found to contain weed seeds should be rejected.—John H. MacDonald, Cape Breton Co., N. S.



The above cut clearly demonstrates the advantages to be gained by planting trees in holes exploded with C. X. L. STUMPING POWDER. The ground is so pulverized that the roots can immediately expand in search of nourishment.

Also used for clearing land of stumps and boulders, ditching and subsoiling.

Women's Institute Meetings in N. S.

Editor Maritime Farmer :

Miss Jennie A. Fraser, Supt. of Women's Institutes in Nova Scotia, assisted by Miss Helen Dutcher, of Charlottetown, a graduate of ,Macdonald College, will hold meetings for the purpose of organizing Women's Institutes in the following places:

Canning—Monday evening, June 8th.
Lakeville—Tuesday evening, June 9th
Bridgetown—Wed. evening, June 10th
Round Hill—Thurs. even, June 11th.
Annapolis Royal—Friday evening, June 12th.
Bear River—Sat. evening, June 13th

During the following weeks these ladies will hold meetings in Yarmouth, Queens and Lunenburg Counties.—F. L. Fuller.

Strawberries After Harvest.

After the fruiting season is past the patch is mowed and raked, then the rows are thoroughly cleaned up, and made ready for the next year's crop. In our location we find burning over the beds inadvisable. Mowing, followed by cultivation with a five-tooth cultivator, a weeder and a hoe is our method. This disposes of the weeds and grass that may have sprung up during the fruiting season and covers up the crowns from which a new root system will spring up.

or

Chas T. White & Son,

SUSSEX, N. B.

The Noted Clydesdale Stallion

"Baron Kelvin"

Reg. No. 12462

will make the season of 1914 at the farm of J. W. Calbeck within one mile of Summerside, P.E. Island, and at Charlottetown. He has an unbeaten record in the show ring both in Scotland and Canada. In 1911 he won the championship at Toronto and Ottawa, defeating the best horses in Canada and in the same year he won first prize and championship at Ogdensburg, N. York, open to all breeds of draft horses. He is a massive horse, weighing about one ton and with superb quality. Service fee $15.00 for the season with return privileges should mare not prove with foal.

Also the trotting and carriage stallion

Capt. Aubrey

(48050)

the fastest trotting sire in Canada. Fastest producing son of "Peter the Great" in America Race record, 2-07¼. Trial 2.06¼. Record at 4 years, 2.15¼ on ½ mile track. Bay stallion 15.3½ hands weighing 1200 lbs., foaled in 1904.

Sire of "Aubrean" 2.17½ at 4 years and several others in the Standard List. Will stand for service at the farm of J. W. Calbeck Summerside, P. E. I. and in Charlottetown.

Service fee $25.00 with return privileges. Further particulars and cards of both the above horses upon application to

C. A. MITCHELL,
School St., Charlottetown.

or the owner,

JOHN RICHARDS,
Bideford, P. E. I.

Halifax Markets.

GRAIN—Oats, 49c to 51c. bus., bagged, 52c to 54c; Peas, whole $.00 bbl.

FEEDSTUFFS—Bran, $30.00 to 31.00 ton; Shorts, $31.00; Middlings, $31.00 to $32.00 ton; Linseed Meal, $37.08 to $39.00 ton; Gluten Feed, $32.00 to $24.00 ton; Corn Meal, $1.65 to $1.75.

GRASS SEEDS—Timothy, 8c to 11c lb.; Com. Red Clover, 19c to 24c lb.; Mam. Red Clover, 20c to 21c lb.; Alsike, 17c to 20c lb.

HORSES—Drafters, $250.00 to 275-00; Roadsters, $200.00 to $250.00; Carraige, $175.00 to $200.00.

DRESSED MEATS—Beef (carcass), 8c to 13c lb.; Mutton, 9c to 11c; Veal 6c to 9c lb.; Pork, 9c to 12c lb.

DAIRY PRODUCTS—Creamery Butter, 28c lb.; Dairy Butter, 22c lb.; Cheese, 15c lb.

POULTRY AND POULTRY PRODUCTS—Eggs, 20c doz.; Fowl, 15c to 18c lb.; Ducks, 18c to 20c. lb.; Geese, 17c to 20c lb.; Turkeys, 22c to 23c; Turkey Gobblers, 15c to 17c lb.

FRUIT—Strawberries, 20c box; Cherries, California, $2.50 box.

MISCELLANEOUS—Hay, $16.00 to $17.00 ton; Wool, 25c to 27c lb.; Beef Hides, 12c to 13c lb.; Calf Skins, 18c to 20c lb.; Sheep Skins, 75c to $1.50 each.

VEGETABLES—Potatoes, $1.25 per bag; Turnips, $2.50 bag; Parships, $2.25 bbl.; Cabbage, crate, $2.25; Tomatoes, $4.00 case; Cucumbers $1.00 doz.

LIVE STOCK—Lambs, $4.50 to 5; Steers, butcher, good, 7c lb.; Steers, butcher, common, 6c lb.; Hogs, 125 to 200 lbs., 9c.

Although recent despatches from Woodstock, N. B., stated a heavy slump in potatoes, it certainly is not in evidence on this market. Potatoes here are decidedly firm at $1.35 bag, and are scarce at this figure. Parsnips have had quite an advance and are now offered at $2.20 bbl. Turnips are also firmer at $2.50.

In the feed market, Bran and Middlings are high, the former is firm at $30 to $31 per ton, and the stocks of Middlings held are light. The price of live stock continues steady. Dealers, however, are holding shipments back from outside points, in order not to overcrowd the market. In the fruit trade, Tomatoes continue pretty firm at $4.00 per crate. Strawberries in quart boxes are now offered at 18c to 20c.

ONE CENT A WORD.

JERSEY COW—7 years, large, due latter part of July, big producer, quick sale eighty five dollars. Others coming in. J. F. Hall, Lunenburg, N. S.

Volume 19. SUSSEX, NEW BRUNSWICK, JUNE 23, 1914. Number 18.

A Systematic Rotation of Crops Enriches the Soil

And Swells the Farmer's Bank Account

By O. C. White, B. S. A., Ottawa

FOR the past ten years, experiments have been carried on to determine the reative value of different rotations or successions of crops. The results distinctly point out the advantage of growing crops in such regular order that after each crop the land will be left in the best possible condition to receive the one following.

Before presenting the results of our experiments to date, brief mention may be made of the chief reasons why a systematic rotation of crops is more profitable than long-continued growing of the same, or similar crops, on the soil.

1. Because different plants have different manurial requirements.
2. Because plants vary in their power to abstract certain foods from the soil.
3. Because plants do not feed to the same depth in the soil.
4. Because all plants are not alike in the residues they leave behind.
5. Because a proper rotation aids in the conservation of soil moisure.
6. Because some plants tend to produce better tilth than others.
7. Because certain weeds can be more effectively controlled.
8. Because different plants vary in their resistance power to bacterial and fungous diseases and to insect enemies.
9. Because the employment of a variety of crops distributes labor requirements more evenly over the season.
10. Because it practically insures the farmer against complete loss of a season's harvest.

The line of farming engaged in must, however, determine to a great extent the kind and relative amounts of crops that shall be grown, and may, in some cases, prevent following to the letter the rotation that would provide the largest returns. In any case it may be said that a good rotation will include (1) meadow or pasture, (2) roots, corn or other hoed crop, and (3) some cereal crop. The results of our experiments go to show that for greatest profits these crops should follow each other in the order named.

The following rotations have been devised to meet different requirements. One or the other of them is likely to be found suitable for conditions that obtain on the average live stock farm in Eastern Ontario and Quebec.

Rotation 'A' (Five Years' Duration).

First year.—Hoed crops. When corn is the hoed crop used, manure is applied in spring at rate of 15 tons per acre and shallow ploughed shortly before planting time, turning under clover and manure. After the hoed crop is harvested, land is shallow ploughed or cultivated.

Second year.—Grain. Seeded down with 8 pounds red clover, 2 pounds alsike, and 10 pounds timothy per acre.

Third year.—Clover hay. Two crops expected. Top dressed in fall with manure at rate of 15 tons per acre.

Fourth year.—Timothy hay. Field ploughed in August, top worked and ribbed up in October.

Fifth year.—Grain. Seeded down with 10 pounds red clover, which is allowed to grow to be turned under following spring when the hoed crop is corn.

This rotation has proven an excellent one here. When carefully followed, and when cultural operations were well performed, weeds have been kept under fair control, and crop yields have been maintained. One-fifth of the land is in hoed crop, two-fifths in grain, one-fifth in clover hay and one-fifth in timothy hay or pasture.

It supplies a relatively larger proportion of grain to roots and hay than the ordinary three or four-course rotation, and for that reason would be preferable where considerable grain is called for.

Rotation 'B' (Five Years' Duration).

First year.—Hoed crop. When corn is the hoed crop used, manure is appied in spring at rate of 15 tons per acre, and shallow ploughed shortly before planting time, turning under both clover and manure.

Second year.—Grain. Seeded down with 10 pounds red clover, 2 pounds alsike and 5 pounds timothy per acre.

Third year.—Hay. Ploughed late fall, manured at rate of 15 tons per acre.

Fourth year.—Grain. Seeded down with 10 pounds red cover, 2 pounds alsike and 5 pounds timothy per acre.

Fifth year.—Clover hay.

Though the arrangement is different, this rotation is very similar to 'A' in the relative amounts of the different crops it supplies. In 'A' both clover and timothy hay are provided, whereas in 'B' clover hay only is grown. 'B' has maintained crop yields, and has gvien profits equal to 'A' in the tests so far condducted, but, as indicated, does not answer the purpose where a ertain proportion of timothy hay is called for. It can, however, be easily extended into a six or seven-year rotation to include timothy hay or pasture. As a seven-year rotation the crops would succeed each other in the following order:—

Hoed crop; grain, seeded down with thy hay or pasture; grain, seeded down with clover and timothy; clover hay; timothy hay or pasture.

Rotation 'C' (Four Years' Duration).

First year.—Hoed crops.

Second year.—Grain. Seeded down 10 pounds red cover and 12 pounds timothy per acre.

Third year.—Cover hay.

Fourth year.—Timothy hay. Field ploughed in August, manured at rate of 24 tons per acre, worked at intervals and ridged up in late fall in preparation for hoed crops.

This rotation is most satisfactory from all standpoints, except that it supplies a rather smaller proportion of grain than is often desired. Where live stock is the mainstay of the farm, this is, however, a very minor fault. The turning of a shallow furrow when ploughing sod in preparation for grain or corn has been found to be good practice here. In preparing for roots, deeper ploughing or the regular plough with subsoiler is to be advised.

Rotation 'D' (Three Years' Duration).

First year.—Hoed crop. For corn, manure is appied in spring at rate of 18 tons per acre, and shallow ploughed shortly before corn planting time, turning under both cover and manure. For roots, land should be ploughed previous fall.

Second year.—Grain. Seeded down with 10 pounds red clover, 2 pounds alsike, 6 pounds alfalfa and 6 pounds timothy per acre.

Third year.—Clover hay.

This would be a most excellen rotation to put into practice where sufficient rough land was available to serve as pasturage. It is the rotation that would supply the greatest amount of forage of the best description for dairying or beef production. It ls better for heavy than for light soils.

Rotation 'E' (Three Years Duration).

First year.—Corn. Manure appiied in spring at rate of 18 tons per acre. Shallow ploughed shortly before corn planting time, turning under both clover and manure.

Second year.—Peas and oats mixed. Cut green for cattle. Seeded down with 10 pounds red clover, 2 pounds alsike, 6 pounds alfalfa and 6 pounds timothy per acre.

Third year.—Clover hay. Cut green for cattle.

This is a rotation specially designed to supply soiling crops. Two years' records only have been kept.

If a careful examination of the above rotations be made here will be noted a few desirable characteristics common to all:—

1. Grain fields are always seeded down with clover, even though it be used only as a fertilizer, as in the case of the fifth year rotation 'A'.
2. Grass and clover seedings are heavy. Increased crops of hay and rare faiures of a catch have justified them.
3. Hoed crops form a large proportion of every rotation. An attempt to farm a small area without a hoed crop was not successful. Weeds could not readily be kept in check.
4. No field is left in hay for more than two successive years. Our records show that the second crop almost always costs more per ton han the first, and that succeeding crops are very liable to be grown at a loss.
5. Barnyard manure is applied frequently, in comparatively small quantities rather than at long intervals, in large quantities.

In order that the net profits (profits after deducting the cost of rent, all manual and horse labour, manure, seed, twine and use of machinery) as well as the yields of these rotations could be determined, careful records have been kept of all items chargeable against the rotations.

The season of 1913 was so extremely dry that many of our crops were grown at a loss. The returns are therefore, very low as compared with the average returns for preceeding years. A re-arrangement of the rotations was made in 1912, hence averages have been drawn from the preceeding eight years only.

Costs, Returns and Net Profits..of Rotations 'A', 'B', 'C', 'D' and 'E'

Rotation	Cost to operate per acre	Value of returns per acre	Profit or loss per acre, 1913	Profit, average of 8 yrs. 1904-11
	$ cts.	$ cts.	$ cts.	$ cts.
A (Five years' duration)	17.55	19.40	1.85	8.78
B (Five years' duration)	21.83	21.47	— .36	9.03
C (Four years' duration)	17.08	16.97	— .11	8.15
D (Three years duration)	19.35	17.80	—1.55	10.08
E (Three years duration)	19.14	19.50	.36*	

*Records kept for 1912-1913 only.

Second Annual Convention of N. B. Homemakers

Forward the For Home and County Movement

With fine weather and an excellent representation of delegates form over the Province, the second annual convention of the New Brunswick Women's Institute opened in Fredericton, on Tuesday evening, May 26th, in the Assembly Hall of the Provincial Normal School

From the beginning of the first session to the end of the last session great interest was manifested on the part of the delegates present and the Department feels that each Branch chose wisely in sending the delegates they did.

As stated in my report, "the delegates make the Convention," therefore, considering the splendid attendance and the willingness to give and receive all possible help during the short time we were together, it is ample proof that our second annual meeting was a decided success and we trust the result will be an increased efficiency on the part of the members and the promotion of the work during the coming year.

To the readers of this page let me say that it is impossible to cover the whole field of work taken up by the Women's Institute in one convention, but the report given below will indicate the importance of the gathering.

Address of Welcome.

Mr. J. B. Daggett, Secretary for Agriculture presided at the opening session. In his opening remarks he explained why it was impossible for the Hon. Mr. Murray, Minister of Agriculture, to be present that evening and give the address of welcome as stated on the programme. He said the Minister would be present the closing even ing and address the delegates.

The absence of the Minister necessitated the address of welcome to fall to Mr. Daggett, who, as usual, was equal to the occasion and very heartily welcomed the delegates to the second annual meeting. Mr. Daggett referred to the advance made in Institute work during the past year and hoped the day would soon come when Women's Institutes would be in every corner of the Province.

In closing, he again extended a cordial welcome on behalf of the Government and trusted their sittings together would be profitable and pleasant.

Reply to Address of Welcome.

In her reply to the address of welcome, Miss Bessie Fraser, of Grand Falls, thanked Mr. Daggett and the people of Fredericton for the cordial welcome extended to them. She referred to the rapid strides made by the Women's Institute in New Brunswick and felt sure she voiced the sentiment of the great majority when she said that we do not want the vote. An organization with a motto "For Home and Country" must accomplish something, must make its influence felt. Miss Fraser said our work was unlimited. To us was entrusted the task of training young minds, of fitting boys and girls for facing the world and its battles and of learning to fight it nobly.

In closing, Miss Fraser said if the women of New Brunswick and Canada did but a little of this great work they would not have lived in vain; they would have fulfilled their destiny and some day they would surely hear the "well done."

Address

A visitor to the Convention was Mr W. W. Hubbard, former Secretary for Agriculture He was called to the platform, as he was really the father of the Institute movement in New Brunswick. Mr. Hubbard congratulated the women on the amount of good they were accomplishing. He told them in their hands lie not only the life of the country, the government of the country, but its future. The children that come from the home make the government. There can be no more noble work than by the woman co-operating in forwarding this work of making this one of the best spots on God's green earth on which to live.

Home Sweet Home.

How Women's Institutes Can Aid Our Public Schools.

The address delivered by Mr. R. P. Steeves, Director of Eementary Agriculture, was both interesting and instructive. Mr. Steeves divided his address into four parts with the following headings:—

1st.—Women's Institutes can aid the public schools, by acquiring a broader and more accurate knowledge of the aims and purposes of the public schools.

2nd.—By acquiring a knowledge of the work that is being carried on in the schools at the present time and the conditions under which that work is being done.

3rd.—By actively co-operating with teachers and pupils and linking together school and home interests and stimulating all to a better knowledge of the Province's resources.

4th.—By demanding that the teachers' responsibilities and duties be recognized in a greater degree than they are and that the profession of teaching be composed in a greater degree of mature men and women, who have an earnest purpose and settled habits and who are worthy of taking a leading position in the activities of the district and of demanding and receiving a good living stipend.

Mr. Steeves' address was considered so very instructive that the supervisor was requested to ask him to write a leaflet on this important subject for our Women's Institutes, going much more into detail and telling the women what they would have to do in order to be placed on the board of school trustees. The Supervisor interviewed Mr Steeves and he has kindly consented to have this leaflet printed in time to be read at the annual meeting of the school Boards.

Wednesday's Sessions.

The first part of Wednesday morning's session was taken up largely with the reports from the Branches, ten Institutes reporting at this stage of the meeing.

Mrs. C. W. Dobson, of Hillsboro, very kindly wrote a paper on "The Duties and Opportunities of our Officers and Members," but owing to illness in her family could not be present to read it, and her substitute, Mrs. H. M. Steeves read the paper. Suffice it to say that many excellent points were brought out and if all officers and members were to live up to what Mrs. Dobson says, the work would rapidly advance on all sides.

Supervisor's Report.

In presenting her annual report, Miss Winter, the Supervisor, referred to the growth of the work during the year, comparing the work done in New Brunswick with that of other Provinces. She told of the many advantages of the Women's Institute, mentioning its objects and aims, and dwelt at length upon the lines of work taken up during the year. Her trip to Nova Scotia to atend the Short Course in Household Science and the Nova Scotia Women's Institute Convention, and the Household Science Course held last April at Sussex, were mentioned, also libraries for Institutes, printed programmes and literature sent out from the Department.

Miss Winter devoted part of her report to the assistance the Institutes had given the public schools, and advocated that all school boards should have one or more women trustees. She hoped the day was not far distant when New Brunswick would have medical inspection of school children.

In conclusion, Miss Winter mentioned the many lines of work yet to be accomplished by the Women's Institute and she hoped the delegates would return to their homes enthused with the importance of the work and would continue to co-operate with the Department in systematizing the work and making it more effective.

Splendid papers and Addresses.

If space would only permit we would like to publish the papers read and addresses given at this convention, but not having room for same we can only say that each and every paper proved very helpful and the writers are to be congratulated on preparing and delivering in such an able manner what was requested of them.

The papers and addresses include:—"A Delegate's Duty," by Mrs S. B. Wass, of Fredericton; "Parliamentary Procedure and Business Methods for Institutes," by Mr. R. P. Gorham, of Fredericton; "The Care and Propagation of House Plants," Mr. John Bebbington, Sr., Fredericton; "Keeping Young People Interested in Country Life," Mrs. Chester Keith, President of the Corn Hill Women's Institute; "Programmes and Courses of Sttudy for Institutes," Mrs. James E. Porter, President of the Andover Branch of the Women's Institute; "Right Habits of Work," Mrs. Albert R. Fawcett, President of the Upper Sackville Institute; "How shall we increase Our Membership," by Mrs. Benj. Pomeroy, a member of the Enterprise Institute; "The Sanitary Home" and "Medical Inspection of School Children," Dr. W. H. Irvine, of Fredericton; and "What to Eat and Why," by Miss Imogene Jonah, of Sussex.

Nova Scotia Represented.

One of the features of Wednesday afternoon's session was the report of Miss Jennie A. Fraser, Superintendent of Women's Institutes of Nova Scotia, on the progress of the work in that Province. Miss Fraser has every reason to feel proud of the Branches in Nova Scotia. Although work in her Province was started only a year ago, Women's Institutes are well known in Nova Scotia and interest in the work is ever increasing.

We were also fortunate in having with us Miss Florence Brown, of Port Williams, N. S. She not only presided at Thursday morning's session but gave a very glowing account of the work done by the Port Williams Institute, of which she is a valued member.

Ontario Represented

Mr. Andrew Elliott, of Galt Ontario, was in the city Thursday and attended the afternoon session, when we had the pleasure of listening to him speak on Institute work in general. He not only paid the delegates many compliments but congratulated them on the advance they had made in Institute work. He said the women were at the head of all good work and there was nothing that was doing or could do so much good as the Women's Institute. Mr. Elliott concluded by saying he had never attended a Women's Institute Convention where the average attendance had been as good as it was in Fredericton.

Minister of Agriculture's Address.

The closing evening, Tuesday, May 28th, Hon. Mr. Murray was in the chair and addressed the delegates and visitors as follows:—

"I want to offer an apology for my non-appearance at the opening of this Convention. I had looked forward to being here, but important business called me away. I am glad, however, that my friend, Mr. Daggett, gave expression of my regret on that occasion and stated why I was unable to be present.

The last time I addressed a gathering on this platform was to the students of the Normal School—that intelligent body of young men and women who came here to complete their education. I was embarrassed on that occasion. If I was embarrassed then, in addressing a body of students, that feeling of embarrassment is intensified to-night.

MISS HAZEL WINTER

Superintendent of New Brunswick's Women's Institutes

I was to have extended, on Tuesday evening, a cordial welcome on behalf of the Department of Agriculture and the Government of New Brunswick. I did not want that expression omitted. Permit me to say that you are most heartily welcomed to this capital of the Province, and this welcome comes with a very great heartiness and a great measure of sympathy for your work from the Government of this Province. I had arranged with Mr. Clarke to accompany me here tonight, but he had, quite regretfully, to forego that pleasure. The hospitality of the city of Fredericton will be shown tonight by the Women's Institute of this city in giving a social at the close of this meeting.

"Matters relating to the Women's Institute movement have been gone into fully by Mr. Daggett, Mr. Hubbard and Mr. Elliott, and have been fully discussed. I am in hearty sympathy with the movement you have before you. I like the motto "For Home and Country." It means something, something which we all can appreciate.

"I was told this evening that a question was put in the box this afternoon, asking wheter or not it was right for women to vote. I also read, in an account of the meeting of Tuesday evening, that one of the women said: 'this is not a suffrage gathering.' It is not a suffrage gathering. I want to make myself clearly understood. We members of the Legislature have had a suffrage question put before us; some have had to take one side, some another. I myself took the side in opposition to the movement as it was introduced at that time. I made a statement then which I desire to make again; that when there is a general demand from the women of the Province of New Brunswick for a reasonable measure of women's suffrage, I am prepared to endorse thenr request, but when that request comes from a small section of the women of the province, which does not represent the women as a whole, I am not prepared to accept their request. So far as I am personally concerned, a gathering of women interested in the Women's Institute work is very much better than a gathering of women discussing women's suffrage.

"You are here tonight, having adopted as your motto "For Home and Country," for the express object of being home builders. I believe home builders lead to the highest ideals and acomplishments of man—home builders such as you are or desire to be. The influence of women on the life of every man is beyond expression. I desire to say that, because I know, in my own personal experience, the influence of women has been great. The man who aspires to advance to be a better man has, in some remote corner of his heart, the ideal woman before him. That woman may be a mother, sister or his wife, but with every man there is an influence for good being exercised, to a greater or lesser extent, all the time by reason of some woman.

"In speaking of the suffrage movement, why I do not like the idea, it is not because woman has not the judgment to decide whether this or that party is to run the affairs of the country, but because my ideal of womanhood does not lead me to look upon her as one who would prowl about the ballot box. The ideal woman is the one who guards the home.

It is to the wife or mother a man can go, in seasons of distress or trouble or discouragement, after having faced the discouragements in the strug gle for existence. The influence exercised over my life, as closely as I have been lead in the paths of right, has been the influene of my wife. One of the greatest influences for good over my life is the remembrance of kneeling at my mother's knee and saying "now I lay me down to sleep."

"Woman is worthier of something highert han mere political attainment. By encouraging and furthering a movement such as that in which you are engaged in here to-night, you are living up to the motto "For Home and Country." When you up-build the home, then, through that home, you are upbuilding the country, of which we are so proud to be citizens.

"This is an expression of my own personal opinion. Permit me to say that I give each person here tonight the right to hold a different opinion.

"Referring to the subject of Women's Institutes, I understand this movement began in the Province of Ontario about fifteen years ago. It is three years old in New Brunswick. first year sixteen organizations were formed. The movement has met with excellent results and the women recognize that through organizations such as these homes could be made more attractive and better in every sense of the word.

"Since 1911, I am advised, by the report which the supervisor submited to the Department, forty-one organizations, with a membership of 856, have been formed. I think it is a wonderful growth and tribute to the energy of the women. The possibilities before you are great and it is a work which is ennobling in its character.

"Having told you that the work is important and a good thing, you will ask 'What, then, as a member of the Government, are you prepared to do?' We are prepared to give just as much asistance to this organization as our financial resources will allow. This is a huge sum for a work which has only been in existence three years. We are prepared to augment that amount just as rapidly as the work grows and our finances permit. That is the attitude of the Government at the present time. In discussing this with my colleagues, they were in perfect sympathy with the work and believe it will do the people of this province much good in the future. The interest of the government in an undertaking is something that is sought by many people. Sometimes this assistance is sought for causes which are not altogether worthy; but a movement having for its object the upbuilding of home life, the upbuilding of the province generally, the Government is in hearty sympathy and is prepared to support.

"The movement and result of the work is attributed to the energy and foresight of the women of this province. We have in New Brunswick one of the best provinces in the Dominion of Canada. All of Canada is an excellent country, but I am convinced, after visiting many parts of Canada, that we have possibilities which many of us fail to realize. We have a country here teeming with possibilities. Our agricultural possibilities are just beginning to be realized. Our forests have for years given abundant wealth. Our mineral resources are great. The earth will still give up her substance and the fame of New Brunswick will be known as one of great possibilities, surpassed by none. In this beautiful climate we have raised up a race of people equal to any on the continent and the women of New Brunswick stand just as high as the men of this province, and form a citizenship of which any province might be proud. I believe that the people do realize the possibilities here and are beginning to take advantage of the great opportunities.

"For Home and Country." The basic object of the organization is the advancement of the home life, the uplifting of the home surroundings; that means loyalty. Loyalty in the home means loyalty in the country. What is loyalty? Blind faith as a ruler? It is something far away beyond that. It is that down in our heart which makes us proud of our home; and when we are loyal to our home we are loyal to the town and province, that begets loyalty to the great Dominion, and loyalty to the Dominion begets loyalty to the Empire. We must have faith in our future and a determination to advance our country's interests, not only along materialistic lines but along spiritual lines, which will uplift the life of each individual. On us as individuals rests a large amount of that responsibility. This working in harmony one with the other tends to raise the ideals of the country. We boast of our progress in material affairs, our armies and navies, but far greater than those and far more to be envied is the place that can boast not only of armies and navies but can boast of a contented people and happy and prosperous homes.

"It is your aim to make the province happier. I congratulate you on this. It is something which will go down to every individual in the province. I take advantage of the occasion which is offered to me, to extend to you the Government's most cordial welcome, to asure that whenever you visit here we will be glad to extend our assistance in every way possible, and to give expression to the wish that the work of the Women's Institutes will go forward with the same progressive spirit that you have retained up to the present time.

'Home is the dearest spot on earth. It has been said 'men make the houses women make the homes.' It is a great work which ies before you.

"As the responsible head of the Department of Agriculture, any assistance that I can give, any help that will be of benefit to this institution, anything that I can do that will not in any way conflict with the public interest, I am at all times willing and glad to give."

WATERLIGHT

This famous Thoroughbred Stallion was burnt to death when Mr. Geo. W. Fowler's barns were destroyed by fire last week. Waterlight was imported from Kentucky six years ago by the New Brunswick Department of Agriculture, and purchased at auction sale at St. John by Mr. Fowler, who paid close to $1,000 for him. On the turf, in the show ring and in the stud Waterlight has been a winner. His untimely death is a great loss to the horse breeding interests of New Brunswick.

SPECIAL FOR HALIFAX EXHIBITION

Since prize lists were printed, the Canadian Jersey Club has offered twenty-five dollars for championship male and female at this Exhibition.

Question Box.

As mentioned in Mr. Murray's address, the question box was a pleasant feature of this year's convention. At first we thought the women had no questions to ask, but when the hour arrived for the box to be opened, so many enquiries were encosed some had to be left unanswered with the promise that the next issue of our Official Organ would contain the questions and answers.

Musical Programme in Connection With Convention.

During the afternoon and evening sessions solos were rendered by Miss Mary Gibson, of Marysville, N. B.; Miss Florence Brown, of Port Williams N. S., and a piano duet by Miss Bessie Everett and Miss Mildred Walker of Fredericton.

Presentation

A happy interruption the closing evening was the presentation of a cut-glass ink-well and stand and toilet bottle to Miss Hazel Winter, the Supervisor, by Mrs. S. B. Wass, on behalf of the Women's Institutes of New Brunswick. Miss Winter suitably replied.

Delegates entertained by Fredericton Branch.

A muscial programme, consisting of vocal and instrumental music, followed by a reception was tendered the delegates and visitors present by the members of the Fredericton Branch this brought to a close the second annual conevntion. The next convention will be held at Fredericton, pprobably the first week in October, 1915.

A complete report of the convention, including papers, addresses, reports of the Institutes, etc., is to be printed in the near future, and may be had upon application to the Supervisor at Fredericton.

A Handy Garden Tool.

Take an old hoe, the wider and larger the blade the better. From a piece of pastboard cut a portion the size and shape of hoe blade, then space this off so that from four to six narrow blades or tines are drawn with the pencil similar to a rake, only the tines should be from ½ to ⅝ inch wide. Cut out clean the intervening spaces, place over the hoe blade and trace with an awl or file shank the outlines of the pattern upon it. With a heavy, sharp, cold chisel cut away the steel as indicated and afterwards file away all the rough edges and shape it to suit. Various formed rakes, scuffle hoes, weeders, etc., may be thus easily and quickly made to suit the fancy and kind of work required.

Special Prize for Sheep.

A silver cup is offered for competition at the St. John Exhibition for best judging of sheep by amateur.

A Sweepstakes prize of $25.00 is offered for competition at the St. John exhibition for "Best Stallion, any breed as evidenced by six of his get."

THE MARITIME FARMER.

ENTOMOLIGICAL WORK IN THE VALLEY

Prof. G. Gordon Hewitt, Dominion Entomologist was in the Annapolis Valley recently conferring with his officers in that district.

Field Officer Geo. Saunders is carrying on the work in that district. The bud moth is the special study of Mr. Saunders at present. On June 26th, he has arranged for a demonstration on the bud moth to take place in the fine young orchard of Mr. Ralph S. Eaton. It is expected that a large number will be in attendance as special trains at excursion fares will be run to Kentville that day.

Every fruit grower should attend this meeting. Mr. Sanders is in a position to demomnstrate from observation some terse results from two years spraying on a block of Wagner trees in Mr. Eaton's orchard in controlling the bud moth.

Upon this subject Mr. Sanders says:

Any orchardist who is at all in doubt as to whether spraying pays may be certain that the benefit derived from controlling bud moth by his two sprays, one before and one after the blossoms, will more than pay for the entire cost of applying four sprays to his orchard. I am not decrying the other sprays in any way; they are as useful as the two here spoken of for other purposes, but we are in a position to state with certainty that we can control bud oth to such an extent in the Annapolis Valley that the benefits derived from controlling it alone will more than pay for the entire cost of spraying.

I need hardly say that it is, above all, necessary to use the most adhesive poison obtainable, such as paste lead arsenate.

The Provincial Entomologist, Prof. W. H. Brittain's squad of nine San Jose Scale inspectors have been working between Truro and Windsor and will continue westward to Digby before going on to work in Yarmouth and Lunenburg counties. In the course of a recent interview, Prof. Brittain said: "We have not found a live San Jose Scale. It is also pleasing to notice that the Aphis has not been so scarce for years. We had anticipated a scourge of this pest this season, but its parasites have been busy and the result is good."

JERSEY CATTLE CLUB

The Canadian Jersey Cattle Club was one of the last of the pure bred cattle organizations to commence the work of registering the National Live Stock Records. However, since they commenced, the work has gone on very satisfactorily till now there are almost five thousand registrations. The Club has also made most exceptionally satisfactory strides in Record of Performance work that there are now about seventy cows which have qualified for the Record of Performance yearly test. These represent animals from a great many different herds and imported animals as well as Canadian and United States bred animals. Jersey cows from almost every province are qualified on the Record of Performance, however, it has only been within the last year or so that the breeders have fully awakened to the great value to be derived from this yearly testing, that now more breeders are entering cows almost daily. Perhaps there is as great value in this work from a selfish standpoint, that is, that a man may know his own cows, as from any other standpoint, but from a monitory standpoint it helps one wonderfully when the come to sell stock from Record of Performance ancestors. It is most interesting to study the breeding of the cows which are qualifying on this test, however, to date, there have been but two sires whose names have entered the list.

To be enrolled upon this list a sire is required to have four daughters each from a different dam qualified. The two sires whose daughters have accomplished this for them are Brampton Blue Beam, who was bred by B. H. Bull and Son, of Brampon, Ont., and who has since been in service in their herd; that of James Bagg and Sons, Edgeley; that of Joseph M. Dolson, of Fallow, and now stands at the head of the herd of C. A. Julien Sherman, at Red Deer, Alta. The other bull which has qualified is Mary Maid's Brigadier, No. 695, who has been at the head of the herd of A. H. Menzies and Son of Pender Island, B. C.. This bull was bred by H. C. Taylor, of Oxfordville, Wis., and is sired by Mary Maid's third son, a bull which traces back into the families which produced some of the cows which made Jerseys famous at the World's Columbian Exhitition at Chicago in the early nineties. Several other bulls have one, two and three bulls qualified and it is to be hoped that in the near future there will be many more sires with sufficient daughters qualified to have their names on the honor roll.

THE WOMEN'S INSTITUTES

The Women's Institute Movement is going on apace. On another page of this issue will be found a report of the convention recently held in Fredericton. Encouraging reports also reach us from Prince Edward Island and in Nova Scotia Miss Fraser is working away, extending the usefulness of the organization in her province. Accompanied by Miss Grace Dutcher, teacher of Domestic Science in Prince of Wales College, Charlottetown, she has been holding meetings in the Annapolis Valley and a number of new institutes have been formed.

STUDY ON FARM ANIMALS

We understand the Peabody School of Education, University of Georgia, has issued a nicely illustrated bulletin, the main object of which is to bring out the impoprtance of cattle husbandry in rural education. The bulletin illustrates the different dairy and beef breeds and contains instructive material in use in rural schools.

"This bulletin," writes Professor Odum, head of the rural education work, "will have a wide range of circulation and will go into schools throughout the south. I think it will develop the right sort of sentiment and have its results in improved cattle in Georgia."

"The time is coming, slowly but surely, when our rural school boys and girls will be studying about the respective breeds of horses, cattle, sheep swine, poultry, etc., rather than about tropical and other animals and birds that, perchance, they may never see unless they visit a menagerie as was so ably said by our friend Rev J. Hunter Boyd, before a meeting of the N. B. F. & D. A. at Fredericton several years ago when he was trying to impress his audience with the necessity of more agricultural teaching in our rural schools.

AN ESSENTIAL TO HERD INPROVEMENT

The first step in herd improvement is in the selection of a suitable bull. Such a bull, besides being a well-developed individual, with strong constitutional and vital powers, must be purely bred in order that he may have sufficient prepotency to transmit his characteristics to his offspring, no matter what may be the qualities of the females with which he is mated. He is likely to be found in a herd all the members of which are uniform in productive capacity and have been bred under the same conditions for a number of generations. A bull useful as a prepotent animal to mate with common or mixed females, is quite as likely to be the son of parents of something more than average merit as the offspring of what some are pleased to call "phenomenal" animals.

In the columns of the Maritime Farmer will be found advertisements of breeders of quality stock in all the popular breeds. When you are prepared to purchase a sire to head your herd or flock and have decided upon the particular qualities required make your wants known to our advertisers. You will get as good value for your money by patronizing the home breeders as you will by going farther afield.

USE AND ABUSE OF WORK

The most positive feature about the affairs of people in both country and town these days is a quiet determination to perform some useful, profitable work. This is in marked contrast to the atmosphere which pervaded the country the past three or four years. True, many people have been consistently engaged in honest productive work, but there has been a vast army of half-idle men who have been trying to get something for nothing. This element is now not so prominent, in fact, scarcely noticeable. They have gone with the decline of the fever of speculation and we are fast settling down to the humdrum of taking wealth from the soil and distributing it in exchange for necessities of life. The reaction from the "easy come, easy go" sort of existence to which many had become acustomed and which many felt is not the most agreeable thing that could happen, but natural forces do not permit of continued violation of the rule, "by the sweat of thy brow shalt thou eat bread." And just to the extent that wealth has been accumulated by means other than giving value to that extent has the rule been violated and the penalty must be paid in harder work, which crystalizes in the form of interest to be paid.

In nature the only recreation that is allowed is that taken in the pursuit and operation of natural function, work, and natural forces are just as powerful in the every-day affairs of people. If we will have joy and pleasure without remorse or the penalty of paying in some other form we must be careful not to give ourselves up too largely to the pursuit of non-productive efforts which are wasteful of time and energy.

The man who improves a highway is a public benefactor. Let farmers' public spirit manifest itself in well-dragged roads. Let every farmer drag the roads bordering his land after each rain, and improve them 50 per cent. The effort is worth while and should appeal to the pride of every land owner and tenant. Let's drag the roads all summer.

Destroying the Cabbage Worm.

The cabbage worm is well known to every gardener and works a great deal of damage every year, destroying cabbages, cauliflowers, turnips and even flowering plants which have succulent leaves, such as stocks, mignonette and nasturtiums. There are two varieties of cabbage worms, the native and imported species, but they both resemble each other and both are destructive. They feed on the leaves of the plants mentioned, and it is a common sight to see a whole cabbage patch with every leaf perforated with holes. If they are allowed to get a start and are unmolested they will in a short time destroy the whole crop.

Description of Cabbage Worms.

The imported cabbage worm is green in color, while native species are bluish, with yellow stripes. The full-grown caterpillar is about an inch and a half long. Towards the end of summer, when it's work of destruction is over, the caterpillar passes into the chrysalis stage, and in the spring or early summer, the butterfly or adult emerges. ' She lays her eggs on the under side of the leaves, where they hatch in about a week, and as there are several broods a season the garden is again quickly infested.

The butterflies of both sspecies, imported and native, resemble each other very much and are hard to tell apart. They are generally white, with black marks on the upper side of the wings and yellow or green markings on the lower side.

Method of Control

Pyrentheum powder is a well established remedy. It should be mixed with five times its bulk of flour and dusted into the cabbage just at nightfall. In order to make the mixture effective the flour should be mixed with the pyretheum over night.

Paris green and arsenate of lead are also used to good advantage, but there is a danger of these poisons being injudiciously handled and their use is therefore not highly recommended, although careful tests have been conducted which show that there is little danger in using these insecticides at any stage in the growth of the plant. The safest time to apply Paris Green is just before the plants begin to head. It should be mixed with 25 times its bulk of flour, road dust or sifted ashes and applied to the affected leaves.

Big Turnip Tournament.

Young Agricolas of Cumberland are off on their first lap of the race for the best turnip patches. When the seeds they are now sowing reach maturity in full blown "neeps" they are to meet the gaze of agricultural experts and their merits pronounced upon as standing stock and for the roots they produce for the Maritime Winter Fair.

Young Cumberland is out to show young Cochester that the boys of this county acknowledge no better at the game of farming. Once they have said so and backed it up with a prize patch of perfect specimens, measuring 1,250 bushels to the acre. That was last year. What this year holds in store is mere conjecture. Colchester's youthful farmers ran a close second with a field yielding only 75 bushels less. Profiting by their past experience, it is only natural that they better their efforts over in Colchester and the same principle applies here also.

This turnip raising idea has been expanding and developing fast since its inception three years ago, nuitl now no small measure of skill and industry is brought into play as the competing patches are watched and groomed throughout the summer.

The competition has grown until between two and three dozen farmers in Cumberland alone nurture choice seedlings which are tended and coaxed along by ardent farmer lads.

Quantity and Quality Grow.

Why turnips have been chosen of all vegetables is explained by the philanthropist who three short years ago founded this farming festival. A Nova Scotian waxed wealthy in New York, he turned his mind to some method of helping his home province. He conceived the thought that to promote live stock raising here the way could best be paved by providing cheap fodder grown at home—turnips. The scheme was soon set in motion with the help of Charles Hill, of Ouslon; F. L. Fuller, Truro, and Professor Cumming, of the Truro Experimental Farm. Prizes of $75, $50 and $25 were put up in Cumberland and Colchester and a check covering all expenses was sent along by this anonymous giver. This has been done three seasons and is to go on indefinitely. The entry list has grown each year and already there is a marked change being wrought in local agriculture, as the quality standard of cattle feed is being raised in keeping with a quantity increase.

Pictou Caught on.

An evidence of the far-reaching effect of this forward movement in farming is the staging of a similar contest in Pictou county this summer. Pictou knew a good thing when she saw it, and private subscriptions have provided prizes for a turnip growing competition there.

Here is a concrete idea of what an acre of turnips will do: Last year the largest production was 1,350 bushels, one acre of ground growing 40 tons of cattle feed. An acre of corn reared 10 feet higgh will yield 20 tons of silage and it looks an enormous quantity. But this turnip field doubled that record. Wherefore the choice of turnips as the cheapest nourishing fodder. To further extol its virtues, this one acre plot produced enough to feed 20 cattle 40 pounds a day for three and one-half months. Along with straw and a little grain it would fatten more than treble the amount of beef raised on the average farm of the east.

To equalize the competition only boys between 15 and 20 years of age and resident on farms assessed at not more than $3,000 can enter. Finally the prize money must be used for some such purpose as improving the farm, adding to the live stock, paying for an agricultural education or other scheme approved by the judges.

The donor of this gift has certainly the satisfaction of accomplishing something tangible in his native province. He not only has founded an industry of itself and developed another but he also has awakened the farming instinct in the plastic youth of the land who thus learn to extract its real wealth most effectually.

Neglected Roadsides a Serious Evil.

The roadside is not only a hotbed for weed seed production, but a clearing house as well for seed distribution.

It is becoming more apparent each year that something must be done to relieve the scarcity of farm labor or the roadsides will become even a greater menace than ever they have been in the past. A pathmaster said the other day that he had tried to get someone to cut the weeds on his road beat, but failed to find anyone who would do it, even when the labor cost would be applied on their road tax.

The writer was recently traveling along a public highway which lay through what had been at one time a swamp, but was now drained, and some of the best of land was lying on either side of the road. The turnpike was high, and a ditch ran along the one side. Between it and a crop the farmer who owned he adjoining farm was cutting down the weeds. I stop-work, and incidentally remarked that I would see that the proper person was notified to cut the weeds on the roadside. A mower run up and down about twice would have made quite a clean job. The farmer said it was a county road, and some of the residents thought the weeds left standing there would retain the snow on the turnpike in the winter. I told him I had gone over the same road last spring before the snow had gone, and there was from two to three feet of snow on it, and that I considered their excuse a lame one.

"Well," said he, "as you see I have gone along the distance my farm extends and cut out one of the weeds there."

"Yes," said I, "I see it is the bue weed." "Oh, that's what you call itt?" "Yes," I answered, "but there are a number more here as bad, and one or two even worse if they get into your field." I pointed out out the perennial Sow Thistle and the Ragweed.

There was one of the greatest assortment of weeds one would see in a day's travel on that roadside. There was Canada thistle, common evening primrose, pigweed, lambsquarters, burdocks, milk weed, golden rod, and others, along with these already mentioned, growing most luxuriantly and loading with seed. It seems to me that it would pay farmers to take a mower and do something to check the spread of weeds from the roadsides adjoining their farms at least, if they cannot, without trouble, get the proper authorities to do the work. The work of the railroad corporations should bring a blush to the faces of the farming communities when it is seen what they are doing to destroy weed life along their tracks. Let out the cattle and sheep on the highways, anything rather than weeds.

A great deal of attention is being paid to grading and gravelling the highways these days. It is strange that when roadmakers take up the grass along the sides that they don't scatter some grass seed along the sides of the roadbed. This seed would soon form another sod that would prevent the weeds from growing there. Instead of that our road builders are making it easier for chickory, ragweed, and other weeds which are increasing amazingly on the public highways, to get a foothold. Then there are the ugly looking chaps, elecampagne and easel, so common in many places, while blueweed, oxeye daisy, burdocks, and hound's tongue are occupying others.

Something must be done, and that right early, to stem this tide of evil.—A Farmer.

Fitting Horses for the Show Ring.

It is a common thing to see stock exhibited at small fairs without any fitting whatsoever. Cattle, particularly, are often taken before he judge in a condition which prohibits his handling them—unless he possesses more than the average amount of nerve. Horse owners, however, very seldom take a horse to a show, even a very remote one, without having him well groomed at least. There is a tremendous scope in the fitting of show ring animals; it can be properly called an art among exhibitors of high class stock. Naturally it is hardly to be expected that the exhibitor at a small country fair should spend hours in fitting his cattle or horses for the judges' inspection, but in every case the animals should be clean and well groomed. This is only show etiquette, and it reflects credit on the exhibitor, whethe receives a prize or not.

Exhibitors at the larger exhibitions are not immune from criticism in this respect. One hardly ever sees an animal exhibited by an ambitious breeder in such poor showing condition that a city visitor would notice it, but many animals are put in the ring, under a great handicap, because the owner either does not understand or has neglected the fine points of fitting.

In a class where there is a wide gap between the winning horses, fitting may not have much weight with the judge, but where the placing hinges on details, as it generally does at our larger shows, the horse that is in the best showing condition has a decided advantage.

The failing of most exhibitors is the showing of horses in poor flesh. No matter how much an exhibittor may console himself with the assurance that his horse, although thin, is in excellent shape, he has no opportunity of calling the judge aside and explaining to him why his horse does not show the weight and smoothness of his competitor. Flesh covers a multitude of sins, rounding off the horse's body, giving him a more symmetrical and weighty appearance. There is a big difference between having a horse in good, fleshy condition, well rounded off and having a horse loaded down with fat to such an extent that his legs become stocky and his action ungainly. It is therefore essential that the exhibitor use discretion; his horse should not be thin, nor should it be in flesh at the expense at of cleanness of limb, style and action.

Quite often horses are brought into the show rings at big exhibitions and their manners quickly show that they have received no training for the ring. A display of action is demanded by most judges, and the horse that is trained to the halter, walks and trots without hanging back or jumping into the crowd at the ringside is going to show himself off to better advantage and create a better impression on the judge. The horse which is to be shown should be accustomed to halter leading and should be trained to stand quietly, walk and trot straightly and smoothly. Every exhibitor has his own way of decorating the mane and tail of the horse, of fixing up the feet and legs to show off the cleanness of bone, fineness of feather, slope of pastern and soundnesss of foot, and in fact one very seldom sees this part of the horse fitting neglected. Too often, however, one sees a horse in thin condition or green to the show ring. The judge places a horse on what he sees. The better a horse displays his qualities the better chance he has of getting into the short leet. It must always be remembered that the judge places on actualities more than on possibilities.

Preservation of Fence Posts.

An experiment covering twenty years, to determine the value of post treatment, was recently completed under eastern conditions, where decay is more rapid than in drier parts farther west.

The posts were treated by the following methods:

1. By charring.
2. By filling rock around the post when set.
3. Putting on the preservation with a brush.
4. By the open tank method of treatment, which consisted in keeping the posts and treating fluid heated up to the boiling point for 2 or 3 hours and then letting them cool down in the fluid.

The conclusions reached which should hold good under western conditions are as follows:

1. That charring the parts placed under ground does not add to their durability.
2. That filling in around the post with stone or brick-bats does not increase the durability.
3. That creosote is a better preservation than coal tar or petroleum.
4. That brush treatment is not nearly as effective as open tank treatment.
5. That cheap woods when treated by the open tank method are cheaper and just as durable as the high-priced cedar posts.—C. C. Carpenter, Colorado Agricultural College.

Jersey Records.

Among the number of Jersey cows that recently qualified for the Record of performance, we find the three-year-old Nellie of Draffan. No. 2447, owned by C. & H. Cann, Chegoggin, N. S., with a record of 8982 lbs. milk, 6.72 per cent. fat yielding 604 lbs. butter in 365 days.

HORTICULTURE.

Selecting Cover Crop for the Orchard.

A cover crop has been defined as one which has been used for the particular purpose of securing its mulching and physical effect upon the land in the intervals between the regular crops or the normal seasons of tillage, and to improve the soil chemically when legumes are thus employed. If we are to grow fruit economically and of superior excellence in northern latitudes, more and more attention must be given to the question of orchard cover crops.

In orchard management three main methods are recognized and employed in different sections: First, cover crop; second, clear culture; third, sod mulch. There are many things which may be said in favor of each of these systems, but for the northern fruit areas the cover crop has everything in its favor. Some of these advantages are summarized as follows: The cover crop will hold leaves and snow, thereby lessening the depth of alternate freezing and thawing; it will make the soil friable; increase its moisture-holding capacity and render it more capable of resisting drouth; when the cover crop lives through the winter, it dries out the soil in spring, and makes early tillage possible. From the chemical standpoint the advantages are equally great. The leaching nitrates are retained in the soil, humus is added, without which chemicals are of little avail and plant food already in the soil is made available, and increased in amount if the crop employed is a legume.

Prevents Trees Winterkilling.

That which makes the cover crop most essential in the north is winterkilling. Very often the prolonged dry weather of the summer months has prevented vigorous growth, so that on the approach of rain in early autumn the tree exerts itself to such an extent that growth is more rapid than during its normal growing period. There is no time for the proper ripening of this wood and "winterkilling" is the result with consequent weakening of the tree. Much of this may be prevented by means of the cover crop as well as that of the tree, and the cover crop is much the more greedy of the two. The result is the tree is robbed of moisture at just the right time and the succulent growth of autumn prevented.

It is true that in a very wet year the grower has not absolute control of moisture, as he would have in an irrigated district, where rainfall is a factor of small moment, but that it is effective there can be no question.

From one set of experiments conducted at Macdonald College while I was connected with that institution, the drying effect of different cover crops was ascertained. The experiments were conducted in a young orchard, and the percentage of moisture in the soil determined about the middle of September, with results as follows:

Soil Moisture Under Various Cover crops

Millet	7.24	per cent.
Oats	10	per cent.
Rape	10	per cent.
Winter rye	11.6	per cent.
Crimson clover	11.8	per cent.
Buckweat	11.8	per cent.
Red clover	12.3	per cent.
Vetch	12.8	per cent.
No cover crop	15	per cent.

Thus, we see that the strong growing cereal crops and rape run down the moisture content of the soil very rapidly under conditions, and that this effect is more quickly secured than with the clovers, owing, no doubt, to the fact that they are comparatively slow in producing much leaf area. Our experiments also indicated that the moisture content of apple trees increases in direct proportion to the soil moisture content upon which they are grown. Also, that an excess of moisture in the trees caused a lower percentage of blossoms to set fruit. All these problems, complex in their solution, suggest lines of investigation worthy of further study.

Granted that cover crops are necessary, the question at once arises as to what to sow and when to sow it. The date of sowing for any section must be determined by local conditions such as rainfall, frost, etc. Once I was severely critized concerning mmy date of sowing, as fixed for a certain section in Quebec, on the ground that in the Hood River section cover crops were sown some six weeks later than I was in the habit of doing. In many northern sections it has been demonstrated over and over again that all cultivation should cease by July 1 and the cover crop sown at once.

The best crop to sow for cover has been given much attention, but the solution is not easy. Bailey says that the golden scale of cover crops for orchards begins with rye and ends with crimson clover. In the main this is true, but for some soils difficult to obtain a "catch" of clover, rye may be the better of the two and buckwheat better than either.

My own experimental work has shown the relative amounts of green vegetable matter returned to the soil, the fertilizing constituents of same, depth of frost line, etc., when the usual cover crops are employed. Results are as follows:

Enormous as the amounts of plant food are, returned to the soil in this way, it should be remembered that these amounts of nitrogen, potash and phosproric acid were taken from the soil in every case except the legumes, and barring them, the chief work accomplished was in making invaluable plant food available from the fertilizing standpoint. With leguminous plants, however, the case was different As is well known the clovers, vetches, etc., have the power through their root nodules of taking up free nitrogen from the air, and building it up in the plant tissue. By plowing under such crops we have a distinct gain from the nitrogen standpoint.

In some sections leguminous cover crops have been used for so long a time that the soil has been overstocked with nitrogen. The result is just as would be expected—the trees are good to look at but are apt to become "shy bearers." Such conditions are being corrected by using buckwheat and rye in place of the legumes. Like everything else the use of cover crops must be made a matter of study by the individual. He must meet his own conditions and the meeting of them spells success.—E. M. Straight.

How Cover Crops Compare

Cover	Vegetable matter, tons	Depth of frost inches	Nitrogen, lbs	Potash, lbs	Phosphoric acid, lbs
Red Clover	15	—	367	210	102
Crimson clover	17	15	269	179	114
Vetch	14	12	244	173	55
Oats	10	11	136	81	41
Rape	48	19	499	606	183
Rye	11	18	92	112	41
Millet	9	12	120	98	44

With Every Batch

of bread you make with Regal Flour successfully, you will wonder why you didn't try it before. No use waiting. Get

REGAL FLOUR

now, and avoid baking-day troubles.

Too many cooks spoil the bread by using inferior flour. Don't *you* make this mistake, but always insure success in baking by using only REGAL FLOUR. Acknowledged to be the most uniformly excellent of any flour sold.

Get a barrel from your grocer. If it isn't satisfactory, we'll refund your money.

The St. Lawrence Flour Mills Co., Ltd., Montreal, Canada

Fruit Crop Report.

From the Province of Ontario there have been no adverse reports so far as weather conditions are concerned. The season in Western Ontario was from one to two weeks late in opening.

In Nova Scotia and the Maritime Provinces conditions have greatly changed during the last two weeks. Up to that time the reports had all been very favorable and indicated a record crop. On the nights of June 3and 4, however, very severe frosts were experienced throughout the central and western portions of the Annapolis Valley, northern Nova Scotia and New Brunswick. In the Annapolis Valley this frost resulted in considerable injury to apple blossoms, especially of early varieties, and on low lying levels the injury was quite marked. On later varieties, such as the Ben Davis and Spy, in orchards on high land, and in those near the base of the North Mountain, the damage was not so great. So far as reports indicate, the section affected by this frost was in the central and western part of the valley in the counties of Kings and Annapolis, though no definite reports have been received as to the amount of damage done. The report is a particularly disappointing one, inasmuch as it is the third successive year in which the crop in Nova Scotia has been reduced to below average. In the northern counties of Nova Scotia it is not anticipated that the injury to apples will be great, since very few varieties were in full bloom at the time. Cherries and plums are quite seriously reduced. The weather in Nova Scotia has been cool

What protection will your roof afford eight, ten or fifteen years from now?

Most roofings look alike. Many are made to *sell*. A few to *wear*. If you let service—not salesmanship—sell you roofing, there's but one choice—NEPONSET ROOFING.

NEPONSET records like these: "One NEPONSET Roof ripped up after giving 8 years of the best kind of service and re-laid a second time"; "NEPONSET Paroid now giving its 16th year of excellent service"; "not a single leak in 13 years," are due to just this—NEPONSET Roofing is "slowly made." This is why it is so slow to wear out. Dollar-for-dollar,

NEPONSET

PAROID ROOFING

gives best, longest and safest service.

Surely send for ROOF BOOK—Free.

and wet and conditions will be ideal for the development of apple scab unless thorough preventive measures are adopted.

In British Columbina, the weather during the month of May was admirable. There have been frequent showers, and practically all varieties of fruit have set well. The season has been from two to three weeks earlier than usual.

Apples

The season for apples, according to present indications, will be a very satisfactory one. There are certain sections, of course, where, on account of local conditions, the crop has been reduced, but these are, in the main, only small in area. In Nova Scotia where earlier indications pointed to a record crop, the latter repoprts are very pessimistic and state that a great many of the orchards in the Annapolis Valley have been completely ruined. It is perhaps safe to presume, however, that these reports are somewhat exaggerated, and that while the injury is undoubtedly severe, yet it is not so great as was first expected. It is probably true that the earlier varieties will be short and that orchards on low lying land have been injured, but that the injury has been general throughout the entire Annapois Valley, or that all varieties have been affected, is very doubtful.

In Ontario, too, there are certain isolated sections where the raveges of tent caterpillar have reduced the crop, but in all orchards where thorough spraying has been done and where the owners have given the orchards careful attention, the yield will be a very satisfactory one.

The general report from British Columbia is that a crop well above average will be harvested, particularly of the early varieties.

District 1, Counties North of Lake Erie.—But one adverse report has been received from Western Ontario regarding the apple crop. Several growers report it to be the best for many years. The bloom was particularly heavy and the set has been a good one. This report holds good throughout the whole of the district.

District 2, Counties on Lake Huron and inland to York County.—Reports are almost as optimistic from the inland counties as from those in District 1. There is a fairly general report that Spies will be short in Brant county and that the winter apples in Middlesex have not set well. Throughout this entire district there are quite a number of orchards which do not receive the best of care and which consequenty are a menace to growers who are more up-to-date.

District 3, Lake Ontario Counties north to Sharbot Lake and Georgian Bay.—Where spraying has been satisfactorily carried on, the crop will be a heavy one; but where orchards have been at all neglected, the trees are overrun with Tent Caterpillars and the quality of the fruit will be greatly reduced through the lowered vitality of the trees.

District 4.—Ottawa and St. Lawrence Valleys to Lake St. Peter and Southwestern Quebec.—Reports in this district are generally favorable. In the province of Quebec there has been a great deal of damage done by caterpillars in unsprayed orchards, particul arly in the county of Huntingdon. The crop generally, even in these infested areas, will be about an average one.

District 5, New Brunswick with Northeastern Quebec.—The same injury from frost that was experienced in the province of Nova Scotia, has also been reported in New Brunswick. In view of the fact that the ater varieties were not fully in blossom at the time of this frost, there is a possibility that on these the damage will not be severe. On the earlier varieties which were in full bloom, there is every likelihood that the crop will be greatly reduced.

District 6, Hants, Kings, Annapolis and Digby Counties in N. S.—In the eastern Annapolis Valley where the damage by frost was not so great as in some of the central and western portions, a large crop of all varieties is expected. Even where the frost was serious, some of the later varieties escaped and on these a full crop is expected. Starks, Baldwins and Blenheims are reported short in Annapolis county.

District 7, Nova Scotia not included in District 6.—No authentic reports have been received from District 7. The season was extremely late and in many sections trees were not in bloom on June 6th. Consequently, it is more than likely hat the injury caused by frost in the Annapolis valley has not been experienced to any great extent in this district.

District 8, Prince Edward Isand.—Practically the same conditions apply in Prince Edward Island as in District 7.

District 9, Lower Mainland and Islands of British Columbia.—Reports from the lower mainland of British Columbia are favourable and it is generally considered that the crop will be very much larger than that harvested in 1913.

District 10, Inland Valleys British Columbia.—In the Okanagan and Kootenay valleys the apple crop, according to present reports, will be between medium and full. The earlier varieties do not appear to have set so well as some later sorts, but taking the average of the district the crop promises to be a very satisfactory one.

Districts 1, 9 and 10 ship the commercial crop of peaches and other tender fruits.

Districts 1, 2, 3, 6, 9 and 10 grow plums, pears and winter varieties of apples for long distance markets and exports.

District 4 ships Alexander, Wealthy, Fameuse and McIntosh Red apples.

Districts 5 and 7 will not produce sufficient winter fruit for home consumption.

Pears.

The pear crop in Ontario will be a light one. In the southern counties the crop is reported fair, with Kieffers particularly abundant, but in eastern Ontario trees were badly winter-killed and the crop, except in a few instances, will be an entire failure. Practically the same condition applies to the few pear orchards in the province of Quebec. In Nova Scotia prospects are somewhat better and something over 50 per cent. of a full crop is expected. An excellent crop is reported in Brit ish Columbia.

Plums.

Plum trees blossomed well in southern Ontario, but the set was a very light one, and the crop wil be below average. In the county of Lincoln, Japanese varieties appear to be almost an entire failure, and even the European sorts are reported light. Further east in Ontario, the plum crop is a total failure on account of winter-killing of buds, and in many cases the trees themselves have been seriously injured. In the province of Quebec, the prospects for the native America-na varieties are good. Nova Scotia reports a very heavy blossom, but up to. date no information has been received regarding the set. In British Columbia the conditions are generally favorable and a crop considerably greater than last year is expected.

Peaches.

So far as Ontario is concerned the reports remain practically the same as those which were published a month ago. With the exception of the Essex Peninsula and a slight scattering in Lambton county, the peach crop in Ontario is a total failure.

In the Okanagan Valley of British Columbia, the later estimates are not so favorable as those received earlier in the season. The reports on early

The Massey-Harris Separator Gives Satisfaction

Satisfaction follows the use of this Separator

These are the Reasons Why

It saves more of the cream at all temperatures than any others.

It is easy to fill—easy to turn—easy to clean.

It is built to last.

It is a neat, symmetrical, nicely finished machine—one you will take pride in having and using.

DAIRYING.

Economical Milk Production.

The manufacturer perhaps more than the retailer looks closely after the matter of cost knowing that his principal hope of making a good profit lies in attaining economy in the actual production of the article, for no profit can be expected if the selling price is below the cost price.

Is not the dairy farmer a manufacturer? So it would seem to be wisdom to look the more closely after cost especially as he does not expect the selling price of milk to soar. Assuming that the farm is in good condition and carefully handled, what does milk cost per hundred pounds? That can be ascertained only by keeping records of each individual cow.

This is all he more necessary because "men (and cows) were deceivers ever." They may appear to be good heavy roducers, but their value as economical producers can only be determined when their yield of milk and fat is checked up by the scales and test. Of what use is it when the factory pays 95 cents per 100 pounds o keep cows whose milk costs $1.25 per 100 pounds just for feed alone? This is what often happens till cow testing is taken up. Milk and feed record forms are supplied free on application to the Dairy Division, Ottawa.

It is quite possible to have one dollar's worth of feed return two dollors' worth of milk through good cows, that is, cows selected by the test. This is both economical and profitable milk production. The average cow is not an economical producer because she has not been selected, but, like Topsy, "just growed." A dairy farmer will prove his business ability as a manufacturer when the herd is composed of economical producers. Make each cow pay a good profit.—C. F. W.

Color Markings of Holsteins.

What are the correct markings of a Holstein cow? A clear knowledge of what constitutes good color is essential to intelligent breeding. In 1910 the Holstein-Friesian Association of America passed an important rule regarding colors that bar registry. The following explanations of the ruling have been issued from the Asociation:

"Upwards of 95 per cent. of the catte of Holland are black and white, and his fact was one of the strongest influence in leading the founders of the American herd-book to define eigible cattle as those large, improved, black and white cattle already registered.

"With such a broadly defined standard of color markings the question has often arisen whether any proportion of of black and white would still be eligible for registry.

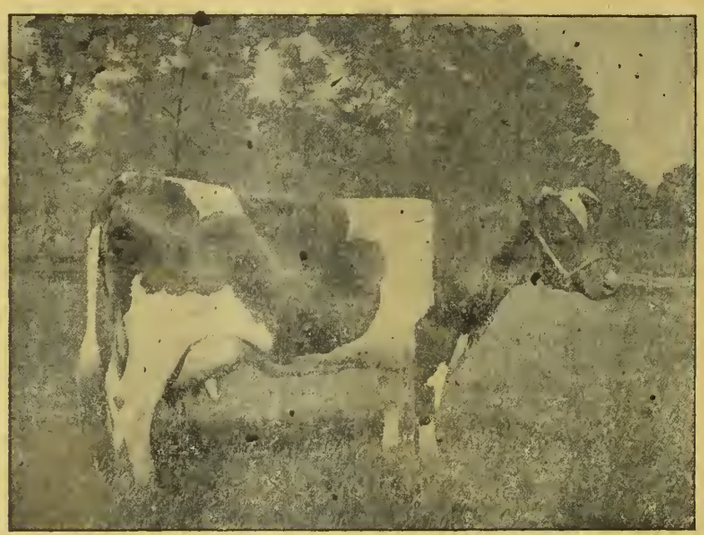
"The color markings of this breed constitute one of its many attractive features. Beauty of for mand beauty of color markings are valuable assets in an animal. Our predecessors wisely determined that cattle, to be eligible for registry, should be black and white, but did not limit the proportions or placing of the spots. Time and observation have determined that cattle of inferior blood, or those possessing an infusion of other blood, often disclose their blood lines through their color markings, and the markings of many of the so-called grade cattle are distinctive and easily recognized by the experienced breeder. These considerations and others, not tending at all towards a fad in color markings, have led to the establishment of the rule concerning color markings that bar registry. These are: Solid black; solid white; black switch; solid black, with only white on belly; black on legs, beginning at feet and extending to knees and hocks; black on legs, beginning at feet and extending to knees, with white interspersed; grey, or mixed back and white, generally prevailing; patches of other colors than black or white—red, brown or dun; red and white.

"Solid colors, either all white or all black, bar registry. That is readily understood. Solid black, with white only on the belly, is interpreted to mean that no animal upon which the white is not visible to the bystander without bending to look up under the belly, will be recorded. Black on legs, beginning at the feet and extending to knees and hocks. Well now, what does that mean? A good picture would be easier than words to describe it, but you are safe in not offering for registry an animal which is possessed of four solid black legs, the black extending up to the knees and hocks. Why? Because extended observation teaches that the chances are more than even that such a marked animal contains other than pure blood in its veins.

"Black on legs, beginning at feet and extending to knees, with white interspersed, is still another variation, and is often found in grades or mongrelbred cattle. It means four back legs. upon which are spots of white surrounded by the black.

"Grey, or mixed black and white, generally prevailing, means the condition of the coat often seen in horses known as roan, where grey or white hairs more or less thickly interspersed with the prevailing bay, sorrel, or chestnut color, only in our case the white hairs are always mixed with black. Now, this rule does not relate to that grey appearance sometimes seen in very old cattle, generally about the head and neck, but if you defer registry until such coloration does appear you will quite likely be debarred; but if you have a calf or youngster that is distinctly grey where it should be black, kill it, don't breed from it.

"It is also quite as futile to register cattle in which the black hair at maturity is interspersed with red, giving a general brownish or rusty cast to the animal. Such are not desirable, for you do not want them, nor does anyone else who knows a Holstein.

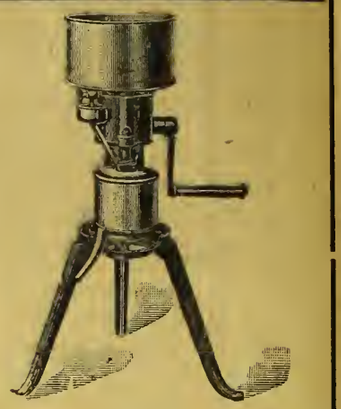


Example of a Well Marked Pure Bred Holstein

The Holstein-Friesian Association of America are drawing the line tightly against registering Holsteins that do not comply in markings with the 1910 ruling. This rule is given in the article adjoining and made clearer by illustrations herewith.

"Now, all this does not mean that Holsteins do not breed true to color. They do, and in this respect are the most prepotent of all improved breeds. A pure bred Holston bull bred to mongrels or grades of other breeds will almos invariably mark every calf clear black and white, even the calves from old cows which have for years dropped calves from bulls of other breeds."

"Melotte" CREAM SEPARATORS



The "Melotte" will increase your butter yield 25% besides improving the quality.

Saves time and labour, space and utensils.

Owing to its Suspended Bowl the "Melotte" is the simplest, most easy running and consequently the most durable cream separator made.

"STA-RITE" GASOLINE ENGINES

Every "Sta-rite" engine is built to live up to its name.

It's not an easy job to build an engine that will always "Sta-rite," but we think we have succeeded. By painstaking attention to every detail of construction we have eliminated the troubles usually incident to carburetion, ignition, cooling and the other things that keep many an engine from "staying right" on the job.

The "Sta-rite" starts right and finishes right—does any task you set it to quickly and economically, without a kick.

Clip the coupon and send for the "Sta-rite" book—it tells how we took the trouble out of gasoline engines.

If you are interested in a Separator ask for the book on Empire Disc Separators or Baltic Separators—the Baltic is a machine for small dairies—the smallest size selling at $15.00.

We have some unoccupied territory in which we would like to hear from reliable agents. 5S

Markings Such as This Debar Registration

The most noticeable failure here to comply with the H.-F. Association standard of color is the black switch. The black legs are also a disqualification.

Records or the Dairy Breeds.

Recenly there have been so many inquiries for information pertaining to the highest record producing cows of the various breeds that we present the following data:

The above tables are thoroughly interestng and they present in a concise form, in fact, a more concise form than is usually available, the successful work of the various breed associations in establishing yearly records of their cows.

It must be noted, however, that only the highest cow in each class is given It does not imply that these are the only great records of each breed. For example, in the first group there is another cow that has produced more han 999 pounds of butterfat. Banostine Belle De Kol has the highest yearly record of the Holstein-Freisian breed, but hers is not the only one over 1,000 pounds of fat. The same is true in the other groups and classes.

Another interesting feature in connection with these records is the progress that has been made in testing. If one were to take the highest records of the various breeds for 1912 or for 1911, he would find hat great progress has been made, that the world, certainly the dairy world, has been moving rapidly in the line of record making and the establishment of new standards toward which the breeders are working. This is surely an age of progress.

cream separator. The Standard skims clean. It gives cream without a taint. It gives rich cream. In fact, the Standard can be regulated to deliver cream of any density the factory requires. Our new catalog explains fully the many features that make the Standard so popular with cheese and butter factories and with progressive dairymen. Write for a copy.

The Renfrew Machinery Co., Ltd.

Head Office and Works, Renfrew, Ont. Agencies Almost Everywhere in Canada

When shipping cream to creameries, set the separator so that the cream tests about 30 per cent. The creameries prefer cream of this richness, because it is just about right for butter making purposes. When you ship cream testing 40 to 50 per cent. you lose a certain amount of butter fat by the thick cream sticking to the inside of the can, and you run a risk of receiving a smaller test. With very thick cream testing is a little more difficult, and reading is apt to be charred, and the slightest mistake in weighing the sample makes a bigger difference in the reading than when the cream tests around 30 per cent.

Of course, the mistake may be in your favor, but the risk isn't worth it.

About Shipping Cream.

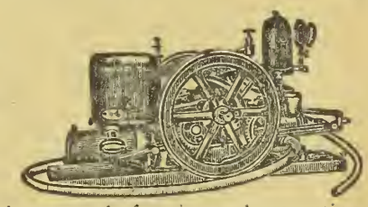
Big Price for Grade Holsteins.

Mr. H. F. Page of Matsqui, B. C., under date of April 23rd writes as follows:—

"At a public auction held today by M. E. Alexander, Clayburn, B. C., 28 grade cows made an average of $172.25 25 of which were Holstein grades. The top price made was $265.00. This cow was sold by the writer to Mr. Alexander a year ago for $200.00. Eighteen of the cows made over $200.00 each. This looks to me like a record for Canada or Unied States.

The prices certainly indicate the quality as well as he man behind the cows."—W. A. Clemens, Sec'ty Holstein-Friesian Association.

Protect your trees and garden



A Fairbanks-Morse Spraying Outfit offers you the most effective and economical means of destroying insects and of curing and preventing plant and tree diseases.

The spraying machine illustrated here can be used for practically every spray use on any farm, and will quickly pay for itself in improved crops.

You can buy a Fairbanks-Morse or Gould Spraying Pump, from a brass hand pump costing a few dollars up to an engine-operated, truck-mounted outfit of the highest efficiency.

Send for free catalogue of spraying outfits and appliances. It contains much valuable information, tells you what to spray, what chemical compounds to use, how to prepare them, when to do the spraying, etc. We are the largest Canadian dealers in farm engines, scales, and mechanical goods of every kind.

LIVE STOCK.

Sheep Dipping and Dipping Apparatus.

It is somewhat strange that it should ever have been necessary to compel the sheep owner to dip his sheep. The farmer, as a rule, in spite of all the reflections cast upon his alleged want of business methods, has a keen eye to the main chance, and his pocket appeals to him as it does to most others. It would have seemed the natural thing, when the good effects of dipping became evidenced—when it became obvious that the dipped sheep were free from infestation by insects, and were able peacefully to go on feeding and fulfilling their mission in the world, while their undipped relatives were suffering tortures which often made them into scarecrows, and in many cases actually caused death—that there should have been a rush for dips and dipping apparatus, and that the farm on which dipping was not part of the regular routine would soon become a rarity. In point of fact, the utility of the "dip" has been generally recognized, but there are always backward members in every family. Some farmers in remote districts were behind the times, large numbers would not take trouble which they considered unnecessary, while others were simply inefficients who could not overtake their work or were too careless to trouble about it. It is to some extent true that the farmer who neglects his sheep at this time of the year has to pay pretty severely for it, but it is also true that he may inflict damage on other owners by disseminating sheep scab—and hence it is that the State has thought it necessary to step in and protect the sheep owners generally from the consequences that might follow on want of care shown by individuals; and thus the sheep dipping orders, irksome as they may be considered by some, are really a provision of the State to protect the careful business-like farmer from the negligent or careless owner. That the protection is still needed is shown by the prosecutions occasionally reported for failure to dip, and it is alleged that evasions of the orders, by imperfect or incomplete dipping, are frequent in some districts. This is one reason why the progress made in the elimination of sheep scab is so slow.

Objects of Dipping.

We have made reference above to sheep scab as the worst of the pests whose attacks dipping is designed to prevent or to frustrate; but the objects of dipping, of course, extend far beyond scab, which is fortunatey mainly confined to a few districts and unknown in the majority of flocks. The sheep is attacked by several insects and lice, kebs, ticks and flies have to be warded off or destroyed. There is no method of dealing with these that is as satisfactory in its results as effectual dipping, but it is necessary that the word "effectual" dipping should be emphasised. The Board of Agriculture, within certain limits, leave the farmer free to chose his own dip, and home-made preparations may be put on the "approved list," but the compounding of dips is a matter that requires technical skill of a high order, together with appliances for which home substitutes are not easily provided. and the home made dip, even if the formula may be reasonably good, may very easily be spoilt in the making. We advocate, therefore, unhesitatingly, the buying of a dip that has a good general reputation. It may, or may not, be cheaper than the home made article—probably it will be if any allowance is made for the work—but it will certainly be more reliable; it will be properly compounded and, if used acording to the directions of the makers, it is tolerably certain to be safe and efficient.

One of the chief properties of a dip should be that its affect will remain in the wool an appreciable time. It is not a very difficult matter to kill the insects affecting the sheep unfavorably, but "there are plenty more where they came from," as a veterinary friend of ours used to put it, and much of the value of a dip is absent if it does not render the animal an unsuitable host for the pests for a considerable time after dipping. As the season when dipping becomes compulsory is at hand, the matter should be fully considered and the claims of the various preparations offered duly taken into account.

The Dipping.

The methods of dipping adopted have been very diversified, but there can be no question that the swim bath, which provides for the complete immersion of the sheep, is far and away the most effective. The sheep is in a natural position all the time, so that there is little risk of injury—even sheep in lamb may be safely dipped; the motion of swimming brings the dip in contact with all parts of the fleece, and the actual labour is lightened. This means that a greater number of sheep can be dealt with in a given time and that fewer hands may be employed to get through the work. Flocks vary greatly in size, but the needs of the small owner have been provided for by several makers of apparatus, and visitors to our great agricultural shows will have seen on exhibition baths of various types, both hand and swim. Mesrs. W. Cooper and Son express the opinion that hand baths are wasteful of time, labour, and money, and they add also that they are unsatisfactory. On the whole, therefore, we advise the intending purchaser, if he can manage it, to provide a swim bath, the extra cost of which will be repaid in a comparatively short time in the labour saved and the greater efficiency attained. One of the savings will be the amount of dip used. The sheep carries away an enormous amount of fluid in its fleece, and if this is not allowed to drain back into the bath, the bill for the dip will be needlessly heavy. However, in all these matters the farmer has to cut his coat acording to his cloth, and if he cannot see his way cear to the swim bath there are numerous hand baths of good type with which he can carry out the work.

Some Points to Note.

There is an old and much quoted saying that you can take a horse to the water but you can't make him drink, and the truth underlying this has some bearing on the question we are dealing with. It is easy to find an efficient dip, and it is easy, if one is prepared to spend the necessary cash, to get suitable apparatus, but notwithstanding this, it is not always easy to get the dipping carried out properly, and it is much to be feared that in a large proportion of cases the protection which dipping should yield is not afforded to the sheep. There are a few points on which emphasis should be laid. First see that you get a good dip, one that is not only eectual in killing insects on the sheep but will make the fleece uninhabitable by the pests for a considerable time afterwards; next see that the directions of the makers are strictly followed as to quantity, etc. See that the mixing is done properly. It is possible to mix most things, from household mustard to sheep dip, in the wrong fashion, and inexpert handling may easily result in the fluid being really less potent than it should be, though of course, the solubility of the different dips varies. If a deposit of solid matter lies at the bottom of the bath, it is not of much use to the sheep, so that care should be taken so to carry out the preparation that the dip is really dissolved. Next, time the dipping properly. If the sheep are to remain one minute in the bath, let the seconds be checked of by means of a clock or watch, and let it be some one's duty to call the time. It will facilitate matters if the time piece be hung up close at hand. Many people think they can calculate a minute "near enough" without a

watch. If they can they are the exceptions, but in all propability if they submitted to the test they would find that they are frequently very far "out." This would be the case even if they had their attention fixed on the calculation, and the liability to error would obviously be much greater in the circumstances attending the work of dipping. We have known the minute to be called when less than thirty seconds have passed, and the only safe plan is to keep a clock or watch, with a second hand, and to refer to it for each dipping. It is good economy to provide that the drainings shall run back to the bath. The fleece holds a tremendous amount of moisture, and there will be great waste of material if this provision is not made. Failing a proper draining pen, see that the sheep are kept in an enclosure that will not be grazed over, or after consequences may be serious.

Is the Cow in Calf?

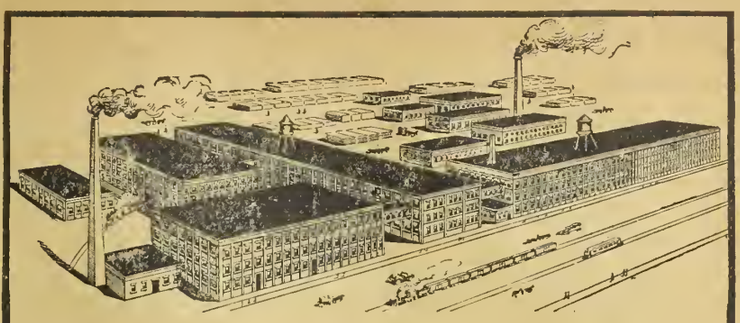
This is a question which often perplexes the dairy farmer, and it is a very important matter for him to decide aright. There are many signs relied on, but none are infallible, and even experts are occasionally mistaken. There are absolutely no "sure" or "certain" indications, and readers of experience in breeding will doubtless remember to have seen cases in which the condition of a particular animal has remained undetermined right up to the time when the offspring was produced, or unti the lapse of a period long beyond that of a normal uterogestation had practically settled the question. We say practically, because the failure to give birth to a calf is not positive proof that the animal has not been pregnant, for there are many cases on record of the mummified remains of a foetus having been found in the uterus of a cow killed fat by the butcher, or on post mortem examination when death has taken place from accident or disease entirely unconnected with gestation or parturition. They will also know of other cases in which cows have been most unexpectedly found with a calf at foot, or discovered in the act of presenting it when their pregnant condition was not even suspected.

Some Signs.

The sign chiefly relied upon by the cowkeeper is the continued absence of oestrum subsequent to service, the cow not coming into season at the usual period, and refusing to take any notice of the bull, and he of her. Implicit confidence in this often leads to error. In the other direction, the appearance of oestrum at the usual recurring period is equally inconclusive of the cow not being in-calf. In the cow, as well as in other animals, oestrum may recur not only once but several times after conception. Cows have been known to appear at oestrum regularly, and to acept service within a month of parturition, although the rule is that the bull refuses to consort with such animals. The cessation or non-appearance of oestrum subsequent to service may, of course, be taken generally as an indication taht the cow is in-calf, and its re-appearance that impregnation has not resulted, but the exceptions are so numerous that the absence or recurrence of oestrum cannot be regarded as absolutely a safe guide, either one way or the other. Another rational or subjective sign is a considerable improvement in condition or a tendency to fatten. Cows are not usually vicious, capricious or "jady," as are many mares, which often become completely changed in character when in foal; but to a limited extent an improvement in the temper of "wicked" cows has been observed, and the in-calf cow early becomes more tranquil in disposition, and takes a great deal more rest. Taken with other signs, an improvement in condition, a greater evenness in temper, loss of vigour, and a greater tendency to rest may assist the observant owner in coming to a conclusion as to the state of his cow. As the foetus gradually grows in the uterus its capacity increases, and becomes visible externally, especially on the right side of the cow, but the abdomen also enlarges generally, and towards the end of gestation it becomes pendulous, and the flanks hollow. The spine appears to drop, while the lateral portions of the croup sink so much as to make the sacrum and haunches towards the root of the tail look more salient. Increase of weight is a physical sign, and it has been proposed to weigh animals from time to time to demonstrate the presence or absence of a foetus, but either weighing or measuring must be an extremely fallacious test as to the pregnancy of an animal. An empty cow may increase in size and weight by slow degrees as readily as the man who weighs her, or a pregnant cow may lose flesh faster than the growth of the foetus would compensate for.

Improvement in Condition.

There is generally a rapid improvement in condition during the first period of gestation, and often a loss of it during the last. The enlargement of the udder is a material sign of pregnancy, but one that varies very much in different animals, and it is reliable only in the case of heifers carrying their first calf. In heifers the mammary gland begins to undergo development soon after conception, or towards the second or third month, but when we remember that virgin animals can, and frequently do, produce milk, it will be seen that absolute reiance cannot be placed on this. Changes in the milk do not become apparent until quite late in the gestation period, when, in the majority of cases at least, there will be numerous other and more reliable signs of the condition of the animal; and they are not always reliable.



Ordered Where the Best is Wanted

When the officials of a Company are arranging for the erection of a new plant, and want the best material regardless of expense, *Brantford Roofing* is specified oftener than any other ready roofing made.

This great plant of The McLaughlin Carriage Co., Limited, Oshawa, Ont., was roofed entirely with *Brantford Roofing*. The Company, having in mind what a heavy investment their new plant represented, wanted a roof that would be fireproof first of all; but also proof against frost, rain, heat, chemical fumes and other unfavorable conditions. They chose

Brantford Roofing

in preference to all others, because it met their demands on every point mentioned. Furthermore, it has a reputation for durability that common roofings cannot earn.

When you roof—whether it's a shed or barn or a great industrial establishment, follow the lead of Canada's foremost business men and have it done with *Brantford Roofing*. It costs no more! To-day—write for free book on roofing and samples.

Our new patented appliance for laying Brantford Roofing is worth investigating. Positively prevents buckling or expansion.

Sensible Signs of Pregnancy.

The sensible signs of pregnancy do not begin to be apparent until the fourth or fifth month, when the contractility of the foetus muscles begins to be developed. These movements are feeble at first, but towards the end of pregnancy become, in the majority of cases, vigorous and unmistakable. The milker recognizes them readily as he leans against the cow with his head while milking her, and it is during this act that he frequently beomes aware of the cow's condition by feeling the calf "kick." In many cases these foetal movements can be distinctly seen as well as felt, and various experiments, as barbarous as they are stupid, are resorted to to determine the presence of a foetus in the uterus by exciting its movement. A favorite one is to give a drink of cold water after heating the cow by driving her round the pasture or yard—a test that may demonstrate the animal's condition by causing her to abort. The only really useful and practical means of detecting the sensible signs is to combine the senses of sight, touch and hearing. What can be seen of the foetal movements is not very reliable until the closing days of gestation, when other signs will probably be equally apparent, and it must always be remembered that the fact that the calf has at no time been seen to kick, and that movements cannot be detected by employing the sense of touch, is never reliable evidence that the cow is not in calf. It is said that the beats of the foetal heart can be detected by auscultation in front of the symphysis pubis, but the part is an awkward one to get at in the cow, and the inexperienced may easiy be confused by other sounds. The indications obtainable by manual exploration are through the abdomen, the rectum and the vagina. Exploration by way of the two last is a method of examination which should be confined to the veterinary surgeon, but the farmer and dealer commonly undertake the abdominal examination with success, and, if ordinary care be exercised, it may be employed with perfect safety. In the case of the cow, it is about the fifth month when the foetus can be detected by manipulation of the abdomen. The cow should be standing up when examined, as the signs are not so easily perceptible when she is recumbent. The examiner stands on the right or milking side of the cow, with his back towards her head, and applies the palm of the left hand against the abdomen, pressing it firmly, the right hand resting on her back. The movements of the foetus can then be detected as it stirs at regular intervals. These movements are generally strongest in the morning, and while the cow is feeding.

Buying Cows "In-Calf."

In buying a bunch of heifers for feeding or of baren cows to go on grass, mistakes are commonly made, and qquite a number of them are found, after they have been kept for some time, to be forward in-calf. This mistake neither skill nor care can always guard against. In buying cows alleged to be in-calf, or as due to calve on a certain day, it is always wise to take a warranty where this is obtainable, and at cow sales, sometimes with the connivance of the auctioneer, cows are sold as to profit on a certain date, the purchaser being allowed to assume that

THE HORSE.

Crib-Biting and Wind-Sucking.

With the exception, perhaps, of kicking, crib-biting or cribbing and wind-sucking rank as the two worst of the various so-called stable vices of horses, they being decidedly subversive of he horse's condition and wind, and tending more or less to impair its usefulness for work. A horse afflicted with either of them should never knowingly be bought, and, fortunately, it is very often possible readily to spot a cribber or wind-sucker by the mark made on the neck by the cribbing or throat strap which is commonly employed to repress the evil. A horse in which either habit is of long standing and strongly developed is also usually characterized by possessing a big, flatulent belly, while in the case of crib-biting there is a possibility of detecting the presence of the habit by certain marks of abnormal wear to be seen on the front teeth. Cribbing and wind-sucking may be looked upon as being merely two different forms of the same bad habit, and sometimes a horse will practice them both. The former is much the more prevalent, but the latter is, generally speaking, the more serious. Both consist in the horse drawing air into its mouth and swallowing it by a convulsive movement of the muscles of the throat, the essential difference between the two forms being that in crib-biting the animals lays hold of the edge of the manger or some other convenient object with its teeth when indulging in the habit, whereas, wind-suckers are able to suck in the air without catching hold of anything. The latter is the more difficult feat, and requires more practice, but once wind-sucking has been acquired it is apt to be much more inveterately indulged in than cribbing, with correspondingly more insidious effects on the condition. Both forms are readily recognized, for the horse places its head and neck in a peculiar attitude, and there is the convulsive contraction of the throat as the air is gulped down, while in most cases a grunting sound is also to be heard. Those not acquainted with this kind of stable vice sometimes think that the horse is merely belching. The inexperienced also occasionally confuse cribbing with the trick, which many horses have, of biting at the manger edge when rendered irritable during grooming by the use of the curry-comb or the application of the brush to sensitive parts of the body, or on the girths being drawn tight when they are being saddled. Such biting at the manger from irritability is quite a harmless trick, though it is said sometimes to lay the foundation of the cribbing habit, but, speaking from personal observations, that is very rare.

Cause.

The exact cause of crb-biting and wind-sucking is often obscure. It is usually considered that these bad habits in the first instance principally originate as a result of idleness and a mischievous propensity, the horse having nothing to occupy itself with while standing in the stable between meals, in the same way as some horses, from a similar motive, are caused to eat their bedding and others to tear their clothing or to gnaw at the wooden stall partitions. This explanation is certainly supported by the fact that it is chiefly horses which pass most of the daytime in the stable and are taken out for only comparatively short periods daily that become cribbers or wind suckers, whereas, those which regularly work long hours are relatively seldom addicted to those vices. Indigestion is also sometimes assigned as a cause, but it is very questionable whether this theory is correct. Undoubtedly, marked symptoms of indigestion go hand in hand with both cribbing and wind-sucking, but in these cases the indigestion is in all probability, as a rule, rather the result of the vice than its cause. The constant swallowing of mouthfuls of air, which dilates the stomach abnormally, must naturally react more or less adversely upon the digestive functions, and in bad cases either habit, but particularly wind-sucking, may be so persistently practised as to render the animal subject to attacks of flatulent colic. But not only does this air-sucking interfere with the digestion, but the undue distention of the stomach which it causes gives rise to pressure upon the diaphragm and the lungs so that the wind also suffers impairment. Both cribbers and wind-suckers mostly prove untrifty doers, and are troublesome to maintain in satisfactory bodily condition. Often they carry but very little flesh.

Prevention.

The expedient most usually resorted to is a broad, padded cribbing strap, which is buckled tightly round the neck at the throat; this proves perfectly effectual in a certain proportion of cases but in others it is found unavailing. Other contrivances are the cribbing muzzle and crib-biting and wind-sucking bit. The former prevents the horse from catching hold of the manger or any other object; and as the animal can eat its hay with it on the muzzle need merely be removed when it is eating its grain. The wind-sucking bit consists of a hollow tube, with holes in it, which is placed in the horse's mouth, being fastened to the headstall. Whenever the animal attempts to suck in air with this bit in its mouth the air passes out again through the tube, so that its effort to swallow it is frustrated. Unfortunately, the bit is apt to make the mouth sore after a while, for which reason it is in many cases not practicable to use it for any length of time. Occasionally another contrivance is used, this consisting of a short ash staff, with a buckle and a spring-hook, which is fastened to the headstall at one end and to the roller at the other, its object being to prevent the horse from arching its neck and drawing in its muzzle towards the breast for the purpose of getting air. Crib-biting is frequently successfully checked by putting the animal in a loose-box, where there is no fixed manger or rack, or any other projection of which it could catch hold with its teeth, a wooden box being used for feeding it, which is removed directly after the food has been eaten. Sometimes, however, this plan will cause the horse to start wind-sucking when it finds its attempts at crib-biting foiled, or it may even continue to crib by using its knee as a support for its mouth. Smearing the edge of the manger with tar or some evil smelling substance, which is sometimes recommended as a preventive of cribbing, is rarely found successful in practice.—Argus.

Horse Collars Wrong—Remedy.

As long as the collar is illy formed and bears unduly upon any particular portion of the shoulder, the horse will continue to have blisters until he finally overcomes them by developing callouses. These not infrequently cause deeper and still more troublesome injuries.

The rational and proper proceeding in the case of sore shoulders is to treat the collar. When that is corrected the sore shoulders will disappear, even without treatment, though a reasonable attention will probably hasten their recovery. As put out by the manufacturer, the new collar has two serious defects: First, notwithstanding the fact that the cross-section of the neck at its juncture with the shoulder of the normal draft horse would show some kind of a curved line entirely around, yet the manufacturer makes his collar with a small curve at the top, a larger one at the bottom, and connects these two by long, straight tangents, just as engineers make railroads. This design causes a collar that in size is otherwise a fit to

FLEMING BROS., Chemists,
41 Church Street, Toronto, Ont.

set too closely to the horse's neck about midway of its length on full-necked horses, and above and below it does not rest down upon the shoulder where it should. The principal pressure is thus concentrated upon a few inches in length upon a very narrow bearing, and as the collar is too loose both above and below, a slight twisting motion is established, highly productive of blisters.

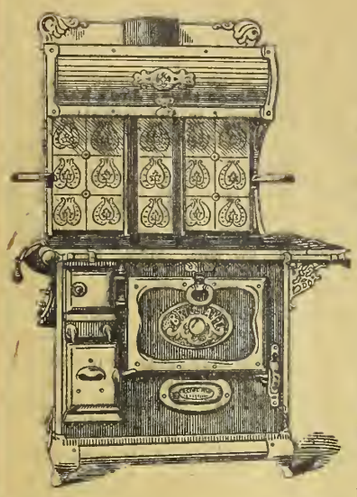
In order to avoid this result the purchaser frequently buys a collar too large. The collar then works up and down and still makes blisters. Second, notwithstanding the fact that the bearing surface of the draft horse's shoulder is either flat or slightly convex, depending mainly upon his condition of flesh, yet the collar maker takes no account of so important a detail, but forms the bearing surface of his collar, particularly at the draft point, as convex as he can get it, so that when placed upon the horses neck, the contact of the two bearing surfaces, collar and shoulder, will be along the narrowest possible surface instead of the broadest possible as it should be. The effect is to again concentrate the pressure and hasten the blister. The horse owner endeavors to avoid this trouble by loading his horse with all kinds of pads under the collar, some of which help matters, but all are inconvenient and generally unnecessary.

What Farmers Can Do.

We can, in a measure, avoid the results of their misdeeds by comparatively little effort. First, by taking a long collar as it comes new from the dealer and soaking it in water for several hours until in a degree pliant. Then, having the horse that is to wear it close at hand for trial, and some rigid arm or device, like the horn of an anvil, to work upon, by bending and shaping the collar until in its general form it actually fits the horse's neck. Second, on each side of the collar upon the surface toward the horse's head and a little above the draft point, just under where the hame rests, cut a cross with your pocket knife, both the vertical and horizontal arms of the cross to be 2 inches or more in length. Then with your fingers on a hook, pull out through these holes enough of the straw or stuffing to entirely remove the convexity on the face part, as the maker calls it. Be sure and take out enough, there is little danger of getting out too much. Then, after the excess is removed and the remaining portion uniformly distributed, take a smooth, round stick like a baseball bat, or smaller, and beat the face of the collar until it is both smooth and of such shape as when placed upon the horse's neck and bearing portion of the collar will rest upon the entire bearing surface of the shoulder.

Your collar will then fit the horse. He can work in it tin comfort. If he already has galls from previous work, you may either treat them or leave them alone. If you have fitted the collar according to these directions they will get well just the same. If his blisters are raised into bunches, make corresponding depressions in the collar, so that the surface will still bear throughout its whole extent. Have no fear of injuring the collar by soaking and cutting it, you cannot do it half the injury that the maker did. The water will soon dry out, and the crosses you will have cut will do but little harm, as the wear a these points is not great. This treatment has been specified for new collars. Old collars have usually been shaped by he horse himself with much pain and trouble, until in a measure they come to fit, just as we used to shape our boots and shoes with our feet before the shoemakers learned how to make them properly. If, however, you have old collars that the horse has been unable to fit by the effort of his shoulders, attack them just as above described for new ones. You can't do such a collar any damage and the worst bungler in the world may help it some.—N. E. Homestead.

STOVE ECONOMY



There is no saving in having a poor stove. It burns up fuel without giving the right kind of heat. You cannot regulate it for cooking purposes either. It takes a good stove to turn out first class bread, cakes or pastry all the time. You will not be disappointed in choosing a

POULTRY.

Geese as Farm Fowls.

Hundreds of dollars more yearly might be made in farming communities if goose raising was more generally cultivated. It is a branch of farming that women and children can attend to from start to finish with the exception of a little assistance at killing time.

Any farmer who has a cow pasture with running water within reasonable distance from the farm buildings has an ideal place for the rearing of geese. There is no other fowl so intelligent as the goose; it is tractable and easily kept out of mischief. The larger varieties never fly over, and seldom try to get through or under fences, if they have plenty of grazing ground and drinking water. Although they delight in a swimming pond it is not a necessity; they wll find pools along any little stream sufficient for their daily bath, and while goslings are wearing their garments of down they thrive better to be on the water very little.

Geese are almost immune from disease; I have reared hundreds and never lost one from sickness. But for many years I did lose a large percentage of my goslings, as did my neighbors, always before the goslings were feathered out. I watched long and patiently before I discovered the cause, also a preventative, which I will explain later.

The Embdens are an excellent breed of geese; they are pure white and yield an abundance of feathers. They are faithful sitters and good mothers. The Tolouse is a larger and more rapidly growing bird, and in some localities is more popular. The latter breed are prolific layers, often laying more than twice the number they can incubate. Fifteen or sixteen eggs are as many as should be given to the largest goose; more would mean loss from the outside eggs in the nest becoming chilled. The first of the clutch can be set under hens, and though hens are not natural mothers for the little foraging goslings, if a little extra trouble is taken in keeping the hen cooped, and moving the coop around occasionally to "pastures green," she makes a very good foster mother. Whenever possible, however, give me the goose mother.

The Laying Season.

Slaked lime, leached hard wood ashes should be left within reach of laying geese. Feed very little grain through the laying season; give plenty of bran mash, corn fodder, clover hay and vegetables. Little food of any kind is required after the grass begins to grow.

Geese usually begin to lay about the first of March. When you see an old goose coming from her house picking up straws and casting them behind her you may know she has laid an egg, or is thinking seriously of doing so. Now is the time to look after the nests. Each goose must have her own separate nesting place, always on the ground floor, and space enough partitoned off for her to turn around easily. Put two or three handfuls of straw into each pen, and see that the goose goes into her own apartment to lay her first egg. This will prevent all disturbance, as each goose will generally keep her own nest.

A goose lays every other day. Removing the egg from the nest, where she has overed it with straw, does not discourage Mother Goose; on every second day she returns, pokes over the straw and deposits another egg, then marches noisy from the goose house and joins the other geese. The eggs should be removed from the nests when laid, placed in a box or pan on cotton wool, covered with a light flannel and kept in a cool place. Turn the eggs evry other day; if this is negected the heavy yolks will adhere to the shell.

When a goose becomes broody let her sit two or three days before giving her her eggs; in the meantime she will shape and feather her nest. To make the nest remove the straw and feathers, turn in half a bushel of fine, dry chip dirt—or better still, dry horse manure—add as much dry chaff, hollow out the nest and put one of the two armfuls on top. Make the nest shallow and roomy, and finally add the feathers you had taken from the nest. It is then ready for the eggs.

Hatching Time.

A goose incubates four weeks; the goslings pip 24 hours before hatching. Never disturb the geese at hatching time; they will manage all right if left alone. If there is a weakling unable to get from the shell without assistance, better leave it there, as it would not be likely to amount to much if it lived.

I once had a pen of five geese, sitting in separate stalls side by side, all due to hatch at the same time. Three geese came off with five goslings; the fourth followed with two. They began feeding outside, and, much disappointed over the poor hatch, I went into the goose house to ook for the fifth goose, expecting to find her sitting on a nest of addle eggs. I found on her nest, but to my surprise her pen was iterally filled with yellow goslings; some were sitting on her back, and others were peeping out from under her wings. and she was mothering them in evident pride and satisfaction. There were 48 in all, and I never understood the secret of the little goose atracting the goslings from their rightful mothers. I found, however, before the season was over, that she was by far the best mother and caretaker in the flock.

Geese are very nervous when they first come off with their young, and should be disturbed as little as possible. Goslings are clumsy little fellows and not very strong the first day out, but if the day is warm and sunshiny they will gain strength remarkably fast. Feed a little wheat bran mush the first few days, and provide plenty of water in shallow pans or troughs raised an inch or two from the ground, just high enough for the goslings to reach the water easily and not topple over into it.

Gosling Mortality.

Sixty or seventy years ago New England grandmothers tried goose raising, and sooner or later nearly all of them gave it up because the goslings were so prone to die while in pinfeather. The cause of this no one could explain. The flock would be all right when they went to pasture in the morning; at night perhaps half or more of their number would be found dead along the road where they had fallen on their way home. The next morning what remained of the flock would be unable o walk, and their feet and legs would be hot and swollen. Sometimes they lived for several days, but none ever recovered. After years of discouragement and loss the cause of all the trouble was found to be toad polliwog poisoning, the goslings having eaten the polliwogs from pools and stagnant ponds. Common salt was found to be an antidote and it put an end to this menace of goose raising.

Feed a salted mash every morning before the goslings go to pasture, the quantity of salt about the same as one would use in preparng food for the table; or what is just as effectual, slightly salt their dringing water before they go out in the morning. After the goslings are fully feathered there is no more danger from this poisoning. Frog polliwogs are not poisonous to them.

Plucking Geese.

Geese may be plucked three or four times a year; the ganders as soon as the geese are through laying, the geese not until after the goslings are a week or two old. Geese that aret o be wintered over in a cold climate should not be closely plucked the last of the season. Goslings lose their feathers when ripe; a light plucking does them no harm and saves the feathers. To pluck a goose, tie her legs together, put a thin stocking over her head and hold her firmly in the lap. Do not remove too many feathers at once, and never the bolster feathers that support the wings. Ripe feathers pluck easily, and cause the goose little inconvenience; unripe feathers pluck hard and are of proper quality, the quills blood-tipped. As soon as plucked put the feathers in moth-proof sacks where they are to cure.

Two or three weeks before killing begin feeding corn; this with plenty of dringing water is all that is necessary for fattening. Kill the same as Turkeys or other poultry, cut off the wings at the first joint, hold the dead goose by the head and feet and immerse in boiling water; then wrap in a thick blanket and let steam 10 or 15 minutes. Pluck the feathers to within two or three inches of the head. As soon as plucked have ready a pan of very thin boiled starch with which to moisten the skin; this lays the down and gives the body a smooth appearance.

Goose wings sell for 25 cents a pair; live feathers for $1.50 to $2.00 per pound, and dead feathers for a ittle less, prices varying according to quality.

Backward Chicks.

In every flock of brooder chicks, no matter how promising, there will usually turn out to be from one to half a dozen or more that fail to keep pace with the rest. This is not always due to natural defection, but may be the result of various circumstances or conditions, by reason of which certain individuals get a setback or poor start. A careful glance does not discover them. The breeder may flatter himself, as he watches an animated bunch, all seemingly as "bright as buttons," that he is to raise every chick. But some morning he is surprised to find one dead. Others soon follow. Then he looks over his charges more closely. He finds that several are tottly on their legs, that while they rush in with the others at feeding time, they are so buffeted about by their stronger brothers that they eat but little, and that they are weakly and not growing as fast as the rest. These may be saved by a little extra attention, as doubtless a portion of the dead ones might have been saved if taken befcre it was too late.

I always keep close watch of my flocks for first signs of these laggards, and fancy I have developed considerable expertness in the early detection of them. On first spotting a suspect, I grab him up and feel of his crop. If it is empty into the feed-dipper he goes, which should be deep enough so he cannot jump out, as he may try to do at first. As I chore about the brooder, I keep an eye out for any other not up to size, weak-legged, or with an injured eye or foot, or defective in any way, until I have perhaps a half-dozen in the dipper helping themselves. This I repeat daily, being careful to crumb in a good bit of hard boiled egg to go with the "chick-feed," and in "extreme cases providing flour bread soaked in warm milk. It is surprising how soon these favored ones will learn to come up to you, like little beggars, each meal, not forgetting the habit long after they are able to fight their way with the rest

Of course, there are thousands of chicks hatched each year that cannot be made, by human power, to live more than a few days. Erors in incubating and breeding (mostly the latter) are responsible for them, and it is utterly useless to bother with them. They look about as well as the others perhaps tor the first few days, but the experienced breeder soon learns to distinguish them, from their lack of vigor and weight, and the fact that although they may make quite a pretense of eating, but little is ever found in their crops. It is not of this cass I

PEERLESS PERFECTION
It's made right—from high grade material. In the construction of our PEERLESS FENCING we use open hearth steel wire. Rid Your Fowls of Body Lice!

Every form of poultry life is more or less afflicted with lice. They suck the blood and sap the life of your fowls, thus seriously interfering with egg production. **PRATTS Powdered Lice Killer** instantly reaches and kills all lice on hens and chicks, and destroys insects and bugs on vines, plants and flowers. Sifter-top cans, 25c and 50c.

PRATTS Liquid Disinfectant keeps the poultry houses clean and sanitary. Highly concentrated.

RED ROSE TEA "is good tea"

Constipation

is an enemy within the camp. It will undermine the strongest constitution and ruin the most vigorous health. It leads to indigestion, biliousness, impure blood, bad complexion, sick headaches, and is one of the most frequent causes of appendicitis. To neglect it is slow suicide. Dr. Morse's Indian Root Pills positively cure Constipation. They are entirely vegetable in composition and do not sicken, weaken or gripe. Preserve your health by taking

Dr. Morse's Indian Root Pills 48

write, but of the chick with a fairy good constitution that meets with a setback of some sort. He may not get quite what he needs to eat some day, or gets crowded or overheated during the night. This woudn't matter much if he were a member of the old biddy's flock of 10 or 12, but one of a rioting mass of 50 or 100 he is borne hither and thither, in his weakened condition, until he quite loses heart. I have brought chicks like this around all right, when I actually had to force soaked bread down their throats at the outset, and have carried those afflicted with all sorts of deformities along to the broiler stage. The very worst forms of leg-weakness, too, can usually be cured by the simple means indicated above. Some say leg-weakness is caused by over-feeding. Perhaps true, but somehow, the more I can get my cripples to eat, the quicker they get strong on their pins. Try the plan for yourselves. Give all the ailing chicks free access to the contents of the grain-dipper, being careful not to keep them out of the brooder long enough to get chilled. If this doesn't bring them out right, the chanches are nothing else will.—John L. Woodbury, Cornish, Me.

Poultry Culture.

Sanitation and Disease.—Good sanitation means clean houses and clean yards. A common shortcoming is to neglect the poultry house until the droppings acumulate in such quantity as to menace the health of the fowls. as often as once or twice a week the dropping board should be cleaned. Good sanitation means sunlight, fresh air, absence of dampness, pure water and opportunity for exercise; it means the removal of sick fowls from the flock and the swift cremation of any that may die, as well as dead animals of any kind that may be found on the premises.

Medicines and stimulants are not necessary to keep a fowl in health. A healthful environment is better. Drugs often undermine the physical vigor and bring on a condition of disease. The notion that egg production must be stimulated by cayenne pepper, coperas, Venetian red or Spanish fly is a serious laying, even under normal conditions aying, even undrr normal conditions, so weakens the vitality as to seriously reduce the facility of eggs. What must be the effect when egg production is unnaturally forced by stimulating drugs?

Not the least feature of good sanitation is the dust bath in winter to fortify against the invasion of lice and mites. Overcrowding is a menace to health. So also is pampering. On the farm, where a free range invites to exercise and there is an abundance of sunlight and pure air, health should be the rule and disease rare occurance.

Disease in the flock has been the stumbling block of many a hopeful poultryman. Here are a few general principles for prevention: The foundation stock should be strong and vigorous if we expect to maintain the stock in a healthy condition. The environment must be kept as nearly ideal as possible at all times. When disease appears in a flock these remedies must be promptly applied.

White Diarrhoea.—This most fatal of all diseases is handed down from hen to chick. It is caused by a species of bacteria known as Bacterium Pullorum. It secures lodgment in the ovary and develops there. When the egg is laid some of the cells are found in the yolk. When the chick hatches it becomes infected with the disease. Other hicks contract the disease from the infected ones. Nearly all die and the few that survive have low vitality, and, if kept as breeders, are sure to perpetuate the disease in their offspring.

Treatment.—Inject all fowls from which eggs are to be used for hatching with ten drops of Oculum. Disinfect the incubator with a sppray of creoline sponge the eggs with the alcohol, and supply the chicks in the brooder with green food.

White Comb is a species of mould. The remedy is to place the fowls in dry quarters and apply a mixture of lard and iodoform, or even lard and sulphur.

Roup.—This is probably dreaded more than any other disease. There need be no fear of it if the environment is made sanitary. The common remedy is the axe. Isolate all sick fowls by placing them in warm, dry quarters and applying to the head a mixture of lard and sulphur, giving a liberal portion internally. About three applications will cure the worst cases. —H. A. McKeene, Secretary Illinois Farmers' Institute, Springfield, Ill.

To Shippers of Eggs.

The following instructions to merchants who ship eggs are sent out by the Swift Canadian Co. Farmers may profit by the suggestions:

1. If buying from others, insist on first quaity eggs only.
2. Keep in mind the perishable nature of the product, and do not hold eggs, but ship while fresh.
3. Never keep eggs near kerosene, onions. fish, or any other strong smelling substance; they readily absorb odors.
4. Never expose eggs for market to direct sunlight, rain, or to extreme heat from any source.
5. Do not wash eggs.
6. All eggs should be shipped in good strong cases, with fillers in good condition, and packed with excelsior flats on top and bottom. Do not use newspapers as flats.
7. Remember that 10 per cent of the eggs produced are wasted due to improper handling
8. Tag all cases plainly, so as to assure prompt and proper delivery.
9. When shipping, always mail bill of loading, express receipt, and memorandum invoice. Your shipments can then be properly checked and in case a shortage occurs, it will not be necessary for you to write full particulars after you receive your returns.

Cleanliness an Important Factor.

There are two most undesirabe conditions resulting from the usual accumulation of filth around the poultry buildings on most farms.

First, it encourages disease, ice and mite pests. Second, these influences combine to force the birds into a sickly, unhealthy condition, curtaiing the profits from both the sale of fowls and the eggs produced by the flock.

Cleanliness is very easily maintained in and around the poutry buildings by frequent removal of the droppings from the roosting house (if every day, so much the better); frequent changing of the nestings; and a knock-out blow against the lice and mites every time they are discovered about the yards.

Examine the roost occasionally, looking closely on the underside of them for mites; likewise, keep a close watch on the nest boxes and if any of the pests are discovered spray the building and shut the chickens out for a day or two, the roosts being left out out in the sun during the day. If lice are on the birds, powder them thoroughly with lice killer, or if the weather is warm enough dip them in the ordinary solution used for that purpose.

McCormick—The Binder of Satisfactory Service

HERE are some of the things that stand back of McCormick binder service. On a McCormick binder the reel has a wide range of adjustments and handles successfully, tall, short, down or tangled grain. A third packer assists in handling grain that is full of undergrowth or that is very short. The tops of the guards are nearly level with the top of the platform, allowing short grain to pass freely without obstructing the guards or knives.

The floating elevator on a McCormick binder handles grain in any quantity and does not clog. The cutter bar is built to use either smooth section or serrated knives. The improved McCormick knotter does good work without the usual close adjustments.

The McCormick local agent will explain these and other important features on the McCormick binders which are built especially to meet Western Canadian conditions. You can get catalogues from him, or, by writing the nearest branch house.

An Egg-Laying Record.

Pictou Advocate: Mr. Arthur Davidson, of Waterside, has a flock of 70 hens, which laid 1,782 eggs in the months of March, 107 dozen, all but two eggs. At an average of 30 cents a dozen this figures out a nice little sum of money. In February Mr. Davidson sold 66 dozen of eggs in addition to what was used on the farm. These hens are simply barn-yards, a mixture of all breeds.

One of the most important points in egg production is to keep the male away from all the hens whose eggs are being used for commercial purposes. Fertilized eggs are very easy to spoil unfertilized ones can never be spoiled by partial hatching, and this is where the trouble has begun with most rotten eggs.

Valley Farmers Visit Truro.

The annual farmers excursion from Annapolis Valley points to the College farm, Truro, took place on the 19th inst. A large number of farmers with their wives and families enjoyed the excursion and spent a profitable day at the College viewing the ideal methods that are there practised under the careful management of Prof. Cumming and his efficient, obliging staff.

From the Old World to the New.

Some fifty years ago, a Scotsman, by the name of Malcolm McKenzie, residing in Scotland was in very poor circumstances. His family consistsed of a wife and seven children, four daughters and three sons. Mr. McKenzie was a mason by trade and always had plenty of work, and his wife and eldest daughter did fine sewing and lace making, but with all their efforts, they coud barely earn enough to keep the wolf from the door, and it is a fact that the hard-working father and mother often went hungry or scantily clad that their children might not suffer. It can be readily imagined that in an over-crowded town like Linlithgow, where rent and provisions were high, and wages low, that the problem of providing for a family of nine was a serious one, and ofen had Malcolm McKenzie and his wife held consultations when their children were snug in bed, as to how they might better their circumstances or reduce their expenses but all to no purpose. The anxious parents always talked such matters over alone and never in the presence of their children whom they loved so dearly. "They'll have cares enough to trouble them in life as the grow older" they used to say, "so we'll not burden their young minds nor cause them any worry as long as we can shield them from it."

One day as Malcolm McKenzie was at work building a cellar wall for a man by the name of Davidson, by chance he over-heard his employer talking to a strange gentleman, whom he rightly conjectured was a Canadian by the run of his conversation, which was in this wise: "I tell you Davidson," he was saying, I can't manage to see how so many people manage to live in these Old Country towns; the people moving about reminds me of bees around a hive.

"Yes, this town, at any rate, is pretty well populated," laughed Mr. Davidson, "and weare all very much alive, too, but there are some very poor people here just the same."

"There must certainly be," replied the Canadian. "I have visited many towns in both England and Scotland, and I am sure that they are all overcrowded. How unevenly the world is divided. Here, you have hundreds of people more than you need for the good of the country, and in Canada, we don't have half enough. Why don't some of them pack up and go to Canada or the 'new world' as you people call our fair Dominion, and take up farms. There are hundreds of acres there to be got for a song, both in the western part and in the Maritime Provinces. A man can take up a piece of land there, I mean in Nova Scotia or New Brunswick, covered with timber more than enough to pay for it and set him on his feet. The soil is fertile and the climate ideal. I tell you Davidson, Canada is the coming land, good settlers are all that's needed."

"I dare say," answered Mr. Davidson, "no doubt many of us would be better off if we were out there digging in your Canadian soil, and raising our living from mother earth."

"Now! that's the time you said it, Davidson, for there are hundreds and hundreds of acres just waiting to be taken up. We have pioneers in both New Brunswick and Nova Scotia and they are prospering, too, and the happiest people living. I would rejoice to hear of some of your stalwart men coming out."

"I presume, by your glowing account, they might do all right," replied Mr. Davidson, with a smile of derision, "but the majority of the working class here are too poor to live, let alone have money to go prospecting to Canada." "Yes, I suppose that's true," answered the stranger.

"Which part of this wonderful Canada do you reside in Mr. Fletcher?" asked Mr. Davidson.

"From Maitland, Nova Scotia. I have a cousin, though, who started farming in pioneer style in the back woods of central New Brunswick eight years ago and now he is in comfortable circumstances."

As these gentlemen passed out of sight and hearing, Malcolm McKenzie, the mason, sat down in serious thought. "If I were only in Canada," he thought, "and could take up some land where we could raise our own vegetables, keep some cows and in a few years make a home of our own. I'm tired of paying rent, moving from tenement to tenement and barely feeding and clothing the family. If I had the money I've paid out for rent alone since Alice and I have been married, I'll bet I could go to Canada and buy a good farm. I wish I'd spoken to that gentleman and asked him more about it, but I'll tell Alice what I heard him say and I'll make it my business to go see him tomorrow and tell him that I happened to hear his conversation about Canada and enquire more into the particulars."

Soon the hard-working mason arose and continued his work in a pre-occupied mood. His thoughs were full of Canada. That night after the children were in bed and he and his wife talked over their joys and sorrows, hopes and fears of the day, as was their custom, he told her of the conversation he had accidentally overheard between Mr. Davidson and a Canadian gentleman by the name of Fletcher.

"Oh, Malcolm!" cried his wife, "if we could only go. Think, we could all help you on the farm and raise everything we'd need, instead of buy, buy, all the time, we would have all our own butter, eggs, meat, vegetables, in fact, everything. I lived two years on a farm years ago, and I always look back to the time as one of the brightest spots in my life. I've told the children about those times so often, and they will listen so eagerly and then ask, "why can't we live on a farm, now, mamma?"

"Yes, I know," replied her husband, "I spent one summer on a farm with my uncle just before we were married and I liked it very much and was getting to know considerable about the work. How often we have talked about those times and longed to give our children the happiness and freedom of the country. I should have taken up a farm in the highlands but father urged me to continue at the masonry."

"But if we could go to Canada, Malcolm," continued his wife. "Think of the advantages! I have ofen read of the acres and acres of land yet to be taken up but the thought never occurred to me for us to go."

"But, my dear, I'm afraid you don't know the hard-ships and privations the pioneer people have to endure, I could not think of allowing you to face them."

"But my dear husband, are we not facing hardships and privations here every day?"

"Yes, Alice, we certainly are, and the future looks black and unpromising before us. If I could only go to Canada a cauple of years first."

"No Malcolm," answered his wife, "I shall never allow you to go alone, if we ever go we must all go together."

"Much as I would like o go Alice, I see no prospects of it for years, or at least until the children get old enough to help earn money to take us there."

"Yes, that's so answered Mrs. McKenzie, "we can't save anything yet, but only think Malcolm, if we ever could go and take up a farm, what help the children will be to us. Here we cannot afford to educate them and they play about the streets with all classes of children. Our poverty debars us from mingling with our equals and I shall make no friends among the degraded people of the town. Mr. and Mrs. Davidson and Harry Gordon are our only friends."

"Yes, dear, I know," replied her husband. "It is a hard way to bring up the children in idleness, poverty and bad company. We can do no better for the present, however, but I intend to talk with Mr. Davidsson and the Canadian man to-morrow and tell them I accidentally heard part of their conversation regarding Canada, and how much we are interested, and the hard struggle we are having to live here. Perhaps he can tell me about the conditions of taking up land in the pioneer style, it may be, our luck will change, and it will be no harm to have the information."

"That's so," returned his wife, hopefully, "we should not complain while we all have our health, but trust in God to plan our future."

Malcolm McKenzie and his wife were blessed with happy, hopeful dispositions. They worked hard and did the best they could to get along, but they never wasted time in useless complaining, so long as they could provide for the children and make them happy, they were happy themselves. Often the thoughts of the future troubled them when they might not be able to provide for all, but they did not let it have a depressing upon their spirits.

CHAPTER II.

Several weeks later as Mr. and Mrs. William Davidson sat conversing before a cosy fire in their handsome residence in Linlthgow, Scotland, Mr. Davidson suddenly exclaimed turning to his wife. "I'm really going o buy that laundry, Sarah. You know I told you about Harley's laundry being closed up, and there has been many complaints about the work done at the Cornet laundry, so I'm going to buy the Harley and set up, myself, I believe there's money in it."

"Yes, I should think there would be money in the laundry business, providing they do first class work," his wife replied.

"That's what I think," returned Mr. Davidson, "I am going to make all the arrangements this week and be ready to start operations next Monday if possible. I think I can get Mrs. Malcolm McKenzie and their two or three eldest children to work in it. You know Mrs. McKenzie is a very capable woman at all kinds of work. I spoke to Malcolm about it yesterday and he was almost sure that his wife would go."

"Oh, William, I'm glad you spoke about them. They are dreadfully poor, I know, and such a large family, it has puzzled me how they manage to live at all. Mrs. McKenzie is a nice, lady-like woman and always does her work so nicely. I always get her to do all my sewing, in fact, any work I can to help them. Go see her William, by all means, before engaging any one else."

"That I will," replied her husband, "she's a very nice woman, and Malcolm's a fine man, too. Many's the job I've put in his way. He is in a great way to go to Canada and take up land. He overheard me talking to Mr. Fletcher, the Canadian from Nova Scotia, last week, and he was giving Canada in general a great puff, and the many advantages there for the pioneer. Really, Sarah, I believe a family like Malcolm McKenzie's to once get a start in Canada, if they had their health, their fortunes would be made."

"Ugh, pioneer life," exclaimed Mrs. Davidson in disgust, "the lonliness and hardships make me shiver to think of them. I don't believe Mrs. McKenzie would ever consent to go."

Mr. Davidson laughed. "But Malcolm tells me, my dear," he said, "that she is very anxious to go, so you see she has better courage than yourself, after all. However, if I get them into my laundry to work and making an easier living, I trust they will forget the new world entirely."

So William Davidson bought the Harley laundry and Mrs. McKenzie and her two eldest children, Ellen and George were employed in it. Fanny, the second daughter had to remain at home to look after the work and care for the younger children in her mother's absence. Mr. McKenzie continued working at his trade and found steady work.

It will be readily understoodt hat the McKenzie family were now living more comfortable, and as the weeks and months slipped by, saved a little money. But how about going to Canada? Did hey abandon the idea, now that they were living more comfortably? Oh no, it was the talk of them all, the parents having told the children sometime before, of their desire to go out to Canada, and poor children, they were wild with delight at the prospect, and many were the questions asked of what the life would be like. It was al-

THIS WOMAN'S SICKNESS

Quickly Yielded To Lydia E. Pinkham's Vegetable Compound.

Baltimore, Md. — "I am more than glad to tell what Lydia E. Pinkham's Vegetable Compound did for me. I suffered dreadful pains and was very irregular. I became alarmed and sent for Lydia E. Pinkham's Vegetable Compound. I took it regularly until I was without a cramp or pain and felt like another person, and it has now been six months since I took any medicine at all. I hope my little note will assist you in helping other women. I now feel perfectly well and in the best of health." — Mrs. AUGUST W. KONDNER, 1632 Hollins Street, Baltimore, Md.

Lydia E. Pinkham's Vegetable Compound, made from native roots and herbs, contains no narcotic or harmful drugs, and to-day holds the record of being the most successful remedy for female ills we know of, and thousands of voluntary testimonials on file in the Pinkham laboratory at Lynn, Mass., seem to prove this fact.

For thirty years it has been the standard remedy for female ills, and has restored the health of thousands of women who have been troubled with such ailments as displacements, inflammation, ulceration, tumors, irregularities, etc.

If you want special advice write to Lydia E. Pinkham Medicine Co., (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

The right to wear a Clean Collar

Every man can have a clean collar if it's a Challenge Waterproof Collar. Best to wear at work or for dressing up after work. Not shiny, but look just like linen. Always neat and comfortable and are cleaned with soap and water.

Sold at all Gents' Furnishing and Dry Goods Shops, or send 25c. for Sample Collar.

G. Y. CHOWN, Registrar, Kingston, Ont.

most wholly the topic of conversation of their evenings after work.

"Now, papa, tell us what it will be like when we go o Canada," one of the little folks would ask for the hundredeth time.

"Well my child," the father would reply, "we must first sail many, many days to reach Canada, then we must buy horses and wagons and drive many miles into the woods, then cut down trees and build a house, after which we will dig up the soil and plant our seeds. And you must remember we will be miles and miles from other people, no trains nor teams nor children for you to play with, nothing but woods all around. How will you like that?"

"Oh, we'll like that," they would cry, "all of us will be there together, won't we?"

"Yes, all of us."

"Then we'll be happy," they would say. "Horses to drive, cows to milk, chickens to feed, and help you to raise everything."

"Did you get Mr. Davidson to write to that man in Nova Scotia to find out how new setters get their land, and when is he best time to go," his wife asked.

"Yes, I've been taking to him about it and he told me he would give me his address and I could write him personally. He said also he would write to him too, that I was anxious to go."

So the sequel of the matter was that Mr. Joseph Fletcher, Maitland, N. S., received two letters six weeks later from far-off Scotand the purport of which was that a gentleman by the name of Malcolm McKenzie wished to learn all the particulars he could of the conditions of taking up land, the best part of Canada to locate, and the best time of the year to reach Canada.

Several weeks later William Davidson received a reply from Mr. Flecher saying: "He was glad to hear that one Scotsman, at least, had come to his senses, and realized the possibilities of success in Canada. Don't discourage him," he continued. "I can't just recommend any part of this province as yet, but I have written a cousin of mine in New Brunswick. I hear there is land there of the very best, and the climate I know is ideal. As soon as I get a reply from him will write Mr. McKenzie, with all the information I can receive to assist him."

Mr. Davidson gave Mr. McKenzie his letter, which he read to his family that evening.

The children called regularly at the post office for Mr. Flettcher's promised letter to their father, day after day for nearly two months and at last were rewarded by receiving a plump package for their father, bearing a Canadian stamp. What anxious children they were as they waited for the return of their parents that evening and how eagerly the large letter was thrust into his hand with the exclamation of, " there papa, we'll know now if we are going to Canada won't we?"

"I expect we will my dears," he answered as he gave them a kiss all around, "but we won't read it until after tea, then we shall all sit around the fire and take the evening to master its contents."

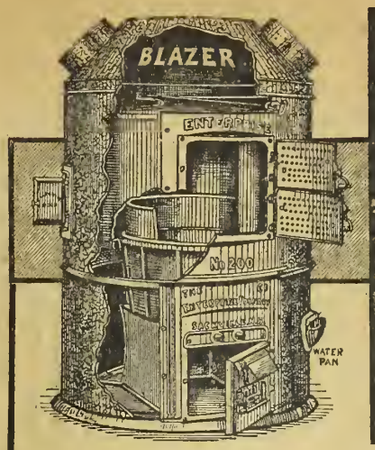
So the eager children had to be content. Nevertheless, a couple of hours later when the mother had her housesold duties all performed and they gathered around the fire, Malcolm McKenzie broke the seal and read the letter aloud, which was as follows:—

Maitland, N. S.,
Feb. 1st, 1863.

Mr. Malcolm McKenzie,
Linlithgow, Scotland.

My Dear Sir,

I received your letter a long time ago requesting information about Canada and the mode of taking up land. I also received a letter from Mr William Davidson, your friend, also requesting me to interest myself in your behalf, said letter I answered some time ago. I did not answer your letter before as I have been investigating matters a little. I am sorry to say I can't seem



REASONS

SCIENTIFICALLY correct *principle*—supplying warmed *fresh* air, and ventilating the house as well as heating it.

PROPER PROPORTIONS—strength where strength is required, generous dimensions, but not too high lor low cellars.

BEST MATERIALS—steel where steel is best, charcoal iron where it is better.

LARGE ASH-PIT, anti-clinker grates; large feed door; direct damper, worked from the front; easily-reached water-pan; heavy, two piece flanged fire-pot (patented by us); gas-proof steel radiator. Easy to clean out.

MOST ECONOMICAL—costs less to install than hot-water radiator systems; gives generous heat; low coal consumption; requires little attention, no repairs, and will last a lifetime.

Made in Four Sizes.

The ENTERPRISE Hot Air Blazer Furnace

is correct in principle, durably constructed of the best materials and economical and convenient in operation. It supplies a generous quantity of warm, fresh air to every part of the house, with less coal than is burned by many furnaces greatly inferior in heating capacity.

Patented and exclusive features are responsible for this economy, and also for its great durability

Health as well as comfort, demands pure air in the house. Ordinary heating systems warm the same air over and over again, until it is dry, dead, and unwholesome. The Blazer Furnace ventilates the house, and heats all parts of it evenly, protecting occupants from headaches and colds.

Write for this book. It is free.

There is a Blazer representative in your vicinity who will be glad to explain its features fully and to estimate the cost of installation in your home. If you do not know him, write us for his name.

Enterprise FOUNDRY CO. SACKVILLE, N.B.

DON'T LET YOUR WIFE BEND OVER A WASHTUB

all day, rubbing and scrubbing in a hot, steamy wash-house. Think of the drudgery—the backache—the serious illnesses too often caused by chills. Avoid this! Get her a

Maxwell

"HIGH-SPEED CHAMPION" WASHER

and ease this burden and save money. Clothes washed cleaner and whiter in half the time. A dry, clean floor, too.

Go with the wife to the nearest Maxwell dealer and see the Maxwell "High-Speed Champion." Notice how easily it works—almost runs by itself. See the lever at top, and crank handle at side. Both equally easy. There's not a better washer on the market than this. It means lighter work and better health. Also enquire about our Washers for Water, Electric or Gas Engine Power.

to hear of any suitable location for you in Nova Scotia, but I wrote to my cousin in New Brunswick, who went there eight years ago and began farming in real pioneer style, and who is now prospering. He replied at once, saying "if this Mr. McKenzie, of Scotand, is coming out to take up a new farm, he can't do better than to come here. My nearest neighbor is eleven miles away but there is a tract of excellent land with a fine growth of lumber consisting of spruce, pine, cedar and the best of hard-wood. There is no cleared land at all, but the soil is a black loam and very fertile. The piece of land I refer to contains one hundred and sixty acres, and is situated half way between my place and my nearest neighbor, so you see he will have a neighbor on each side o him, about five miles away. The best time for him to arrive here is early in April, he then will have time enough to build a log shanty before croping time. Next fall and winter he can get out lumber for sale, clearing his land at the same time. There is also a big demand for Shingles, which we make by shaving them out of the soft lumber. If he wants to start farming from the stumps, this is his chance. I guarantee no failure if he is willing to work My wife and I are anxious to have them come as we want nearer neighbors. You say he has a large family, so much the better, he will be having more help every year. You better send this fellow my address and he can write me if he likes. I am also sending you papers from the government about the piece of land and the method and conditions of getting it, which will interest him. He, however, can arrange all that after he gets here." That's about all he says concerning you," wrote Mr. Davidson. You will find the government papers he speaks of encosed, also his address, if you wish to write him.

In closing I will say if you decide to go to New Brunswick and settle you will find Thomas a good friend and I feel sure this is an excellent chance for you. Hoping this information will be satisfactory and that I will hear from you again if I can aid you in any way, I am

Yours truly,
Joseph Fletcher.

P. S. This is my cousin's address: Mr. Thomas Richardson, Ruther Glen, Carleton Co, New Brunswick, Canada.

(Continued in next issue)

The Saving of Child Life.

Of 36,686 deaths in Nova Scotia during the five years' period ended Sept. 30th, 1913, 7,153 (19.5 pepr cent. of the total), ocurred in children under the age of one year.

After the end of the first year, the first year the proportion of deaths amongst children decreased as age increased, as follows: during secocnd year 3.3 per cent. of the total; during the third year, 1.7 per cent. of the total; during the fourth year, 1.1 per cent. of the total; during the fifth year .9 per cent. of total.

An analysis of the statistics shows that three of the commoner infectious diseases have a special bearing ppon mortality in young children. Thus 55 per cent. of all deaths from measles, and 83 per cent. of all deaths from whooping cough occurred in children who were less than two years of age, while nearly 60 per cent. of those whose death resulted from scarlet fever were under the age of five years. This is in keeping with the experiene of most countries. Both measles and whooping cough are especially apt to destroy life in infancy, while scarlet fever claims its largest share of victims from those who are about five or six years of age.

During the five years under consideration, 191 lives were lost to our province through measles, 229 through scarlet fever, and 366 through whooping cough. Such figures indicate very cearly that these diseases are not the trifling ailments which they are commonly thought to be. Moreover, even when they do not kill they often leave behind exceedingly troublesome and disabling conditions. and they frequently open the way to infection by the germs of pneumonia, tuberculosis and other diseases.

It is the consensus of opinion that increasing age not only renders one less susceptible to these diseases, but that it also protects against a fatal issue and against serious complications and sequelae in those who are attacked. For these reasons, it follows that every effort should be made to protect young children against infection by these,, as by the other, infectious diseases. Deliberate exposure of young children to such infections should be regarded as a criminal procedure—one which not only endangers the life or subsequent healthfulness of the child so exposed by which establishes an additional focus from which infection may spread to other children. The longer the child is enabled to escape infection, the more likely it is to escape either completely or with a comparatively mild attack.

Sixteen per cent. of the deaths which occurred during the first year, and thirteen per cent. of those which occurred during the second year of life, resuted from infantile diarrhoea. This condition is mainly caused by improper feeding, and is one of the diseases which might be completely abolished by careful attention to certain simple rules. Success, however, necessitates the co-operation of all who deal in or handle milk, and a thorough system of milk inspection and control is a prime necessity. It is particularly amongst "hand fed" infants that diarrhoeal troubles are found, and mothers should know how to prepare and preserve the milk for their babies.

In five years, no less than 1143 children under one year of age, and 157 children between one and two years of age, died of infantile diarrhoea in Nova Scotia. These deaths were almost confined to the hot months. It is therefore particularly during warm weather, that the greatest care must be given to the feeding of young children. Carelessness at this period may cost your baby its life or may condemn it to a lifelong invalidism. "They who pine in their youth can never look spruce in their old age."

The Department of the Public Health, Nova Scotia, isues a booklet on the care of the baby which may be had free on application to the Provincial Health Officer, Halifax, or to any Medical Heealth Officer in the province.

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

To Can Raspberries Without Sugar.

Pick berries early in the day before they are heated by the sun, put in preserving kettle with enough cold water to almost cover, and bring them to a boil. When all are thoroughly heated through, turn into jars and seal while hot. We have canned them by this method for many years, and always with success.

Gooseberry Jelly.

Boil 4 pounds sugar and 3 cups water together until it is ready to jelly when cooled. To this syrup add an equal measure of gooseberry juice, let it boil a few minutes, and then turn into jelly glasses.

MARITIME DELIVERY STATIONS

IN order to give our customers in the Maritime Provinces quicker and better service we have opened delivery stations in Halifax, N. S. and St. John, N. B. At these stations we will always have large stocks of

Preston Safe Lock Shingles, Acorn Quality Corrugated Iron, Preston Metal Ceilings and Sidewalls, Eavetrough, Conductor Pipe, Acorn Plasterers Corner Bead & Wall Ties, etc.

Our Galvanized Iron passes the British Government Acid Test, the severest test known.

Mutual Helpfulness.

In these days of rush and hurry, of commercialism and greed of gain —which reduced to the last analysis is only and purely selfishness—that loftier and finer virute of mutual helpfulness seems in large measure to be crowded out. Now it is this spirit of helpfulness that the organizers and promoters of Women's Institutes aim to create.

The Hon. John Dryden, for many years Minister of Agriculture for Ontario, regarded the organization of Women's Institutes as the greatest work accomplished, during his tenure of office; and the Hon. C. C. James characterized them as one of the greatest achievements of the twentieth century. Surely, then, some benefits may be had or hoped for from their organization and maintenance in our province.

As the Institute has, for its main object the improvement of the social life of the community in general, and of the home in particular, in what way may it be a benefit to us? For it is said, that the home of a woman lies nearer to her heart than anything else.

Perhaps one of the many ways it might be helpful is by producing a spirit of sociability and neighborliness, and also by giving us an opportunity to look away for a short time from the confines of our own, perhaps, restricted environments and see some of the conveniences and accomplishments of others.

One would naturally think of cooking as one of the subjects to be discussed with interest at the meetings for good cooking is one of the essentials of good house-keeping, but not by any means, the only one. And when good house-keeping has been thoroughly attained to it may not always mean good home-making. Although one cannot be realized without the other. Yet, there might be a danger of having things so scrupulously clean and straight-laced that one could not feel comfortable lest at some time the cushions, rugs or draperies should be put out of their proper order.

Perhaps one of the great essentials of home-making is the coveted virtue of amiability, which is so much easier described than attained.

Another feature of home-making is hospitality, which we are enjoined to use without grudging, and which we all so much admire as recipients. And, should not all the family feel free to invite to their home occasionally their friends and associates? If not, they will go elsewhere, and the ties of home will be severed rather than drawn closer together, for we never forget the associations of the old home, away back in our childhood days, when the enjoyment of life did not depend so much on the abundance of things which we possessed.

Then, there are so many qualifications required nowadays in the modern housekeeper and home-maker that life assumes a very serious aspect when viewed from the standpoint of modern scientists, with regard to the rearing of children and the care of grown-ups, when we remember that it is claimed by those scientists that half a million lives are cut short and five million people are made ill yearly by preventable diseases caused by germs, bacteria, microbes, atoms, etc., etc.

That six hundred infants die under two years, and millions of children fail to reach the best physical development because their parents or guardians did not understand how to care for them in the light of science. One cannot but wonder what possible geniuses some of us might have developed into had science only come to our rescue in our infancy. But, no doubt, life was easier when, as Kipling aptly puts it, there were

"No theories of germs to chill affections budding blisses,
When ardent lovers took their fill, no microbes on their kisses,
How happy they were, not to know the germ fad, forty years ago."

But you will say this sociability, this hospitality, this scientific care of homes and their inmates requires time, and we are so busy now, from whence then, this extra time?

Something must surely be left out, but what. Perhaps by making a closer study of our work we might plan to leave out some of the non-essentials, for

"Labor with what zeal we will,
Something still remains undone,
Something unaccomplished still
Awaits the rising of the sun."

Yet, when all the material side has been summed up of house-keeping, cooking, social entertaining and kindred duties and pleasures, there is yet something which far outweighs these things in importance to us who are mothers, viz., the moulding of the character of those committed to our care; for we realize that as the twig is bent the tree is inclined.

How important then that the young minds should be stored with the elements which make for the purity of life, and nobility of character. —By Mrs. M. W. Townsend, Grangemount, P. E.I.

SCROGGIE'S mid-summer sale

The Scroggie Midsummer Sale Catalog

is the most wonderful book of summer bargains we have ever issued. It contains bargains for men, women and children—bargains in things for the home, sporting goods—things that will make summer life worth while. It will be ready for mailing soon. Fill in the coupon, mail it to-day, and your copy will be mailed you the minute it comes off the press.

Every article quoted in this Catalog will be at a big price reduction

The dress section contains all the cleverest of summer dress creations at most unusual bargain prices—in other sections there is a host of bargains in catchy summer apparel, dress accessories, and other smart summer suggestions at big savings.
If you are interested in getting the best merchandise that the world has to offer at the lowest prices, you should not be without a Scroggie Summer Sale Catalog in your home.

Here is a guarantee that protects you

"If you are not perfectly satisfied with any purchase you make from us, return the goods and we will either exchange them or refund your money, as you wish, by return mail."
W. H. SCROGGIE LIMITED

Back of this ironclad guarantee stands our reputation of 31 years' honest dealing that we dare not jeopardise.

W. H. SCROGGIE Limited
Montreal

Please send me free of charge a copy of your Summer Sale Catalog

Name.....

MONTREAL

Sunshine Jam.

To 1 pound berries allow ¾ pound sugar, place on back of stove and stir until sugar is dissolved, then let come to a boil and boil a few minutes, after which spread on a platter and set in the hot sun until it thickens. It may be 2 or 3 days, but it will well repay one for the trouble. Put up in glasses and seal with melted paraffin.

Currant Jelly Without Cooking.

Pick over ripe currants carefully, wash, mash, and strain through jelly bag. For every pint juice allow one pound sugar. Stir until sugar is dissolved, and then put away in air-tight jars. Expose jars to hot sun for two or three days, and then put away in a cool, dark and dry lace.

DON'T SWAT THAT FLY
and leave the disease germs to be scattered through your house.

USE WILSON'S FLY PADS
and kill both the flies and germs. Sold by all Druggists and Grocers all over Canada.

Winter Evenings in the Home.

It is with a decidedly shy feeling I present my paper today as it is the first I have ever written for any cause. But as the Women's Institute has eliminated the words "I cannot" from the English language I must go ahead whether I sink or swim.

Eve had many domestic problems, no doubt, and no Women's Institute to help her. Poor Eve! But from the nature of her clothing, I presume she did not have winter evenings in the home to confront her. It has been a subject of much discussion, and has lain close to the heart of many mothers and has been a problem in many homes.

It is said that the Englishman's home is his castle. 'Tis a lovely thought that there at least the humblest reigns supreme. Bobby Burns, the inimitable, in his "Cotter's Saturday Night" gives us his idea of an evening.

"The cheerful supper done—
They round the single for circle wide".

The day's work done and the heart at rest. The Irishman, bless his happy heart! Some way we always think of that home as a jolly happy spot with the pig in the parlor on a winter's evening, with love-making and scrapping the order of the day.

At the end of the day the Arab pitches his tent, kindles a fire and his winter evening has begun.

Drummond, in his "Habitant" shows us a winter evening in a Canadian home. The fire, the parents, the maiden—poor Philemon who "look for de moon on de wrong side de house." And always and ever the lover in poetry at least.

But when it comes to winter evenings in your home and mine it seems a harder matter to discuss.

Those first winter evenings when there are just "we two" is not much of a problem—is not, pernaps, worth discussing.

Then when the babies, so dear, so wee, the joy of an evening is to know they are safely tucked in bed and as we watch them sweetly sleeping we wonder how such dear hands and feet can make so many steps and cause so much work and worry.

Then, while we are thinking it over, and laying our plans we suddenly find those tiny hands are large as our own and those tiny feet are beginning to walk in paths we had not shown them. It is beneath their dignity to have a bed time and—oh, you know it all now or will so soon that you may as well get ready now. So our winter evenings have come with our young folks around us and how they shall be spent is the question.

Now is the time when we have made the huge mistake of leaving our youth behind us, the only thing for us fathers and mothers to do, it seems to me, is to turn around as quickly as we can and run back for it. Do you remember how it used to be when we got started for school and had forgotten a book. The sudden dash back for it lest we be too late? 'Tis so we must go back for our youth if we are going to use it in this evening school for the session will be short.

We need games and I think we should learn to play them. Not haphazardly; be a good partner and don't have to be coaxed in just to fill a side and then let that side loose through your inattention or lack of knowledge. What higher praise do we want than "if mother plays on our side, we will win?"

You who can make music be thankful; it fills such a large place. If you can make music, then in the name of our common humanity make music. Don't have to be coaxed and flattered until people would rather go without than yield to your vanity.

Good books and the best papers should be provided. You would call a man unwise, at least, who would sow chaff in his field instead of grain. Yet the chaff is carefully stored in the yong minds if opportunity is given, and the spirit of unrest created by the impossible adventures in many books and papers. Don't let us forget, the "mind is the measure of the man."

Then we must have our friends and our children's friends. It need not always take a lot of preparation. Some home-made candy and some fruit or cake, a royal welcome and a happy time. If there are young people living near, be thankful and make the most of them. Let some of the fancy work and the fussy things go but make the young folks have a good time and so have one yourself.

I have taken this from a parents point of view. There is the other side. What part must the children take? A large part. Don't think mother and father do not understand. Their youth is such a little piece back, and it is for you in a measure to keep the distance short. Do your part in these winter evenings. Don't think some one else is having it easier to be happy than you are. Put your young shoulder to the wheel and show what you can do to make, not just yourself happy, but those around you happier. "'Tis what you give you keep."

There is an old legend of the people who heard of the vine of happiness that might be planted and would bring them joy. They left home to search for it. After journeying in many lands searching, they became discouraged and returned home only to find the home covered with the vine. I fear we do not count our mercies. It was a homeless man who wrote "Home Sweet Home."

I cannot tell you how to spend the evening in your home for I do not know. And so you see my paper misses the point for which it was written. I only know they should be spent in the happiest manner it should be possible to attain.—Mrs. W. O. Logan, East Leicester, Cumberland Co., N. S.

A Real Lever Simulation

GOLD WATCH FREE.

A straightforward generous offer from an established firm. We are giving away Watches to thousands of people all over the world as a huge advertisement. Now is your chance to obtain one. **Write now**, enclosing 25 cents for one of our fashionable Ladies' Long Guards, or Gents' Alberts, sent carriage paid to wear with the watch, which will be given Free (these watches are guaranteed five years), should you take advantage of our marvellous offer. We expect you to tell your friends about us and show them the beautiful watch. Don't think this offer too good to be true, but send 25 cents to-day and gain a Free Watch. You will be amazed.—WILLIAMS & LLOYD, Wholesale Jewellers (Dept. 69), 89, Cornwallis Road, London, N., England.

all dust is carried up smoke pipe. See the McClary dealer or write for booklet. 35

Wholesome Summer Beverages.

More wholesome than the beverages you get at the soda fountains are those prepared at home of pure fruit juices and syrups. They are not only harmless, but refreshing and nourishing for both sick and well persons.

Juices of all kinds of fruits may be canned or bottled at home by straining through flannel cloth, then heating to a temperature of 200 degrees and sealing in bottles or mason jars. If put in bottles pour melted paraffin over the cork. Do not boil, but seal while simmering, just before reaching the boiling point. If boiled it will be necessary to skim. Syrups are made by adding as much sugar as you have juice, and reduced to syrup by boiling.

Big Ben

They Say He's Worth 8 Million Dollars

Yes Sir! American farmers and business men, and their wives and children have said, "He's worth eight million dollars," for they've paid that much to 20,000 jewelers to get him to come to work in more than three and a quarter million homes (3,250,000).

Big Ben is only four years old, but he's made a bigger success for himself than any other clock alive.

You'll find him on all the big farms—helping to get the farm hands out on time—helping to get the bigger, better yields. You'll see him 'round the house telling the womenfolks the time all day so they can have the meals on time.

You'll see him in the parlor on the mantelpiece—7 inches tall, sturdy, handsome, triple nickel-plated, ticking quietly and *'tending to his knitting.*

In the bed rooms in the morning you'll hear him calling different people different ways—in "that" room, with one straight "hurry-up" five minute ring, and in "that other room," with ten short "reminder" calls lasting ten minutes. Tell him how you like your call—he'll accommodate you.

Call on Big Ben at your dealer's. His price is $3.00. Let him show you what he does. If your dealer hasn't Big Ben, a money order for $3.00 addressed to his makers—*Westclox, La Salle, Illinois*—will bring him to you anywhere in Canada duty charges prepaid.

SYNOPSIS OF CANADIAN NORTH-WEST LAND REGULATIONS.

THE sole head of a family, or any male over 18 years old, may homestead a quarter-section of available Dominion Land in Manitoba, Saskatchewan or Alberta. The applicant must appear in person at the Dominion Land Agency or Sub-Agency for the District. Entry by proxy may be made at the office of any Local Agent of Dominion Lands (not sub-agent), on certain conditions.

Duties—Six months residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres, on certain conditions. A habitable house is required in every case, except when residence is performed in the vicinity.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead Price $3.00 per acre.

Duties—Six months residence in each of six years from date of homestead entry (including the time required to earn homestead patent) and 50 acres extra cultivation.

A homesteader who has exhausted his homestead right and cannot obtain a pre-emption may take a purchased homestead in certain districts. Price $3.00 per acre.

Duties—Must reside six months in each of three years, cultivate 50 acres and erect a house worth $300.

The area of cultivation is subject to reduction in case of rough, scrubby or stoney land.

W. W. COREY,
Deputy of the Minister of the Interior.

N. B.—Unauthorized publication of this advertisement will not be paid for.—58783.

Now is the Time to Plan for the Summer

Students can enter at any time as we will not this year have any summer vacation, the number in attendance from a distance making it inexpedient to interrupt their work.

Besides, St. John's cool summer weather makes tudy during the warmest weather just as pleasnt as at any other time.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write today to Mrs. M. Summers. Box P. 309 Windsor. Ont.

A sprained ankle may as a rule be cured in from three to four days by applying Chamberlain's Liniment and observing the directions with each bottle. For sale by all dealers.

Grape nectar is made by adding together the juice of 2 lemons, 1 orange, 1 pint grape juice, 1 small cup sugar, and 1 quart water. Serve ice cold. If served in sherbet dishes the lemon and orange should be sliced.

A drink that is among the best for invalids who cannot take solid nourishment is made by heating the white of 1 egg and pouring over it a little grape or other fruit juices, adding cracked ice and a little sugar.

The whites and yolks of two eggs well beaten and the juice from 2 lemons, with sugar and water to make four glasses of the beverage, constitute one of the best summer beverages when served ice cold. This drink is relished by almost anyone, and contains real nutriment. It can be taken into the stomach when other things are nauseating.

What is known as berry vinegar may be made of any ripe berries, such as strawberries, raspberries or cherries. Put 4 quarts of berries into a bowl and pour over them 2 quarts of good cider vinegar. Keep in a cool place for two days, then strain the vinegar through a cloth. Again put 4 quarts of berries, either the same kind or different, as desired, and pour over them the vinegar strained from the first lot. After two days strain again, and put the strained juice in a preserving kettle with three quarts sugar. Heat slowly, and when the vinegar boils skim carefully. Boil 20 minutes, then put in sterilized bottles. About 2 tablespoons of the vinegar to a glass of water makes a very refreshing drink.

Lemonade has always been one of the most satisfying of cold beverages. To have always at hand the material for making a glass of lemonade, extract the juice from half a dozen lemons, add to this juice a pint of sugar and an ounce of tartaris acid. Pour into this a pint of cold water and boil till thin syrup. Put in a sealed jar or bottle, and when needed, pour a little of the syrup in a glass and add water and ice. It is the work of amoment to prepare a glass in this way.

Strawberry Sun Preserves.

Use only the best berries, perfectly ripe, and of a deep, dark red color. Boil together 3 pounds granulated sugar and 2 cups boiling water without stirring, until the syrup will spin a thread when dropped from a spoon. Cook the berries in this syrup about about 15 minutes after they begin to boil, then pour the preserves on large china platters, cover with gauze, and set in the sun for two or three days. Remove the plates to the house as soon as the sun sets, and put them out again as soon as the sun rises, moving them about so as to keep them in the sun all day. Pack in jelly glasses and seal with melted paraffin.

Canned Strawberries Without Cooking.

Allow 1 quart best granulated sugar for each quart strawberries. Mash the strawberries with a silver fork, and be sure that every berry is thoroughly crushed, or they will not keep. Mix thoroughly with the sugar and then pour into the jars, shaking down firmly, and let stand a few minutes to settle. Be sure that there are no air bubles in the jars, then fill to overflowing and screw on the covers. If the jars are sealed air tight, strawberries done in this way will keep indefinitely. Currants can be canned in the same way.

Sunshine Jelly.

Allow 1 pound sugar for 1 pint fruit. Use only just enough water to dissolve the sugar. Let it boil, and skim, and then add the fruit and cook as follows: For strawberries cook slowly 10 minutes; gooseberries and cherries 15 minutes. All fruit is to be cooked very slowly if the shape is to be retained. Spread on a platter, and place in the sun until the syrup thickens and "jellies." Put away in glasses.

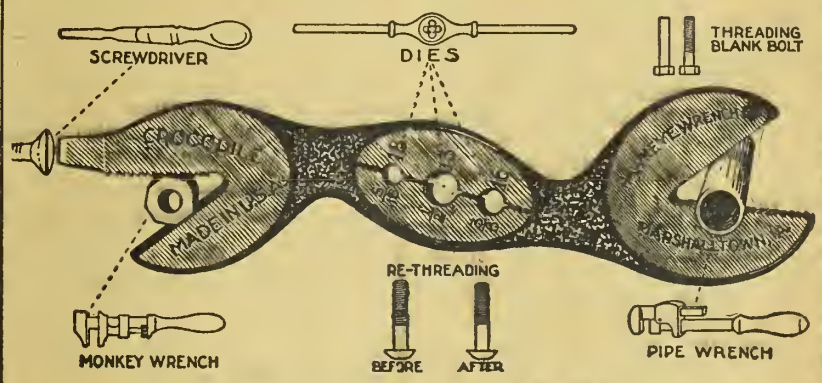
The Crocodile Wrench

An All Around Handy Tool for the Home, Farm and Shop



Six Handy Farm Tools in One

The Crocodile Wrench is drop forged from the finest tool steel and scientifically tempered. Every wrench guaranteed against breakage. It is 8 1-2 inches long and weighs ten ounces.

A pipe wreuch, a nut wrench, a screw driver and three dies 5-16, 3-8 and 1-2 inch for cleaning up and re-threading rusted and battered threads, also for cutting new threads on blank bolts. Dies will fit all bolts used on standard farm machinery.

Teeth and dies are case-hardened in bone-black, making them hard and keen.

The dies on this wrench alone would cost $1.50, and would be worth more than that to every farmer, as they would often save valuable time, besides an extra trip to town for repairs.

Sold everwhere for 75 cents cash.

How to Procure a Crocodile Wrench

On receipt of $1.00 we will send you the Maritime Farmer for one year and also one of these Crocodile Wrenches. New subscriptions will date from time of receipt, renewals from date of expiration of present subscriptions. Send us two new cash in advance subscribers to the Maritime Farmer at 80 cents each and we will send you a wrench for your trouble. Or for 75 cents cash we will send you a wrench.

The Maritime Farmer, Sussex, N. B.

The Menace of the Fly.

It has now been established that flies are not only a nuisance, but that they are very active distributors of disease.

While by preference they infest places where filth abounds, they are of ubiquitous habit, and pass cheerfully from the manure heap, the privy, the garbage pail or the sick room to get the first taste of food intended for our dining tables to deposit on it such filth as they are able to conveniently carry and mayhap the germs of such diseases as typhoid fever, tuberculosis, infantile diarrhoea, etc. The infection of the dreaded infantile paralysis is very probably carried by the stable fly, which in biting the little victim 'inoculates it with this disease.

The chief breeding places of flies are collections of garbage and manure—particularly horse manure. In such places they multiply with great rapidity. Each adult female fly deposits several hundred eggs, which pass through the cycle from egg to fly within eight to ten days. Seven to ten generations are bred annually. Thus the progeny of a single female fly, which has survived the winter, may amount to several millions in but one season. The Merchants' Association of New York estimates that the progeny of one pair of flies for one summer, if all survived, would occupy a space of 14,000,000 cubic feet, even if pressed together. There is good reason therefore, why the campaign against the fly should be commenced at the very beginning of the season.

Our houses (particularly the dining room and kitchen, and all sick rooms our food, (including fruits and vegetables which are eaten uncooked), and the faces and bodies of infants should be protected against flies by suitable screening. Every fly should be killed on sight. But the principl means of controlling the fly pest is by doing away with the breeding places.

Particular care should be given to the removal of stable manure, which during warm weather, should under no condition be allowed to remain at a less distance than a quarter of a mile from a human habitation. Garbage, contents of privy vaults, and refuse of all kinds should be similarly removed if the preferable destruction by fire cannot be carried out. Manure pits, garbage receptacles, etc should be made very tight, to prevent the maggots from getting into the underlying soil, and should be systematically and completely emptied at least every four days during warm weather. They should moreover, be carefully guarded by screens or otherwise made fly tight, or should be sprinkled liberally and frequently with chloride of lime or a solution of sulphate of iron. Privies and privy vaults in particular should be thoroughly screened.

Cuspidors should be given special care. A little solution of formalin, a teaspoonful to a pint of water, should be placed in each cuspidor. This solution, sweetened with sugar and exposed in saucers, will kill flies in a room.

It is important to carry out these precautions from the very commencement of the warm weather, and to persist in them throughout the fly season.

The presence of flies indicates the presence of filth or of insanitary conditions in the neighborhood, and in a certain sign that a cleaning up is necessary. The trapping and swatting of flies is undoubtedly of value, but reliance must especially be placed on the elimination of breeding places.

Do not patronize dealers in food stuffs whose wares are not kept carefully screened from flies.—W. H. Hattie, Dept. of the Public Health, Nova Scotia.

You save time and money

on every crop you harvest with the aid of a

LOUDEN Junior Sling Carrier

Patented Brace Block

A heavily ribbed malleable iron block attaches to the truck arms just below the track, and the bolt connecting the sides of the carrier frame passes through the lower end. This takes all strain off the bolt and increases the strength of the truck arms. No load can spread them.

Adjustable Trip

Used when desired to carry the load into the mow without elevating to the track. Slip it up or down on the centre draft rope as desired. A simple, effective adjustment without complicated parts. This trip is supplied when ordered without extra charge.

The Great Triple Purchase Feature

Three ropes lifting the load instead of two, as with the ordinary carrier; gives the horse one-half more power, reduces the strain on the ropes and lengthens the life of the outfit.

Engine Trucks

Distribute the load well along the track, increase the strength of the carrier and cause the load to run more steadily. No four-wheeled carrier, however much spread out, is so easy on the track or runs so steadily.

Short Truck Arms

The Truck Arms are only 5 inches long, nearly straight and extremely well braced. They cannot be sprung.

The Unbreakable Axle

These Axles are simply an extension of the main frame. Note how they are shouldered out at the frame; impossible to break them. No riveted or bolted pin axles are used on Louden Carriers. Such axles are always causing trouble.

Patent Bushings

The Pulley Sheaves run on Patent Bushings, recessed into the side of the frame. This takes all the strain off the bolt and puts it on the frame where it belongs. The sheaves are large, of extra strength and easy running.

Sure to Work

A trip stirrup extends below the carrier frame and attaches to the locking mechanism. It is impossible to keep the horse going on the draft rope and not bring the sling pulleys in contact with the trip stirrup. Once this is done the car is bound to leave the stop block and run back into the barn with the load. Side winds or uneven loads, cannot affect the proper working of the LOUDEN JUNIOR SLING CARRIERS.

Write for catalogue and special descriptive circular dealing with above Carrier.

LOUDEN MACHINERY CO., Dept. 38 GUELPH, Ont.

Hay Tools, Feed and Litter Carriers, Stable Equipment, Barn Door Hangers. (3)

Ten Tons Strawberries and a few Bouquets.

Bliss M. Fawcett, Esq., Sackville, N. B., who is one of the progressive farmers of the Maritime Provinces, is showing just what agriculturists in this part of Canada can do, by applying moderm methods to their business.

Mr. Fawcett writes the Maritime Farmer that he expects to harvest 10 tons of strawberries this year.

This spring Mr. Fawcett sold seven Shorthorn Bulls and could have disposed of as many more if he had been possessed of them. He expresses satisfaction at the particularly good prices that Maritime Province farmers are receiving for goods.

Incidently Mr. Fawcett expresses his high appreciation of the helpful articles which appear regularly in the Maritime Farmer. He has been an interested reader ever since the Maritime Farmer started, 20 years ago.

There is no real need of anyone being toubled with constipation, Chamberlain's Tablets will cause an agreeable movement of the bowels without any unpleasant effect. Give them a trial. For sale by all dealers.

Little Boy Was Not Expected to Live

Was taken Sick with Diarrhoea

They Were 30 Miles From a Doctor

SO GOT

DR. FOWLER'S

Extract of

WILD STRAWBERRY,

Which Cured Him

Mrs. Fred Schopff, Pennant, Sask., writes:—"I used Dr. Fowler's Extract of Wild Strawberry when my little boy was not expected to live. We were thirty miles from a doctor, when the little fellow took sick with Diarrhoea. He at first would sleep nearly all day, and at night would be in pain, and would have a passage every five or ten minutes. This went on day and night until he began to pass blood. I gave him "Dr. Fowler's," but without any good effect at first, so I began to give him a larger dose, and soon he began to get relief. It was the only medicine I had in the house at the time, and I always keep it now for inside of three days my boy was out playing, and was as well as ever."

This grand remedy has been on the Canadian market for nearly seventy years, and is without a doubt, the best known remedy for all Bowel Complaints.

Refuse to take any other preparation when you ask for "Dr. Fowler's." There is nothing else that can be

"JUST AS GOOD."

Price, 35 cents.

See that the name of The T. Milburn Co., Limited, appears on the wrapper.

These tablets are mild and gentle in their action an especially suitable for people of the middle age and older. For sale by all dealers.

FLORICULTURE.

I have been asked for remedy for that common pest, the cut-worm. I have described in previous articles its habits and appearance but I have as yet found no remedy that is of any value save that of digging them out and destroying them. A number of so-called remedies are always published at this season of the year. I have tried a great number of them but have never had any success with them. The best and surest thing is to dig carefully about a plant that has been cut off and if you look closely about half an inch from the surface quite close to the plant you are almost sure to find him. This is not half so much work as it seems to be as the number of this insect are really quite limited and if you would examine your beds carefully every morning for two or three days you would soon exterminate your foes. By the middle of July, they will have commenced to transform and they will not trouble you to any extent the remainder of the season.

I often see palms, ferns and other ornamental plants placed in position in a room remote from the light of the windows which, in this season, of the year are apt to have the curtains too closely drawn for the benefit of plants that may be in the room.

Now, while removing a plant to the interior of the room for exhibition or ornament for a few hours will not injure it, a stay of even one day in such darkened position may seriously affect the health of your plant, especially if it is in a vigorous growing condition. Remember plants are like animals. They must have both light and air to assist the chemical changes constantly at work in order to make healthy, vigorous growth.

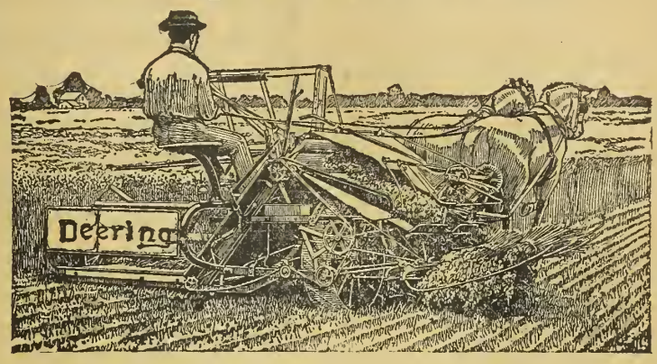
Many persons think that palms, ferns, etc., that naturally like shade from the sun will do well in the dark but the full light from a north window is none too much for them in our climate. Those plant lovers who can afford the luxury of a wardian case for a north window can reap a harvest of enjoyment without much care in the vigorous growth that such plants are adapted to such a situaton will make. As many do not know how they are best made or the class of plants best suited to them, I will briefly give information as I have two inquiries on both points.

The base of a wardian case that will fill an ordinary window should be made five or six inches deep as long as the window is wide and from eighteen inches to two feet wide and about the same in height as the width the side ends and top of glass, hinged and loosely fitted to give a little air. If fitted tight the top will occasionally have to be lifted a little to give air inside the base. A zinc trough should be filled about four inches deep. The case thus finished should be placed on a stand high enough to bring the base of stand and window on a level, thus bringing the plants in case out in bold relief against the window.

To stock your case put into the bottom of the zinc drawer at least an inch of coarse gravel or other drainage material, then fill up with good, light rich soil.

For your plants you have a wide circle for selection. Ferns, Orchids, Lycopodiums, Rex Begonias, all flourish in these cases. For a centre plant for a case, nothing is better than a bright foliage Rex Begonia, the remainder of the case filled with ferns, Lycopodiums, low-growing Marantas, etc., with two or three of some small bright-green creepers at the sides of the case. Water thoroughly and as the case is quite close water is not often needed, the evaporation condensing on the glass and returning to the plants.

Deering New Ideal Binder



A Deering New Ideal binder will go into any grain field and cut, bind and deliver all the grain in that field. Any Eastern Canadian farmer can prove this statement to his full satisfaction by studying Deering binder features and trying the machine.

The reel is adjustable for tall, short, down or tangled grain. The special T-shape cutter bar enables the operator to tilt the platform close to the ground when necessary. The bottoms of the guards are almost level with the bottom of the platform, preventing trash being pushed in front of the knife.

Either smooth section or serrated knives can be used. Three packers and three discharge arms aid in doing efficient work. The main frame is made of tough, strong steel bars, forming a unit which the hardest usage can not twist out of shape. Then there is the famous Deering knotter—simple, accurate, unfailing.

"Maritime Farmer-" Coupon No. 2

We Want Every Reader of The Maritime Farmer to Sign and Mail This Coupon

Mail it and get a free set of Catesby's suit or overcoat patterns and be convinced that it is possible to buy a better suit in London, England, for $13.25 than could be bought in Canada for $25.00.

You've heard that clothing is much cheaper and better in England—you know that English fabrics are the finest in the world.

Think, then, of the advantage of securing a suit made of the best English woolens, cut in the latest Canadian, New York or London style (whichever you prefer), and tailored to your individual measure, delivered to your door all duty and carriage charges prepaid, for about half what you would have to pay if you bought it in Canada.

Isn't it worth while, then, to get our patterns and see what there is in this offer? You can't lose anything by it but you may save a whole lot.

All you need do is to fill in the coupon and mail it to our Toronto office. By return we'll send our latest Style Book, 72 pattern pieces of fine English suitings, a letter explaining our system of doing business, and a self-measurement chart that is so simple you can't go wrong in taking your own measure.
We will also send you testimonials from Canadians who at first were as sceptical as you are, but who are now satisfied and regular patrons.

Write now. If you don't want to cut this paper, send a postcard or letter. We will mail the patterns anyway, But to get them you must mention the Maritime Farmer.

Had a Weak Heart and Bad Shaky Nerves for Years

Milburn's Heart and Nerve Pills Cured Him

Mr. H. Percy Turner, Marie Joseph, N.S., writes:—"I have had a weak heart and bad, shaky nerves for years, and have tried almost everything, but nothing did me any good till I was advised to try Milburn's Heart and Nerve Pills. I was surprised to find how one box helped me, so I tried two more and am now completely cured. You may use my letter as an aid to others suffering from heart or nerve troubles."

Milburn's Heart and Nerve Pills are a specific for all run down men and women troubled with their heart or nerves.

Milburn's Heart and Nerve Pills are 50 cents per box, or 3 boxes for $1.25 at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

The above cut clearly demonstrates the advantages to be gained by planting trees in holes exploded with C. X. L. STUMPING POWDER. The ground is so pulverized that the roots can immediately expand in search of nourishment.

Also used for clearing land of stumps and boulders, ditching and subsoiling.

When your child has whooping cough be careful to keep the cough loose and expectoration easy by giving Chamberlain's Cough Remedy as may be required. This remedy will also liquify the tough mucus and make it easier to expectorate. It has been used successfully in many epidemics and is safe and sure. For sale by all dealers..

Whitewash.

Whitewash is the cheapest of all paints, and for certain purposes is the best, according to Farmers' Bulletin 474. Lime, which is the basis of whitewash, makes a very sanitary coating, and is probably to be preferred for cellars and the interior of stables and directions for making whitewash are taken from "White Paints and Painting Materials," by W. G. Scott):

Ordinary whitewash: This is made by slaking about 10 pounds of quicklime with 2 gallons of water.

The lime is placed in a pail and the water poured over it, after which the pail is covered with an old piece of carpet or cloth and allowed to stand for about an hour. With an insufficient amount of water, the lime is "scorched" and not all converted into hydrate; on the other hand, too much water retards the slacking by lowering the heat.

"Scorched lime is generally lumpy and transparent, hence the use of the proper amount of water for sadking and an after addition of water to bring it to a brush consistency.

Factory whitewash. (Interiors): For walls, ceilings, posts, etc.

(1) Sixty-two pounds (1 bushel) quicklime, slake with 15 gallons water. Keep barrel covered until steam ceases to rise. Stir occasionally to prevent scorching.

(2) Two and one-half pounds rye flour, beat up in ½ gallon cold water, then add 2 gallons of boling water.

(3) Two and one-half pounds common rock salt, dissolve in 2½ gallons of hot water.

Mix (2) and (3), then pour into (1) and stir until all is well mixed.

This is the whitewash used in the large immplement factories and recommended by the insurance commpanies. The above formula gives a product of perfect brush consistency.

Weatherproof whitewash. (Exteriors): For buildings, fences, etc.

(1) Sixty-two pounds (1 bushel) quicklime, slake with 12 gallons of hot water.

(2) Two pounds common table salt, 1 pound sulphate of zinc, dissolved in 2 gallons of boiling water.

(3) Two gallons skimmed milk.

Pour (2) into (1), then add he milk (3) and mix thoroughly.

Lighthouse whitewash: (1) Sixty-two pounds (1 bushel) quicklime, slake with ten gallons of hot water.

(2) Twelve pounds rock salt, dissolve in 6 gallons of boiling water.

(3) Six pounds Portland cement.

Pour (2) into (1) and then add (3).

Note.—Alum added to a lime whitewash prevents it rubbing off. An ounce to the gallon is sufficient.

Flour paste answers the same purpose, but needs zinc sulphate as a preservative.

Molasses renders he lime more soluble and causes it to penetrate the wood or plaster surface; a pint of molasses to 5 gallons of whitewash is sufficient.

Silicate of soda solution (about 35 per cent. Baume) in the proportion of 1 to 10 of whitewash produces a fireproof cement.

A pound of cheap bar soap dissolved in a gallon of boiling water and added to about 5 gallons of thick whitewash will give it a gloss like oil paint.

An old receipt of whitewash, issued by the Lighthouse Board of Treasury Department, said to be very good for outdoor exposure, is as follows:

Sake half a bushel of unslaked lime with boiling water, keeping it covered during the process. Strain it and add a peck of salt, dissolved in warm water; three pounds of ground rice put in boiling water and boiled to a thin paste; half a pound of powdered Spanish whiting and a pound of clear glue, dissolved in warm water; mix these well together and let the mixture stand for several days. Keep the wash thus prepared in a kettle or portable furnace; and when used, put it on as hot as possible, with painters' or whitewash brushes.

SPECIAL ADVICE FOR MEN

Strength Restored By New Method

MANLY MEN ARE THE WORLD'S POWER TO-DAY

The little book described below (which I gladly send free, sealed, by mail, to any young or elderly man anywhere) contains in its 85 beautifully illustrated pages everything a man need know with regard to certain strictly personal subjects, and as a guide through his entire life, from the delicate period of youth, when wholesome advice is most needed, on through early manhood to a ripe, vigorous, healthy old age. Over a million of these books have been thus distributed by me all over the world. Therefore, please use coupon below and get YOUR free copy by return mail. SANDEN CO., DISTRIBUTORS.

Do you know, my friend, that there is a wonderful new way to apply a certain, great, natural FORCE to your body, and by which you may, without effort, trouble or inconvenience, treat your own self in the privacy of your home for debility and lost vitality, without using a single drug or medicine? This great FORCE, as a restorer of vitality and as a means to overcome those weaknesses which result from indiscretion and unnatural practices, is to-day being used all over the civilized world, and I give it as my honest opinion, based upon a vast observation and study, that any man anywhere, who leads a decent, manly life and who applies this marvellous FORCE in a scientific and rational way, can, without employing a single drug, be restored again to a state of perfect, rugged health and vigor, without a remaining ache, pain or weakness.

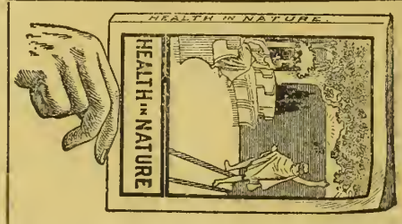
As we all know, these debiliating weaknesses handicap a man in every condition of life, while, on the other hand, a perfect speimen of vigorous, robust, lusty manhood is ever admired by both women and men alike, while, of course, it is certainly only such a man who can attain the really great success of life. Therefore, I say to you, no matter what your size, whether you are small or large, no matter what your occupation, no matter whether you are a college graduate or workng on the farm or in the factory, no matter whether you are young or elderly, it is all a question of your vigor and your vitality, and if I can give you a good, abundant supply of this same great power of VITAL FORCE, then it is easy to believe that I can completely restore your vigorous health, can overcome the evil of past indiscretions so you will be exactly the same in your influence over people, exactly the same in your manly bearing as other manly, strong-nerved, warm-blooded fellows of your acquaintance.

With an idea of attaining this all for you, I recommend you to investigate a simple little VITALIZING APPLIANCE of my invention, which I am now sending out in great numbers for use by men everywhere who need new manly strength. This little VITALIZER is very light, weighing only several ounces, and can be worn without any one suspecting that you are wearing it. You buckle it on your body upon going to bed and take it off mornings. Thus while you sleep it sends its wonderful power which I call VITALITY or VITAL FORCE, into your blood, nerves and organs. Users say it takes pain and weakness out of the back from one application, and further say 60 to 90 days' time is sufficient to restore a state of health, strength and vigor. I am not offering this VITALIZER here for sale, but want you first to send for my book, that you may learn all about the whole wonderful subject, and why I get such quantities of testimonials from users everywhere telling of results after drugs completely and utterly fail.

NOTE— With special attachments VITALIZER is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, nervousness and general ill health. Please write for book to-day, or, if near by, I should like you to call. Hours—9 to 6.

Use Coupon; Get Free Book

Remember, the little illustrated book which I send free, sealed, by mail, as per coupon below not only fully describes my VITALIZER, telling of a special offer by which you may get one on special terms for use in your own case, but contains a great fund of private advice for men, some good, wholesome cautions, and a lot of general information that might be of value to you to the end of your days. Therefore, please write or call.



DR. M. F. SANDEN CO.,
140 Yonge St., Toronto, Ont.

Dear Sirs:—Please forward me your book, as advertised, free, sealed.

NAME .....

ADDRESS .....

The washes which contain milk, flour, or glue are not to be advised for use in damp, interior places, owing to danger of decomposition of the organic matter. For such locations it is better to use one of the formula containing none of these ingredients. Whitewash is applied with a broad whitewash brush and is spread lightly over the surface, no attempt being made to brush it in as in the case with an oil paint.

Growing Good Carrots.

Carrots grow best in light soils. The long varieties require a good depth of soil which must be deeply stirred and thoroughly pulverized. Long, shapely roots cannot be produced if they encounter hard clods of earth and hard soil formations.

Light soil that has been well manured for a former crop is excellent for carrots. A lot of fresh barnyard manure or any animal manure worked into the soil only a few inches below the surface causes the roots to be short and forked. Shallow plowing has a like effect. If manure is applied it should be plowed under so as to allow the roots plenty of room for downward growth.

When planting with a garden drill carrot seeds are very likely to stick together. To facilitate sowing the seed and insure a more even distribution, it is a common practice to mix the seed with sand. After the plants show through the soil, the space between the rows should be stirred frequently with the hoe. This keeps down weeds and aids the growth of the plant.

As soon as the plants are large enough to handle they should be thinned to from four to six inches apart, according to variety. Showery weather is best for this work. Early thinning is desirable, as it encourages the production of large, shapely roots. Delay often results in the production of thin, ill-formed roots.

It is now well known that not more than one case of rheumatism in ten requires any internal treatment whatever. All that is needed is a free application of Chamberlain's Liniment and masaging the parts at each appication. Try it and see how quickly it will relieve the pain and soreness. Sold by all dealers.

An Improvised Road Drag.

If no road drag is kept on the farm one can easily be made for temporary use from a spiketooth harrow, a plank and a few boards. The plank should be about six inches wide, or at least wider than the protruding pointed ends of the harrow teeth. It must be as long as the harrow is wide, and should be placed on edge on the ground beneath the harrow, so that it fits back against the rear cross row of teeth. Make two auger holes near the top edge of the plank and pass wires through these, to fgsten about the crossbeams.

On top of the harrow and between the cross rows of teeth place two or three boards to stand on. It is now complete, and by hitching the team so as to give a slight angle to the harrow, one has a good scraper. By standing on the boards and varying one's position relative to front and rear, you can change considerably the amount of raking done by the front rows of harrow teeth, and the amount of the surface dirt loosened up and carried to the centre of the road.

Last spring we used this arrangement. The road had been cut up badly and then dried. We found the raking of the front harrow teeth to be just the thing as they knocked off the knobs so they were loose and ready to be shoved into the depressions by the plank.—P. C. Grose.

Road Building.

Start with a system and keep to it
Take the worst places first.

Keep a good cross slope on all of your roads.

Grade the hills and protect the ditches.

Put in permanent bridges and culverts.

Use the best and most durable culverts obtainable, and put them in wherever there is a possibility of the water lying for any length of time by the side of the grade.

Grade up the roads in the flat or low-lying places as much as possible.

Give the earth road drag a fair trial, and use it every time you get a chance—oftener if you can make it.

Put clay and sand together; they do better together than by themselves.

Never put sod on the travelled way

Encourage first yourself and then your neighbor to buy wide tired wagons.

Forget who voted for you or that you will run again. Build roads, not a political machine.

After the road is once built don't stop there, maintenance is then the most important factor. Keep the road constantly in repair. A few hours' work spent in repair when first needed will save endless trouble in travel and days of repair work later on.

What you do, do well.

Jersey Performances.

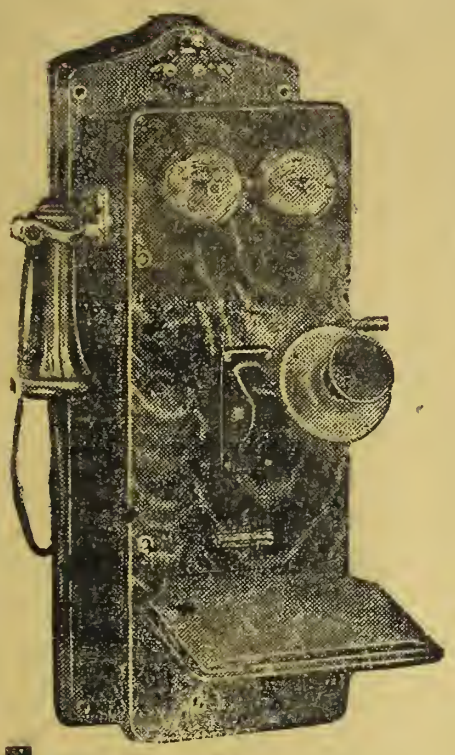
The following cows have lately qualified for the Record of Performance of the Canadian Jersey Cattle Club:

Sadie Mack 2nd, No. 3237, commenced her test when 1 year, 329 days; 8446 lbs. of milk and 481 lbs. of butter fat. This heifer is owned by H. E. Gee, of Hagersville, Ont., and is sired by Boyle's Highland Laddie.

May Daisy Bell No. 2425, owned by Wm. Clarke, No. Wiltshire, P. E. I. Sired by Brampton Rex; produced in one year 8507 lbs. of milk and 442 lbs. of butter fat.

Foxy's Queen, No. 3238, also owned by Mr. Gee and by the same sire as above, produced in 2 year old form, 8711 lbs. of milk and 464 lbs. of fat.

It's a Pleasure To Use These Telephones



They are the clearest-Talking and loudest ringing bridging telephones on the market. They are guaranteed to be superior in design, material and workmanship. They have several exclusive features that add to their efficiency. Made in wall phones, as illustrated, and desk or table styles. "Also Manufacturing Agents for the Magnaphone Co., under Mr. Geo. R. Webbs' Canadinn Patents No. 123363, No. 124537, No. 131145."

Brampton Pontaine Rose, No. 4600, tested by B. H. Bull & Son, Brampton, produced in her 4-year-old form, 8784 lbs. of milk, 535 lbs. butter fat.

Feed the Soil.

The dairy farm is the farm that is fed and not robbed. It is just as important to feed the land as it is the stock if one would maintain his farm in a high state of production. There is a certain standard in the production of any grain crop or any other farm commodity which must be reached if more profit is to be enjoyed. In raising corn the United States Department of Agriculture has given us the following figures.

Forty acres of corn yielding 75 bushels per acre makes as much net profit as 104¼ acres of corn yielding 50 bushels per acre or 293 acres of corn yielding 40 bushels per acre or 3,270 acres of corn yielding 35 bushels per acre.

The above figures taken from the United States Department of Agriculture year book.

Corn figured at 42.4c per bushel, expense per acre, $14.63.

Of a class of eighty-eight young men and young women, who graduated this year from McGill University Montreal, over fifty percent. were from the Maritime Provinces.

Strongest and Most Stylish-Looking
MARITIME Ornamental Fencing and Gates have *the quality*. There is no gainsaying that. Only *first* quality tubing is used for the gate frames. We could, like many makers, use *second* quality and save *one-third* to *one-half* the tubing cost. We could also use *small* wires and save some more. But we use *large,* strong, stiff No. 9 wire. This wire is more smoothly, thoroughly and *heavily galvanized* than the wire generally used for fence and gate purposes. You know what that means. Strongest, *most lasting,* as well as most stylish-looking. Write for *free catalogue,* showing the different designs, and from them choose a gate you'll be proud of.
NEW BRUNSWICK WIRE FENCE CO., Limited
Moncton - New Brunswick
MARITIME ORNAMENTAL FENCING AND GATES

Fruit Crop Report.

(Continued from page 651)

varieties are still quite promising, and for the later varieties the general report appeaprs to be that slightly over half a crop will be harvested. In the Kootenay Valley the peach crop is a failure.

Tomatoes.

In Western Ontario, the acreage under tomatoes is unquestionably the largest for many years. As a direct consequence of the peach crop failure, a number of growers planted tomatoes presuming that the profits to be derived from them would offset the loss sustained through the failure of the peach crop. There is consequently a grave danger that the supply of tomatoes this year will be much greater than the demand and that prices will be very low. The heaviest plantings appear to be in the counties of Lincon and Wentworth. There has also been a heavy planting of tomatoes in the Okanagan Valley in British Columbia.

Cherries.

An abundant crop of all varieties of cherries is reported from the Niagra district and from the southern and western counties of Ontario. In the counties of Norfolk, Peel and Went worth, the reports indicate that the sweet varieties will yield only a light crop, but the report is extremely good for all other varieties. The same injury which reduced the crop of pears and plums in eastern Ontario, has seriously affected the crop of cherries and the result will be a very light yield and in many orchards a complete failure. Practically a full crop is reported from Nova Scotia. There have been some reports from British Columbia stating that in the Okanagan district the set was not a particularly good one; in the Kootenay Valley the prospects are excellent.

Grapes.

The grape crop is one upon which growers are generally safe in relying for it is only in very unusual cases that there is any shortage in commercial orchards. This season is no exception, and reports from the Niagra district indicate a crop between medium and large, and in many instances fully 25 per cent larger than was harvested a year ago. In other sections of Ontario, where vineyards are few in number, there has been considerable injury by frost.

Strawberries

As a general rule the strawberry crop will be below average and prices will run high. The cause of this shortage varies with the particular district from which these reports originate. In eastern Ontario there was a great deal of winter injury to the plants, and in some instances the drouth of 1913 so weakened the mother plants that the stand this year was not a good one. In other parts of Ontario the wet spring interfered very seriously with the proper fertilization of the blossoms In British Columbia, no adverse conditions have apparently arisen, and a full crop berries is expected in the principal small fruit sections of the province.

Insect Pests.

Undoubtedly the most serious insect pest this season is the Tent Caterpillar which is completely defoliating many orchards throughout Ontario and Quebec. The situation seems to be very bad in Districts 3 and 4. In orchards which have not been thoroughly sprayed, the trees have been completely over-run with the pest and are now almost beyond control. It is unfortunate that such a state of affairs should exist since there is no reason why the Tent Caterpillar should not be controlled by efficient spraying. Bud moth is quite serious in the Annapolis Valley. It has also been reported in the counties of Lambton and Norfolk in Ontario and in New Brunswick. Cut worms are doing considerable to young tomato plants in District 3.

Fungous Diseases.

The only disease which appears to be seriously in evidence is the peach leaf curl. In western Ontario where the orchards have been to some extent neglected, as a result of the winter killing of the buds, and where early spraying has been disregarded, the disease is very widely spread. It has also been reported from the Kootenay District of British Columbia.

Fire blight or pear bight is reported from the Okanagan Valley but does not appear to be spreading to any serious extent.

Foreign Prospects.

United States.—New York State reports a fair crop of Baldwins with a falling off in Greenings. Prospects throughout the entire Republic, however, are that an excellent crop of apples will be harvested. Peaches, on the other hand, are short; in New York State the crop is practically a failure except along the shore of Lake Ontario, and even there it is light. In West Virginia peaches, plums and small fruits were injured by frost and will be short. The Missouri peach crop is also short.

England.—Plums and gooseberries slightly damaged by frost in April. Apples are reported a full crop, with plums, pears and cherries about 75 per cent.

Holland.—Slight damage to all fruits from frost, and to small fruits from insect pests. Conditions generally are reported good.

Germany.—Prospects for apple crop favourable, although some sight damage is reported from frost. Cherries are reported a full crop, with some slight local injury from insects.

Later

Fruit Commissioner's Office, Ottawa, June 15th, 1914.

The following information has been received this morning by telegram:

Lake Ontario Counties.—Present indications point to an apppie crop double that of last season. Heavy June drop expected. Weather conditions favorable. Cherries and plums a failure. Caterpillars plentiful.

Lambton County.—Prospects are for an abundant crop of all fruits except peaches, which are reported very light. Apple crop promises to equal that of 1912. Rain needed for small fruits.

Annapolis Valley.—Indications point to a light crop between Bridgetown and Kentville. On high lands conditions are better and in eastern Kings and Hants prospects are good Duchess, Gravensteins, Ribstons and Greenings will be light. On other varieties, crop will be double that of last year. Frost and continued dry weather seriously affecting small fruits.

Okanagan Valley.—Showery weather interfering with shipments of early which have matured two weeks earlier than last year and droppeed heavily. Fire blight well under control. Weather conditions excellent. Jonathan and Yellow Newton fair. Wealthy, Wagener and Spitzenburg heavy. McIntosh light. Big increase in tomato acreage. Following are estimated comparisons with 1913 crop: Apples, 25 per cent increase;; Pears, 20 per cent. increase; Plums, 15-20 per cent. increase; Cherries and Peaches, no increase.

Pacific Coast.—Strawberry crop badly injured by drouth and softened by recent rains. Prospects of raspberries good. Aphis troublesome.

Quebec.—Prospects better than for several years past. Excellent bloom and no frost. Some drop on account of drouth. Wealthy trees promise a very healthy crop, and Fameuse and McIntosh a good crop. No trouble from caterpillars except in Rouville and Huntingdon. Strawberries came through the winter well, but drouth is shortening the crop. Slight winter killing of raspberries.

London, England, June 12th.—All fruits damaged by frosts in May. June weather unfavorable. Trade predicts 50 per cent. crop of apples and black cherries. Late varieties of cooking apples badly damaged. Pears and plums estimated at 75 per cent. Currants very poor. Present season regarded as most unfortunate ever experienced.

Essex, Ontario.—Apples well loaded except Greenings. Cherries promise a full crop. Large acreage of tomatoes in fine condition. Peaches promise a full crop, with no leaf curl. Some young trees winter killed.—Donald Johnson, Fruit Commissioner.

A Good Record.

During the month of May the semi-official records of 45 Holstein-Friesian cows and heifers were received and accepted in the Record of Performance. In the mature class Birdie 2nd's Netherland comes first with 800 lbs. butter. Countess Carrie Mercedes adds one more to the lists of Canadian cows giving over 20,000 lbs. milk. As usual the four-year-olds are not overly strong. Grebegga 2nd stands highest with 670 lbs butter. Prince Edward Island comes to the front in the three year-olds with Ruby Nig, making the good record of 750 lbs. butter. Ruby Nig produced 16,555 pounds milk, and is owned by Lea & Clark, Victoria, P. E. I. Even stronger are the two-year olds which are led by Duchess Wayne Calamity 2nd with 846.25 lbs. butter, a new Canadian record for that age. Closely following her are the two British Columbia heifers, Lady Pietje Canary's Jewel and Lilith Pauline Calamity Jane 3rd with 830 and 825 lbs. butter respectively.

See that your hog yards and pastures are tightly fenced. The roaming hog makes slow gains and lots of trouble.

Dates to Remember.

St. John Exhibition, St. John, N. B., Sept. 5 to 12, 1914.

Haliax Exhibition, Halifax, N. S., Sept. 12 to 19, 1914.

St. Stephen Exhibition, St. Stephen, N. B., Sept. 15 to 18, 1914.

Charlottetown Exhibition, Charlottetown, P. E. I., September 22 to 25, 1914.

Sydney Exhibition, Sydney, N. S., Sept. 29 to Oct. 3, 1914.

Lubricating Axles.

Many lubricate axles only to prevent wear; they over-look the fact that by reducing the friction they lessen the draft. A well-oiled axle lightens the load. Oil to axles is best governed by the rule of "little and often." If too much is used, it exudes at the ends, gathers dust, and thus the lessening of the friction is not so great, while oil is wasted. In nearly every case where the lubricant is wasted, it is because it is stuff not fit to be used, for a good lubricator costs enough to keep the average man from allowing it to waste. Oil that "gums" much is unfit to be used. Castor oil is a splendid lubricator for axles, but used alone may gum too much. This is corrected by the addition of refined coal-oil (that used for lamps) or lard; the coal-oil is the better. Some wagons are yet made unprovided with metal shields or "thimbles," being banded with steel; for these some tallow may be used, as it is one of the best lubricants when iron and wood are brought together. Pine-tar is a good addition to the lubricant for wagon axles, and is part of the "axle greases" sold. Plumbago is another good addition; its fine particles fill the small irregularities in the opposing surfaces, thus making them smoother. A mixture of lard and plumbago is good for the journals of reapers, mowers, etc.; we have found castor oil and refined coal-oil also good for this use, particularly for use on the "sickle-driver." For carriages, nothing is better than castor oil and a very little lard oil or refined coal-oil. Lard oil alone has not "body" enough for the journals of reapers, mowers, etc.; add a little castor oil, or tallow or plumbago. While the axles of reapers, grain-drills, hay-rakes, etc., will not need lubricating so often during the year as the axles of the wagon, oiling them must not be neglected, as the rough ground the wheels pass over makes the wear on unoiled axles quite rapid. The axles of corn-cultivators require frequent lubricating. For these the best lubricants are those recommended for wagon axles.

The St. John Exhibition

The 1914 St. John Industrial and Agricultural Fair will be held at St. John, N. B., on September 5th to 12th inclusive. The prize lists are now in the hands of the public and competition is open to the Dominion of Canada. Entries in all departments close on August 1st. Be prepared to make entries in as many sections as you can and plan to visit the fair, where you will find matters that will interest and amuse you, thus combining instruction, business and pleasure in the right proportions.

Special Prizes.

In the prize list of the St. John exhibition, recently received, we read that the Clydesdale Horse Society of Great Britain and Ireland has donated a gold medal for the best Clyde stallion and another for the best Clyde mare, any age. The only condition implied is that no animal can win two of the Society's medals in the same season.

The Shire Horse Society of England also offers a gold medal for the "best Registered Shire Stallion."

The Canadian Hackney Horse Society offers silver medals for the best Hackney Stallion and mare.

Disastrous Fire at Sussex.

On the afternoon of the 17th inst., Geo. W. Fowler, M. P., Sussex, N. B., who takes a deep interest in farming, and who had, in the course of the past two years, erected horse and dairy stables that were a credit to the town and a model of high ideal to the entire farming community, had the misfortune of losing the magnificent and splendidly equped structures by fire and thus sustaining a loss of upwards of $20,000, only a very small portion of which was covered by insurance. The origin of the fire still remains a mystery. So rapid was the progress of the flames that it was with the utmost difficulty the valuable Holstein cattle were saved. It was found impossible to save the horses, seven of which perished in the flames. Among the number were several valuable animals that Mr. Fowler prized very highly. Included in the number was the Thoroughbred stallion "Waterlight," one of the most famous show and speed horses ever imported to Canada. Waterlight won his thousands on the American turf and left a lot of exceptionally fine colts. His untimely death is a distinct loss to the horse breeders of Kings County. Several valuable Standard Bred fillies of great promise, also perished. By strenuous efforts, the piggery and beef stables were saved. We were sorry to see the magnificent buildings wiped out for we looked on the Fowler barns as one of the places of interest to which we could direct visitors to town as we knew that there they could see ideals, which would set them thinking along the lines of modern equipment for the care of farm stock.

Concrete Hog Houses and Feeding Floors

Enable you to raise bigger hogs and better pork without heavier feeding. A concrete feeding floor permits the animals to clean up *all* the feed without waste, and eliminates the possibility of your hogs contracting disease. To you they

Mean Bigger Profits

Hog houses of concrete are sanitary, easily cleaned, maintain an even temperature and give plenty of light and air, which tend to better the quality of pork. Concrete will not rust or rot. Never needs repairs or painting. It will outwear any other material for farm structures. Write for this beautifully illustrated free book "What the Farmer can do with Concrete." It shows how to build Hog Houses, Feeding Floors and many other things the farmer needs.

THE T. EATON Co LIMITED

TORONTO CANADA

To Keep the Nails Clean in Gardening.

Gloves are useful for gardening, but not only do the finger-tips quickly wear out, but if the soil be wet when planting they get clayed up and become a hindrance. So that it is advisable, whether gloved or gloveless, to take some means of protecting the nails from grit, and this is most effectually done by pressing the tips of the fingers into a quantity of flour till they are so packed with it that the soil gets small chance of entrance. After gardening operations wash the hands with toilet soap, and brush the nails, and when the hands are dry, rub in a very little lanoline, which will prevent roughness of the skin.

Advantage of Farm Separator.

There are some excellent reasons why a farmer should own and operate his own cream separator. There is little or no loss of skim milk, which of course, is very valuable for feeding. There is less danger of introducing diseases like tuberculosis if the milk is skimmed at home, and only the milk produced upon the farm is fed. Time is saved in not having to haul whole milk to the factory. Less bulky products have to be cared for upon the farm- There is a wider market for cream than for milk.

Is the Cow in Calf ?

(Continued from jage 655)

they are in-calf, and will calve on a date coresponding with the date of the alleged service. Very often the cows have not been near a bull, and in other cases the date of the alleged service has been so antedated as to lead the purchaser to conclude that she is weeks nearer to calving than she really is, if in-calf at all. There seems no remedy in such a case, for a calf is not guaranteed, and the statement that the cow was to profit on a certain date means nothing. It is a trick often practiced by the seller at the expense of the buyer, a trick that many dairymen consider smart when they success fully practice it on a fellow farmer, but which they call by another name when they themselves are the victims of the fraud. The only thing, where a warranty is not obtainable, is to rely on personal skill and judgment as to whether the cow is in caff, and, how far advanced; and, in those cases where the signs are wanting, to leave the animal alone.—Vet.

On Dehorning Cattle.

Theodore Ross. Secretary for Agriculture for Prince Edward Island writing on the question of dehorning cattle in the May issue of the Farmers' Advocate says:—

"This is the best time of year to dehorn cattle. Nearly all agricultural papers are advising the use of caustic potash when calves are about three days old to prevent the growth of horns, but the writer found that in his case at least, this method defeated the purpose. Cows that have been dehorned as calves, use their heads almost as viciously as if they had not been dehorned, and although they cannot tear one another, they frequently do serious damage. They are liable to be hard on fences, throwing off poles or batons and breaking down wire. If, however, their horns are alowed to grow till they are coming two years of age, and are then removed the cow is practically quieted for life. As yearlings they are learning that their horns are their means of defence, but they have not yet been able to do any injury. When their horns are taken off at this age they are completely defenceless, and are hardly ever troublesome. The writer has been dehorning regularly at this age for some years. About fifteen years ago we first dehorned cattle. A valuable mare had been hooked, and the experiment was the result. Of ten cows milking, we dehorned nine, the remaining one was old and was besides very quiet. That evening some of them did not eat all their feed, and they were off in milk from two to nine pounds each. The next morning they all took their feed as usual and were off from four to nine pounds ech. The following evening all except one were up to the old standard and inside of a week we were getting from twenty to thirty pounds more milk daily from our ten cows than we had been before they were dethroned. That spring we used the Caustic Potash on our calves, as we did also for the next two years. The poll cows gave us considerable trouble and we attribute the loss of some premature calves to the fighting of the cows. Since that time we have dehorned regularly and with the best of results. If done at this time of year, the cut is healed before the flies become troublesome.

Docking Lambs.

In recent issues several contributed articles have appeared relating to the methods practiced by sheepmen in docking their lambs. No doubt there are thousands of lambs in the country yet to be docked and for those who may be called upon to attend to the operation we may say we know of no better plan than to stand the lamb up on all four of his legs with an attendant holding him while the operator cuts the tail from below upwards, with a sharp knife. All that is necessary is to double the tail down over the knife and make the cut close enough to the back of the lamb. By this method the knife slips between the vertabrae and there is far less injury than when the old method of laying the tail on a board and cutting it off with a chisel is practiced. This often drives the chisel or knife, if the latter be used, directly through one of the vertabra causing considerable pain and set-back to the lamb. We would urge sheep breeders not to neglect the practice of docking their lambs. Do it while the lambs are young, from one to two weeks of age.

Where the pigs are alowed to run with the sow and to wean themselves it is almost impossible for the mature female to produce more than one litter a year.

$12,000 Farm, $4200

1500 apple, 250 pear trees, besides plums, cherries, peaches and berries on this 50-acre farm, which experts estimate will soon be producing fruit to warrant a valuation of $12,000; cuts 25 tons hay; brook-watered pasture; near depot, village, neighbors, schools, and adv.; splendid 9-room painted house supplied with spring water, large barn, carriage and poultry houses, pretty lawn with century shade trees; a great bargain for part cash; for travelling instructions to see this and many others throughout the famous Annapolis Valley, see page 83; "Strout's Farm Catalogue 37," just out; choice selections of real bargains throughout N. S and N. E. States; write today for your free copy. Address Farm c/o Maritime Farmer Office.

Boys and Girls!

We will Send you *FREE* an Electric Flash Light, which sells for $2.00, for two new subscribers to the Maritime Farmer.

The Storage and Use of Soil Moisture

Compiled from a Series of Experiments

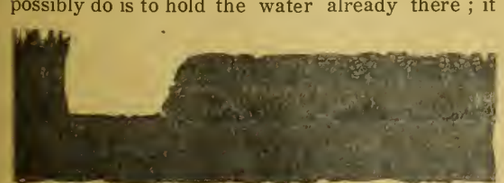
By W. W. Burr, Nebraska.

MUCH has been written the last few years in regard to the storage of moisture in the soil, which is correct and well-founded. Other statements have been made which were either incorrect or so stated that they allowed the wrong inference to be drawn. We have found that when the moisture comes in sufficient quantity and is properly distributed we can store this moisture in our soil in considerable amount. However, we have not succeeded in storing enough moisture

Was not disced before or after plowing

before seeding the crop to mature that crop. Whenever there is sufficient moisture present in the soil at seeding time it gives an effect which might be termed overstimulation; that is, it starts more growth than can be supported throughout the entire season, the plants stool out, giving a heavy growth of straw which makes rapid use of the moisture which falls. If, then, a dry season comes, such as high winds, high temperature and low relative humidity, the demand for water under such conditions is so great that the crops suffer. In the intermountain country, where hot winds and increased evaporation do not prevail, it is probably possible to produce a crop almost entirely on stored water. Our work has shown that where there is moisture stored in the soil to be used in addition to the rainfall which comes we are much more certain of a yield of grain. This has been especially true of winter wheat.

On the other hand, we have found that we cannot store water excepting it comes as rather heavy rains, or in frequent showers for a period if the rains are light. The isolated shower does very little good for storing water, and even a heavy shower falling on a soil surface which is already dry and hot will be lost before it can get deep enough into the soil to be held by any cultivation. Certain erroneous ideas in regard to the storage of soil water are still quite prevalent. The idea that continued cultivation will accumulate water in the soil has no foundation. The only thing that cultivation can possibly do is to hold the water already there ; it cannot create water. When there is sufficient water already in the soil to cause an upward movement of water to the surface, cultivation will check this movement, and there may be an accumulation of water just below the cultivated portion of the soil. The cultivation is, however, to prevent the escape of the water already there, and not by any mysterious means to create water. It is simply reducing the evaporation from the surface and killing the weeds to prevent their use of the water. The fact that this water, already present in the soil, has been held, while in an adjoining field, where no cultivation was done, it has been lost, has been the basis of certain misconceptions. Some men have been led to think that the stations and dry farming men are trying to teach that by continued cultivation we can accumulate water in the soil even though it does not rain. The fact is, if the soil is already dry and no precipitation comes, the moisture content of the soil cannot be increased by any amount of cultivation. We can, however, by stirring the surface and killing the weeds, conserve moisture after it has been soaked into the soil.



A poorly-made seed bed—Disced after plowing but not before —The large air spaces prevent capillary action

Disced before plowing, making the contact compact between the bottom of the furrow and tha furrow slice

Storing Water in the Soil

Storing water in the soil consists in getting the water into the soil and then preventing its escape. There are a number of factors and conditions which modify or control the storage of water. It seems best to divide these factors and to treat them under separate heads so that the importance of each may be better understood. Only those factors which are largely under the control of the farmer will be discussed.

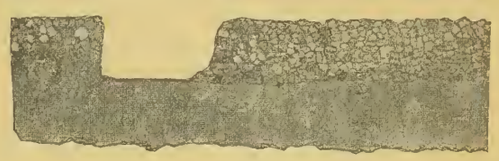
Getting the water into the soil depends upon—

The condition of the surface soil at the time of the rain.

The character and amount of the rain.

The amount of water already in the soil.

Water runs off more freely from a smooth, dry surface than that from a surface which has been loosened by cultivation. Where the surface has been cultivated, the water runs into the openings made by the implements used, and is held until it can soak into the soil. Where the surface has not been stirred there are no such open spaces to catch the water. As soon as the soil at the surface has been filled it can hold no more except as the water is removed from the surface by penetration to the lower depths. The water which falls in excess of the amount that can readily be absorbrd by the soil will be lost as run-off unless the surface is very level. Obviously the amount of the run-off from any rain is governed largely by the type of soil and character of the rain. A loose, sandy soil offers so little resistance to the penetration of water that there is very little run-off even during heavy rains. The resistance to the penetration of



A perfect seed-bed—Disced before and after plowing—Seed bed to the left is too shallow. Note: Soil particles magnified 1,000 diameters.

water increases as the soil becomes heavier or more like clay. All graduations are found from the sand which offers so little resistance to the penetration of water, to the gumbo, where penetration is extremely slow. We have observed that water will stand for several days over a heavy gumbo spot, and be lost mainly by evaporation rather than conserved by penetration, often penetrating only a few inches into the soil.

All Rain Not Equally Good

The character of the rain has also an important influence on the amount of water which will be retained from any given rain. The more rapidly the water falls the greater the run-off. During heavy, torrential rains the water falls so rapidly that it does not have time to penetrate into the soil and is lost by run-off. The beating drops of water often puddle or clog the surface, making it more difficult for the water to enter. The more open and porous the surface is the more water it will admit from any rain. Thus a cultivated surface will retain more water from a heavy rain than an uncultivated surface. It is a matter of common observation that a heavy downpour of rain frequently does less good than a much lighter rain that falls more slowly. The type of rain that is really most beneficial is the rain of sufficent amount and falling slowly enough to be carried into the soil to a depth where it will not be exposed to the rapid surface evaporation of water present in the soil when the rain comes.

Showing how effectively a surface mulch prevent the escape of moisture

What's Being Done to Put the Home on a Business Basis

IS the housewife facing a great revolution? Is the efficiency idea which has already revolutionized many industrial plants, now going to attack the last stronghold of tradition—the Home?

Signs point that way. The ideas of motion study, standarized conditions of work, scientific management of servants, had simply to be announced to strike a responsive chord among intelligent home-makers. Efficiency is in the air, and has penetrated to the kitchen no less than to the counting-room, and to general home-making—even to woman herself.

No one disputes that the home is the last of great industries remaining unrecognized. Every other great division of the work of the world has become more or less emancipated from personal drudgery, from the ancient apprentice system, from unstandardized work and pay.

For this reason those who formerly gladly entered the ranks of household workers [illegible] attracted to other professions. According to figures compiled by the Business Course, families employing servants number only 8 per cent. of the population,—which means that the average woman does the bulk of her own housework.

The Kitchen-Sink at Applecroft—Showing Dish-Washing Based on Motion Study and Scientifically Planned Heights and Arrangement.

Tendencies Working Against the Old-Time Home

The most serious evidences of the decay of the home such as it used to be are seen on every side. From scores of points the home has been, and is being attacked. The chief of these are:

1. Decided drift to large cities, where more and more of the original functions of the home, even to cooking, are being diminished.

2. Increasing demands of sanitation and modern ideas in home-making which compel progress upward with, or downward from, accepted standards.

3. Greatly increased cost of living, compelling either disastrous extravagances or lowered standards, or increased brain management on the part of housewives to meet the situation.

4. General broadening of woman's horizon and making the entire line of human endeavor her sphere, with the home becoming more incidental, as with man.

5. Gradually increasing economic loss in raising a family of children, due to child-labor laws, educational laws, cost of living, etc.

6. General heightening of intelligence and ingenuity, which is the case with woman's work, as with man's, results in the endeavor to apply labor-saving, time-saving, and energy-saving ideas to work. Only the intelligent and ambitious consider their time valuable enough to try to save it. Women have for centuries considered their time worth little or nothing.

The two great leveling forces—education and democracy—have been hard at work on the new generation, with the result that a terrific pull upward on standards of living have come about. The new generation wants the best of everything, no matter what its parents were and how they lived. It refuses to recognize any class distinction except lack of distinction.

Demand for "Efficiency" in the Home of To-day.

These facts have the deepest possible significance in the new movement for efficiency even in the home, even in the home-maker herself. It is not as if some sudden, new magi had sprung up in the word "efficiency"—like a fad of white-topped shoes. The causes have been gathering pace for years and efficiency principles are only the best expression of the need.

Women are not particularly attracted by the word "efficiency", and they do not excite themselves over "motion study" in the home. The greatest touchstone which the efficiency movement has for women and for their present situation is personal efficiency, or the scientific mental attitude.

This is but the reaction to be expected from woman, who has operated herself on her emotions for ages past. She finds not only that she cannot continue to do this and be happy (if she has any intelligence!', but also that feeling, slaving devotion, and mere manual work no longer entirely solve her problems. Civilization has become too complex and full of new difficulties and demands. Evolution is acting upon her—she feels the pressure of its compulsion if she thinks she finds that it is today a question of the "survival of the efficient."

The old home which manufactured for all its needs within its own walls, demanded chief labor and manual skill but vastly more mental and spiritual qualities. The old-fashioned woman—no matter how attractive in romance—cannot compete with the requirements of today. She is only a housekeeper and her housekeeping is far below modern standards!

The strong atraction which modern cults and mental systems such as "New Thought," "Christian Science," even Astrology and Hindu Philosophies have had for women, is explained by this new pressure upon the mental existance of woman—pressure on the one side by increased education, and on the other side by increased severity of economic necessity. She must grow mentally and readjust herself, or else slide backward and downward with alarming rapidity.

The efficiency idea is a solution. It has caught the need of man's world with genius and effectiveness; and because men and women are really close to each other in spirit (necessarily, since millions of women work side by side with men,- the efficiency idea is probably going to do for women exactly what it is doing for men. In fact, it is a splendid sign that the sexes are joining their spheres and making toward the real ideal of comradship, when the same ideal of efficiency takes hold of them both.

If the home is to survive it must do so on reorganized basis. No industry founded upon admittedly unwilling, uninterested millions can continue to operate. yet everybody admits the tremendous discontent among home women. As at present operated, house keeping is distasteful to admittedly the livest and most intelligent portion of housekeepers, and is only endured in a dull way by the masses of women. Its grave faults have been that it lacked in mental interest, that it was without the spur of competition, and that it did not possess the dignity of a serious position. Degradation has more nd more attached itself to housework as ambition has raised other standards of living. Every other members of the family hastened to rise from the drudgery state of his chosen work, but the woman who merely "kept house' has felt her wings clipped.

Applying Industrial Principles in Home Management.

One of the earliest attempts to apply industrial principles to the home was made ten years ago by Charles and Mary Barnard. For a number of years they mainttained a "Household Experiment Station," at Darien, Conn. Professor Barnard, himself a technical engineer. was the first to study tools and devices with the trained engineering point of view. Professor Barnard believed that there was too much experiment and guess work in housekeeping, and spent much time developing data, especially on the use of the newer fuels and labor-saving appliances. His idea was to give women the result of scientific experiment and serve them by stimulating the idea of progress in home development.

Mrs. Mary Patterson, under the auspices of the Federation of Women's Clubs, next caused widespread comment and interest by equipping an exhibition kitchen laundry, and dining-room with many of the most modern devices for saving labor—many of them electrically operated. It was her purpose to demonstrate the increased efficiency which is possible in a home where machinery—electric stoves, vacuum cleaners, incinerators, etc., are used to replace the time and labor for servants. Numbers of women and men visited her home before she dismantled the exhibition; and her inspiring personal message to these visitors on the art, as well as the science of home-making, did much to advance the rapidly growing welcome for more scientific management in the home.

Frank Gilbreth, the most famous of the pioneers in motion study (the man who revolutionized brick-laying) began to be interested in the application of motion-study to the home and wrote and made several addresses about it.

Martha Bensley Bruere, in a book which generalizes the efficiency idea mainly in its application to the family budget, co-operative laundries and marketing, etc., continued public interest in this newer scientific home-making.

My own book, "The New Housekeeping," was the result of several years of work and experiment, and was the first to emphasize methods, and the personal attitude of a woman toward her work, rather than mere tools and machinery. By this time the subject had come one of the most definite and decided interest—not only to women, but to men. Everywhere reference was made to it, and in a space of three months practically every newspaper of importance in the three big Eastern centres bad had interviews with either myself or others interested in the movement. Lectures. articles, and educational preparations along these lines are now common, and it is necessary now rather to prevent the sound ideas back of household efficiency from receiving the injury of mere faddism.

One Woman's Experience

The Applecroft Experiment Station, (Greenlawn, Long Island) is simply a concrete, actual home, in which—as far as possible—ideas of home efficiency, particularly in the country, might be developed and made known to other women.

It may be interesting to note the way in which the stattion came into existance.

One evening, several years ago. when without a servant, I counted the number of pans, pots and dishes I was washing. There were eighty-seven in all. I timed myself on this unpleasant old task which I hated from the bottom of my heart, and found it took forty-five minutes to wash, dry, and lay them away. When I was through I was so heated and tired that I didn't feel like doing anything else all the evening.

That evening, however, we were entertaining a friend who was prominent in the new science of industrial efficiency. He and my husband were discussing it, and I heard them say, "motion study" and such mysterious phases as "standardizing" and "standard practice." Although I was tired, I found myself interested in spite of myself. I asked our friend to explain what he meant, and he did, telling me how efficiency was revolutionizing the office and the factory.

"Do you mean to tell me," I asked skeptically, "that you think such things could be applied to the home?"

(Continued on page 699)

Dairying in the Maritime Provinces

Perhaps there is no other country in the world that is oftener referred to as an example of thrift and prosperity than is the little kingdom of Denmark. In bygone years it was not so. Her people fairly struggled for their existence but in recent years the scene has changed and the adverse conditions of poverty have given place to the conditions of thrift and prosperity to which we have already referred.

How came this change? The answer can be put in a very few words. The people of Denmark took stock of themselves, of their geographical position, and of their natural resources and found that of all the industries which were open for natural development dairying presented the brightest prospects. To the industry of dairying they turned their attention with a will and to it they applied the great principles of co-operation in its most important phases. The old yet ever new adage "In unity there is strength" coupled with business dairy methods have helped to place Denmark where she is today.

The example thus set by Denmark is emulated by the best agricultural experts the world over and efforts are being made by the agricultural departments of progressive governments to imitate Denmark in this respect and like her, strive to place on the market products of such quality that the world at large will take notice of them.

Hon. Sydney Fisher, when Minister of Agriculture, and his successor in office, Hon Martin Burrell concurs with him, during the course of an address at the Maritime Winter Fair said:—

Whenever I have visited the various parts of the world, I have found the most universal prosperity in dairying countries." This statement bears out the observations of the Maritime Farmer in this respect. If the leader were to glance over our subscription lists they would find a much more healthy circulation condition existing in the sections where dairying is carried on extensively than in sections where other industries are conducted. Our circulation manager tells us that collections are always promptly made in the dairying districts. There is a reason for this. The receipts from dairying do not come in fits and starts; they come in at frequent regular intervals and consequently the dairyman always has more or less cash at hand every day in the year. And notwithstanding the fact that dairying entails a lot of hard work the cow owner wears an honest smile in all kinds of seasons.

Hon. Sydney Fisher also said "Moreover, I have always regarded the Maritime Provinces essentially adapted to the dairying industry," and Prof. M. Cumming of Nova Scotia in his 1908 report states "we must say it is our honest conviction that dairying is the most important of all branches of animal industry in which Maritime farmers could engage and upon which the future prosperity of the province so greatly depends."

Visitors to our provinces, who have observed our succulent, well-watered pastures, our temperate climate, comparative freedom from troublesome flies, splendid crops of hay, roots and green feeds of all kinds, good crops of grain, and, withal, our splendid local markets, have frequently wondered why high-class dairying is not a more prominent feature of our rural economy. We ourselves have oft been at a loss to explain this condition, for we have failed to fully comprehend our remissness.

"Too much labor." This is the most frequent reason adduced by those whom we thought could, to better advantage pay attention to this remunative line of farming. And yet other flourishing industries involve the employment of much labor, their very profitableness varying, for the most part, with the number of hands employed.

The old way—wasting energy by stooping.

The modern plan—working without stooping.

Albeit, we are far from recognizing the difficulties incurred with hired help, and we fully recognize the desirability, if it were possible, of carrying on a line of profitable farming without employing labor. But as labor is essential to profitable manufacturing or commerce, so it is essential to profitable farming, and the problem is to select a line of farming in which necessary labor can be employed to the greatest profit. Dairying we believe to be that line, and we believe so not only because of the profits which can be made from careful dairying, but even more, because the dairy farmer is the farmer who can employ his labor to profit the year round, and hence does not have to depend upon what floating help is available at the rush of the year's work. We must remember, too that if we expect our sons to remain at home and build up our country, we must provide avenues of profitable employment for their labor. Dairying, more than any other line of farming offers this, and would prove the means of holding our families together in the land of their birth. And besides giving profitable employment to our sons and to our hired help, dairying helps to build up the fertility of our farms.

In concluding his 1908 report, Prof. Cumming said:

"As for ourselves, we have been so impressed with the importance of dairying in Nova Scotia that we have sought to put in comfprehensive form a tribute, which we herewith submit, to the cow that in the last analysis is

A Tribute to the Cow.

We have sung of man and his achievements—of the poet, the orator, the statesman, and those who, in their lot of life, have done their duty. We have sung of our country—its resources its beauties, its grandeur. We have written of the throngs of the city and have idolized the life midst green fields and by running waters. We have thrilled at the song of the bird and the speed of the swift limbed horse. We have wondered at the instinct of the beasts of the forest, the field, and the air. These things terrestrial have filled our minds. But who, that has pictured the brute creation, the noble horse, the mighty lion or the songful bird, has stopped to thing of her, who, of all man's animal friends, is the greatest—the cow.

Remove her from this globe and think we will take. Old England's roasts of beef, the food of her valor and solid acievement, those smoking steaks—we'll take them. That mug of milk by yonder high chair—we'll snatch it from the eager hands of that rosy cheeked child. That plate of yellow butter, that pot of cream, that cheese—we'll take them and leave you to give thanks over dry bread and tea and strawberries unmellowed by those toothsome products of the cow. Those boots and shoes that save you from the snow and rain—we'll take them. And more too, for stop to thing of whwat we owe the cow. From her head to her tail, there is not a thing but is used to minister to man's wants. Our milk our cream, our butter, our cheese, all come from the cow. Her flesh is the food of all nations. Her skin is on our feet and with it we guide our swiftest horse. We comb our hair with her horns. The very buttons that hold our clothes together are hers. We purify our sugar with her blood. We wash our hands with her fat. Her hair holds the plaster to our walls. Her hoofs are the source of our glue. Her bones and blood fertilize our land. Her sons have drawn our plows and have cleared the fields by our settler's cabins None other like the cow! From morn to night, and from night to morn, she gathers her food, and even while we sleep, changes it into the food as well of our babes as of our aged parents.

Thing of the commerce that would cease with her. Think of the long freight trains, the mighty ocean boats, the great stock yards, the creameries, and factories all over the globe. Let her cease and half the world's commerce is at an end. Think of a Denmark scarce two-thirds the size of Nova Scotia, exporting through the medium of the cow, one hundred million dollars worth of produce. Think of a Holland vieing this. Think of what she might do for this country of ours."

"Premier Matheson, his commissioner for Agriculture, Hon. Murdo McKinnon and the ever alert Secretary for Agriculture, Theodore Ross, and their staff of Prince Edward Island, are ever alive to the value of the needs of the dairying industry in Prince Edward Island.

In New Brunswick, Premier Fleming Hon. J. A. Murray, Minister of Agriculture and Secretary J. B. Daggett, together with as capable a staff of dairy experts as one can find anywhere are pushing the industry towards the high-water mark of proficiency.

In Nova Scotia, Premier and Minister of Agriculture, Hon. G. H. Murray, Prof. Cumming, who has done more for the young men of his province than any other mortal in leading them to see the greatness of their natural resources and consequent advantages and the various members of the agricultural department's staff are uniting their efforts in upbuilding an enviable reputation for their province in the dairying industry.

In a future issue of the Maritime Farmer we will give an account of what is being done along dairying lines in Prince Edward Island, New Brunswick and Nova Scotia.

The Better Farming Special

The better farming special touring I. C. R. points in New Brunswick under the auspices of the local department of agriculture was in Sussex on Dominion Day.

Sussex was a busy and gay spot on that day. The military manoeuvers of upwards of four thousand soldiers the Saint Francis Xavier Church's annual picnic and the Better Farming Special were attractions that brought holiday crowds from far and near. They came by train and they came by team and some on foot until Sussex had within its confines the largest population in its history. From one centre of attraction to another went the crowds and in the course of the day the Farming Special train was well inspected by many hundreds of men, women and children. Of course, some visited the cars through idle curiosity and simply walked in at one end of the train and streamed out at the other end and went on to some other centre of attraction. But all the visitors were not of this class. Many interested farmers visited the cars. They came early and stayed late. They were interested in the various exhibits placed in the cars for their benefit.

When the Maritime Farmer representative visited the Special each and every officer in conection with the movement were busily engaged answering questions and explaining the aims and objects of the various exhibits.

In one car, Mr. Ford, the Live Stock Expert for the Province and J. Frank Roach, of Sussex, had charge of several specimens of cattle, sheep and swine.

In the cattle line, a nice Ayrshire cow, an Ayrshire calf and a dual purpose Shorthorn were on exhibition.

A Shropshire and a Chevio represented the sheep industry and a Chester, a York and a Berkshire represented the swine industry. There were also some specimens of poultry and poultry appliances in charge of Mr. Jones, Poultry Superintendent.

Car number two had dariying apparatus, exhibits showing the results of field crops tests and samples of drainage tile, fertilizers and hives of bees.

C. W. McDougall, Dairy Superintendent for the Proviince, was in charge of the dairy section. Of particular interest to dairymen who visited this department were the feed and production records of several herds in the Sussex Record Centre, compiled under the care and mangaement of Mr. H. N. Flewelling. One herd of twenty cows had eleven star boarders and only nine cows were producing a margin of profit. A herd of seventeen cows had two

DAIRY FEEDS AND RECORDS.

In these days of sharp competition it is necessary for the dairy farmer to make a close study of his business if he is to succeed. Like the manufacturer, he must know exactly what his products cost him and determine the source of his profits and losses. In fact he should make a business proposition of the whole farm. We can point to some here and there who have followed this plan with wonderful success, but the condition of the dairy industry as seen on many farms points to the need of better methods and a more definite knowledge of the business. In no department connected with the farm is there more need for absolute data than in the dairy. There is no business which shows a greater range of profit than that of dairy farming. There is need of more careful business methods in the selection and breeding of dairy cows; of keeping records of the yield of milk, the cost of rations, and the fertility elements added to and taken from the soil. Too much money is expended by the average farmer for commercial feeding stuffs. A larger percentage of the foods for our dairy herds should be grown on the farm. Many small farms would be capable of carrying a larger herd if a more intensive system of growing crops were practiced in these days. But after the dairy farmer has produced all he possibly can on his farm, he still has to go into the market for commercial feeds, especially protein, and it is absolutely necessary for him to study the different feeds on the market. The number of cattle feeds now available is very large and appear to be constantly increasing. We have now a great variety of waste products from the manufacture of oils, starch and breakfast foods. At one time farmers produced all that their cattle ate, but all this is changed, so that considerable knowledge is now needed regarding the composition and character of the numerous kinds of feeding stuffs on the market. The by-products in the manufacture of flour,—wheat, bran and middlings, are foods of standard excellency in composition and palatableness. The by-products from the breweries carry a high per cent of protein and are palatable and bulky. The gluten meals are by-products from corn in the manufacturing of starch and glucose. From the manufacturing of oils we have cottonseed meal and the oil meals, all palatable and rich in protein. Probably no more convenient and rational classification of grains and grain products can be suggested than the following, proposed by Lindsey:

Class I. Thirty to 45 per cent protein; 30 to 45 per cent carbohydrates. The oil meals and gluten meals.

Class II. Twenty to 30 per cent protein; 60 to 70 per cent carbohydrates. Gluten feeds, dried brewers' grains, malt sprouts, buckwheat middlings, peas and beans.

Class III. Fourteen to 20 per cent protein; 70 to 75 per cent carbohydrates. Wheat bran, middlings, rye bran, mixed feeds.

Class IV. Eight to 14 per cent protein; 75 to 85 per cent carbohydrates. Barley, corn, oats, rye, wheat, hominy, oat feeds, corn and oat chop. The hays and other fodders belong with this class.

A CREED FOR THE COUNTRY BOY

I believe that the country which God made is more beautiful than the city which man made; that life out of doors and in touch with the earth is the natural life of man. I believe that work with nature is more inspiring than work with the most intricate machinery. I believe that the dignity of labor depends not on what you do, but how you do it; that opportunity comes to the boy on the farm as often as to the boy in the city; that life is larger and freer and happier on the farm than in the town; that my success depends not upon my location, but my self; not upon my dreams, but upon what I actually do; not upon luck, but upon pluck. I believe in working when you work and playing when you play, and in giving a square deal in every act of life.

ATTENTION YOUNG MAN.

We call the attention of our readers to the advertisement which appears elsewhere in this number of the Agricultural College at Truro. Nine years have elapsed since this institution was formally opened, and during that time great progress has been made. The attendance in the regular classes has gradually grown from 17 to over the centuary mark and in the Short Course from 68 to over 350.

The reasons for this growth have been three fold; First, the excellent work done at the College, and second, the recognition which the farmers of the Maritime Provinces are giving to the necessity of an agricultural education for those who propose spending their lives upon the farms of this country. Thirdly and what is more important, results can already be seen in the increased enthusiasm, in the more intelligent farming methods and in the larger percentage of young men who are seriously taking up the business of farming on a business basis.

The courses at Truro are planned to meet the needs of the average farmer's son who has only had the advantage of an ordinary school education and who wishes to increase his general education and at the same time to acquire a knowledge of the underlying principles of agriculture. In the past the ages of the students have varied from 15 to 35, the average being about 20. About 90% of those who have entered the College are now engaged in farming.

A small number have entered other pursuits of life, and about 5% have continued their courses at the Ontario Agricultural College, Guelph, and at Macdonald College, Quebec, with a view to completing their four years course and obtaining a B. S. A. degree. Eight students from the Nova Scotia Agricultural College entered the third year at Guelph last fall, joining a class numbering 67. In the final examinations held last spring, these Nova Scotia Agricultural College men all ranked the first twenty, which gives evidence of the thoroughness of the training which they received at their Alma Mater at Truro.

The advantages of a student desiring to obtain his B. S. A. degree taking his preliminary course at a Maritime Province institution are great. First of all, the instructors are familiar with local condition and, hence, the instruction is of a character more applicable to the needs of the students, than can be given at any institution not situated in the Maritime Provinces. Then no tuition is charged so that the total expenses are considerably less. When in addition it is considered that the students have always stood well in their classes at Guelph, Macdonald and other Canadian institutions, the advantage becomes still more apparent.

It is about time the young men in the Maritime Provinces were considering their program for next winter and we strongly recommend them to think seriously of the advantages with an education will give them in future life and follow up this consideration by writing to Truro for a calendar of the Agricultural College.

SURVEY YOUR OWN FARM.

Did you ever take an afternoon off and stroll over your own farm, viewing it in the impartial manner in which you would survey a neighbor's farm? Looking the farm in the face in this way is a wonderful educator, and all of us can afford to do it at least once a year.

Sticking too close to hard work makes us narrow in our vision. Obvious faults are apt to escape our notice. For instance, it is easy for one of us who has plowed for 40 years around a large boulder in the middle of an otherwise clean field, to come to regard that obstruction as a necessary evil; a few pounds of blasting powder and half an hour's work would remove the obstruction and improve the field immensely. The barnyard may be very unsightly and mussy to a stranger, but all right to us because we have become accustomed to seeing it that way. A gate that insists on sagging and dragging may lose us enough time and energy in a year to build half a dozen new ones to take its place, but we have become so accustomed to hauling that old gate around that it too is classed as a necessary evil.

It is wonderful how many small points in need of improvement we can find if we will only give our farm a square look in the face. Many of the most obvious faults may be remedied by half an hour of energetic work. There are few of us whose farms are so perfect that they would not be the better of an annual clean-up.

EDITORIAL NOTES

Put heart into your work for heart's sake.

Every man has a place to fill. Yours is as big as your farm.

Neglect is the thing that makes the weeds grow in your garden.

He who preaches thrift to others must make his own life count.

A man may be a child of circumstances, ruled by them or a parent of circumstances; ruling them.

There is a great future ahead for the man who goes ahead now and keeps well up with the present.

The man who is making his farm pay is a man who is making it his sole business to do that very thing.

Don't waste your time wishing you were like others. If you be like them they would then be so much like you that you would no longer like them.

The Storage and Use of Silo Moistures.

(Continued from page 681)

Of equal importance with the two factors above mentioned in governing the amount of water held in the soil from any given rain is the amount. A very dry soil offers much greater resistance to the downward movement of water than does a moist soil. In a very dry soil the movement is so retarded and the amount of water required to moisten is so great that the water from a single rain, coming alone, is generally held near the surface. From here it is soon lost through the rapid evaporation which takes place at the surface. On the other hand, where the soil is already moist when the rain comes, it is much more quickly carried away from the surface. It is also distributed to lower depths in the soil and thus protected from the rapid loss at the surface. On the other hand, where the soild is already moist when the rain comes, it is much more quickly carried away from the surface. It is also distributed to lower depths in the soil and thus protected from the rapid loss at the surface. Frequent observations have been made along this line on the native sod. This is usually hard and dry. It is seldom wet more than a few inches by the rains that come singly. The lower depths receive moisture only during "rainy" or "wet" spells when a second rain comes before the moisture from the preceding rain is lost.

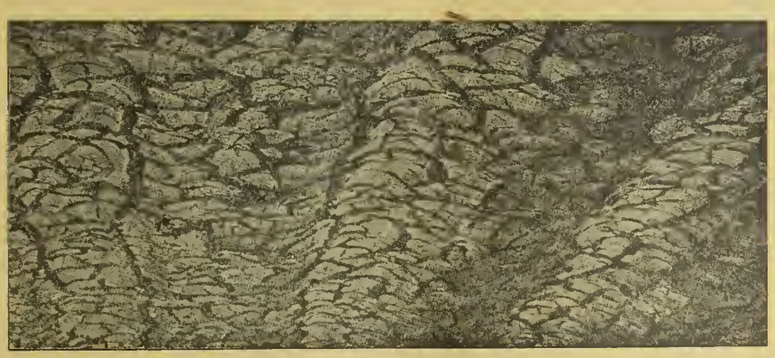
How Moisture is Lost.

It is seldom that we get enough water into the soil to allow percolation beyond the reach of the plant. Percolation does not take place to any considerable extent until a soil is filled beyond its carrying capacity. This point is very seldom reached, but when reached, the percolation is beyond our control. The second means of escape that is, evaporation from the surface, is to a certain extent under the control of the farmer. There will always be some loss even under the best system of cultivation, but it can be reduced to a minimum. The water that evaporates from the surface reaches the surface in much the same way that oil from the bowl of a lamp reaches the flame. The water passes from one soil particle to another until it reaches the surface and is lost in evaporation. This upward movement is quite rapid when the soils are wet and is retarded as they dry out. If the surface of the soil is cultivated it becomes loose and dry. Both the looseness and the dryness tend to retard the further movement of water to the surface. Water moves very slowly through a loose or dry soil. In this section a rain is usually followed by a hot sun and wind. These cause a more rapid loss of water from the surface than can be supplied by capillarity from adjoining soil particles. The result is that the soil surface soon dies. This is of itself a check to surface evaporation. The water from below moves slowly through the dry surface. If the rain is of sufficient amount to make the surface smooth and connect with the under moisture it should be stirred as soon as practicable. In order to reduce evaporation from the surface to a minimum, it is essential to have on the surface not only a dry soil but a loose soil. Cultivation will stir the surface soil, causing it to dry out more quickly and leave the soil kernels not so closely in contact. The fewer the points of contact between the small particles of soil and the drier they become the more effective is the mulch in reducing evaporation. Another reason for cultivation soon after a rain, especially where a field is bare, is that a smooth soil blows much more quickly than a rough soil. This, of course, applies to the soils that are light enough to blow and in regions of frequent high winds.

On this type of soil we feel that two or three inches is sufficiently deep to make an effective mulch. Where the mulch is too shallow there will be enough circulation of air through the mulch to cause considerable loss. On this soil almost any implement that stirs the surface can be used if it does not pulverize the soil too finely. Where the surface has become so dry that the draw-harrow pulverizes we prefer the disk. On still lighter soils the disk might pulverize too much and make some other implement preferable. The objections to a very fine or dust mulch are that it will blow and that it offers too great resistance to the penetration of rain water.

The third means of escape of water from the soil, that of being drawn out by growing vegetation, is much more effective on this type of soil than surface evaporation. Considering only the moisture content of the soil, the water used by any plant is lost. From the standpoint of the farmer only the water which is used by weeds is lost. This is, of course, a real loss, since the weeds have but little practical value. The little value they have is furnishing organic matter to the soil. The water that is taken up by the roots of the crops, passed through the plant and exhaled by the leaves, has served its purpose. It is for this purpose that we strive to store the moisture in the soil.

As much water is required to grow a pound of dry matter of weeds as is required to produce the same amount of dry matter of some of the farm crops. From the standpoint of crop production weeds are the worst enemy of the farmer who is farming under a limited rainfall. Any water used by weeds is lost to the crop. It is hardly practical to keep all weeds down, but the crop is usually cut short to the extent that is has been robbed of the water by weeds. From a large number of tests that have been made it is found that where weeds are allowed to grow throughout the season they dry the soil as thoroughly as does a crop of small grain.



A Dry, Baked Soil t hat is Losing Moisture.

Cuts by courtesy Farm and Ranch Review, Calgary.

Cultivation to Conserve Moisture

Cultivation is the one practical means that the farmer has for conserving moisture over any considerable area of land. It is by cultivation that the surface is put in condition to catch and hold the water until it can soak into the soil. Weeds are killed by cultivation and thus prevented from using the water which falls.

Cultivation also checks the loss of water from soils by direct evaporation. Stirring the soil loosens the surface, hastens the process of drying the soil particles, so that the water from below cannot so readily reach the surface by capillary action. In other words, we purposely sacrifice the moisture in the cultivated layer in order to conserve that in the deeper levels.

Summer Tillage

From the standpoint of storing moisture in the soil we have found summer tilling, which is clean cultivation without any crop for a season, the most ideal way in which to store moisture. When the rainfall of a season is insufficient to produce a profitable crop it may be better to summer till than to crop every year, and thereby store a small portion of one season's rainfall to store with the rainfall of the following season for the production of a single crop. In other words, to use not "two years' rainfall for one crop," but rather a small portion of the first year's rainfall for the crop. Our investigation shows that it is only under favorable conditions that as much as 33 per cent. oft the rainfall of one season can be carried over to the next, and that during the most unfavorable season only 10 per cent. of the second year's rainfall is utilized for crop production under the best system of summer tillage.

Summer tillage is a system that has been practiced for a long time in the drier sections of the country. Although this method of utilizing moisture is seemingly an exceedingly wasteful one, it is probably the best one yet devised for some crops, soils and climatic conditions. It is obvious that it will hardly be profitable to summer till a shallow soil, for in such soils the effect of cultivation is of little value in storing water. Where there is a layer of hard-pan, gravel, rock or sheet water close to the surface the amount of water which the shallow layer of soil above this stratum will hold is so limited that probably one good rain will fill. It is possible under normal weather conditions to store a considerable amount of moisture as a safeguard to the crop against drouth. It must be borne in mind, however, that the bad effect of overstimulation, already mentioned, will sometimes more than offset the benefits of this stored moisture and that in some seasons the increased yields due to summer tillage may not be sufficient to pay for the extra expense.

In 1911 the total amount of rainfall was greater than in 1910, but this distribution of the rain was not as good. Only about 10 per cent. of the total rainfall was held. The trouble was that either the rain would fall in such light showers that it was not sufficient in amount to soak into the ground deeper than the first few inches of the surface, or else the showers would come singly, and falling on the hot, dry surface would be lost through the rapid evaporation. The best distribution of rain for storing water is when the showers are so frequent that the surface does not dry out thoroughly between them. One such rainy season with several inches of water falling during a period of several days will do more good from the standpoint of storing water than a much heavier rainfall falling as simple showers. It takes an inch of water to wet the surface six inches. If, then, only an inch of water falls the most of it will be lost in creating a mulch. If another rain comes while the surface is still moist it can be carried into the lower soil.

Disking After the Binder

It is frequently not desired to summer till in the preparation of the seed-bed for a crop. The same principles, however, should be applied as are applied in summer tillage; that is, keeping the surface in shape to catch the water and keeping the weeds from using the water. The preparation of the seed-bed should commence as soon as practicable after the preceding crop is off the ground. Usually the longer the seed-bed is prepared and kept in proper condition the greater the amount of water that will be stored. A firm seed-bed is essential for all crops. After a crop of small grain has been taken from the ground it usually becomes weedy unless it is cultivated in some way, or unless it is so dry that weeds will not grow. The weeds that grow on the grain stubble field, after the previous crop has been taken off, use the water and plant food, which should be saved for the succeeding crop.

Considerable work has been done to determine the effect of disking after the binder on the conserving of soil moisture. Wherever there was sufficient moisture in the soil to produce a crop of weeds and these were killed by disking, we found a saving of moisture on disked land over land not disked. In some cases where heavy rains came during the test some benefit was found by the disked land catching more of the water than was caught by the unstirred soil. We have not made actual test to determine the financial profit in disking, but from the moisture standpoint it will prove beneficial to stir the surface so that it can catch more of the rains that may come, and kill the weeds that are on the ground. The soil is frequently so dry and hard after harvest that it is necessary to weight the disk in order to make it do the work thoroughly.

Plowing Versus Disking

From tests that have been made at the station, plowing has been better for storing moisture than disking. The difference in some cases has been very little. It is dependent on the amount of rain that comes while the test is being made and the rate at which the water falls. If heavy rains fall the increase in moisture content of plowed land over disked land is greater. This is to be expected, since the plowing stirs the surface of the soil more thoroughly, and puts it in better condition to catch any rain that comes. The plowing will also kill all of the weeds. The disk does not in all cases do this. It may be preferable—if a soil does not blow when it is fall plowed—to plow the stubble fields instead of disking them. This, however, is frequently impracticable due to the dryness of the soil.

Artificial Mulches

It is a common practice to use artificial mulches among shrubs, small fruit and in some cases vegetables. The station has done some work to determine the value of artificial mulches from the standpoint of catching and holding the water that falls. These mulches are usually composed of old hay, straw or manure. From the standpoint from which they are applied, that of retaining water, they are most efficient and have a practical application. Wherever it is desired to grow shrubs, ornamentals or small fruit the mulch can be used for retaining water. Against its efficiency in holding water is sometimes advanced the opinion that it forms a harboring place for injurious insects. We have no data on the latter point. For storing water a mulch of straw or hay has been found more effective than a soil mulch. The hay mulch is so open and porous that water falling as rain will readily penetrate into it without runoff. A hay or straw mulch is also more effective in reducing evaporation. The mulch itself quickly dries after a rain, but protects the water in the soil underneath from loss through evaporation. The particles composing the artificial mulch are so coarse and have such large spaces between them that water from below cannot move upward by capillarity.

Depths to Which Crops Use Moisture.

The depth to which a crop will use moisture depends upon the root development of the crop, the length of its growing season, its normal development, the type of soil on which it is being grown and the location of the mois-

(Continued on page 704)

HORTICULTURE.

Thinning.

Thinning apples pays at least 100 per cent. Of course, it seems small potatoes to take one tree with say five barrels of apples and spend twelve and a half cents worth of labor on it, thinning of apparently good apples (and, inadvertently, some which you do not intend to take off,) all to gain a miserable extra price of 25 cents on the crop of five barrels. By what crop planted in Nova Scotia—save the Lime Sulphur plant—will produce more than 100 per cent. profit? It comes at a time of the year when most people "have their crop in" and if some bloated millionaires who believe in growing hay for the good of the community, are still busy at its cutting, then all the better for the apple men.

Thinning pays for other reasons which it is hard to estimate in cash. For instance, thinned fruit has a much better chance to be run over to fill orders for the South Africa trade. This will be especially true this year when the Wagners have set so well. Thinned Kings will also share this advantage.

There is another reason which would make thinning a profitable practice; suppose the cash paid out to thin the apples was only equalled by the extra profit received for the apples instead of being repaid twice over. Our Nova Scotian apples are about the lowest class apples sent to England, with the exception of the jam apples sent to Holland, etc., used in preserving.

Now I know you people are like us Scotch. You think you are the big IT in the apple world, but if you could see the Winesaps, Yorks and Grimes as I have seen them, you might, sack some of your political gas bags at your fruit meetings and obtain samples of your competitors' goods to see what you are up against.

However, whether you believe it or not, you need to look out and gain a better name for quality and less for spots. The Tysons in Pennsylvania, where I was staying last winter, only packed apples of 2¼ inches and over and sent the smaller to the cider mill (commonly called vinegar factory.) Where would you be with your small threes, by threes, mixed threes and 29 per cent. No. 1 tree run, which was all mine packed? Their fruit was thinned and was 80 per cent. free from worm or spot with 8,000 barrels and 300 acres. Perhaps Nova Scotian apples won't need thinning everywhere in the Valley but Wagners, Kings and most especially Spys are setting full and will certainly pay for the labor.

The apples stay on so much better through gales that it is hard to estimate the profit in that respect. In 1911 I had 1433 barrels of all sorts and, out of that, 61 barrels were drops. In 1912 I had 2211 barrels of sorts, and only 87 barrels for the evaporator. In 1913 I got 913 barrels and of them only eight went to the evaporator and the rest made $2.02 tree run for the Berwick Fruit Company.

The last objection I want to dismiss from your minds is the great loss of bulk due to thinning. It does seem queer that apples act so contrary (especially Spy.) It sometimes looks to me on my very thick trees that one apple to every cubic foot of space would just be the ideal. Of course, you would not have enough leaves on most of your trees to make so few apples big enough. As your trees are so rambling you would probably be tempted to annex a good part of the heavens in your estimate and so might come out not so far astray after all.

Take this loss of bulk and here is what I found. 1st Spy tree cropped in 1907, 4 barrels; 1908, one half barrel; 1909, 5½ barrels; 1910, off; 1911, 6½ barrels; 1912, off; 1913, 7½ barrels.

This is a rather small tree and had over 1,000 good sized apples taken off in thinning besides many little nubbins which were not counted.

Tree 2, also Spy; Crop; in 1907, 6½ barrels; 1908, ¼ barrel; 1909, 6¾ barrels; 1910, 1-3 barrels; 1911, 7½ barrels; 1912, off; 1913, 7 barrels.

This also had 1,000 apples or more besides nubbins removed. It is also an undersized 27 year old tree on indifferent poor soil.

To end up with I wish you would can one remark you are so fond of, and that is "Our apples are the finest flavored in the world". If this remark were duly evaporated to one hundredth part of its bulk, it might then be used by even

Crop Report.

We are not in a position to estimate with more certainty as to the amount of Competition we shall have to contend with this year.

As far as our own crop is concerned we can safely reckon on 1,500,000 barrels of shipping apples.

Reports are more encouraging now than at first and orchards that had the appearance of being burned after the frosts of June 3rd and 4th are now showing a very fair set.

Gravensteins, Wagners and Bishop Pippins are in abundance.

We are preparing to market 900,000 to 1,000,000 barels which will be our percentage of the total crop.

Naturally we are therefore gathering all data possible as to what competition we shall have to contend with and on which markets this competition will be met.

Starting with the West we find that Washington's latest estimate is 5950 cars, roughly 3½ million cases, nearly 50 per cent. more than last year.

Oregon expresses some doubt as to what their crop will be but think that possibly it will be as large as their record crop of 1912.

The apples of these two states are of a different class to our own and supply a different trade so far as Europe is concerned, consequently, unless they have a tremendous surplus to market in England, we have little to fear from that direction.

These states do, however, affect to a certain extent our trade in the Canadian North West and for this reason the early operations of the Co-operative selling agencies of both states will have to be carefully watched.

Our principal competitor on our great market (England) is western New York.

The grower of this State made a splendid impression last year by the quality of their pack and have therefore become a factor to be dealt with Reports indicate a larger crop of apples from this district, also from the State of Maine. As in Nova Scotia, there is no sign of spot although should there be any material changes in the weather this could easily develop between now and harvest.

In Ontario, there will be a large crop.

Where spraying has been satisfactorily carried on the crop will be a heavy one but where orchards have been neglected the trees are overrun with tent caterpillars and the quality of the fruit will be greatly reduced through the lowered vitality of the trees.

Prospects in Quebec are that Wealthy trees promise a heavy crop and Fameuse and McIntosh Reds a good crop.

In Okanagan Valley the outlook for Jonathans and Yellow Newtons is fair; Wealthy and Spitz fair.

The English crop, which much affects the price of our fall apples, is reported light.

Adverse weather conditions, cold and wet with severe frost, have reduced the crop to 50 per cent. below average.

With our large crop it will be necessary to extend our markets.

The North American Fruit Exchange have a large staff on their permanent Sales organization.

These men are expert salesmen, the best men that can be obtained and any market giving the slightest promise is thoroughly looked after.

We must adopt a similar agressive campaign if we would market our big crop to the best advavntage.

There are several promising markets that must be looked after, this means that more men must be employed, but it must be done.—A. E .Adams, Sec'y United Fruit Companies, Ltd.

Fruit Men Meet Commission Johnson.

Mr. Daniel Johnson, the newly appointed Fruit Commissioner at Ottawa paid his first visit to the Annapilis Valley last week, to overlook the fruit interests in order that he may become acquainted with the conditions in Nova Scotia jointly with those of Ontario and British Columbia, over all of he is solely at the head, according to the late changes made by the minister of Agriculture in separating the Fruit Division from the Cold Storage Department.

Mr. Johnson was met at Windsor accompanied by Prof. Cumming on Saturday the 27th inst. by Mr. Tremaine the member for Hants and taken by auto through some of the most important orchards for Hants and Eastern Kings. On the drive throug to Wolfville, there he was met by an auto party consisting of Messrs. Prof. Blair, Prof. Brittain, S. B. Chute, Fruit Inspectors G. H. Vroom and F. B. Westcott, J. M. Robinson, A. H. Westcott, H. A. Welton and Capt. Allen.

The party then visitied a number of orchards on the drive through Starr's Point, Canard, Sheffield Mills, Centreville, Northville, and Woodville, there they looked over the Father of all the Gravensteins, the big tree of J. A. Kinsman which has produced as high as 32 bbls. apples in one year and by all appearances it will repeat this season.

After calling at Mr. Howard Bligh's big orchard from which he expects to pick 7,000 bbls. apples this year, the party then returned through Brooklyn Street to Kentville.

Judging by the questions asked and remarks passed by Mr. Johnson the Government made no mistake in the man they placed at the head of the Fruit Division. Mr. Johnson was very agreeably surprised at the prospect of such a large crop of apples in the Valley which was contrary to the reports he had received at Ottawa of damage by frost. Although the frost in some sections may have reduced the apple crop a few hundred thousand barrels, still it will be comparatively a small proportion of the whole estimated crop of the Valley, which will be from present prospects be as great as ever produced in Nova Scotia any previous year.

Mr. Johnson visited the Fruit Growers of Annapolis Co., on Monday and then returned to Berwick to attend the 2nd. Annual Meeting of the United Fruit Co., of N. S.

Mr. Johnson interviewed at St. John on his return reported that the outlook for the apple crop this fall is very promising. It is estimated that more than 1,250,000 barels will be harvested. The trees on the highlands are in much better condition than those on the flatland in the centre of the valley. These latter suffered somewhat severely from the late frosts in June which nipped the tender buds and blossoms. In the whole province it is estimated that about 750,000 barrels were lost through these late frosts.

Mr. Johnson was met in St. John by S. L. Peters, Dominion Fruit Inspector for New Brunswick, and with him he will make a tour of inspection of the fruit growing districts of New Brunswick.

Directions for Sending Specimens.

Orchardists are urged to examine their trees and plantations very closely for injurious insects and fungous diseases.

Specimens of insects, if dead, should be wrapped in paper or cotton and enclosed in a strong pasteboard, tin or wooden box. If the specimen is particularly soft, it should be packed in cotton saturated in alcohol. Wherever possible, grubs, caterpillars and so forth should be packed alive in a box together with a supply of their food; air-holes are not necessary. Particulars as to where the insect was found and the nature of the damage which it is doing, whether to leaves, buds or stem, are frequently of great importance.

In the case of bacterial or fungous diseases, choose specimens representing every stage of the disease. Most material or material likely to decay, should be packed as dry as possible. Press small plants or parts of larger ones carefully between layers of newspapers, protecting this if necessary with stiff cardboard. Fruits, each separately wrapped, should be packed in strong cardboard boxes.

All such packages should contain the name and address of the sender, and are carried postage free.

Send specimens of insects to: Dr. C. Gordon Hewitt, Dominion Entomologist, Central Experimental Farm, Ottawa; and

Specimens of bacterial or fungous diseases to: H. T. Gussow, Dominion Botanist, Central Experimental Farm, Ottawa.

Apple Industry in Good Shape.

Progress in every phase of the apple industry was the tenor of the convention of the United Fruit Co., Ltd., which closed at Berwick on July 1st. Co-operation was putting new life into the industry, the orchardists were giving scientific attention to the problems confronting them, their product was becoming more popular in the great markets abroad, and the methods of packing were steadily improving. As an index to the proposed expansion of the company, a resolution was passed at one of the sessions authorizing an increase of capital from $50,000 to $200,000. In the afternoon session officers were elected for the ensuing year, as follows:—President, John Donaldson, Port Williams; Secretary, A. E. Adams, Berwick.

The two days' convention was an unqualified success, bringing together

ACADIA UNIVERSITY
WOLFVILLE, Nova Scotia.

Departments
Arts and Sciences. Applied Science. Theology.

Degrees
B.A., B.Sc., B.Th., M.A., and certificates in Engineering admitting to third year in best technical schools. First year in Medicine, Law, and Theology given as electives in Arts course.

Equipment
Largest undergraduate faculty in Maritime Provinces. Three new and splendidly equipped Science Buildings.

Expenses
Expenses light, and over $1000 given in prizes and Scholarships yearly.

2.—The General Course.
3.—Manual Training (wood and iron).
4. Business Courses.
Necessary Expenses $200.00 including Board and Tuition. For Calendar and other information. Write to Principal
W. L. ARCHIBALD, Ph.D.,
WOLFVILLE, - - NOVA SCOTIA.

nearly the entire roll call of the organization. The programmes at the largely attended public meeting held Tuesday night, and the regular meetings of the convention provided a grist of instructive lectures, every one of them dealing effectively with some phase of the industry.

On July 1st, the first item was the report of the London office, which was given by John N. Chute, the European representative. He said that Liverpool was the greatest centre of distribution for fruit in the world. London Manchester and Hull followed in succession. Ribstons, handled at the proper seasons, were very welcome in London, and Blenheims were very much liked in the north of England. Wealthys are getting to be more appreciated. There has been a great improvement in the packing of last year, and a uniform method was increasing.

A. E. McMahon, the company's inspector and organizer said that the most important thing about packing was facing, and being careful about packing Number Threes.

Prof. Haycock then gave his report on evaporators and their needs.

A full report will appear in our next issue.

Irish Apples for English Market.

Although the Irish Fruit trade does not attain to any very considerable proportions, yet the export to great Britain is worth approximately $790,000 per year, apples being the largest item. The area under fruit in Ireland has been extended considerably in recent years and this is especially true of orchards, the acreage of which for the year 1912 was more than 40 per cent greater than that for the year 1908. The largest fruit-growing areas are to be found in county Armagh.

A marked improvement has been effected in the marketing of Irish fruit. In conjunction with the Ulster Fruit Growers' Association, rules for the grading and packing of fruit have been drawn up and standard packages have been approved; a very distinct improvement has been effceted in the packing of apples in stanrard barrels on Canadian lines. The association's label on a barrel or box of apples is a guarantee as to the variety and grade of the contents and also that the package is a standard package. The label bears the packer's registered number so that if the contents are found to be other than what they should be, he can be communicated with.

Cost of Apple Production.

We are apt to be led away with the stories of $3 to $5 a box for apples secured now and then by certain individuals and think that they thereby have a much greater return on the capital invested than when we sell the fruit at $3 a barrel. It costs $1 a box to put the finest Oregon fruit into Chicago and its costs more by the time it gets to New York or Philadelphia. If we can get 50 cents a bushel for our fruit in the orchard we can live in years of normal crops. I venture to say that the man who can secure the sale of his apples at $2 a barrel in the orchard one year with another will make good money; whereas, the poor westerner could not pay for his packages, pack the fruit and send it to New York for $2 a barrel.—Samuel Fraser, Livingston County, N. Y., in N. E. Homestead.

Ford
THE UNIVERSAL CAR

Ten million miles of advertising. A half-million Fords, averaging twenty miles a day, circle the world four hundred times every twenty-four hours. If the car wasn't right this tremendous publicity would put the Company out of business. The Ford is its own best salesman. A demonstration is a revelation—take yours today.

Six hundred dollars is the price of the Ford runabout; the touring car is six fifty; the town car nine hundred—f. o. b. Ford, Ont., complete with equipment. Get catalog and particulars from any branch Manager or from Ford Motor Company of Canada, Limited, Ford, Ont.

P. E. I. Fruit Crop Report.

..Apples—There is an abundance of bloom on early and fall varieties. With the exception of a few districts winter varieties also show a fair amount of bloom. The trees were later coming into bloom than usual. Frosts in a few sections have done some damage, more Counties. One correspondent from Alberton reports canker worms and bud moth very bad in that district. At Malpeque, the prospects for apples are not good. Bud Moth and Oyster Shell Bark Louse are doing some injury in unsprayed orchards.

Strawberries—Indications point to a fair crop, notwithstanding some damage by frost. There was also some winter injury.

Plums—Prospects for plums are unfavourable. Black Knot has killed many trees and impaired the vitality of others.

Cherries—The indications for cherries are good. Damage from frost has been slight.

Bush Fruits—There will be about an average crop of bush fruits. The frost possibly will effect the yield slightly.

A Word to the Wise.

Fruit growers who are thinking of economizing by not using poison in then ext spraying should see the ravages of the green fruit worm in some of the less thoroughly sprayed orchards where in a great many cases the apples have holes eaten right in the seeds. This green worm has at least a fortnight yet to work.

DAIRYING.

Raising of Ayrshire Calves.

At birth the calf is allowed to remain with and nurse the dam until the milk is fit for use. When the calf has nursed the first milk, the dam is milked out and the milk giver her to drink; both calf and dam get a good laxative. We like to feed the calf whole milk the first month or three weeks, then gradually change to skimmed milk. By the time it is on skimmed milk the calf usually is eating hay and grain. We feed about what hay and grain the calf will clean up twice per day. Should the milk be scarce, we use one part linseed meal and two parts bran. Make a gruel, adding sufficient water to make a drink twice per day. Fall calves are given warm drink all winter, changing to water in the warm spring weather. The grain fed dry to calves consists of bran, two parts, ground oats and corn, or Schumacher Stock feed, two parts, and linseed meal, one part.

Up to producing milk the heifers are fed while in the barn, hay, ensilage and grain, the latter of the above mixture. Feed for results; see to it that the heifers are thrifty and growing all the while. When carrying the first calf, of course grain is increased as is necessary.

For roughage for our dairy cows, we raise hay, as much clover as possible, ensilage for the silo, and green feed for summer, usually having ensilage until the first of June or later, and as much later as possible. The grain ration consists of as near the natural food as possible. Price has considerable to do with the kinds of grain used.

At present we are feeding a mixture of bran, linseed meal (old process), gluten, hominy, Schumacher Stock feed and Ajax Flakes, 100 lbs. of each with salt sufficient. We feed one pound of grain to three or four pounds of milk given, dependent upon the condition of the cow. Our cows must be in good condition and we look to that rather than follow any fast rule of feeding.

For green feed we have winter rye, then oats, peas and barley sown as early as possible; later we have millett and still later, barley, sown usually on the ground where the oats, peas and barley were cut, getting two crops off the same land. We also get a second cut of millet. The later crop, barley, is not hurt with early frost.

Our method or system of feeding is practically the following: After milking, feed ensilage (average about 30 lbs. per day) with grain on top, then a liberal feed of hay; cows are watered, then given a second or continuation feed of hay—what they will clean up. This represents the morning feed. In the afternoon hay is fed at 2.30, then cows are watered; a second feed of hay to those that need it; then prepare for milking. After milking, give ensilage as in the morning.

This is what the average cow gets. Of course we all have a few individuals in the herd that either need or are worthy of special attention.—John A. Ness.

Cause of Difference of Income in two Pure-Bred Dairy Cattle Farms.

The writer compares carefully with the aid of tables two dairy cattle farms situated in favorable positions as to means of communication. They are respectively 400 and 160 acres in extent and the smaller of the two yields a managerial income $3,380.62 higher than that of the other.

The following table shows the principal data of the inner economy of the two farms:

	Farm I	Farm II
Total area	400 acres	160 acres
Arable land	101 acres	103 acres
Total capital	$56,289.50	$49,190.10
Fixed capital (amount and percentage of total)	$41,600 73.9 p.c.	$22,800 46.4 pc..
Working capital (amount and percentage of total)	$14,689 26.1 p.c.	$26,390 53.4 p.c.
Investment in cattle	$ 4,990	$21.555
Number of head	61	67
Total receipts	$ 8,750.90	$13,811.74
Live stock products sold	3,030.00	3,337.99
Live stock sold and increased inventory of live stock	3,476.50	7,390.25
Sale and increased inventory per cattle unit	18.22	126.08
Total running expenses	4,234.77	4,196.90
Expenses for labour	2,270.40	1,639.60
Printing and advertising	11.00	245.00
Interest, 5 per cent. on capital	2,814.47	2,459.50
Total expenses	7,899.24	9,579.46
Net results (managerial income)	851.66	4,232.28

The extent of arable land is very nearly equal in two farms, while the running expenses are nearly the same.

The total expenses are even greater by $1,680.22 on the smaller than on the larger farm. Consequently the great difference in the net results can only be used by the difference in the receipts; it comes chiefly from the sale of cattle and from the difference in the increase of inventory. The writer is of opinion that the higher managerial income of the smaller farm is almost entirely due to more judicious breeding, selecting, testing and advertising. —D. H. Otis, in Hoard's Dairyman.

The Work of Fifty Guernsey Cows.

The last fifty Advanced Register records of Guernsey cows approved and ready for certificates show some interesting figures relative to the records being made by this breed.

Thirty-six out of fifty gave an average of over 505 lbs. butter-fat, showing the standard that many Guernsey breeders are setting for their herds. Four of the number averaged 622 lbs. and two were 713 lbs. each.

To the dairyman who does not aspire to making world records, but wish to know what he may reasonably expect from Guernsey cows, the foregoing figures are worthy of note. He is prpoud to know that a Guernsey cow, May Rilma, 22761, holds the world's record for butter-fat production, with a yield of 1073.41 lbs. butter-fat in one year, and perhaps equally pleased to know that he has selected a breed the rank and file of whose cows show such averages.

When he considers further the cost of production and sees that he has received greater returns from his feed and the care given than he could have obtained with any other breed, he has renewed cause for satisfaction.

In this group of cows, four records are for the second year, and three are for their third yearly records, demonstrating that they "come back" repeatedly and improve their previous year's work. As illustrating this, we cite the case of Anton's Patience 24474, whose three years' records are as follows:

First year—7618.80 lbs. milk; 430.15 lbs. butter-fat.

Second year—10358.80 lbs. milk; 572.82 lbs. butter-fat.

Third year—11934.00 lbs. milk; 643.-16 lbs. butter-fat.

While these are not phenominal records, they show the great value of A. R. work to the dairyman in following just what his cows are, or should be doing. The number of breeders who are taking advantage of this work is steadily increasing.

Cost of Rearing a Calf.

Mr. Clausen, the writer of a Danish Bulletin, gives a summary of the cost of rearing a calf on the basis of the quantities of food administered and corresponding in nutritive content to Kellner's rules for feeding. The cost of attendance, rent of tsable, insurance and interest of working capital on the one hand and the value of the manure on the other hand, are not included in the account. The whole milk is valued at 13 cents per gal., and the skimmed milk at 3 cents per gal. Concentrated foods and hay are taken at the market price.

The weekly costs of food rise at first on account of the increasing quantity of whole milk given. In the fifth week a part of the whole milk is replaced by skimmed milk, in the seventh week whole milk is completely stopped, and in its place meal, crushed linseed and oats are fed.

The cost of rearing a six-months-old calf amounts to $32.80 inclusive of initial cost. With a live weight of 385 lbs., the cost per cwt. works out to $9.50.

Maritime Holstein Records.

In the list of seven day official records of Holstein-Freisian cows accepted between the dates of June 1st and 15th, we find the following:

Senior four-year-old class—Ruby Nig, 14213, owned by Lea & Clark, Victoria, P. E. I., with 560.25 lbs. milk, yielding 20.54 lbs. fat, the equivalent of 25.67 lbs. butter, 80 per cent. fat.

Junior four-year-old class—Segis Korndyke Calamity, 145.41 owned by Logan Bros., Amherst, N. S., with a record of 502.4 lbs. milk yielding 18.22 lbs. fat, the equivalent of 22.78 lbs. butter, 80 per cent. fat.

Senior three-year-old class—Miss Cornelia Vale, 177,79, owned by Lea & Clark, Victoria, P. E. I., record, 316.-

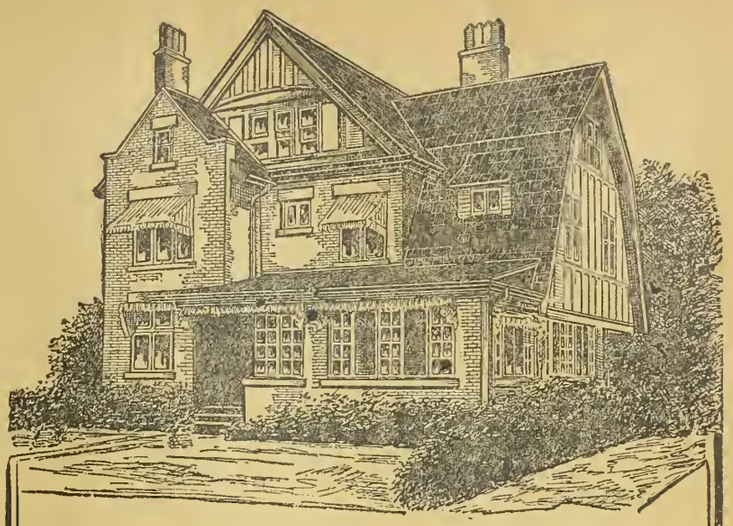
Milk, Milk Men and Milk Pails.

Of all food products, milk is the most perishable. There are two reasons why this is so. First, because it is in itself an excellent feeding ground for bacteria of all kinds and therefore, for the bacteria of fermentation and decomposition, second, in its production it is more exposed to contaminating influences than is any other food product. There are two great fields within which bacteria exist in unthinkable numbers. These are the earth and the alimentary tract of all animals. So when soil or manure come in contact with milk it becomes at once thoroughly charged with bacterial life. In Wisconsin most milk is made into butter and cheese. If the raw product comes to the factory laden with bacteria, the finished product cannot rank with that made from clean milk. The result is a lessened price for the butter or the cheese and that means a lower price for the milk.

Both butter and cheese are fermentation products, and require the action of bacteria in the process of manufacture. But the necessary fermentation requires a specific bacteria, not those introduced in filth. The latter may actually retard the action of the proper bacteria while at the same time setting up a series of harmful fermentations which defeat the ends of even the most expert operator, by creating bad odors and flavors and inferior physical character. This is a matter that means dollars and cents to the creamery or cheese factory patron and it is therefore worth his time to study well the methods by which bacterial infection of the wrong kind may be prevented. This matter of cleanliness in milk is one that is coming to be recognized more and more as a factor to be considered in setting the price upon milk. It is right that this should be so. The man who supplies a filthy milk to a factory and in the doing of it lowers the price of the finished product for all the other patrons should not be paid a premium because of the inferior quality of his product; but he should be the man to make feel the effect of his own carelessness. It is just as fair to grade milk on the basis of cleanliness as on that of fat content, as both have a direct bearing on the value of the finished product.

From a bacteriological standpoint, the question of clean milk is largely a question of proper stall construction. A farmer cannot spare the time to wash the cow's udder every time he sits down to milk her, but he can build a stall with a proper drop back of it so that the cow will keep clean automatically. Then too, the yards can be kept free from accumulation of manure through which the cows will have to walk in going to and from the stable. The sanitray milk pail may wisely be adopted as a means of promoting cleanliness. There are a number of different forms of this pail on the market, but they all follow the general principle of having a small opening through which the milk enters the pail and this opening is protected by a screen of cloth or wire gauze. Careful determinations show that milk drawn directly into a sanitary pail contains only from three to fifteen per cent. of the number of bacteria that is found in milk drawn under similar conditions into the ordinary form of pail. Other aids to cleanliness are: clipping the hair from the flanks, udder and tail; wiping the parts from which filth might fall into the pail with a wet cloth before beginning to milk; avoiding the use of battered utensils or those with soldered seams; cooling the milk immediately after drawing.



Modern Roofing for Modern Homes

Brantford Asphalt Shingles are a twentieth-century product—the ultimate in house-roofing material.

They are uniform in thickness—can be laid quicker and cheaper than any other shingle made. Use them wherever wood, slate or tile shingles can be used. Brantford Asphalt Shingles are pliable—they can be laid to better advantage than any other, and will fit any corner, curve or angle. Made in three absolutely fadeless colors: green, red and black.

Brantford Asphalt Shingles

improve the appearance of any house. Tasteful effects can be secured without extra expense by combining two or more colors. They never become weatherbeaten or unsightly. They are fire-resisting, unwarpable, and attractive. They need no painting, make a warmer house, reduce insurance charges, are next to indestructible, and the cost is little more than that of wood shingles.

With Brantford Asphalt Shingles there is no splitting, no curling, no decay, no variation in quality, no need for replacement every few years. Once laid, roofing cares are ended.

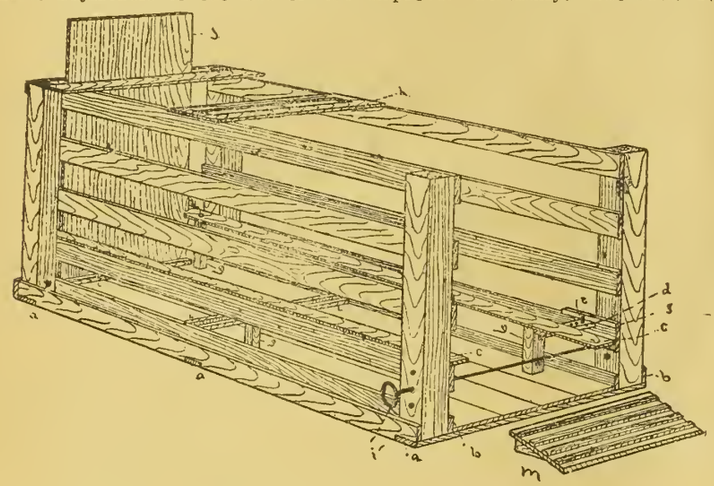
Breeding Crate for Swine.

Amateur, Cumberland Co., N. S.—I have some young sows that I wish to breed to an old boar that does not carry his weight very well. I am told that a breeding crate can be made whereby this difficulty can be overcome. Will you please explain how such a crate is made, giving dimensions. If you have a cut of a crate of this kind I would be pleased if you would publish it in your valuable Maritime Farmer.

Ans. A crate like the one shown on this page will answer your purpose admirably. It can also be used where large sows are being bred to small boars.

The dimensions of the box are: Length, 5½ feet; width, 2 feet; height 3feet. The length of the short box which may be made by moving the end board J into the slot K is 3½ feet. The corner posts are 2 feet 4 inches, scantling and the sides 1x4 strips; a a a are joists for nailing the floor to; b b extra boards to which the joists are nailed to stiffen the sides of the box; c c are boar supports which hold the boar's weight during service. The one on the right side is adjustable to the size of the



Swine Breeding Crate.

sow and should fit up tight against her side; d is a piece used to adjust the right hand support; e is a pin which holds the support in place; f is a strip to hold in the groove or mortise; the g's, of which there are six, are pieces which hold the supports solid and are thirteen inches in length; h is a wooden screw to hold the front end of the adjustable support in place; i is a seven-eighth inch rod which is placed behind the sow to keep her from backing out of the box; j is a movable end board which is used to adjust the box to different length sows.

When long sows are to be bred the board is placed at the end of the box as shown in the diagram, and when short sows are to be bred the board is removed and placed in the slotted board k. L l are cleats which hold the bottom end of the board j in place; m is the platform used to raise a small boar high enough to serve a large sow.

The Future of the Shorthorn.

A topic of never-failing interest among Shorthorn breeders the world over is "What to do next?" In the discussion started on this subject by a very prominent American live stock paper and taken up in Britain by the "Farmer and Stock Breeder," many valuable opinions have been offered. Subjoined are the views of three very well-known breeders, as quoted from the columns of our progressive contemporary just named.

A SCOTCHMAN'S VIEWS.

Naturally after the many different views aired recently on this subject, I feel somewhat reluctant to add further to those already given; but as you make the request, here goes: Personally, I am entirely in favor of the Scotch type; but I am, and have always been, anxious to improve it and am willing to admit, as in most things, improvement is possible.That the Scotch blood is still the 'best is indisputable. Take, for instance, the male and female champions at the Royal for the last five years. In 1912 there was, owing to the foot-and-mouth trouble, no show; so for the sake of statistics, I include the Tredegar show of that year instead, as the show took place after the trouble was over. What is the result? Out of these ten honors five have been awarded to animals of pure Scotch breeding, four to animals either whose sire or dam are Scotch, and the remaining one comes from Bates origin with a good dash of Scotch thereto. Therefore, I must cordially recommend a "drop o' Scotch" as the best we know of.

But the question of the "next step" opens up a new field. Can we improve? Certainly! But how? That is the question. For some years now I have been endeavoring to introduce the lines and style of the English cattle, and am so far more than satisfied with the result; but experience teaches that the cross must not be too drastic. There lies the danger. Introduce the cross mildly, possibly only a quarter cross, and that only once in three generations, and I venture to think there will be no reason to regret it. To the strong-minded breeder, who can resist the ridiculous tendency to rush to extremes, whether for pedigree, color, or anything else, there remains a great field. He needs must remember that history repeats itself, and that the past gives us good proof, in the wonderful success of Amos Cruickshank, that the strong, resourceful man, with the tenacity of purpose necessary to carry out his fixed intention to breed and produce animals of a type best suited to the markets of today, will meet with the reward he deserves.

I am afraid that very few, far too few, breeders have the necessary self reliance to enable them to back their own judgement, and without that, well, unless it is there, I should be very dubious of success to any extent. I have many times regretted taking advice which, although apparently sound at the moment, proved subsequently that "two heads are not always better than one." I have a great belief in the man who can show such courage as to back his judgment through thick and thin.

It is the man who can overcome all prejudices, etc., and who can produce the best who will eventually score, and more power to him!! for he will have much to contend with before he reaches his goal, which he will have to do by the road of many disappointments. These, however, should help to sweeten the fruits of success, richly deserved, for they will not be easily obtained.—I am, etc.,

ALEX. T. GORDON.

Newton, Insch.

Prefers Home-Bred Bulls.

In breeding Shorthorns I have never confined myself to any particular one of the three main lines of blood, but in choosing my breeding stock whether the foundation of their pedigree was Booth, Bates, or Cruick shank. I quite recognize that a certain amount of close breeding is necessary, both to fix a type and maintain it, and prefer to use home-bred bulls as much as possible. In my ouinion the merit of the immediate ancestors of an animal on both sides is a more important question in relation to its breeding value than whether (half a century ago) the original dam was bred at Kirklevington or Sittyton.

Speaking from my own experience, I think I have obtained better results from Cruickshank bulls that I have from either Booth or Bates bulls, and for producing beef animals I certainly believe in a large proportion of Cruickshank blood. There seems to be an idea in some quarters that too much Scotch blood does away with the milking capacity of the Shorthorn. I do not suppose the average Cruickshank cow is as deep a milker as the average Bates cow, but I have Cruickshank cows very good milkers, and I think a Scotch cross can be beneficial in every herd.

The successful breeder of the future, in my idea, will be the happy man who, having collected in one herd all the three main types, has the skill so to successfully blend them as to eliminate the worst faults of each and combine in one animal the best features in all three.

I often think that we lose some of the best sires by rejecting the short pedigreed bulls. Everyone admits that some of these are very good animals, and though, of course, they are perfectly eligible to be used here, they are often rejected for a bull not quite so good in himself and whose pedigree is longer. When buying a bull it is always a pleasing thought, even if it never materializes, that after you have used him for a year or two it may be possible to

Concrete walks need no repairs
THEY are not only best at first but are cheaper in the end than any other kind of walk. They are clean, permanent and safe. There is nothing to become loose nor are they slippery. They improve the general appearance of a house and are a source of great satisfaction to every housewife because they keep children out of the mud, prevent colds from wet feet and prevent dirt from being "tracked in" on floors and carpets. Equally important is the fact that they never wear out and never need repairs.
This free book "What the Farmer can do with Concrete" tells all about concrete walks and how to build them, and a score of other things needed on every farm. Write for it to-day.

sell him to an Argentine buyer for a substantial profit. The Argentine restrictions as to pedigree seem unnecessarily stringent, but as Argentina is generally prepared to pay liberally for her views, we are most of us inclined to fall in with then and thus neglect the short pedigree bull. More particularly in Cumberland and Westmorland, I think, there are strains only just eligible for our Herd Book which might be valuable in breeding the dual purpose Shorthorn, an animal so much in fashion at the present day. I am etc.,

J. A. WILLIAMS.

EVERY farmer knows that his cows yield more milk and better milk when they are contented. Are your cows contented? Are they profitable? If not, make them so by doing away with your old-time wooden stalls. They gather dirt, harbour disease germs, and prevent the free circulation of life-giving air and sunlight.

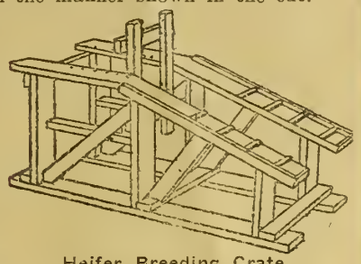
Breeding Crate for Heifers.

When a heavy bull is used on a small cow or heifer it is safest to use a breeding crate. This is more satisfactory even with a mature cow. A good breeding crate may be made in the manner shown in the cut.



Heifer Breeding Crate.

It is made entirely of 2x4 and 2x12 pieces. The bottom pieces are nine feet long. The width between the plank is two feet. The height at the front is 20 to 24 inches, and at the centre post three to 3½ feet. The length from rear to centre post is 4½ feet.

Best Dairy Shorthorns.

It is to be hoped that the olh rivalry which formerly existed as to the merits of the different lines of Shorthorns is not to be revived. We acquire the best that we can get, and to limit the field of selection would be a mistake.

The only experience that I have had has been with what is known as the dairy Shorthorn. Our purpose is whilst maintaining the characteristics of the breed, to restore to it those milking qualities for which it was once so famous. This is no easy matter, and it will take years to accomplish. For years Shorthorns have been bred for beef at the expense of the milking side. It is extremely difficult to find a good milking strain amongst long pedigreed cattle. The chief use of pedigree is to fix type. "Like breeds live" is only true of those animals which can trace back to an ancestry possessing the same qualities for a number of years. Pedigree breeding, however, can be over done and become a fad.

When animals can be traced back a few generations to forbears which have consistently exhibited good milk ing qualities, it is sufficient. They may be expected to breed true provided that an equal care is taken in the seleltion of the bull. I do not think it is possible to lay down any absolute rule.

Some animals have strong characteristics and leave their stamp on their descendants, others can hardly be traced. A milking herd can easily be severely damaged by the use of a bull which has not been carefully bred for milk. So in breeding stock one can acquire and lose. It is the same with all the different qualities of an animal. Undoubtedly from the short pedigreed Shorthorn a fine milk strain will be evolved, and personally I am in favor of a wide field of selection, so long as great care is taken to ascertain that the qualities required have been transmitted for a reasonable time.

I am not a believer in too close breeding, although no doubt that is the quickest way to fix a type.—I am etc.,

C. ADEANE.

Babraham.

Advertise Your Cattle.

Kimballs' Dairy Farmer says:—

No phase of agriculture has so bright a future as the breeding of high class, pure bred dairy cattle. There is not a pure bred dairy cow east of Chicago today that is not demanded west of Chicago. Furthermore, all through the east and south farmers and dairymen are trying to locate good, well bred, productive dairy cattle, and all are willing and anxious to pay remunerative prices for them.

It has been said that if a man will build a better article than his neighbor—even though it be only a mousetrap—the world will beat a track to his doorway, though he may live in the depths of the woods. This is true yet, except that because of the largeness of the present-day world it is absolutely necessary to advertise in order that the world may know the value of that which you have for sale.

There is not a breeder of the dairy cattle in America today who advertises persistently who is not entirely sold out of both females and serviceable age bulls. The bull calf is a bugbear to the breeder who, "penny wise and pound foolish," keeps his light hid under a bushel. Bull calves represent money to him who breeds good dairy cattle, and by judicious advertising paints his name in the skies and becomes generally known as a breeder. But he who depends upon selling to his neighbors and recognizes not the largeness of the world and cheapness of shipping crates and express rates has but one outlet for his surplus calves, the veal block.

The only breader of dairy cattle who is justified in advertising and profiting himself and his customers thereby is he whose cattle are not sufficiently good to be serviceable to those who desire to buy. All others not only place themselves in the path results from advertising, they make of making sales profitable to themselves, but by making the sale which themselves benefactors to those to whom they sell.

It is true that advertising incurs some expense. Everything in this world worth while does. But the thinking man realizes that he had better spend a few dollars advertising to rid himself of his surplus stock at a good price than to spend 10 times as much money for feed and labor to keep the animals he does not need and finally sell them for less than they are really worth.

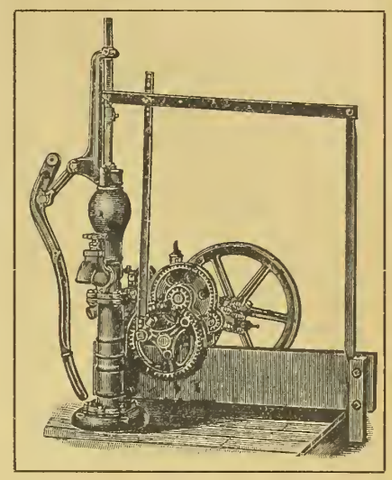
It is not only your opportunity as a breeder, but your duty, to let it be known through the Farm Papers, read by the prospective customers, that you breed and have for sale good, well bred, thrifty, rugged, heal thy bull calves, cows and heifers.

Flaxseed Jelly for Calves.

The best substitute for butterfat, to be fed along with skim milk, is flaxseed jelly, prepared by boiling flaxseed in water until a thick jelly-like consistency has been attained. Stir this into the skim milk. Commence with a very little, and as the separator milk is substituted for whole milk, gradually increase the amount of flaxseed jelly until each calf receives about a cupful to each feed. Continue this as long as the skim milk is fed, or for six months at any rate. Meantime, a mixture of bran, oat chop and corn meal may also be allowed in increasing quantities, commencing with a pinch thrown in the pail after the milk has been drunk. Meals, especially coarse and starchy ones, should not be mixed with the milk, but flaxseed jelly may be safely fed in this way, and with very satisfactory results, although for calves under a month or two, a small proportion of whole milk should be added.

THIS LITTLE ENGINE

is designed to take the place of the man at the pump and anyone who watches this outfit pump water for ten minutes will never again be willing to work the pump handle. The operating cost is very small and a splendid feature is that this engine can be easily connected to "any old pump." The ladies often start it to pump a single pail of water. They rest while it works.



The Outfit Complete as shown sells for $70.00. The engine alone $55.00. Immediate shipment from stock.

THE HORSE.

Keep Close Watch on Colt's Foot.

Left to itself the foot of the colt does not always grow according to the most approved fashion. There is need for the careful horseman to keep close watch on the colts' hoofs. In stony or gravelly soil the horn usually wears off at the rate sufficient to maintain the proper proportions; but in black loamy soils the hoofs are little worn and growing fast they may become unshapely. This may even result in a malformation in extreme cases.

The usual remedy in case of such unshapely hoofs on the youngsters is to shorten the toes with a rasp. The walls of the foot may also be rounded a bit. A rasp and a knife in the hands of an enthusiastic novice, however, are likely to be weilded so as to do more harm than good. The good horseman is always a careful horseman. A toe too long is likely to make a pastern too steep. When the colt's feet need attention it should be given, else the eventual sale price is liable to be cut down considerably. One should also remember that hoof horn, like all other parts of the colt's anattomy, must be made out of the feed which goes in at the youngster's mouth.

Management of the Horse.

The best assets the farmer has, under average conditions, are his horses. Without horses, little could be done on the farm, and the most fertile land and tireless energy would avail little if the horses were not at hand to do the heavy work. It is evident, then, that the farmer cannot give too much attention to the care and comfort of his horses. It is a notable and noticeable fact that the thrifty, prosperous farmer always has good, thrifty horses, while the careless, unsuccessful farmer is the shamed owner of the ill-kept, underfed, unprofitable horses that we sometimes see. Whichever be the cause and whichever the effect, this fact alone is sufficient to point out the advantage of keeping the farm horse comfortable and in the best working condition.

One of the main points in the care of the horse is regularity in feeding. He knows when his feed is due, and if he does not get it then he is sure to fret and worry until the tardy stableman presents it, when he will bolt it down in the quickest possible time, losing half its benefit. The horse which is fed irregularly does not thrive and its appetite is never satisfied, while many stable vices are liable to appear. Only the quantity that the horse will eat should be placed before him, and he should be fed early in the morning, at noon and at night.

A very common mistake in the feeding of horses is to overfeed with hay. Feeding a horse more hay than he will consume in a couple of hours is almost sure to lead to bad results in several ways. The horse will generally gorge himself under such circumstances, and when more provender is eaten than is required for maintenance, the digestive system is exhausted and its influence upon the other nutriments of the ration is weakened. Overfeeding with hay may also become the source of several ills, such as a pot bellied condition, quick tiring if put to work, labored breathing and staring coats. It also predisposes an animal to heaves, and eminent veterinarians have assigned this as a direct cause of the disease. Give the horse all he will readily eat in a reasonable period, and do not let the period between the evening and morning meals be too long.

Only the best and soundest food should be given. Oats is the staple food with hay, but a few roots, carrots and swede turnips may be given, not much at a time. Variety is as necessary to the horse as to the man. A horse may seem to dwell on a constant ration of hay and oats, but if this be varied with other ingredients the difference will soon be noted. Care in watering is always very necessary. Have it slightly warmed in winter and refreshingly cool in summer. Four times a day is few enough to offer the drink. When the horse is hot from use, only give a few mouthfuls: after he is cool, allow all he will drink. Use pure water and keep all receptacles clean.

Another great factor—one of the most important—in the proper management of the horse is grooming. It is said a thorough grooming is as good as a feed of oats." This point must be all the more emphasized as it is so often neglected or only started in the farm stable. The horse should have a thorough grooming twice a day—not simply a "brush off," but a thorough cleaning of the coat and skin. Dirt should never be permitted to dry on him, but when brought in he should be at once washed, scraped and dried. Wash the feet and legs regularly to avoid "mud fever," taking care that the hair is perfectly dry before leaving. To keep the coat glossy and in good condition cover the animal with a thin sheet in summer and a blanket in winter as soon as the grooming is done.

Cleanliness and ventilation are other necessities in the well-regulated stable. Open the windows as soon as the stable is entered and always during the process of grooming. Discard all soiled bedding and sweep the stall out clean, once a week sprinkling a very little lime on the floor. In bedding at

Dysentery is often serious and often a dangerous disease, but it can be cured. Chamberain's Colic, Cholera and Diarrhoea Remedy has cured it even when malignant and epidemic. For sale by all dealers.

night bank the sides deeper than the middle, placing plenty directly in front of the knees. All stable utensils, harness, etc., should be hung up out of the way. There should be a place for everything with everything in its place. Five minutes cleaning up the harness every time it is put away will save years of usefulness.

A little time spent now in giving attention to the shoulders and necks of the work horses will save a lot of time later in the season. See that the collars fit properly, and that the draft comes on the shoulder as it should. Cool off the shoulders several times each day by lifting the collars forward and permitting thet eam to rest a few moments. Wash the shoulders thoroughly every night. Also clean the collar and keep it free from dirt and dry sweat. If these simple suggestions are followed there will be little trouble with sore shoulders.

A horse handled on the above lines will need very little medicine, but in fever, slight cold or when not eating well, give in the feed a tablespoonful of powder, consisting of four ounces each of sulphur, saltpeter and black antimony, two ounces of powdered rosin, and one ounce of powdered Barbadoes aloes, with a dash of oil of juniper. One tablespoonful for the dose.

Indigestion.

The term indigestion when applied to the horse may mean acute, subacute, or chronic indigestion, and the symptoms vary to a considerable extent in each. For example, there is a disorder known as "stomach staggers", "grass staggers," "sleepy staggers," and "mad staggers," according to the stage of manifestation, and this is acute indigestion, in which the stomach is the organ principally involved. Colic or gripes is another form of indigestion, in which the intestines are mainly concerned. It is a great mistake to suppose that equine digestion is completed in the stomach. Many important changes take place in the food material after it passes from this organ, and the majority of cases of indigestion in the horse are of the intestinal variety. Chronic indigestion is variously manifested. There may be little or no pain in some cases; in others there may be slight colicky pains indicated by restlessness, or getting down and up, and sometimes the pain continues in this way for two or three days, but there is an absence of sweating, or of violent abdominal pain and distension characteristic of spasmodic or flatulent colic.

In the majority of cases, however, the most marked symptoms are general unthriftness, including irregular or depraved appetite, loss of condition, lassitude, flatulence, hidebound, rough staring coat, etc. These are very seldom attributed to anything but the right cause, and thus many cases of chronic indigestion pass undetected. Very often they are put down to "worms." As to cure, the chief thing is the removal of the cause. The food should be of the best, and judiciously selected as to nutriment and ease of digestion; it should be fed frequently in small quantities, and mastication should be compelled by mixing chaff with the corn. Attention should be paid to the state of the molar teeth, and if necessary they should be rasped. Water should always be given before feeding. As to medicine, a course of stomachsics and tonics is generally useful. Example:—Bi-carbonate of potash, powdered calumba root, gentian, and ginger, of each equal parts. Give a tablespoonful two or three times a day in the food. In some cases I have found a course of arsenic beneficial for chronic indigestion, and have given ½ oz. doses of Fower's solution twice a day with success, but owing to the cumulative action of arsenic its use must not be continued for more than ten or fourteen days, and it should be intermitted with other remedies. Put a lump of rock salt in the manger.—Veteran.

BAD HABIT—J. T D has a horse that hangs his tongue out when on the road. This is a habit which some horses get into either from nervousness or from a bit that is uncomfortable. The only remedy is to change bits until you find one that suits. A spoon bi'f or one with a large plate fastened in the middle is frequently effective, but sometimes the habit cannot be broken.

SORE TENDONS—S. N. P., N,. S., wants a remedy for a horse that has sore tendons. The best remedy for this trouble is to mix two drams of cantharides with one ounce of lard and rub it on the tendons and let it remain on for 24 hours, then wash it off, and turn the animal out to pasture for several months.

LUMP ON STIFLE JOINT—H. L. D. P. E. I., has a colt that has a soft lump on its stifle joint. Mix two drams biniodide of mercury with three ounces of lar dand rub a little on the lump with the fingers once a week and continue it ofr several months.

Broken wind is the enemy of the horse . . . .

POULTRY

Tainted and Disease-Laden Soil

It is necessary to differentiate between tainted and disease-laden soil, since there is a great difference in the forms of contamination. As a general rule the first expression is employed for both, but this is a mistake. I quite realize, however, that the latter is made more possible by the former, but it does not of necessity imply that the tainted form is impossible without the other.

To realize the importance of the subject fully it is necessary to refer to the question of plant formation. It is a common exprpession to say that nature works in cycle form, and this is true. What is good for one section of the natural world may be poisonous to another. More than this, the waste material from the animal kingdom is the food supply of the vegetable. The plant is built up from the various constiuents of the animal body, including the excreta, and the finished plant forms the food of the animal world. In some instances it may be many years before the animal body is returned to the soil as plant food, but there is no doubt but that this will happen at some time. Thus the various elements, such as nitrogen, carbon, oxygen, hydrogen, iron, calcium, magnesium, potassium, phosphorus, chorine,

Interest the Children in Poultry.

and sulphur work round in a circle from the bird or animal body to the plant, and thence back to the animal or bird.

In view of the above it will readily be understood that there is a balane between the two worlds which must always be maintained; otherwise serious results will accrue. By tainted soil is meant ground that has received a large amount of plant food, but which has been given no opportunity of making use of this plant food by the taking off of a crop. An excess of manure in the ground makes it tainted, or, to use an equally common expression, fowl sick.

One would expect that it was only in the case of those with a very limited area of ground at their disposal that there was trouble to any extent with tainted soil, but unfortunately this is not the case. Farmers, as well as others, are affected by this condition of affairs, although they have many acres over which it would be possible to run their birds. People do not seem to realize that the same laws apply to poultry as to the rest of the natural world, but until they do birds are likely to suffer from this terrible complaint. If grass land is used constantly for poultry it should only be stocked with that number which will produce sufficient manure for the grass that will be grown and taken off the land. If birds are given their liberty, twenty-five to the acre is quite enough; if kept in runs, not more than fifty to one hundred and fifty, according to the conditions, should be run together. The latter figure applies to those cases in which the scratching-shed system is employed. It is possible to keep many more birds to the acre than the figure stated if the arrangements are such that two runs are provided for each pen. In this case one run is used for six months of the year whilst the other run is resting, or, in other words, producing a crop. In the case of backyard poultry keeping, where a few birds are crowded on to a very small area of land, it is necessary to renew the upper soil at frequent intervals, so that there will be no accumulation of excreta.

This state is rendered more possible when thes oil is already overharged with manure. By this term I mean that soil on which fowls have been kept that have suffered from some form of contagious disease. All forms of disease germs increase more rapidly on soil that is tainted, since this forms a good medium for their breeding. There are many diseases that may be included in this category. With young chicken we may mention gaps. When chicken have been kept on the land and have been suffering from this complaint it will take at least four years before it is possible to say that the ground is free from infection. This is true with clean ground—it is more so with land that has been contaminated with fowl droppings. The diseases that are common to adults and which are likely to remain in the ground are many. Roup, diptheric roup, tuberculosis in one form or another, and many others might be cited as instances. In each case infecteion is rendered more effective if the soil in the first place has been overcharged with manure. To overcome these two great difficulties it is only necessary to see that the land is not overstocked with birds, and to remove all infected fowls before they can contaminate the land. If these two points are remembered it may save much loss in the future.—E. T. Brown.

The Worst Enemies of Little Turkeys

The three worst enemies of little turkeys are lice, overfeeding and damp. Successfully combat these and a fine flock is almost sure to result. If the brooding turkey and nest can be kept free from lice before hatching time the battle is half won. Dust the nest material well when eggs are put in, and dust the turkey each week, sifting the powder well through the feathers.

The third day after taking the baby poults from the nest dust them in the following manner. Prepare a box large enough to hold a brood of twenty to twenty-five, with a cover not entirely tight. Sit on the ground in front of the coop, spread an old cloth over your lap and catch the poults, one at a time. Grasp him firmly by the legs, lay him on the cloth and straighten out the wings. Dust thoroughly all over, especially the underside of wings and body and on the head. The dust will not hurt the eyes except to make them blink for a while. Put poult in the box and close the cover. The first thing he does is to shake himself, thus sifting the powder again all through the down. Each one as you put him in will do the same, requesting them al each time. The box will be full of fine dust all the time you are working, and few lice will survive such treatment. When all have been treated turn over the box and let them out. Repeat every week, or better yet, every three days if poults show signs of being lousy, until too large to catch easily. Always dust the mother, taking the hands to sift the powded through her feathers. The lice will be found on the underside of legs, wings and at the base of quills.

Where the lice are very troublesome whitewash the coops every week, putting kerosene in the whitewash, and being careful to fill all corners and crevices. Many use lard or oil on the poults; perhaps it is all right, but I find the insect powder effective and harmless. I only used lard once, and then I mixed it with sulphur making a salve. I applied it to the heads and underside of wings. In two days my little poults began to droop and die. I investigated and found each little wing blistered and the skin all off. Every last one of them turned his little pink toes to the sun. Vinegar was recommended to me as an excellent louse killer but I never have tried it. Most of the insect powders put up in tight boxes are good, but that purchased in bulk is doubtful. If not taken good care of it becomes too old and loses its strength. There is the Cornell powder, which can be made at home, and sulphur alone is good. I believe more depends on a thorough and persistent application than on the kind of powder.

Many turkey raisers ask the guestion: "Why do my young turkeys die when about the size of pigeons? They grow and seem fine until then, but I lose sometimes half my flock at that time." In some cases it may be black head, and that is a bad disease to combat. Bulletins on the treatment of blackheads can be obtained from experiment stations. But there are other enemies to young turkeys, and many are sacrificed to causes less hard to fight. Overfeeding is one, bringing on indigestion, diarrhoea, liver trouble, gry and moving about; exercise is very essential, and they will not exercise if overfed and pampered. They need plenty of sharp grit, and plenty of fresh water in clean dishes. A disinfectant may be added, carbolic acid is good for the bowels and is used in the proportions of one teaspoonful carbolic to one gallon of water.

The first food must be something easily digested, and a hard-boiled egg is not. A raw egg is food for an invalid. Wheat bran is light and will not pack in the bowels. Sour milk is excellent for all fowls, the acid acting on the digestive organs. Mix the bran rather dry with what they will clean up quickly. Continue this food for a month, giving only a little grain such as oat flake or fine chick feed. Change very gradually to a grain diet; first cracked wheat and a little corn, and later whole wheat, oats and buckwheat. Rye and millet seed can also be given, or a mixture of good grains.

When the turkeys are in range they must be fed but once a day. Keep poults out of green grain. If allowed the run of a field or unripe grain they will gorge themselves and die. All grain fed to young turkeys should be a year old. Be sure they are well supplied with sharp grit and fine oyster shells. Keep sour milk before them if possible, but never cook it. Green food must be supplied to young turkeys; they will not, at first, pick it themselves. Cut fine with an old pair of shears kept for the purpose, and mix it with the bran, sour milk and raw egg Green dandelions, narrow dock, onion tops and mustard are all relished by turkeys. After a little it will become quite a task to cut enough for a flock of 50 or more. They are very fond of it.

Place the coops on new ground every year, away from chickens, and feed them separately. Keep the coops dry and clean. If without floors move to clean ground every day and in case of a continued rain sprinkle coal ashes underneath the coop. The little poults must have good care, but never be pampered. Givet hem all the liberty possible. Study turkey nature and use common sense.—Mrs. Niles Grover.

To Break Up Broody Hens

What is more vexatious than the fussy, pale-combed hen that persists in sitting on a door knob, lumps of coal, etc., in an otherwise bare nest, when you are extremely anxious for her to be laying eggs? A number of ways for breaking the habit are in evidence among raisers, the most practiced of which seems to be a coop into which the clucking, fluttering biddy is roughly tossed with the comforting remark: "I'll put you in a jail, you old hussy!" I have found many times that such con-

Montreal, P. Q.; Victoria, B. C.

SYNOPSIS OF CANADIAN NORTH-WEST LAND REGULATIONS.

THE sole head of a family, or any male over 18 years old, may homestead a quarter-section of available Dominion Land in Manitoba, Saskatchewan or Alberta. The applicant must appear in person at the Dominion Land Agency or Sub-Agency for the District. Entry hy proxy may he made at the office of any Local Agent of Dominion Lands (not sub-agent), on certain conditions.

Duties—Six months residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres, on certain conditions. A hahitahle house is required in every case, except when residence is performed in the vicinity.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead. Price $3.00 per acre.

Duties—Six months residence in each of six years from date of homestead entry (including the time required to earn homestead patent) and 50 acres extra cultivation.

A homesteader who has exhausted his homestead right and cannot obtain a pre-emption may take a purchased homestead in certain districts. Price $3.00 per acre.

Duties—Must reside six months in each of three years, cultivate 50 acres and erect a house worth $300.

The area of cultivation is subject to reduction in case of rough, scrubby or stoney land.

W. W. COREY,
Deputy of the Minister of the Interior.

N. B.—Unauthorized publication of this advertisement will not be paid for.—58783.

finement in "jail" does not break the hen of her desire to sit, and on her release after several weeks she went directly back to the nest. The custom of shutting the broody hens in close coops is inhumane, because the practice invites neglect to provide food and water as often as needed. A hen that has been sitting for weeks hatching out chicks which may later be taken from her and given to another hen, is usually weak and pale enough without adding affliction in the way of confinement in a close coop. I remember that a coop containing one or more broody hens was once shoved under a barn driveway and forgotten. Several weeks later their dead bodies were found; an instance of starvation.

The most humane way is to provide a pen in the open where roosts can be put up but no nests. In such a place the hen can be kept for several days without inconvenience, and there is certainly a nearer probability that they will receive better care during confinemnet on acount of being in view every day. Broody hens cooped behind buildings and similar places are sure to be neglected. A cockerel might be put with them in the pens if there is an extra one at hand and he will assist in breaking the habit and her desire to sit. In such a place as the open pen she finds the absence of a nest and the partial range rather diverting, and also has the benefit of sunlight and air to restore her to a healthy condition.

CHICKENS AND DUCKS TOGETHER

A great mistake made by many farmers is in keeping waterfowls and chickens in the same yard, or permitting them to have access to the same drinking water. Ducks and geese should be kept in separate yards, or given the range of a field where they can have access to a stream of water or a pond. If kept with the chickens they will so befoul the drinking water that in a few minutes is becomes unfit for the chickens to drink.

Chickens contract disease, especially bowel trouble, through the drinking of foul water, and if the health of the flock is to be maintained, an abundance of pure drinking water should be kept before them all the time, which is not possible if the ducks and geese are given the privilege of the same yard.

Shade in Hot Weather

Lack of shade and hot weather cut down the egg yield in summer and cause much loss and discomfort to the hens. The low flat shades only two feet high, draw the heat fearfully, and as the yards are bare of green feed and moisture there is no place for the hens to scratch.

I built my hen yards around a lot of pomegranate bushes and kept the bushes well watered. One would be surprised to see how the hens enjoy themselves. They also have a small patch of clover which I cut for them. In the yard also are mulberry trees which afford high shade that makes the suroundings cool. Result: my hens lay summer and winter.

Douglas Mixture for Poultry

This preparation, simple as it is, is one of the best tonics for poultry that I know of. Oil is alterative as well as a tonic, and possesses, besides, antiseptic properties which make it a remedy as wtll as a tonic. It is prepared as follows: Take sulphate of iron (common copperas), eight ounces; sulphuris acid, one-half fluid ounce. Put into a bottle or earthen jug one gallon of water; into this put the sulphate of iron; as soon as the iron is dissolved, add the acid, and when it is clear, the mixture is ready for use.

In hot weather or when the flock is small, less may be prepared at once, but the above proportions should be observed. The "mixture" or tonic should be given every other day in the drinking water. A gill for every 25 hens is about the right amount to give. When there is an infection, it should be given every day, but where there is no disease, not so often, or in smaller quantities if it be used every day.—A. E. Vandervort.

From the Old World to the New.

"A very nice letter," exclaimed Mrs. McKenzie, when her husband finished reading, "and how kind of him to get so much information for us. What do you thing about it, Malcolm?"

"Every thing looks very favorable, I think, but I shall write at once to this Mr. Richardson enquiring more into the Canadian way of living, what capital one must have to start, etc., and what things we must have first."

So, accordingly, a letter was sent to Mr. Richardson who replied briefly, giving all the facts in regard to pioneer life, and urging them to come in April in preference to any other month of the year. "We are anxious for you to come," he wrote, "and if you want me I shall meet you at B—our nearest town, so you can write me before you sail. All I can say against this life, it is lonely but if we get more settlers in we can soon have a pleasant little settlement here."

It must be borne in mind that the McKenzies had been prospering for the past eighteen months and they had all hoarded their eahnings with the sole object of going to Canada, consequently they were able to plan on taking passage for New Brunswick, and to have a few dollars after getting there. So on receipt of Mr. Richardson's letter preparations were made at once to sail on April 17th, for the "new world," which would be less than three weeks.

Mr and Mrs. Davidson were very sorry to learn that they were really going. They had learned in the last few months the real worth of the McKenzie family, and not only were they much valued friends, but Mrs. McKenzie. Ellen and George were doing extra well in the laundry, being smart and trusty, but the work did not agree very well with Mrs. McKenzie. However, when Mr. and Mrs. Davidson found they were really determined to go, they were ready to assist them in many ways.

"You better stay with us another year until your folks get thoroughly settled out there," said Mr. Davidson to Ellen one day "I will raise your wages and board you at my house, and you could help your parents until they get settled.

"Thank you, sir," she replied, "but I am afraid I could not stay behind, and besides I could not live so long without them."

Nevertheless, as the time of their departure drew near, and their money began to disappear for little necessary expenses they had never dreamed of, they found they would have only a few dollars, after paying their passage to Canada. Ellen bravevly came to the rescue and told them of Mr. Davidson wanting her to remain another year, until they got settled. "He says he will raise my wages and board me at his home," she continued. "I'll stay if you wish for I can help you more here." At first they would not agree to have her remamin, but a few days later after talking with Mr. and Mrs. Davidson, and listening to their argumentst hey at last decided to let her remain a year, though with many tears from her mother and the children and her father was deeply touched at the thoughtful self-denial of his eldest child. Mrs. Davidson assured them she should live with her, and she would have a care over her as over her own daughter if she had one. So Ellen was at once promoted from the hard work in the laundry to the position of checking parcels, and in a manner assisting Mr. Davidson in over-seeing the work.

CHAPTER III

On an afternoon in April 1863 many people were gathered at the wharf at Queensferry, Scotland, to bid farewell to relatives and friends who were taking passage on one of the large Empress steamers for Canada. Among those who were to sail were Mr. and Mrs. Malcolm McKenzie and their six children. Ellen, who was to remain at home was at the wharf with Mr. and Mrs. William Davidson and Harry Gordon, a handsome young fellow of seventeen years and who was a favorite with the McKenzie family as well as with Mr. and Mrs. Davidson, and who was also an employee in Mr. Davidson's laundry. It was very sad, the parting between Ellen and her parents and brothers and sisters.

"I could never leave you at all," said her mother," only I feel it is for the best, and I know that Mrs. Davidson will be a mother to you, and Harry here will be a brother to you" she said, turning to the young fellow by her side. "I certainly will," answered Harry Gordon.

Ellen put twenty-five dollors into her father's hand on bidding him good-bye. "Take it, father," she said, "you may need it. I drew that much of my wages in advance." Harry Gordon, too, in bidding them good-bye gave Mr. McKenzie twenty-five dollars. "No Harry returned that gentleman firmly. "I thank you very much, but I can't take it. We are not paupers, and you have no right to give me money you've worked hard to earn. I've no doubt we'll get along all right."

"Yes sir" replied Harry, I believe you will, but please take it, you may need more than you think and I've nobody to work for but my-self. Take it," he urged, "and if you don't need it keep it for me until I come out, you know I intend to follow you in two years, all being well, and take up a farm my-self." So Mr. McKenzie took the money, hastily thanked the generous young fellow and with another hand shake hurried on board after the rest of the family, and in a very short time the majestic steamer could only be seen as a distant speck on the bosom of the mighty ocean.

Ellen returned to her new home very lonely and sad, Having never been parted from her family longer than a few hours at a time. she now missed them sadly, when thinking of the miles of raging waters that divided them and the weary weeks and months that must elapse before she would see them all again. However, Mr. and Mrs. Davidson were very kind to her and in the days that followed she learned to look to them and Harry Gordon for love and sympathy. She devoted her energies more thoroughly to her work and succeeded in discharging her new duties in the laundry very creditably.

Mr. and Mrs. Davidson missed the McKenzies very much. They had assisted them in many ways in getting ready for their voyage, and only George the eldest son knew of the plump package he now had in his possession given him by Mrs. Davidson in parting. "Take this, George," she had said. "It is a little present for you from Mr. Davidson and myself. Don't open it until you reach Canada or tell any of the family about it until you open it. I trust it will be a help to you all."

"But will papa and mamma like me to take it," George had asked. "Why, of course, they will, you silly boy," she replied, "and I shall be offended if you don't. And mind," she continued, as she kissed the handsome boy fondly, " you are not to open it or to let them know about it until you land in Canada."

So Malcolm McKenzie and his wife did not realize for many a day how much their kind friends in Scotland had really done for them. As for George, he concealed the package and did not think of it again for several days, and when he did it was with a burning curiosity to know what it contained, that was to be of value to them all, but he would not open it until he reached Canada as the giver had requested.

They had a very rough voyage out and were all very sick the first two days. Mrs. MceKnzie missed her eldest daughter very much, she had always taken so much care of the younger children, thus relieving her mother. But Fanny, the second daughter, and next to George in age, realized that it was her duty to try to fill her elder sister's place, so she helped her mother to look after the children, and but for the leaving of Ellen behind, they rather enjoyed their first sea voyage, though it proved to be a stormy one. They had felt the parting from Ellen and their other good friends in Scotland very keenly.

"It's one thing to talk about leaving one's own country and another thing to do so," Mr. McKenzie had remarked to his wife as they were taking their last look at the fast receding hills of Scotland, with tear dimmed eyes. But they were blest with hopeful, sunny dispositions, and they resolutely cast their sad thoughts from their minds and thought bravely of their future prospects. They made many acquaintances on board who proved to be chiefly Canadians, and they learned from them all they could of Canada, and pioneer life. Mostly the information was of an encouraging nature, then again, one would talk very discouragingly, but the brave Scotsman and his wife never wavered in their resolve to take up a farm in pioneer style in the back woods of Carleton County, New Brunswick.

CHAPTER IV

It would take too much space to relate all the incidents in connection with the Scotch family's arrival in New Brunswick and their long tiresome journey after arriving in port at the north of the Province, where they took the train for B—a small village in Carleton county, where they were so kindly met by Mr. and Mrs. Thomas Richardson and taken to their comfortable though humble home, thirteen miles back over the rough, muddy post-road. Two weeks later Malcolm McKenzie anr his family moved into iheir own home on the block recommended by his friend Richardson. Several lonely settlers within ten miles came, and helped Mr. McKenzie to cut down trees and erect a comfortable log shanty and a barn. These settlers were delighted with the prospects of having such a nice addition to their settlement or "colony" as they termed it. And how was it with the McKen ie family coming from an over-crowded town and settling, one might say, in the depths of the forest? They were happy in their own home and the novelty of raising their provisions and the care of their little live stock which was all delightfully new to them all, together with the happy prospect of the future, made them happy indeed.

It will be remembered that Mrs. Davidson, the kind friend of the pioneer family, who gave George McKenzie a package on bidding him goodbye with the request that he would not open it or tell his parents about it until they reached Canada. The boy had concealed it in the pocket of an old coat that was among their luggage, and though, boy-like, he wondered what it contained, however, he would not tell his parents until he reached Canada," he said to himself So the days passed and in the excitement of their arrival and getting settled in New Brunswick, he never thought about the package for several days or until one evening while they were talking about their friends in Scotland, and while they were staying with their kind friends, the Richardson's, he happened to think of it and quickly bringing it to light told them of the gift and handed it to his mother who hastily broke the seal and read: For George to buy a horse and harness. From your friends, Sarah and William Davidson, and the bills enclosed amounted to something over one hundred and fifty dollars, a sum sufficient for the purpose in those days.

Mrs. McKenzie wept tears of joy and the children, especially George, was in high glee at the prospect of having a horse of "his very own." Malcolm McKenzie was deeply moved by the generosity of his noble friends in Scotland,

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

WOMAN SUFFERED TEN YEARS

From Female Ills—Restored to Health by Lydia E. Pinkham's Vegetable Compound.

Belleville, N.S., Canada.—"I doctored for ten years for female troubles and did not get well. I read in the paper about Lydia E. Pinkham's Vegetable Compound and decided to try it. I write now to tell you that I am cured. You can publish my letter as a testimonial." — Mrs. SUVRINE BABINE, Belleville, Nova Scotia, Canada.

Another Woman Recovers.

Auburn, N. Y.—"I suffered from nervousness for ten years, and had such organic pains that sometimes I would lie in bed four days at a time, could not eat or sleep and did not want anyone to talk to me or bother me at all. Sometimes I would suffer for seven hours at a time. Different doctors did the best they could for me until four months ago I began giving Lydia E. Pinkham's Vegetable Compound a trial and now I am in good health."—Mrs. WILLIAM H. GILL, No. 15 Pleasant Street, Auburn, New York.

The above are only two of the thousands of grateful letters which are constantly being received by the Pinkham Medicine Company of Lynn, Mass., which show clearly what great things Lydia E. Pinkham's Vegetable Compound does for those who suffer from woman's ills.

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

and related to Mr. and Mrs. Richardson many acts of kindness they had done for them.

So as we see these new pioneers settled in their new home, two weeks after their arrival, among their possessions is George's horse, a noble, large animal, five years old, that his father and Mr. Richardson had bought for him, with the money given him in Scotland, from a farmer nearly thirty-five miles above them, who for the exact sum included a harness, nearly new. My! what a happy family they were when this beautiful large horse a bright bay in colour, with a white stripe in his face and two white feet, was brought home.

"Just what you need, my friends," Mr. Richardson remarked. "You can do nothing at farming without a horse."

So that first summer these new settlers raised their vegetables and fodder enough to winter their horse, two cows and three sheep. That first winter Mr. McKenzie and George cut lumber in partnership with their good friend, Richardson; hauled some to the mill in at the railroad and had it sawed into boards, and out of thin cedars they shaved shingles by hand and sold them which was considered a paying business in those days. Mrs. McKenzie and Mrs. Richardson taught their children as best they could as there was no school within reach, and thus the long gloomy winter in that wooded, forsaken colony passed away.

CHAPTER V

Three years later, September 1866. Malcolm McKenzie has just erected a frame for his new house, and one can see that he is prospering generally. He has quite a large clearing now, and the level fields, though as yet covered by stumps of trees in places, is looking unusually well. His hay is all cut and stored for the third time in the old log barn, and the fields of grain and vegetables now growing looks most luxuriant.

"I tell you what it is," Thomas Richardson remarked to him one day, "you were a lucky man McKenzie when you took up this hundred acres of land, it is the most easily worked claim and the most productive land in Carleton county,"

"Well, I am glad it is," replied Malcolm McKenzie with a laugh, "but I have you to thank for it, you know, for it was you who advised me to settle here, and I must own I have never been sorry I did. The growth of lumber on it is very dense, and I can get all I need for my buildings, I guess, and meet the other two payments on the farm."

The above conversation between the two friends explains the mode of life and the prosperity following Malcolm McKen ie. He cleared land in the fall and winter selling lumber enough to meet his payments regularly and to feed and clothe the family, besides getting a little each year for building a new house and barn. Each spring he burned the debris from the fallen timber, and got it into crops of various kinds, and by the bountiful harvests, it just seemed as if this rich, loamy soil was just waiting to be tilled.

Povidence had been kind, indeed, to Malcolm McKenzie and his family during these few years in New Brunswick, the land of their adoption. No serious illness had been their lot, and though his crops as yet had not been large they had yielded well and as his neighbors used to say, when talking of him, "McKenzie, the Scotchman, is prospering."

And what of Ellen, the eldest, who had remained in Scotand for a year behind the family and now three had passed and yet she had not followed them? Regularly they had heard from her and occasionally she had sent them small sums of money.

It was on the 27th of October, the third year after they came out as they were all nicely settled in the new house though as yet unfinished, that Mrs. McKenzie on looking down the road espied a strange team on an express coming slowly over the rough road, seemingly loaded. "It's Watson's livery team from the station," remarked Mr. McKenzie as it came nearer. "Perhaps it is new settlers going to the upper end of the colony. If so, they likely will stop here to feed their horses and supper."

As they drew near the house the driver halted and asked if they could stop and rest.

"Certainly, certainly," exclaimed the kind-hearted Scotchman, as he went out to assist them, and to take the lady and gentleman passengers into the house.

"Ellen, Ellen, is it really you," cried Mrs. McKenzie, after looking at the lady a moment and then kissing her warmly. "Yes, mother it is," she answered through tears of joy. "And this is Harry, Harry Gordon you know,

REASONS

SCIENTIFICALLY correct *principle* — supplying warmed *fresh* air, and ventilating the house as well as heating it.

PROPER PROPORTIONS — strength where strength is required, generous dimensions, but not too high for low cellars.

BEST MATERIALS—steel where steel is best, charcoal iron where it is better.

LARGE ASH-PIT, anti-clinker grates; large feed door; direct damper, worked from the front; easily-reached water-pan; heavy, two piece flanged fire-pot (patented by us); gas-proof steel radiator. Easy to clean out.

MOST ECONOMICAL—costs less to install than hot-water radiator systems; gives generous heat; low coal consumption; requires little attention, no repairs, and will last a lifetime.

Made in Four Sizes.

The ENTERPRISE Hot Air Blazer Furnace

is correct in principle, durably constructed of the best materials and economical and convenient in operation. It supplies a generous quantity of warm, fresh air to every part of the house, with less coal than is burned by many furnaces greatly inferior in heating capacity.

Patented and exclusive features are responsible for this economy, and also for its great durability.

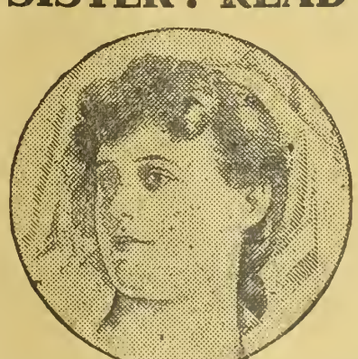
Health as well as comfort, demands pure air in the house. Ordinary heating systems warm the same air over and over again, until it is dry, dead, and unwholesome. The Blazer Furnace ventilates the house, and heats all parts of it eveuly, protecting occupants from headaches and colds.

Write for this book. It is free.

There is a Blazer representative in your vicinity who will be glad to explain its features fully and to estimate the cost of installation in your home. If you do not know him, write us for his name.

Enterprise FOUNDRY CO. SACKVILLE, N.B.

SISTER: READ MY FREE OFFER.



I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience**, we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. If you suffer from **pain in the head, back, or bowels, feeling of weight** and **dragging down sensations, failing or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid,** to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured,** my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—**young or old.** To **Mothers of Daughters,** I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask for the free treatment to-day,** as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309, WINDSOR, ONTARIO

and," she continued with a blush," I am Mrs. Gordon. We were married in Scotland two weeks ago or more and have come out here to live."

Oh! Who can picture the joy in the McKenzie home that night as greetings were exchanged and old times recalled? We will not attempt to describe it.

CHAPTER VI

As it will take up too much space to record all the incidents of the life and prosperity of the Scotch pioneer, I will just speak of the items of most importance.

Twenty-five years from the time this sturdy Scotchman and his family arrived in New Brunswick and took up their abode in the dense woods of Carleton County, we find he has a farm almost up-to-date. His large commodious house is one of the most beautiful rural homes in New Brunswick and now accommodates two families, his eldest son, George, being married some few years before to their district school teacher, a lady of culture and refinement. Walter, a younger son, married a daughter of their old friend, Thomas Richardson, and resides with him and assists in running his large and productive farm. Two daughters of Malcolm McKenzie were school teachers but later married farmers, one in Carleton County and one in Sunbury County, New Brunswick. Harry Gordon and his wife, who located on a farm seven miles further up the colony are progressing well to the present day.

It has not always been fine sailing for Malcolm McKenzie, this making a home in the woods in a strange land and with scarcely money enough to provide the necessities of life for his family, nevertheless, he did it through hardships and discouragements. Often in speaking of the pioneer days he says the greatest blessing he had was his good health. Two of his children died in the summer of 1873 and three years later his large new barn erected the summer before was burned with its contents of hay, grain and farm implements one stormy winter's night, thus leaving him again only the old barn, now dilapitated, of pioneer days. No one will realize the serious draw-back of such ill-luck as those who have met with similar losses. A new barn was again built the following year and our Scotsman continued to prosper until his death. His buildings were all up-to-date, and his farm, which consisted of one hundred and sixty acres, sixty were now under a state of cultivation and well equipped with all modern improvements and a well-kept stock, Mr. McKenzie having made a specialty of raising horses, latterly purebred Clydesdales from imported stock.

In the year 1899 Mrs. McKenzie died and two years later, our brave pioneer at the advanced age of 79 years. He was assisting his son in getting fire wood, he driving the team to haul it while George was cutting. After leaving his son in the woods the load of wood became disarranged and the old gentlemean who had dismounted to fix it, while reaching under the sled, the team which was young and fiery started and caught him between the sleds dragging him for considerable distance inflicting serious injuries and he died two days later, thus ending the life of one of Carleton County's most respected citizens.

Now just a word regarding the settlement where this brave man carved out a home for himself and family. It is now one of the most thickly settled districts in Carleton County. The rough road, which years before went out from the village into the woods and terminated, now goes on many miles through that fertile country coming into the main road at the St. John river in Victoria county and passing through the best agricultural sections in the province. In the settlement where the Malcolm McKenzie homestead lies and where his son now resides, has for many years, had an up-to-date school, post office and telephone lines, and the road which was, years ago, almost impassable, is now well kept and picturesque, being lined with beautiful trees from the village through that thriving farming locality. A large Presbyterian Church stands a short half mile only from the McKenzie home and of which the McKenzies have been members since those pioneer times. The noble Malcolm McKenzie and his good wife now sleep their last long sleep in the beautiful cemetery at the rear of the church.

Are there not more Scotsmen or others who are willing to come out to Canada,, "the land of promise" and make homes. If good fortune so abundantly awarded the Scotch pioneer of fifty years ago, should success not attend the industrious immigrant in these progressive times.—B. I. W.

Farmers and the High Cost of Living.

Editor The Maritime Farmer:

Much has been and is still being said regarding the high cost of living, and so momentous a question has it become that the Government has sent out a Royal Commission to investigate and locate, if possible, the cause for such an alarming increase in the prices of the necessaries of life.

Now I believe that Royal Commissions are all right and are admirably adapted for the purpose .or which the most of them are intended: viz.: to give some dissatisfied politician a job and in that way apply a balm to his wounded feelings and incidentally increase the cost of living as the people must pay for all this. Surely this Commission need not travel farther than the first school house they come to for any boy who has advanced as far as the fifth grade can tell them that the prices are always governed by the law of supply and demand and that as long as the demand exceeds the supply prices will soar higher.

Any one at all observing can see that conditions have changed very materially in the last quarter of a century. The class of people who are trying to get a living without working have doubled and trebled in that time in proportion to the population and of course the proportion of workers or producers has correspondingly decreased.

As a rule it is the "do nothings" rather than the producers that are everlastingly howling about the high cost of living and the reason is obvious. If costs them more to live than it does the working man inasmuch as they must dress better and they must have more luxuries in order to keep up appearances. They sweep over the country in their autos laughing at the farmer, who in the sweltering heat is spraying his potatoes to keep blight and bugs off or his cattle to keep the flies away, and thank their fortunes that they don't have to do it.

But what does the farmer do? He simply smiles and says, "When those people eat my beef and potatoes they have got to pay me for keeping the flies and bugs off." It must be evident to any observer that what the country needs today is more men and women who are willing and satisfied to engage in farming and thus increase the supply of food and other necessaries of life.

These are certainly encouraging times for the farmer. Who ever knew the products of the farm to be in such demand or to being such remunerating prices as they do today? Surely the farmer is just coming into his own, and when I say farmer I do not mean the sluggard but the man who is willing to roll up his sleeves and grasp the plow handles for I believe the old adage

"He who by the plow would thrive
Himself must either hold or drive"

still holds good.

I remember some years ago a man who was farming by proxy as he

Book for Men, Free

8,000 Words, 30 Illustrations

TO MY READERS:

Of the little illustrated advice book described below, which I gladly send free to all men who fill in the coupon. I beg to say that it represents the very BEST information of a private nature which I am able to offer you as a result of over 30 years' observation and study of my subject, during which time I have personally interviewed many thousands of men, young and elderly, single and married, rich and poor alike, who came to me in confidence with their confessions of debility, lost nerve force and failing strength.

It is, reader, this vast and unusual opportunity which has enabled me to compile this very popular and valuable little free book (over a million of which have been sent everywhere to men who wrote me for them), and in a manner to reflect the exact living, breathing experiences and needs of real men who sought information as to the newer ways of self treatment without the use of drugs.

Remember, this book of over 8000 words and 30 illustrations will come to you by return mail in reply to your request, and in a perfectly plain, sealed envelope, for it is no one's business but your own what the envelope contains. There is absolutely no obligation on your part to buy anything or pay anything, and merely the receipt of this book which does not mean in any way that you are to use one of my VITALIZERS (see description below) and, in fact, only a portion of the book has any reference to the VITALIZER at all. Primarily it is a compendium of useful information for private reference, which you and all other men may easily profit by through life.

Therefore, please use the coupon, or if nearby, I should be very glad to have you call.

SANDEN, AUTHOR.

MANLY MEN MOVE THE WHOLE WORLD

It is a fact, reader, which you and I must recognize and admit, that the whole world admires and is fascinated by strong, vigorous, husky, manly manhood, and we must also admit that it is this same manhood and this alone which is back of the real leaders and producers in every walk of life. No matter where we go, we find it to be the manly, vigorous, vital fellow who forges to the front, who fascinates men and women of his community, who does the really great things. An unmanly man merely means nature's laws gone wrong, for it is he who halts and hesitates, who takes the back seat, who does not fit into the picture in a way that a manly, vital nature should. And yet, reader, it is my firm believe that any man, no matter what his past, no matter what dissipations or follies may have left their mark upon his physical and mental being, I say to you that such a man, unless there be some unusual reason, may hope for a complete return of his strength, vigor and self confidence, if he but go about his self restoration in a natural commonsense way.

I make a little appliance which we will call a VITALIZER, because I think that is the best word to describe its strange power. I don't want you to think of getting one of these VITALIZERS just now, but I would like you to investigate my claims as to what I believe can be accomplished by almost any weakened man who uses this VITALIZER faithfully for a few weeks. I speak, of course, of him who is willing to give up dissipation and lead a decent, conservative life, not only while using the VITALIZER, but for the future. The other kind of man, the dissipated, can hope for nothing from any treatment, no matter what it may be, hence such a man is eliminated from my consideration.

This little VITALIZER is made to wear upon the body all night. It weighs only several ounces and is no more unhandy than any ordinary belt, yet it generates a great FORCE that I call VIGOR, which flows into your blood organs and nerves while you sleep. Men say it often takes any pain or weakness out of the back in one application, and that 60 to 90 days' use has been sufficient to restore manly strength and to put men in the "never felt better in my life" class. Special attachments carry the FORCE of the VITALIZER to any part of the body, for the use of women as well as men in cases of rheumatism, kidney, liver, stomach, bladder, disorders, etc.

Over two hundred thousand of these VITALIZERS have been used or are now being used by men all over the world.

You had better learn more of this VITALIZER. It is fully described in my free book. If you live near me, why not call and test the VITALIZER yourself.

WHAT THE FREE BOOK TELLS

The free illustrated advice booklet mentioned above is meant to be a single declaration of certain important truths that every man in the world should know. The day has gone by when men are kept in ignorance of the real problems pertaining to the e private subjects, and this illustrated advice booklet, which I send to men sealed, by mail, gives certain important facts relating to sex, just as these facts are. The booklet also fully describes my VITALIZER and you are told how you may get one for your own use if you decide that you want one. Please use coupon below, or call. Hours 9 to 6.

DR. M. F. SANDEN,
140 Yonge St., Toronto, Ont.

Dear Sirs,—Please forward me your book, as advertised, free, sealed.

FARMER ADS. BRING RESULTS.

termed it, telling me that I was belittling the business of farming by working with my sleeves rolled up and my pant legs inside my boot tops and when the gentry drove by they laughed at me and called me old hayseed. I simply told him that I always dressed accordingly to my work and if the "gentry" didn't want to see me in that garb they could look the other way. That man now would be glad to have my old boots to put his pants into.

A farmer must also strive to keep abreast of the times, and instead of thinking that he knows it all, be willing to benefit by the experience of others as he finds it in Government bulletins, Agricultural books and papers, attendance at Farmers' Institutes or in whatever way he can add to his stock of information. Such a farmer with the advantages of today should make a success of farming and thereby help to cut down the cost of living.

Argyle, N. S.

June 30, 1914.

What's Being Done to Put the Home on a Business Basis.

(Continued from page 682)

"They are universally applicable to any work anywhere," he replied seriously.

Still half skeptical, I decided to experiment. That was three years ago and I can say that it has relolutionized my entire thought and practice about my home, and convinced me that a new era for woman's work—traditionally "never done"—is coming.

Emerson's Twelve Principles

Harrison Emerson, "the apostle of efficiency," has expounded twelve now famous principles of efficiency. I have proved that it is just as possible to apply each one of these twelve in running my home as it is to apply them with success in any factory or office. These twelve principles are:

1. Ideals.
2. Common sense.
3. Competent counsel.
4. Standardized operations.
5. Standardized conditions.
6. Standard practice.
7. Dispatching.
8. Scheduling.
9. Reliable, immediate, and accurate methods.
10. Discipline.
11. Fair deal.
12. Efficiency reward.

No woman can make a success of her business unless she knows why she is running it, and what are the ideals she wishes to follow. The clearer the woman's ideals, the better home-maker she will be.

Tall Women and Short Women and "Sinks"

Then this matter of common sense. It is certainly common sense to hang a pot close to hand instead of stooping for it. We have heard much of "motion study" and "standard practice," and how can these points be applied in the home? There is my old hated task of dish-washing. I used wrong methods. I cramped my back over a sink twenty-eight inches high, when I am a taller woman than the average and need to work on a surface at least thirty-one inches high. I was using the wrong tools, and I wasted time running about for things I needed. Since then I have "standardized" not only dish-washing, but many tasks involving the hands, or the head and hands, working in co-operation. I have examined a great many sinks and tested women of all heights, and have been able to work out a table of the relative height of the worker and the working surface.

STIR THE LIVER UP BY THE USE OF

Milburn's Laxa-Liver Pills

If the LIVER IS LAZY, SLOW or TORPID it is necessary to stimulate it by the use of a medicine that will clean away all the waste and poisonous matter from the system, and prevent, as well as cure Constipation, Sick Headache, Biliousness, Jaundice, Sour Stomach, Liver Complaint, and all sickness arising from a disordered condition of the Stomach, Liver and Bowels.

Milburn's Laxa-Liver Pills are a specific for all these troubles, and have been used for close on to twenty years by many people for these complaints.

Mr. Thomas Duesling, Waterford, Ont., writes:—"I was troubled with my stomach for twenty-five years. I doctored with doctors in Canada and Michigan, but got no relief. There was a friend in Michigan who advised me to try your Milburn's Laxa-Liver Pills, and I did so. I now feel like a new man, and I can't praise them enough to my fellow men."

Milburn's Laxa-Liver Pills are 25 cents per vial or 5 vials for $1.00. They are for sale at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Making Country Life Attractive for the Boys.

Only last month Miss E. G. Boyd read her paper at a meeting of the Newtown and Smith's Creek Women's Institute.

Miss Boyd points out the necessity of parents shouldering more responsibility; making home life of the boys on the farms more attractive; dividing up their hours of work and recreation; giving the boys an allowance; bringing the right kind of literature into the homes; and last but by no means least, teaching the boys to be manly fellows and contented with their lot, by giving them as many pleasures in the country as possible so that they won't be lured to the city to seek employment.

The Boy's Place in the Home.

Boys make the men of the future and on them rests the future greatness of the Empire or State or even our little community.

It has been said that the mother rocks the cradle of the world, and rightly so, as in the homes are sown the seeds that will mature in later life.

A right thought impressed upon a young mind, a wrong tendency checked, and who can tell the far-reaching effect. Too long the idea existed that boys had their wild oats to sow and must sow them. If they sow the wind they must reap the whirlwind, and why should any young man be better after practically wrecking his strength or poisoning his mind by even a few years of wild living?

The training rests largely with the Mother, and if she fails in the trust imposed upon her, the chances are against the boy. But the father's place must not be underestimated. He must see that the boy gets enough of the sterner things of life to prevent him from being a papered pet or to use a boy's own words, a "milk sop."

But there is little danger of the average country boy being spoiled and it is the country boy I have in mind. We will divide his time when awake into two periods; the hours of work and the hours of recreation.

Hours of Work.

Every boy, even a small one, should have some work to do; bringing in the kindling, feeding the hens or some such task. Make him responsible for it and see that he does it faithfully and promptly. Do not be harsh with him but firmly insist on him performing the appointed task. If little Willie hasn't his kindling in at bed-time, it is better to send him after it in the dark than to go yourself or send his brother.

Hours of Recreation

Take the boy into your confidence. Look at things from his point of view. When all the other boys are going fishing don't plan a big day's work for him better let the work go than spoil the day for the boys. This is one of the reasons why one reads so much about the boys leaving the farm. They get all work and no play.

Give the Boy an Alowance.

Provide the boy with a small amount of spending money, but it is better to let him earn it all or part anyway It may be derived from the poultry and the sale of eggs or the strawberry bed, and sell what he raises. I know such a garden, and while not known for its pecuniary value, was an endless source of amusement for grown-ups as well as children and had the additional value of keeping the boys near the home.

Provide the boys with tools, such as jack-knives, hammers, and even a saw, and they will not destroy the tools belonging to their elders, but as they grow older they should be allowed to use the tools.

Encourage the constructive ability of the boy. The kite he makes or the fleet of boats he owns may be his proudest possession. Let him treasure them, time will bring its changes and its own rude awakening.

"Oh that thou could'st know thy joy
Ere it passes, bare-foot boy."

He will look back on thet lme spent in his canoe or on horse-back, or the breaking in of his colt, as the happiest of boyhood days.

Manly Boys.

Train a boy to be on time; on time for breakfast, at school, or even to meet his chums; on time when they gather in the back pasture to go nut-hunting.

Teach him to respect his elders; giving up his chair to an old man, holding the door open for his mother. These are only "hall marks" but they will be of great value to him in later life.

The Right Kind of Books.

Care should be exercised in the selection of literature for the boys. Too often sensational novels fall into their hands and poison their minds. They feel after reading them, as one has expressed it, "Like fighting a boy, stealing a banana, or sassing a policeman." Let the boy have access to good books and encourage him to read them.

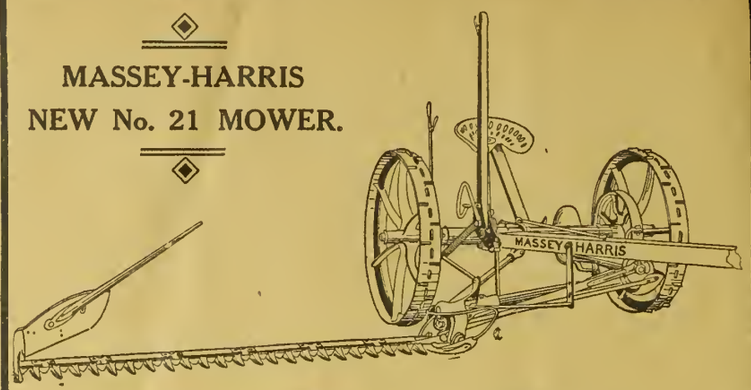
And above all, help the boy to find his life's work. As he grows and develops, his plans will change.

As a small boy he may want to be a carpenter, next a surveyor and finally he may decide on a college course. But whatever his plans, help him to find his work and then work at it like a Hercules. In idleness alone there is a perpetual despair. And remember that the boys make men and through the years to come the boys we thing of now as children will grow to manhood, carrying with them the lessons learned in childhood.

A Small Corner of Prince Edward Island and What the Women's Institutes are Doing for it.

In discussing this subject perhaps it would be more appropriate to say what they are going to do for it, for as yet to the outward eye there does not seem to be much done, but you will see it some day. In the meantime we are getting ready to do things. In all improvements there has to be a preparing of different forces to make them useful. We. ourselves, are the principal forces in this work, which we have undertaken. We have to be moulded and made pliable, as it were, to work together harmoniously, which the men probably think is one of the hardest things for women to do. Another thing that women are accused of is that they talk too much at their meetings. Well, perhaps some of us do, but that is partly what makes our meetings so pleasant, as each one feels that they are a part, or have a part in the social betterment of the district in which they live. Well then, you ask "What has

MASSEY-HARRIS
NEW No. 21 MOWER.



A Big New Mower
for Heavy Cutting

Wide Tread—Wider than on any other Mower—ensuring steady running and overcoming side draft.

Improved Clutch and Throw-out Device.

New Simplified Lift—Attached direct to the Frame—Pole may be removed without affecting the lift or any other parts.

Push Bars are especially heavy and stiff, have Screw Connections at both ends and both Connections are machine-fitted.

Hinged Coupling has long broad Bearings and heavy Pins, doing away with any looseness of the Cutter Bar.

Lift Spring is placed at the rear, giving a direct connection, and is easily accessible for adjusting.

The Sections are longer than on any other Mower, giving longer cutting edges and greater clearance.

Special Circular tells all about it.

Running water on the farm

A Fairbanks-Morse Pneumatic Water System like the one pictured here, can be quickly and easily installed on any farm.

It will furnish you with an abundance of running water for the bathroom, kitchen, laundry, stables, creamery, and for sprinkling the lawn and garden. At the same time it affords you ample protection from fire.

Can be inexpensively operated by hand, motor or small oil engine.

The "Handy" force pump which is a part of this system is easy to operate and will last for years. Tanks are made of boiler steel tested to a pressure of 125 pounds. Any size from 220 gallons up. Send for free booklet, "Fairbanks-Morse Water Systems."

We can supply you with farm engines from 1 h.p. up, sprayers, lighting systems, farm scales, hand and power tools, etc. Particulars on request. Address Dept. 44

Canada's Departmental House for Mechanical Goods

the Institute done for us?" I say, for one thing, that it has brought us together, and brightened our lives a good deal. Then again, we know each other better, like each other better and that makes us better neighbors, or it should do so thus enabling us to have more things in common bringing our aims and interests by the interchange of thoughts and ideas closer together. Even the material comforts with which we are supplied at the close of these meetings bring us nearer. What woman can resist the cheery influence of a cheery cup of tea? And who can refuse the delicious lunches prepared for these occasions? I, for one, won't refuse them, but I do think that they should be less elaborate, or we might restrict them to such occasions as when we are entertaining the many who always want something for their money" and who lend a helping hand financially and favour us with their company. What else is the Institute doing for us. It is making our lives broader and enlarging our views in more ways than one. Of course we are interested in our own immediate Institute, but through this we are naturally brought in touch with the other Institutes on the Island and so on to whole body of organizations of kindred work throughout the Dominion.

Through the medium of good literature bearing on the subjects which deal with those questions of home making, our members are putting forth their efforts with a view of establishing a library in our community. This is an excellent idea and will fill a long felt want. Some people argue that they have no time for reading, but there are very few, if they endeavour to do so, who cannot get a few minutes each day to read something. Cultivate the habit and you will soon want to read more and more. One has to rest some time during the day and I can assure you that a ittle reading goes well with resting, even if you go to sleep over it some of it will remain with you.

Mothers! you who are blessed with little ones when you rock the cradle by having something to read at the same time can improve on the old saying "the hand that rocks the cradle rules the world," for she can rule so much better by having the mind stored with useful knowledge to impart to the child as he grows up. You will be refreshed by having something new to think over instead of merely dwelling on your work all the time and you will also be able to install ideas in the mind of your child which will enoble and make its life seem worth while to itself and others.

The Institute has also given us the chance to indulge in a form of social amusement that can harm no one. I mean our winter evening meetings. We all enjoy them, both old and young. Men and women are social beings. People who live much by themselves get moody and what we call odd. Even some think this habit tends toward insanity. This may or may not be. I think, myself, that as long as a person has enough work to keep him out of mischief as we say with a fair amount of pleasure mixed in, there would be less danger of moodiness or other ills.

In a sermon I read lately I saw the following quotation: "the true pursuit of life is not culture of self, but culture of self for the service of others" so you see the Women's Institute has given us the opportunity of sharing a great many things. Most of us excel in some things in particular such as cake, bread, butter, preserves and many other things as well, some reap much pleasure from reading, others have fine ideas. Let us share all these things and then tell me if the Institute is not doing something for us.

P. E. I. Notes.

During the past two months Mrs. Dunbrack and Mrs. McDonald have paid official visits to twenty-two Institutes and report good work being done in every section represented.

Stirling Institute: About forty members and friends of the Stirling Institute met at the home of Mrs Theodore Pickering, Stanley, on Tuesday afternoon, June 9th. Mrs. Dunbrack and her assistant were present for the first time at this Institute. After Mrs. Dunbrack spoke of the work of the Institute and other matters pertaining to the general work of the movement, Miss McDonald gave a very practical demonstration in millinery, particularly the renovating of hats and trimmings. These hints are of much benefit, especially to those living far from town. The serving of refreshments by the hostess brought to a close one of the best meetings ever held by this Institute. The next meeting which will be the annual meeting will be held at the home of Mrs. H. Bulman on July 16th at 2.30.

York Institute. An Institute was organized at York on the 15th of June with the following officers: Pres. Miss Eliza Vesey; Vice-Pres, Miss Ruby West; Secy., Mrs. P. Brodie; Treas., Mrs. Amos West. This Institute will be known as the York Institute and will hold its regular meetings on the third Wednesday in each month.

Traveller's Rest Institute. Another successful meeting was held at the home of Mrs. J. T. Waite, Sherbrooke on the 12th of June, when six new members were added to the list. At this meeting those present enjoyed the practical demonstration on millinery given by Miss Helena C. McDonald and also listened with interest to a discussion led by Mrs. Dunbrack on Institute work. After enjoying dainty refreshments served by the hostess the meet- adjourned. The next meeting of this Institute will be held on the grounds of Mrs. Hubert McNeil, on July 16th, and will be in the form of a picnic. If the weather is unfavorable the meeting will be held on the first fine day following.

Norboro Women's Institute. The regular monthly meeting of the Norboro Institute was held in the schoolhouse on Tuesday June 2nd at 3.30. Those present listened with great interest to helpful papers on gardening read by Mrs. J. R. Bowness and Miss Hazel Woodside. After which an interesting discussion followed which brought out many valuable points. The next meeting of the Norboro Womeu's Institute will be held in the schoolhouse on July 7th at three-thirty p. m. when anyone interested in the work is invited to attend and take part in the programme. An invitation has been extended to Mrs. A. E. Dunbrack for a Puff Pastry demonstration on that day if she can be with the Institute on that occasion.—Mrs. J. S. Burns, Sherbrooke, P. E. I.

WHY IS HOUSEWORK INEFFICIENT.

Next to he considered are the causes of present-day household inefficiency. By watching myself and others at work I have been able to group the causes of 80 per cent. of the inefficiency of modern housework.

1. The worker does not have all the needful tools or utensils at hand before her when she hegins to work: therefore,

2. She wasts time and effort walking to, hunting for, or fetching ingredients, tools or materials she neglected to have at hand when she hegan the task.

3 She stops in the middle of one task to do something else quite unrelated.

4 She lowers the efficiency of good work hy losing time and putting tools or work away generally due to poor arrangement of kitchen, pantry and closets.

5. She uses a poor tool, or a wrong one; or works at a tahle, sink ironing-hoard or molding-hoard of the wrong height from the floor.

5. She loses time because she does not keep sufficient supplies on hand, and because she does not keep her tools and utensils in good condition.

ARRANGEMENT OF KITCHEN EQUIPMENT.

When I came to study the conditions under which I worked in my kitchen at cook and serving meals, I found that it was impossible to do standardized work under unstandardized conditions. Not only were my sink, tables, and stove too low for efficient work, hut they were in the wrong relation to one another. In fact, I found almost innumerable factors in the average home and kitchen making for inefficiency—actually preventing efficiency—factors which I do not have space even to list properly here.

But let me take this one matter of the proper relation and arrangement of larger equipment in the kitchen.

In (tudying all my kitchen work, I found that there were just two separate processes under which all tasks could be grouped:

Preparing Meals.
Group I.
Work.

1. Preparing all foods.
2. Cooking all foods.

Equipment.

Ice hox, pantry, storage, table, kitchen cahinet, stove, utensils, table trays.

Clearing Away Meal.
Group II.
Work.

1. Removing all foods.
2. Washing utensils.
3. Laying away dishes.

Equipment.

Trays, tables, sink, closets, pantry, ice-hox.

Every task done—from peeling potatoes to washing a skillet—can be placed clearly under one or the other group. One group is those processes which prepare the meal; the second group is those processes which clear away the meal. Each of these processes cover distinct equipment. The reason for so much inefficiency n kitchen work is due almost solely to the facts that these two processes are not kept sepasate and particularly that the equipment of each process it not kept together.

Suppose, for instance, we wish to make an omelet. We take eggs and milk from the ice-box or pantry, beat them at a table, cook on a stove, serve on platter and take to dining-room. This is the preparing process of this dish, and is the simplest method we can follow. On the return trip, kr the process of clearing away I take the empty platter from the dining-room to the kitchen sink, wash it, and lay it away.

Now, if the kitchen tahle, stove and sink are in the right relation to one another, we can "route" our work like a factory; we can make our omelet or any other dish, with the least possible numher of steps, motion, time and fatigue. But if the stove, sink and tables are not in the right relation to one another, it will require twice as much energy to cook and serve the food.

The definite equipment of processes of group No. I. come in this order:

1. Storage. lb
2. Preparing surface.
3. Stove.
4. Serving table.

The definite equipment of processes of group No. 2 come in this order:

1. Stack table to right of sink.
2. Sink.
3. Drain to left of sink.
4. China closet.

In my small kitchen, therefore I have arranged my equipment as follows—First, at the south, an ice-box then a kitchen cabinet, then the stove and at last a small serving-tahle. At the other side of the room come to the right, stack-table, then sink, the drain to left of sink, then china shelves. To make an omelet, I

Look Here Sir!

If you can get a suit valued at $25.00 in Canada for $12.50 from Catesbys in London---Will you buy it?

We undertake to prove to you that you can—if you buy from us.

You've heard that clothing is cheaper and better in London. You know, also, that you can't beat the quality of the genuine English Fabrics.

When, therefore, we guarantee to sell you a suit made of fine English cloth, cut in the best Canadian, New York or London style (as you prefer), laid down at your door, all duty and carriage charges prepaid, for a price about one-half of what you would have to pay in Canada, isn't that worth looking into? Of course, it is.

Then sit down right now, fill out the coupon below, mail to our Toronto office, and get our latest Style Book and patterns. With this book is a letter explaining our system of doing business and a self-measurement form which is so simple that you can't go wrong in using it. We'll also send testimonials from many satisfied Canadians who regularly buy from us.

Get these Patterns now and be convinced

If you don't want to cut this paper, write a postal or letter, and we'll send the patterns anyway, but to get them **you must mention the Maritime Farmer.**

Maritime Farmer. Coupon No. 1.

take materials from the ice-box, turn a step to the right, where I beat the egg on the surface of the cabinet, turn one step to right, for stove, and a last step to the right lays it on the serving table, from which I carry it to dining-room. On the return trip I take the soiled platter from dining-room directly to stack-table, wheel left to sink, let to drain and set left to china shelves.

HOUHOLD RECORDS.

Much as there is in addition to what I have space to say here of kitchen efficiency, I must go on to the application of business principles to other elements of home-making. I am not a "system" fiend, but I found, after wasting much time and energy on searching, pulling and hunting for all my household data, that I simply could not waste this time and energy. In keeping a home I have rent and gas receipts, butcher's and milk bills, addresses of friends and tradespeople, and many other kinds of data.

So, after much experiment, I worked out a filing drawer with cards, in which I keep cards of all the important things I want to know. In this fifteen-inch box, which stands on my desk are parctically all the days concerned in the entire running of my home. I have called it my "Time and Worry-Saving Family Cabinet," and any woman can get such a box or drawer filled with 3x5 cards and make her own sub-heads for her own needs. Here is the complete list of subjects as I have worked them out:

(1) Household Accounts—Sub-divided by months and with a yearly "recapitulation." Separate cards for personals, etc., and for each of the children.

Under every months' sub-division of household accounts there is a set of plain, ruled 3x5 inch cards. In my system they number fourteen. They are as follows:

(1)(Groceries.
(2) Meats.
(3) Vegetables and fruit.
(4) Bread, milk.
(5) Ice, cleaosers.
(6) Service.
(7) Laundry, soap, starch, bluing.
(8.) Fuel, gas, electricity.
(9) Furnishing and repairing.
(10) Medical and drugs.
(11) Church, charity.
(12). Amusement, carfares.
(13) Cash record.
(14) Recapitulation.

(2) Household Records:
a—Family-sizes, record, (shoes, hosiery, gloves, etc.)
b—Clothes-storage record.
c—Linen record (number, cost price and date of purchase.)
d—Preserve record.
c—Pantry record.
f—Anniversary record.
g—Gift record.

(3) Library Records:
a—Poetry.
b—Fiction.
c—History.
d—Reference.
e—Books to read or to buy.
f—Music, repertoire, lyric, humorous, sacred.

(4) Family Medical Records:
a—Physician.
b—Dentist.
c—Oculist.

(5)—Record of Addresses.
a—Social.
b—Professional.
c—Special.

(6) House Hints Division:
a—Toilet and laundry hints.
b—Baby hygiene.
c—Garden and flower hints.
e—Jokes, quotations, etc.
d—Entertainment suggestions.

(7) Home Financial Records:
a—Taxes, real estate.
b—Document record.
c—Bank records.
d—Bills receivable.
e—Bills payable.
f—Personal, financial records, club dues, etc.

(8) General Inventory.
Sub-divided for clothes, furniture, silver, miscellaneous, etc.

EACH WOMAN'S PERSONAL APPLICATION.

Something has been said about methods and systems, plans and schedules, in the household. Now comes the most vital, the most difficult point of all, and yet the keystone of the whole matter—the personal attitude of the woman toward her own work.

Without properly applying the modern ideas of efficiency to her own mind (which is in itself a complete and separate organization) the whole plan of the "new housekeeping" falls to pieces. No stream can rise higher than its source and no household efficiency can be greater than the personal efficiency of the woman who directs it.

Some women regard housework as an orge which has them in its grasp, and from which they cannot escape. Others have a mania for all housework, so that they elaborate, repeat, and prolong work. Still others mistake the physical work of housekeeping for the real ends of home-making; a large group assume a merely tolerant attitude towards houseworkers prefer business, and other careers as more "interesting."

Every one of these attitudes of mind is really poisonous and antagonistic to either efficiency or the highest personal happiness and character. These seven typical attitudes of mind have hung like millstons around the neck of the real emancipation and development of women from household drudgery, is to exchange any or all of these attitudes for the efficient attitude, my interpretation of which I write down here in italics so as to give it every possible emphasis:—Christine Frederick, in Everywoman's World.

See the McClary dealer or write for booklet.

The famous prize-winning Clydesdale Stallion, Baron Balgreddan, has recently been purchased from R. A. Snowball, Meadowbrook Farm, Chatham, N. B., by Mr. John Sharp, of Woodstock, N. B. Baron Bglgreddan is by Baron Primrose. He combines size, quality and action, and if he give as good an account of himself as a sire in Carleton County, as he did in Northumberland County, nothing further need be said. At the Halifax exhibition in 1913 Baron Balgreddan with three of his daughters and another filly won the challenge cup for the best five horses out of one stable. The farmers of Carleton County will do well to patronize this horse.

THIS BARREL

Contains flour guaranteed to give satisfaction or you get your money back. Regal Flour is always preferred by careful cooks because it insures good bread *always*—and palatable as bread can be made.

Good Health Is Impossible Without a Healthy Action Of The Kidneys

When the kidneys begin to "act up" and fail to filter the blood through them, there passes into the system uric acid and other virulent poisons, which will cause some of the severest and most deadly diseases known to mankind.

On the first evidence of the approach of kidney trouble Doan's Kidney Pills should be used, and serious trouble avoided. Mr. Israel Drost, Bath, N.B., writes:—"I am sending you this testimonial telling you what a wonderful cure Doan's Kidney Pills made for me. My kidneys were so bad I was helpless for about two months. I used several kinds of pills, but none of them seemed to be doing me any good. At last I was advised to try a box of Doan's Kidney Pills. When I had taken the first box I found relief, and then I got another, and by the time I had taken it, I was completely cured."

Doan's Kidney Pills are 50 cents per box or 3 for $1.25, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont. When ordering direct specify "Doan's."

The Storage and Use of Silo Moisture.

(Continued from page 685)

ture in the soil.

Some crops make more root development than others and naturally send their roots deeper into the soil to obtain water and plant food. An extreme example of deep feeding is seen in alfalfa. Other crops feed to a lesser depth. The length of the growing season also affects the depth to which water is used. A perennial crop, such as grass, will dry the soil to a considerably greater depth in a series of years than it will in one year. It may be that there is some continued growth of the roots and that they keep growing so long as they can find water, or the drying of the lower soil may be due to the water being brought to the roots by capillarity during the greatly extended time. Winter wheat due to its longer growing season develops a deeper root system than does spring wheat, and consequently uses the water from a lower depth than does spring wheat.

Averaging all of the results obtained on depth of feeding, we have found that oats, spring wheat, barley and corn feed to a depth of 4 feet; winter wheat feeds to a depth of six or seven feet; perennial grasses dry the soil out to a greater depth. Alfalfa will send its roots to greater depths for water than with any other common farm crop if water is available in all intervening portions of the soil to supply the roots while making this greater growth. In this manner alfalfa on the second bottom lands usually obtains permanent water supply. The roots frequently go down to the sheet water where it is within 20 or 30 feet of the surface.

Effect of Weeds

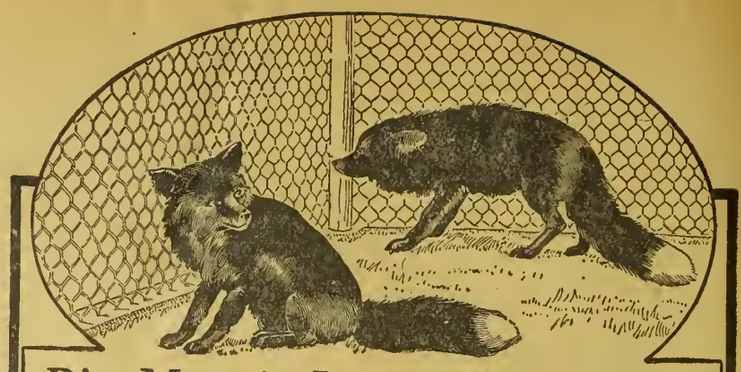
As above stated, weeds are the worst enemy of the farmer who is farming under limited rainfall. All of our trials have pointed to the fact that from the standpoint of storing moisture, the killing of the weeds is even more important than cultivating the soil. Cultivation, however, is the means of killing the weeds and serves to keep the surface soil in condition so that it will catch the water that falls, and not blow.

In 1913 moisture determinations were made in two plots of land being summer tilled. One was being worked acording to the usual method of clean fallow. The other was not plowed until after weeds had started, in order to save labor in the summer tilling process. On June 23, the date of plowing the latter plat, a considerable growth of weeds had started and it was found that the soil was practically dry all the way down, while the other plat had already two feet of moist soil. There was a difference of two and one-half inches of water in the two plats, representing the amount of water which had been lost by all owing the weeds to grow. From the standpoint of storing water, keeping the weeds down is very important.

Summary

This paper is meant to discuss the principles involved in storing water, rather than to teach any actual farm practices. The applicattion of principles to farm practices must be left to the farmer. Our work has added proof that a cultivated surface is more effective than one not cultivated in catching water from rains. We have found than on this soil weeds are the greatest agency or the loss of soil water. Not only before the crop is planted, wherever weeds are growing they are using moisture.

It is left to the farmer to determine the most economical way for him to put the principles into practice. The problems differ from the type of farming, but the principles do not change. One man wants to store water to grow grain for the market; another desires to grow more feed for stock. The returns from either will probably be in pproportion to the water supplied to the crop, unless unusual conditions, such as hail, come during the season.



Big Money Inside The Fence

Yes! There's big money behind the wire netting of a Black Fox Farm. That's why so many owners of ranches for fur-bearing animals buy MARITIME NETTING. They want to feel positive security about the valuable animals inside the fence.

MARITIME Wire Netting is galvanized after weaving—no little places missed or unprotected crevices that will corrode and form a weak spot later on. Fur ranchers can't afford to take any such chances—therefore they buy MARITIME NETTING.

Always a good stock on hand ready for shipment and every foot of it **guaranteed.** Buy MARITIME NETTING for your poultry farm—there's none better at any price, none more strongly guaranteed.

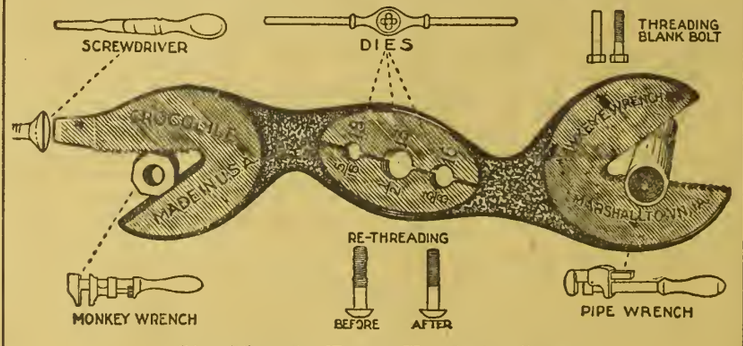
The Crocodile Wrench

An All Around Handy Tool for the Home, Farm and Shop



Six Handy Farm Tools in One

The Crocodile Wrench is drop forged from the finest tool steel and scientifically tempered. Every wrench guaranteed against breakage. It is 8 1-2 inches long and weighs ten ounces.

A pipe wreuch, a nut wrench, a screw driver and three dies 5-16, 3-8 and 1-2 inch for cleaning up and re-threading rusted and battered threads, also for cutting new threads on blank bolts. Dies will fit all bolts used on standard farm machinery.

Teeth and dies are case-hardened in bone-black, making them hard and keen.

The dies on this wrench alone would cost $1.50, and would be worth more than that to every farmer, as they would often save valuable time, besides an extra trip to town for repairs.

Sold everwhere for 75 cents cash.

How to Procure a Crocodile Wrench

On receipt of $1.00 we will send you the Maritime Farmer for one year and also one of these Crocodile Wrenches. New subscriptions will date from time of receipt, renewals from date of expiration of present subscriptions. Send us two new cash in advance subscribers to the Maritime Farmer at 80 cents each and we will send you a wrench for your trouble. Or for 75 cents cash we will send you a wrench.

The Maritime Farmer, Sussex, N. B.

The amouut of water available to the op is the important factor. It is more portant than particular method of lage. We have found that though me methods of tillage give hetter avage returns than some other method, t the method of tillage is overshadwd by the importance of the total iount of water supplied the crop. ater stored in the soil before seeding ids to insure the crop, but it is not fficient to insure a profitable yield. e yield is influenced not only by the iount and distrihution of the seasonrainfall, but hy other climatic condins. Under the same rainfall the ored water tends to insure a nigher ld from any crop. Moisture is the iiting factor of production under our nditions. The soils are still fertile d the replenishing of their fertility a question more for the future than the present.

The application of the principles of ring water may be summed up in a v sentences. The surface should be pt in condition to catch the rains. It ould be cultivated to keep it loose d rough, thus reducing evaporation d preventing blowing. The weeds ould he kept down as far as practiole, hoth before and after seeding, to event their use of the water.

n order to bring farm practices up the point of greatest efficiency it is sential that the farmer understand e conditions under which he is farmg and the principles affecting the actices. A thorough knowledge of e prevailing weather conditions, soil nditions and nature and requirents of crops are all essential. He n then work out the practices.

gulations Pertaining to Organization of Seed Centres.

n order that regularly authorized dies of persons as well as indivials may enjoy the right of memship in the Canadian Seed Grow Association, the following is thorized:

1) That Clause 13 of the Constition which reads as follows: "The sociation may admit as members y persons resident in Canada," to id "The Association may admit as mhers any person or regularly oranized hody of persons resident in nada, etc."

2) That these organized hodies or rsons he admitted as members en the following regulations tother with such others as the Extive Council may deem necessary, e complied with.

(a) That these hodies shall be own as Seed Centres with such pre es as may indicate their location d kind of seed grown.

(h) That the aim and ohject of ese Centres shall be the production d sale of Registered Seed of uniim quality.

(c) That the officers shall consist a president, a secretary-treasurer, d three or more directors to be cted by vote of the memhers.

(d) That the officers and directors all constitute the Board of Direcrs who shall have entire control of e local affairs of the centre suhject ways to the general rules and the ecial directions of the Association.

(e) Members may be elected hy o-thirds vote of any regular meetg of the centre and must pay into e funds of the centre an initial fee $1.00 and such annual fee as the ntre may consider necessary.

(f) The majority of the members all constitute a quorum for any eeting.

(g) The area included in any cene shall not he of greater extent an will enable every member to ve easy and frequent access to a ed plot. The Association may de e limitations hased on the report the Inspector.

(h) The Centre shall supply every ember each year or as often as is necessary, with the same stock of 'Elite Stock' or first generation 'Registered Seed.' With all crops except wheat, oats and harley, the production of 'Elite Stock Seed shall be made hy one member in order to maintain uniformity, hut it is recommended that Elite Srock Seed be sown on two or more farms in order to guard against the possibility of any one seed plot being destroyed. With the approval of the Centre more than one grower, in the case of wheat, oats and barley or other self-fertilizing class of crop may produce Elite Stock Seed provided that all such growers start with the same foundation stock.

(i.) The member or memhers producing Elite Stock Seed shall supply the other members with either Elite Stock or first generation Registered Seed at a price agree upon hy the Centre subject to the seed being accepted for registration by the Association.

(j.) A centre may operate with only one variety of any kind of crop.

(k) All Registered Seed grown by members of the Centre must be offered for sale under the name of the Centre and the registration tag to he attached to the sack by the Inspector must be signed by the Secretary of the Centre.

An Overfeed of Grain.

Some one left the oat hin door open, the horses were loose; and we all know the rest. The thing to do if the accident is detected an hour or so after the grain has been eaten is to get a veterinarian as soon as possihle, says C. L. Barnes, of the Colorado Agricultural College, and pump as much out of the stomach hy the aid of a stomach tuhe as possihle. Then administer a purgative and antiferments. It sometimes happens that exper help is not availahle. If such is the case, then the matured horses should receive from one and one-half to two quarts of raw linseed oil and two ounces of turpentine. Many neglect a horse that has over eaten until the symptoms of colic appears and then call a veterinarian who may have difficulty in saving the horse.

The same precautions should be

taken when a cow has accidentally eaten a part of a sack of oats, wheat or corn. From one to three pounds of epsom salts given to a cow immediately after such a large feed may save the cow's life and also prevent her being foundered. The thing to remember is to do something for the cow immediately after the accident has been discovered.

Essentials in Making Good Clover Hay

The problem of making choice clover hay is often a very difficult one, much more difficult than that of making timothy hay, writes G. G. Williams of the Ohio Argricultural Commission. One reason for this is the earl er season in which it has to be made. The ground is not so thoroughly dried out in June as it is a month later, and consequently hay cures slower. Then, green clover carries a higher percentage of moisture than does timothy, and the journey from field to hay-mow is consequently a longer one. Furthermore, clover shatters much more easily and the saving of the entire plant is accordingly more difficult. And finally, clover hay does not shed water as quickly as timothy.

The total yield of hay and the amount of protein, nitrogen-free extract, fat and ash are higher when the clover plant is in full bloom than at any later period. The harvest should begin promptly, in order that it may be completed before the quality has seriously deteriorated. Clover when cut at its best carries from 75 to 80 per cent of water. Before it is in a condition to safely store in mow or stack, this percentage must be reduced to 15 or 20 per cent. It is important that this be accomplished in as little time and with as little effort as possible. The shorter the time between mowing and storing, the less chance for losses from bad weather.

For the early harvest two methods are workable: 1. There can be no question but that the clover hay is made by way of the hay cock. This is hardly practicable on large areas, but on small and medium-sized farms it is much in vogue. The clover is cut in the forenoon as soon as the dew is off: if heavy, the tedder should be started in two hours; early in the afternoon it can be raked into loose windrows and be put in large, well-made cocks during the afternoon, where it may be left for two or three days Before hauling the cocks should be opened out a little for an hour or two.

Cured in this way the leaves and blossoms are preserved almost entirely, and the color and flavor are at their best. The objections to this method is, of course, the great amount of hand labor required. Upon many farms it is out of the question.

(2) In using the second method usually it will be better to defer the mowing of the clover until the latter part of the afternoon, say from 3 p. m. on, for two reasons; it is not planned to store the hay the day it is cut and one can make wiser plans for the day following late in the afternoon than earlier in the day, but if he does miss it, the damage to the green clover from rain will be little, if it be shook out as soon as the weather becomes fair. Cut at the time of day when the plants carry the least amount of water the clover will be in shape to make rapid strides for the hay mow as soon as the dew is off in the morning. The tedder can probably be used twice during the forenoon to advantage. Early in the afternoon it should be possible to start the side delivery rake, and shortly after the hauling, depending upon the sun and air, as well as the dryness of the ground under the clover. With everything favorable it will do to store in 20 to 24 hours after cutting.

But whatever method is followed it is not advisable to fill up barns or stack half-cured hay. It is important to note that the leaves carry fully three times as high a percentage of protein and fat as the stems, and the heads more than twice as much.

Curing clover hay just right, so that it will come out af the mow bright and sweet, with leaves and blossoms intact, is a rare accomplishment. Its achievement depends upon a happy succession of events, some of which are not in the hands of the hay maker. He must make, and frequently unmake and remake his plans in short order. Hay making is indeed an art. It is as impossible to set up in cold type specifications which will enable one to tell just when his clover hay is done, as it is impossible to tell one how to write a poem. Clover hay, like poetry, is something which has to be felt and heard! The weight of a pile of hay as one lifts it at the end of a fork, appeals to the sense of touch; one can feel whether it is properly made or not. And who that has spent days in the hay field has not not reached a point where the rusele of the clover tells the story of a finished product?

The Better Farming Special.

(Continued from page 683)

star boarders and fifteen profit producers.

Prof. Robert Newton, Principal of the Woodstock Agricultural School and Mr. Reid, the new Field Husbandman for the Province had charge of the field crops section. One exhibit of particular interest in this section was a series of long glass test tubes partly filled to various heights with samples of oats, wheat, barley and peas to depict the difference of quantity in yeild secured by sowing on five different dates seven days apart. In every case with the exception of the peas the exhibit, which was the result of a five years' test at McDonald College, showed that it paid to sow at as early a date as possible.

Mr. Durost talked bees, fertilizers and drainage, using observation hives, apiarian appliances, chemicals, and samples of tile and draining tools to illustrate the various subjects.

D. B. Flewelling, Assistant Horticulturist and Mr. S. L. Peters, Fruit Inspector for the Province had charge of the Horticultural car. In this car was a splendid array of pictures and mounted specimens of farmers' friends and foes in the insect and feathered worlds. This exhibit was prepared by Mr. Wm. McIntosh, Curator of the Natural History Society, St. John.

The inquiring, interested visitors gleaned a fund of information that will help them in their work and the casual visitors could not help but become imbued with the conception that it takes a man of brains to be a successful farmer.

Dr. Morse's Indian Root Pills

are made according to a formula in use nearly a century ago among the Indians, and learned from them by Dr. Morse. Though repeated attempts have been made, by physicians and chemists, it has been found impossible to improve the formula or the pills. Dr. Morse's Indian Root Pills are a household remedy throughout the world for Constipation and all Kidney and Liver troubles. They act promptly and effectively, and

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—

IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvellous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvellous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it towards the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyne, whether new or renewal subscription. When sending in money state which size you want. Send today.

We guarantee these burners to do as represented or money refunded. Extra burners 35c. each.

How Best to Wean a Colt.

Much harm often comes from improper weaning. When a colt is five or six months of age, we place a strong halter on him and put him in a stall with the motber in an adjoining one, and the partition so arranged that they can get their heads together.

The first few days of this treatment we let the colt nurse twice, the next few once, and so on until the weaning operation is completed. We feed the mare on dry feeds and about half milk her twice daily, until she is dry, allowing a little more milk to remain in her udder each time.

We feed the colt on new grass or fine clover hay, and give him a pint of oats three times daily, and in about three weeks' time he is weaned.

When the mare becomes dry the colt and mare are again turned into pasture. Care is taken to provide the colt with a strong muzzle, for if it ever gets another taste of its mother's milk the weaning operation will have to be done all over again, and it is a more difficult task the second time than the first.—W. H. Noland.

For soreness of the muscles, whether induced by violent exercise or injury, there is nothing better than Chamberlain's Liniment. This liniment also relieves rheumatic pains. For sale by all dealers.

FLORICULTURE.

In answer to "Shanklin" would say the reason of the dropping of buds from roses was the sudden change from outside to the close air of the house. In transferring all plants, especially hard wooded ones, the change should be made gradual. After planting keep them where they can have open air for a week or more, spraying well in dry weather and gradually accustom them to a closer air; the same in setting them out from the house in spring bringing them in when the nights seem cooler. In this way you can save the foliage and buds.

My sweet peas did not do as well as usual last year. It is better to use new ground every year for all annual plants of the same kind but plants of different kinds can be planted in soil occupied the last season by other kinds to advantage as the excreta of some varieties of plants act as food instead of poison to other varieties. With the proper amount of potash, nitrogen and phosphoric acid, and given to the soil every year in an available form, the soil kept in good mechanical condition, the same soil can be used many years for the same varieties of plants but as the requirements of different classes of plants of different amounts of these foods vary, a change of location is safer than experiments on the same plot. Two or more feet removed from the old locality would give a change for most annuals.

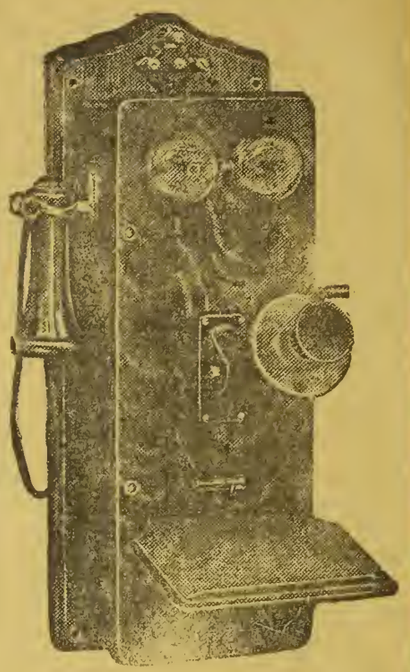
Amherst N. S., writes:—How can I get some early blooming plants—something in the bulb line.

If you wish to have early blooming, summer flowering bulbs such as Gladioli Bessica, Elegans, Hyacinths, Cardicana, Montbritia, Milia Belfora and Tigrideas, pot them as early as you can in April in four inch pots, giving good drainage, using one bulb to a pot or three of the small sizes. Just cover the crown of the bulb with soil, press firmly, water well afterwards sparingly until top growth is established. Give them a moderately warm position, they do not need sun until top growth is established. When two or three inches of this is made give full sun and all the air you can. When danger of frost is over turn out the ball and plant in the garden.

Westfield writes:—Would you be kind enough to tell me in your Farmer what I can do with ants. Our grounds about the house are just alive with them and they are swarming in the Snowball bushes. What could I do to prevent them getting upon the blossoms as they did last year?

It is very difficult to get rid of ants in a lawn (which I presume correspondent means) without injury to the sod. Powdered Borax is the best thing I know of. It should be applied in small quantities and frequently on the infested soil as regards the ants in the Snowball shrub. They are there on account of the aphis, which causes the leaf to curl. As soon as the aphis is destroyed they will not bother the shrub. Apply kerosene emulsion during a dry time.

Put the Latest Style Telephones On Your Lines!



INCREASE the efficiency of your Telephone system by installing the latest style Telephones. Canadian Independent Telephones are the highest grade made. We guarantee them to be superior in style, workmanship, and material to any others on the market. You can prove this true by trying them out on your own lines, side by side with other phones. This you can do without risking a cent. Just ask us about our Free Trial Offer.

Get Our Advice If your locality does not enjoy the social and business advantages afforded by an up-to-date telephone service it is time you got into communication with us. The Professional Horse Trader.

There are many men whose chief vocation is "trading" horses. Of course I do not refer to men who do a legimate business in buying and selling horses, or to those who occasionally trade horses. An honest exchange of horses can often be made by which both parties are benefited, each getting a horse more suitable for the duties required of him and in general a fair exchange of value being made. I refer to the professional trader the man who makes it a business. He is not only always ready to trade, but is constantly an the lookout for a victim.

Such a man does not want to trade because his horse does not suit him and he desires one of another type or class. His idea is to make money out of the transaction and in order to do that he must "do the other fellow." He is a failure. On general principles he must never "deal" unless he is getting some "boot." He occasionally comes into possession of a horse of considerable value, which he will trade for one that is unsound or of bad manners and of little value. In this case, of course, the "boot" will be a good deal and perhaps the "other fellow" has also made a good trade. Now the skill and tricky knowledge of the "trader" has an opportunity for application. His function is to patch up this animal to make him appear sound and valuable so that he may be able to "do" his next victim.

HOW LAMENESS IS TEMPORARILY CURED.

The knowledge these experts acquire in this line is remarkable and in some cases almost incredible. The ability to temporarily check or disguise a case of lameness is an act in which they have attained considerable proficiency. The practice of this art is, of course, seldom possible in cases of acute lameness, but when the lameness is not well marked it may be, and often is, successfully accomplished. When a horse that is to be "traded" is lame in one foreleg below the knee the trader knows that if the nerve supply to the foot can be temporarily rendered inactive the lameness willd isappear. Hence when he is about to show the horses to a prospective victim he will inject a little cocaine or other drug that acts directly upon the nerves underneath the skin on each side of the leg just below the knee. In about 30 minutes the nerve supply to the parts below the knee has become paralyzed and the horse, not experiencing any pain during progression, will go "sound."

Horses that have become sore in one or both fore feet and hence of little value but being generally good iodividuals and probably high-class, if going sound, will often after a few months' rest and attention to the feet make a temporary recovery and go apparently sound. They are then sold or exchanged and the new owner finds out, after having used them for a short time on the roads, that they begin to go tender or groggy.

OTHER PATCH-UP REMEDIES.

When a horse steps short and quick and, when standing, rests one foot and then the other, this should be sufficient to dispel a person's anxiety to buy or trade for him from the professional horse trader, for in practically every case a careful examination will reveal the fact that one foot has been tampered with.

Many "horse traders" know that certain drugs given in certain doses will check the ordinary symptoms of heaves for a short time, fn some cases for a few hours. These men are always ready to trade or give a few dollars for a heavy horse provided the animal, in other respects is a fair individual. The new owner, after finding out where there would be a prospect for a sale or trade, gives a dose or two of the drug and when fts action is established he shows the horse to his prospective victim and in many cases effects a deal.

In case of sweeney or other disease which has caused a shrinking of the muscles, the trader is aware that by forcing air underneath the skin covering the shrunken muscles he is able to fill the hollow. If the hand be passed over the parts filled with air the touch is found to be abnormal, and a crackling sound, like passing the hand over paper, is produced.

Means of temporarily checking undesirable or vicious habits are many. For instance, the use of an iron extension to the crupper so hidden in the hair of the tail that it cannot be noticed is often successfully used in disposing of a switcher and probably one that will kick if he gets the line under his tail. The ways of the professional horse trader are many and usually successful—for him.—W. H. Underwood.

Stock Notes.

"Attention is drawn to an ad. in this issue on page 710 from the Allandale Farm, Hampton, of a nice assortment of stock, including some young stock, as well as mature cows, and as this farm is situated near the railway station at Hampton, N. B., it is a handy location for the stock to be seen, and it will bear inspection of the closest kind.

We would recommend any of our readers, who are in need of stock to go to Hampton and look these over."

During the summer months mothers of young children should watch for any unnatural looseness of the bowels. When given prompt attention at this time serious trouble may be avoided. Chamberlain's Colic, Cholera and Diarrhoea Remedy can always be depended upon. For sale by all dealers.

PURE BRED SIRES

THE LIVE STOCK BRANCH

Dominion Department of Agriculture.

WILL PURCHASE during 1914, a number of CANADIAN BRED Stallions, Bulls, Boars and Rams.

Animals must be of right type, in good breeding condition and of the following ages.

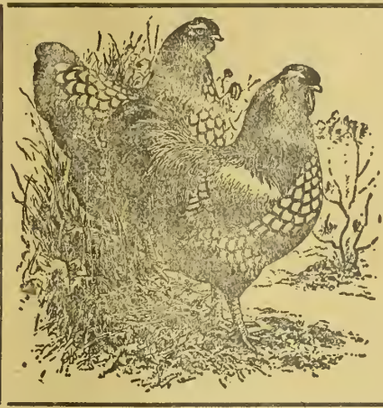
Stallions, three to five years.
Bulls, not under one year.
Boars, not under six months.
Rams, not under six months.

All stallions will be purchased subject to veterinary inspection and bulls subject to the tuberculin test.

Breeders in Eastern Canada having CANADIAN BRED male animals for sale, filling the above requirements and registered or eligible for registration in the Canadian National Live Stock Records, are requested to communicate with the Live Stock Commissioner, Department of Agriculture, Ottawa.

The purchases of stallions and bulls will be made during the current spring months. The purchases of rams and boars will be deferred until the autumn.

Communications must state age and breeding of animals offered and price asked.—60271.



'SILVER LACED WYANDOTTES"

Stock and Eggs for Hatching for Sale.

The Silver Laced Wyandottee is a breed combining quality and beauty, prolific layers, fine table fowl and rank high among breeders of poultry.

The Magnolia Poultry Yard's stock of Silver Laced Wyandottes were winners of first breeding pen at the Amherst Fair in 1913, among strong competition. This is only one of the reasons why you should buy this stock. The work is personally supervised by the owner, and the stock this spring has never been in better condition. Some of my customers have reported 100 per cent. hatches from eggs purchased from me this spring.

Write for information and get your pick of the stock now.

The Magnolia Avenue Poultry Yards

Sutherland's River, - - Nova Scotia

The Bloating of Cattle and Sheep.

When a cow bloats tap at once in severe cases. Make a small incision through the skin on the left side between hip point and last rib, about four inches below the spine. A canula and trocar (a trocar is a sharply pointed instrument inclosed in a hollow tube, the canula) is the best instrument for puncturing the stomach. Insert this through the incision in the skin, press downwards and inward till the stomach is punctured. Withdraw the trocar and leave the canula in the wound until all the gas has escaped through it, which will be an hour or more. Then withdraw the canula, wash wound with an antiseptic solution and allow it to heal naturally. If there is no trocar and canula at hand, a pocket knife may be used but it is not nearly as satisfactory.

In less severe cases, pass a piece of rope, soaked in tar or dip between the jaws and tie it around the horns. This will cause the animal to work his jaws and gullet and so tend to open up the passageway for the gas to escape. Pour cold water over the animal's kidneys.

Two ounces of turpentine, diluted with milk, ounce doses of aromatic spirits of ammonia diluted with water, four ounces of Jamaica ginger well diluted in hot water, and two tablespoonful doses of common baking soda in water are all remedies to be given as drink. Give gentle walking exercise and for a few days feed mashes and give lukewarm water to drink. As an ounce of prevention is worth a pound of cure, never feed moldly or frozen feed and do not pasture on heavy clover, alfalfa and similiar crops after a heavy dew or frost or a light rain.

SHEEP.

Tap the same as for cattle, except tap three inches below spinal column, instead of four. Be sure to clip off all wool within a few inches of incision.

A remedy, not commonly known but that has been successfully used by the writer, is freshly drawn milk. When the sheep is first noticed, run to the nearest fresh cow and draw a quart of milk. (Go to the nearest cow, whether the owner's or the neighbor's, as a moment's time may mean the life of the sheep.) Drench the sheep with this fresh warm milk and in all but the severest cases the animal will be up and moving in about an hour. Other remedies are: Epsom salts, 1-4 pound; sweet spirits of nitre, 2 dessert spoonfuls; bicarbonate of soda, 1 teaspoonful; ginger, 1 teaspoonful. Dissolve in a pint of lukewarm water and give as a drench. If this does not give relief in an hour try: Raw linseed oil, 1 teacupful; spirits of turpentine, 1 dessertspoonful. Give as a drench: if there is no relief in two hours, try: Sweet spirits of nitre, 2 dessertspoonful: bicarbonate of soda, 1 teaspoonful: ginger, 1 teaspoonful. Mix in a half pint of lukewarm water and drench animal every two hours till relieved.

A Hint on Feeding.

A prominent dairy writer has said: "Average dairymen feed their milch cows all alike, equal rations for every stomach, no matter how large or how small the animal may he. By this plan the large eaters suffer at the expense of the small eaters, for the latter set the pace for what the whole herd is supposed to require." Visits at several dairies at feeding-time show that, with rare exceptions this is just what the average feeder of milch cows does. There has been so much said about the importance of feeding properly compounded rations that most dairymen have a fair idea of the subject, and feed fairly correctly in that respect; but feeding each the same amount of the artificial food, whether the cow be small or large, and gives little milk or much, is a quite general error. Usually the bran, cake or whatever artificial food is given is mixed in with chaffed hay, straw, or green fodder, and then each cow given a certain measure of it, regardless entirely of individual capacity and requirement. It is in the feeding of the extra ration where the great error in feeding exists. What is badly needed is to test each one of the cows with artificials, and establish the digestive capacity of each animal and then feed accordingly. There is likely to be found great variability in this respect, and this can only be decided by investigation. This is the only way one can be prepared to do justice to his cows and to his pocketbook. Great stress should be laid on the point of feeding each cow just enough extra ration, but not enough to surfeit. Some cows will consume and appropriate more than others, and, if, their physical needs are not fully supplied, their greatest powers of milk secretion cannot be exercised. Regularity off eedingthat is what in Regularity of feeding is about as essential to best results as correct feeding. All good dairymen are aware of this, and act accordingly. They have a time set for doing everything pertaining to their cows. These animals are particularly creatures of habit. They soon get accustomed to any routine the dairyman may pursue in their behalf, and then they look for the same at the accustomed hour, and almost the same minute, and if milking, feeding and watering do not occur at the same time each day the animals get uneasy and nervous, and they will not do the best their is in them. A wisely conducted dairy is a good place wherein to bring up a young man, for . there he learns the lessons of promptness and regularity which will be likely to govern him in all his business transactions through life.

AYRSHIRE STOCK FOR SALE

Pure Bred Ayrshire Stock or Legible for Registration. Call and look the stock over. Long distance Phone at farm

1 cow, 2 years and 7 months, just fresh; 1 cow, 3½ years, due with second calf this fall; 1 cow, 7 years, grand breeder; 1 cow, 12 years, bred by Turner, Hamilton, Ont.; 1 heifer, 2 years and 3 months, now bred; 1 Heifer, 7 months; 1 heifer, 4 months; 1 heifer, 2 weeks; 1 bull, 2 1-2 years; 1 bull, 1 year; 1 bull calf, 4 months.

We price this stock as follows:

Heifer Calves $15.00 when dropped, $2.50 per month thereafter for feed and care till they freshen
Bull $10.00 " $2.50 " " " " " "
Prices of mature cows based on production basis.

Volume 19. SUSSEX, NEW BRUNSWICK, JULY 21, 1914. Number 20.

Second Annual Report of United Fruit Companies of Nova Scotia, Ltd.

THE Second Annual meeting of the United Fruit Companies of N. S., Ltd., was held in Berwick, N. S., on Tuesday and Wednesday, June 30th and July 1st, when the following report was submitted by the Board of Management:

Annual Report.

Your Board of Management beg to submit for your consideration their second Annual Report and Financial Statement.

The year through which we have passed has presented problems of a most extraordinary and unusual character and your Board feel much gratified that, even under most trying and adverse conditions, they are able to present a report which records success in all its undertakings and a justification of the various policies which have been pursued.

We wish to place on record our appreciation of the splendid loyolty to the principles of co-operation displayed by the great majority of our membership during the trying times experienced at the commencement of the season.

The previous year had, as you are aware, been a year of low prices and the season under review opened with indications of a short crop all around.

Speculators, aware of these facts, visited co-operators and offered prices that in comparison appeared large indeed.

These prices would not have been offered but for the Co-Operative Movement, and we are glad to report that practicaly all of our members remained loyal to their fellows and turned down all offers made, thus successfully defeating the efforts of self-interested speculators to break up the co-operative movement.

Not only did these co-operators demonstrate thereby their loyalty to their fellows and to their cause, but they also showed common sense in recognizing that the speculators were buying for profit and that their Central Association had exactly the same means of earning that profit as the speculators; the only difference being that in the one case the growers marketing through their own business would earn and retain the profit for themselves, while in the other case all would go into the pockets of the speculators.

The test that these circumstances made possible has shown what sterling qualities are possessed by the majority of our membership and should serve as a lesson that it is futile to throw away money in bait to co-operators now that the great superiority of the co-operative method is so thoroughly understood.

During the year six Companies have taken stock in the Company making a total of thirty-eight Companies holding shares in the Central Association and necessitating an increase of authorized capita.

Your Secretary elected at the last anual meeting had to resign in September last having accepted a position on the Experimental Farm at Ottawa.

While we exceedingly regret losing Mr. Davis' services we congratulate him on having secured such an enviable position.

Your Directors at a meeting held in September last appointed Mr. A. E. Adams Secretary to the company.

The system of centraization for which the United Fruit Companies of N. S., Limited, stands, has found ample justification during the past season, as will be demonstrated as this report is presented.

We think that it will be generally admitted that there has been an immense improvement in the administrative department during the past year, and the accountancy department is now as perfect a machine as can be devised.

The promptness with which all accounts have been rendered every month and payments of all balances due have been made, must have been appreciated by managers and must have done much to satisfy all co-operators.

In addition to prompt monthly settlements no company making any reasonable application for funds in advance has been turned down.

We feel that we have every reason to be proud of the prices we have secured and paid.

During the season your Central has handled 274,000 barrels of apples and 38,000 barrels of potatoes, a grand total of 312,000 barrels

Out of this quantity, however, there were only 79,459 barrels No. 1, 36,459 barrels No. 2, the balance 158,000 being No. 3.

There were also in this quantity no fewer than 170 varities, comprising a very large percentage of apples difficult to market on account of the fact that they are unknown.

Yet, in spite of that overwhelming proportion of No. 3 and all those odd varieties your Central has been able to make a return which works out at a mean average (including absolutely everything) of $2.57 per barrel, ones, twos and threes.

While we are prepared to admit that a general shortage of the apple crop has in a measure been the reason for such high prices, yet the system under which we have marketed the apples entrusted to our care has been principally instrumental in enabling us to make such large returns for such a

DELEGATES ATTENDING THE SECOND ANNUAL WOMEN'S INSTITUTE CONVENTION, FREDERICTON, N. B.

During the Convention Mr. W. W. Hubbard, Supt. of the Experimental Farm, Fredericton, invited the Delegates to Visit the Farm. The above photo was snapped in front of the Farm Barns, While the Ladies Were Inspecting the Various Interesting Features.

percentage of the entire crop as we handled.

This method of market regulation was practiced to a certain extent last year but has been perfected during the year now ending; the large percentage of the entire crop now under our control considerably helping to bring about the desired result.

The success of the system to which we refer is only limited by the quantity of fruit beyond our control and for that reason we would welcome the active co-operation of those Companies at present working independently, feeling sure that it would be to the benefit of all to have all co-operators of the valey folowing out the real idea of co-operation, i. e., "working together for the mutual advantage" for thus only can many much-needed reforms be effected.

The new by-laws under which we are working and which were aproved by the Lieutenant Governor of Nova Scotia in Council on Sept. 8, 1913, have been most helpful and have assisted your officials considerably during the year.

The carying out of some of the provisions contained in these by-laws has done much to bring about the better feeling that exists today in all Companies towards the Central Association.

In accordance with these by-laws a meeting of your Directors was called September 27th, and an estimate for the ensuing year was submitted.

According to this estimate which was made before the real business of the year started, the expenses would work out at $13,300 for apples and potatoes and $2500 for supplies, a total of $15,800.

In actual fact the expenses for the year have only amounted to $12,300, for apple and potato accounts and $5452.28 for suplies or a total of $14,-653.48 about$1,100 less than our estimate.

That portion of expense applicable to apples and potatoes works out at four cents per barel.

We are aware that in the matter of expense the Central Association has received some criticism.

We are unable however to understand how the expense can be cut dow in any way and yet have an efficient machine.

We consider, and it is also the opinion of the various Government departments of both Canada and the United States who have investigated our system, that our expenses are absurdly low, considering the amount of work acomplished and the great saving effected in the cost of handling, the enhanced prices realized for the Valley's crop and the reduced prices now paid for nearly all necessities of the farm.

We have, however, investigated the expenses of the various other organizations and we find that our expenses are ridiculously small in comparison.

For instance, we find, acording to the Bulletin of Economic and Social Intelligence that the Californian Fruit Growers' Exchange shows an expense of 7 2-3 cents per box.

The Secretary of this Company, claims that this is the lowest marketing cost for any agricultural product in the United States.

The North Pacific Fruit Distributors write us that the cost of their Central is 15c per barrel, while the sub-central expenses amounts to 30 cents a barrel They state that salaries vary, all the way from $1200 for a manager of a small local, to $10,000 for their Central Manager. They further state that it is the man who can successfully manage the business they want; if successful he can secure about any salary. We feel, therefore, that we need make no apology for an expense of only 4 cents per barel, especially in view of the fact that another 200,000 barels could be handled with practically no additional expense.

The unusual climatic conditions that prevailed during the fall had a very detrimental effect on fall varieties of apples, causing considertble loss to the valley

Much of this loss could have been avoided with more intelligent management in many of our warehouses.

In many warehouses fall apples were hauled in without restriction and piled four or five tiers high

Every barrel brought heat in with it and the doors were often left open all day to admit all the warm air possible and then closed at night to prevent it escaping.

A better system of regulation will have to be employed in future by subsidiary companies to minimize, as far as possible, the effects of adverse climatic conditions. Special instructions will in due season be issued governing this matter.

Your management naturally, during the period referred to, turned their attention to pre-cooling or cold storage as a means of asisting in the marketing of certain varieties.

After making very exhaustive enquiries and collecting all possible data and satisfying themselves as to the utility of certain systems they called your Directors together to obtain their consent to a practical experiment with a Madison Cooper Gravity Brine System.

Although your Directors were satisfied themselves that in the interests of all fruit growers such a plant should be installed, they considered that such a step should not be taken without consulting the membership of all Companies.

Warehouses of the United Fruit Companies Limited, at their Head Office, Berwick, N. S.

The Directors' meeting was therefore adjourned to enable the Directors to place the proposition before the members whom they represented.

At the adjourned meeting an overwhelming majority voted in favor of this progresive step being taken but unfortunately the delay occasioned by the adjourned meeting proved disastrous to the proposal.

Immediately your Directors consented to the erection of a plant the necessary ice-cutting tools were wired for, and a suitable building for storage was purchased.

As soon as the tools arrived every available team was procured to haul, but towards the end of the second day a thaw commenced and our sleding was spoiled

During that short time nearly two hundred tons of ice was cut, hauled and stored.

While this quantity is insufficient to operate a Madison Cooper Plant yet it wil be sufficient to permit of an experiment along the lines of a system of pre-coling now in vogue in certain parts of the States

This experiment will be carefully conducted and strict records will be kept of the results, which will be of great value to your management in any further developments.

During the season your Central load ed apples and potatoes on to no less than 118 boats.

Of these 20 were mail boats, doing the trip in about seven days. Fourteen steamers were brought into the port of Halifax, especially to load apples for this Company.

One steamer and three schooners were chartered to carry potatoes to Cuba. We regret that one of these schoners, the Benefit, was lost, the crew fortunately being saved. Our interests being covered by insurance, no loss was incured.

The average time occupied by the freight boats carrying apples, that is the boats of the Furness-Withy, C. P. R, and Warren lines, was 11 days.

The average is brought up thus high on account of the delay of the Rappahanock and the two trips of the Almeriana, which occupied much too long a period. Including all boats, mail and freight, the average time was 9½ days.

Thermograph charts have been received by your office of the temperature of the holds of all boats carrying your apples.

The themographs have been placed in each hold of each boat and we have therefore, by a careful study of these charts been able to gather much valuable information as to the best apple-carying boats and the best positions in such boats.

The information thus gained will be put to practical use.

With reference to the pack of this year we are glad to be able to report a vast improvement in the direction of the uniformity This is borne out not only by the daily report of your local inspector but also by the detailed and tabulated report of your European representative, who met each boat and examined all packs. It is also borne out by the Trade on the English market who reports a distinctly more uniform pack than at any time previously.

This opinion has also been confirmed by the Special Commissioner sent over to England by the N. S. Government; Mr. Elderkin reports:—

"We have an object lesson of the success of co-operation as applied to agriculture in the packing and marketing of apples in the Annapolis Valley. It was most gratifying to us, talking with people in Great Britain, particularly in Covent Garden, to learn that to-day the brands ot the packing houses in Nova Scotia are sufficient guarantee of the quality of the contents, and will be acepted on the other side without investigation. This was not always so. In fact, many informed me that the reputation gained for Nova Scotia apples, owing to the inferior packing of the fruit was one that was discreditable indeed."

While these good reports apply to practically all varieties we are afraid we cannot include the Nonpareils under the same heading.

There is little doubt that many Companies fell away badly in the packing of that variety.

We attribute this to two reasons, one being the temptation of the big price and the other the fact that our inspector was engaged in organization work throughout the period that this variety was packing.

Reviewing the whole year we consider that to have maintained the reputation of the co-operative pack on a year when our apples were so atrociously scabby and spotted has been quite an achievement and reflects the utmost credit on all concerned.

We are gratified to note that, generaly speaking, fruit growers have realized the absolute necessity of spraying and that this spring spraying has been carried on in a manner never before aproached in the Valley.

The address delivered by Professor Caesar at Kentville, the vigorous campaign carried on by the Co-operative News and the costly expericnce of the past two years have all had their effect in bringing about the desired result.

It is well for the future of the Apple Growing Industry that this awakening has taken place and we trust that at no time will our orchardists revert to the old careless and half-hearted methods of the past.

As an indication of the increased attention that has been given to this vitally important matter, we would state

---

The salaries paid to your officials were as follows :

Mr. S. B. Chute, General Manager	$2500.00
Mr. A. E. Adams, Secretary,	1200.00
Mr. A. E. MacMahon, Organizer and Inspector	1200.00
Mr. J. N. Chute, European Representative	1111.50
Capt. C. O. Allen, Halifax	1000.00
Combined Salaries of Office Help	1847.03
A total for Salaries of	$8858.53

The expenses incurred by these gentlemen in the course of their work are as follows :

Mr. Adams, when visiting Companies and on organization work	$..74.15
Mr. A. E. MacMahon, Organization Work	321.25
Mr. A. E. MacMahon, Inspection Work,	512.00
Mr. J. N. Chute, London Office (including office help)	761.60
Capt. C. O. Allen, Halifax Office,	180.38
Mr. M. K. Ells, Home Markets..	114.25
	$1963.63

The balance of the Expense Account is made up as follows :

Telephones, Telegrams, Cables, etc.,	$926.86
Books, Stationery, Office Equipment, etc	835.75
Printing and Advertising	560.80
Auditing	177.30
Solicitor	100.00
Delegates and Directors' Expenses	349.77
Board of Management	567.00
Sundry Expenses ..	313.84
	$3831.32

that your office handled three times the quantity of spraying material this year compared with last.

We wish to give some explanation in connection with our method of handling the large spotted apples.

During the first few weeks of the season we were permitted to pack such fruit as number twos, but later, in deference to the requirements of the Fruit Marks Act, this pack was discontinued.

Your Board of Management did not feel that they would be protecting the interests of the growers by allowing such splendid fruit as represented by these apples to be simply marked No. 3. They therefore instituted a special pack known as Co-operative No. 3. On the face of the end of the barrel was attached a label reading as follows:

"Important

The apples in this barel are guaranteed to be number one in size but have the defect of being either off-color or spotted. The Dominion Fruit Marks Act forbid this class of apple being marked number one."

The idea of this label originated in the mind of Mr. F. M. Chute, of Waterville, to whom we accord the credit of an idea that has put considerable money into the pockets of the Co-operative Fruit Growers of the Valley.

While dealing with this matter of pack we would quote from the report of Mr. Philip J. Gabler, Cargo Inspector for Canada at Liverpool, published by the Department of Trade and Commerce in Bulletin No. 68 being the April issue of the Census and Statistics Monthly.

He states:—"It will be generally admitted that in these days of keen competition continued improvement is necessary if we are to hold our own or keep ahead and I would like to call the attention of Canadian packers to the fact that the Western New York State people are making a big effort to capture the best of this market. Their fruit is of very good quality generally, and very well graded, and they go sometimes to the extent of what may be termed, fancy packing in barrels, (i. e. fancy paper lace for the face of the barrels and a pad at top and bottom.) These apples easily command top prices."

It should be borne in mind that our apples have to compete with these packs and it is of vital importance that we put up a pack that wil enable us to compete successfully.

We should not be content and cannot afford to take second place to any other apple producing country.

We feel gratified that the Dominion Government have recognized the importance of the Fruit Industry by establishing a Fruit Department and by creating the office of Fruit Commissioner.

We feel that the Government have been happy in their choice of Fruit Commissioner and we extend to Mr. Daniel Johnson our heartiest congratulations on his appointment and feel sure that his administration of our department will be productive of much good.

We wish to assure Mr. Johnson that he may always rely on our support and hearty co-operation in all measures he may undertake to improve the condition of the Fruit Growers in Canada.

In the death of Mr. Alex. McNeil we have lost a true friend not only to the Fruit Industry but also to the Co-operative Movement.

A true co-operator he extended a helping hand to all endeavoring to co-operate with their fellows.

The pioneers of the Co-operative Movement in the Valley owe much to the encouragement and practical assistance they received from Mr. McNeil and we shall never forget that he travelled all the way from Ottawa last year in a wretched state of health, and therefore at great inconvenience, because he was informed that an address from him would accomplish very much good and would be of material assistance to the Central Association.

Cargo Inspection Service—Loading Nova Scotia Apples at Halifax, N. S.

His visit to Nova Scotia was practically the last work he did and we mourn the loss of a friend tried and true.

In August next there will be a Dominion Conference of Fruit Growers at Niagara, to which you have been invited to send a delegate. It will be your duty to elect that delegate during this Convention.

There will be some very important matters discussed at the Conference, the agenda at present dealing with the Size of Packages, Fruit Marks Act, Potato Inspection, Transportation, Markets and Marketing.

We have had occasion to enter protests in connection with certain matters of transportation and three cases have been prepared and submitted to the Board of Railway Commissioners.

These deal with the following subjects: 1st, our right to a clean B L for all shipments; 2nd, our right to route our shipments with our own desire or the wish of our buyers; 3rd, in respect to agreements made under which sidings will be laid to warehouses.

These maters are of the utmost importance, but, on acount of the fact that they are sub judice, we cannot well go into details in this report.

With reference to our operations with potatoes we are glad to be able to state that in spite of the hazardous nature of this business we have been able to pay top prices throughout the season and finish up with a very fair margin.

We wish to call our members' attention to the fact that there has at no time throughout the season been a market that would justify a price higher than 40 cents per bushel, and that would have been the limit of price had it not been for the co-operative movement.

The potato business, however, is as we have stated before, a very hazardous one and will have to be handled in future on exactly the same lines as the apple business, that is, average prices will have to be returned and potatoes will have to be subjected to inspection before being accepted.

In addition to this, on account of the untrustworthiness of many of the buyers on the Cuban market, it will be essential that we have our own man there to represent our interests.

We are firmly of the opinion that this business cannot be successfully and safely conducted otherwise.

During the past season, on account of the smallness of the apple crop, practically nothing has been done in the direction of developing new markets beyond correspondence.

There are always risks of a loss with trial shipments to unknown markets, and as the crop was short and all the members loked for big prices, we had to abandon trials of certain new territory that our own judgment told us should be tested in readiness for a big crop.

One small shipment, however, was made to a certain market with exceedingly good returns and, as a result, arrangements have been made for regular shipments throughout the coming season.

With a large crop ahead of us to market, additional men will have to be engaged to work up certain known markets and develop new ones.

Your London office has again been of unqualified success under the able management of Mr. J. N. Chute.

Mr. Chute will later submit a report to this meeting dealing fully with the work of that office.

There is one notable achievement of your European representative that we wish to deal with and which with becoming modesty he barely mentions in his report.

We refer to the historical change that has taken place in Liverpool.

In last year's report Mr. Chute explained in detail the system under which fruit was handled in this important market; he explained the operations of the various organizations: the Importers' Association, the Brokers' Association and the Buyers' Association

Strong protests have been made for generations of apple shippers from all parts of the world, especially concerning the operations of the Buyers' Association who had the monopoly of the auction rooms and -who persistently refused to allow any but members to buy in the rooms.

Such protests, however, have always been in vain because there was no organization powerful enough to withhold supplies and thus compel recognition.

We are naturally unable to go into details as to how it has been accomplished but have the satisfaction to be able to report to you that today any firm of good financial standing and clean business record can enter the Auction Room and bid for your apples so that in future instead of a few men being able under certain conditions to fix the prices they will pay before the sale comences, your apples will be sold to the highest bidders drawn from all parts of the country, many of whom have previously had to pay the old Buyers' Association as high as 50 cents per barrel profit.

The fact that this extra competition means enhanced prices and prevents market rigging is of course apparent.

In addition to this none of your apples are now tolled by the Importers' Association, saving in that direction, approximately 20 cents on every barrel.

We feel that this is the most important achievement of The United Fruit Companies of N. S., Ltd., and feel sure that all co-operators will share our satisfaction in the knowledge that it is by their concerted action alone that this sweeping reform has been brought about. We will not refer further to the work of your European representative as Mr. Chute's report will deal fully with all details.

Your Halifax office has also accomplished good work at comparatively little cost.

The saving of 50 cents on each Bill of Lading made out, while contributing largely to its upkeep, is only an infinitesimal part of its unquestionable necessity.

Having a Halifax man, with a knowledge of the shipping business, stevedoring, etc., assures the proper placing of cars at the respective boats and the safer handling of the apples. This is very important owing to the large percentage of the loading being done at night after the officials of the steamship companies have gone home, leaving the loading entirely in the stevedore's charge, when frequently boxed and barrelled apples are unloaded

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

THE COUNTY FAIR.

The season for the county fair is almost here. The annual recurrenee of exhibition interest and effort that comes to the farmer and stockman lives in his thought and plans almost from the closing of the fair to its opening the next season. This is just the spirit that should take possession of every progressive citizen in the county where the Agricultural Fair association is organized, and is to become what its highest purpose of educational influence designs it should be, a school of training, in the improvement of agricultural conditions in the community and on the farm.

In every county where there is an effort being made to produce crops and grow live stock there is an urgent demand for the stimulating influence and educational advantages that accompany the well organized and properly conducted county fair. It is the cultivation of a friendly spirit of rivalry among the people of the county that is needed most. To encourage a spirit in each to excel in what they produce on the farm, in the orchard, in the pasture, in the field and in the home.

It is the incentive that encourages competition that should be cultivated. This cannot be so effectively done by any other means than the county fair. The county fair brings all the people together in a happy, jolly frame of mind, and when a neighbor excels the whole community rejoices in his success and try to benefit by their own defeat. The lessons learned at the fair, through these friendly contests of display, are not taken as rebukes, but as good fellowship contests in a common interest. They are in a general way conducted fairly and honestly and are decisions that meet the endorsement of all concerned.

The fair deos not enlist the sympathy and support of persons. It should, but does not. Many will view it merely as a place of amusement, a place of diversion and pastime, a good place to go and see the neighbors and have a good social time. To this class of persons it is worth more than it costs. To others it is an open book; they read as they go from exhibit to exhibit. Each department opens up a new and interesting field of study for consideration and discussion. The educational influence is great, even with those who seem to be but slightly interested. The causal observer is benefited, some new idea is brought before his mind or immature ones developed into practical thought and plans for application.

The county fair is of greatest practical benefit to the exhibitor. When the farmer or stock grower enlists as an exhibitor at the county fair, the seeds of improvement have been sown and the results will be found on the farm by improved grains, improved stock, improved machinery and a general spirit of advancement in all lines of agriculture.

The social feature of the county fair is an important consideration with the family and should not be lost sight of in taking up the advantages of county fair organization. The boys and girls on the farm demand more recreation, amusement and social life than are usually accorded them. The two or three days fair may be made quite helpful as a social feature to the families in the various neighborhoods. The people of the farm are demanding more of the refining influences of social intercourse and will have it. The county fair may be made a great social event in any community. It has all the elements of a picnic or celebration and can be made to take such a position if desired. It is much easier to place the county fair upon a high educational, moral and social plane than to invite rowdyism and dissipation within its gates.

A CREED FOR THE COUNTRY BOY

I believe that the country which God made is more beautiful than the city which man made; that life out of doors and in touch with the earth is the natural life of man. I believe that work with nature is more inspiring than work with the most intricate machinery. I believe that the dignity of labor depends not on what you do, but how you do it; that opportunity comes to the boy on the farm as often as to the boy in the city; that life is larger and freer and happier on the farm than in the town; that my success depends not upon my location, but my self; not upon my dreams, but upon what I actually do; not upon luck, but upon pluck. I believe in working when you work and playing when you play, and in giving a square deal in every act of life.

STUDYING TO IMPROVE HIGHWAYS.

The necessity of having good roads, as demanded not only by the rapidly increasing auto traffic in all countries, but by the increased production of crops that must be hauled to market, has become so important that the United States Department of Agriculture, in co-operation with State Highway Departments and local road authorities, has begun detailed road-making studies in 100 counties.

The purpose of this study is to discover the point of excellence and defects in existing local methods of building and maintaining roads which will aid the state authorities to put local road management on a systematized basis.

This investigation is prompted by the fact that there is at present very little knowledge as to the most effective and economical methods by which a county can develop its roads. At present the methods of financing local road improvements vary from calling on farmers for a certain number of days' labor in lieu of a road tax, or the use of county prisoners in road construction, to bond issues.

The department will study these systems with the view to determining what system or combination of systems work best in actual practice.

Neither is there any standard system of keeping accounts for road building and maintenance, and while some counties know to a penny the purpose for which money was spent, others have no definite check or reporting system. Convict labor in road construction work will be carefully studied.

In connection with the scientific study, the department's highway engineers will advise freely with local officials as to improvements, and thus give each county visited the advantage of direct co-operation, engineering supervision, and assistance.

The investigations, it is believed, will yield important economic data bearing especially on the benefit and burdens of road improvement and showing the extent to which financial outlay under given typical conditions is justifiable. These data, when obtained, will be published and thus made accessable to all county and state road officials.

We trust the data thus obtained will be utilized to to the full by road makers in the Maritime Provinces. Our roads surely needs systematic handling. A man in charge of road work should be a mechanically inclined man possessing enough brains to get the work done to the best advantage, not only from a financial point of view but also from the view point of take advantage of the material and local conditions available. A mechanically inclined man will do more and better work on a certain section of road with $25.00 than a botch could do with $50.00; yet how often political influences put the wrong man at the head of the job.

LET US GROW BUMPER CROPS.

The Editor of the MARITIME FARMER had a pleasant chat a few days ago with Prof. Trueman at Truro. The conversation lead to a discussion on farm crops during which Professor Trueman remarked that "it would be the part of wisdom for the farmers of the Maritime Provinces to concentrate their crop growing efforts mainly on Timothy, clover, oats and turnips rather than waste too much time and energy on crops that are inclined to be seriously affected by sudden changes in climatic conditions. Let us go after hay, oats and turnips until we can grow the largest crops in the world of these three. If one acre can be made to produce from two to three tons of hay there is no reason why adjoining acres could not be made to produce a like quantity if conditions are made the same."

Practical Care of the Dairy Bull

While the conditions on the average farm pertaining to the care of the bull are not so bad as they were ten years ago, still on many farms the bulls are so neglected that their care almost amounts to cruelty to animals. Usually the dirtiest and darkest corner of the barn is selected for the bull's stall, whereas the very opposite ought to be true, as he must be kept in the barn a large part of the time, and for this reason, particularly, needs sunshine light and cleanliness.

The first thing to be considered is the feed of the bull, and I tthink the one ideal ration for a bull is plenty of good clover hay or mixed clover and timothy. Then, in addition to this, I would give four to eight pounds a day of a grain ration consisting almost exclusively of bran and ground oats. If I were to add anything to this ration it would be one pound oil meal. Next to clover hay I would prefer alfalfa, and the feed of a bull is, perhaps, the only place where I would prefer clover to alfalfa.

While many breeders have been successful in feeding a bull some corn silage and while, as far as the bull's condition goes, it is a very desirable feed, my own personal experience, and that of many other breeders as well, is that it has a tendency to make the bull impotent, due probably to its excessive carbohydrates rather than to its succulence. On the farm where they are grown, this succulence can be supplied with roots to better advantage.

A bull should always be given all the clean water he can drink at least once a day.

Handling the Bull.

It is plain from conversation with most dairymen that they are afraid of a bull and this is one of the reasons why so many good pure-bred bulls are sacrificed when two or three years old. Right care and training will do much to combat this tendency. The bull should be halter broken as a calf and when about a year old he should have a two and one-half inch copper ring put in his nose. This is a very simple operation as the cartilage in the nose can be pierced without much pain to the bull, if gone about in a businesslike way and the bull's head is well secured. The operation can be completed in less than two minutes and without the bull becoming excited at all. He should not be handled by the ring until the nose is entirely healed up and is no longer sore.

Then the bull should be tied with a strong bull halter to one end of the manger, and by his ring to the opposite end of the manger, and the two tie places should be three or four feet apart. This will make it possible to approach him from either side without giving him an opportunity to catch you.

As a rope tied in his nose ring becomes wet and dirty and soon rots, a chain made of about three-sixtenths inch iron links, or something equaly as strong, with a large heavy snap to fasten to the ring, is the best way to fasten him on that side. The bull halter should be made of the best one and one-half inch leather well looped, and he should be tied with three-fourths or seven-eighths inch rope.

The Bull Stall.

I have made a cement manger for one of my bulls and I am very much pleased with it. It goes across the front of his stall which is about seven feet wide and is about eighteen inches high and eighten inches wide and the bottom about a foot off the floor. Then in the front of this concrete manger, which is about four inches thick, I have put two upright gas pipes, two inches in diameter, that are bedded in the cement about a foot from each end of the stable. The bull is tied to these two upright rods and there is nothing that he can tear out or that will rot or wear out. There is no place under the manger to harbor rats and vermin.

I atke it for granted that it will not need an argument in these days to convince anyone that the floor is cheaper and more sanitary if made of cement. It is hard to keep a bull stall reasonably clean because so many of them will paw their beding with thair front feet, but this trouble can be obviated to quite an extent by using cut straw or shavings for beding as they cannot paw this back as readily as the whole straw. They should be given beding enough to keep them thoreugh ly clan and they will greatly appreciate and do much better if given a daily brushing.

Whenever the bull is to be handled, it should always be with a good, long, strong staff in his ring, and one that is so constructed that it will not easily unsnap and leave the caretaker at the mercy of the bull. Some of the patent staffs now advertised, especially those having a handle at the end of the staff, and with different contrivances that screw on the ring rather than snap on, are very desirable. Treat the bull with kindness yet firmness, and so handle from calfhood up that he will always respect you as boss, and never have the opportunity to learn that you are really powerless to handle him, even with a staff, if he knows his strength. Pet him if you wish, but never let the thought leave your mind that he is watching for on opportunity to gore you, and this caution is especially needed if the animal is apparently tame as nearly all the accidents with bulls are those that are quiet and therefore trusted.

Trimming the Hoofs.

Where the bull stands in the stall, as he has to a large part of the time, his hoofs become too long and need trimming. This is often done with hammer and chisel but cannot be done satisfactorily in that way. Commence when the bull is young and throw him when you need to and cut off his hoof with a saw. The bull can be thrown with a hobble such as are used on horses, but an equally good or better way is to throw him with the so-called three-way hitch.

To do this a rope is tied around his horns with a knot in back midway between his horns. The rope is run back about a foot and then around his neck just forward of the shoulders and back through the rope at top, making a slip hitch, then back along his spine to a point just back of the front legs when the same sort of hitch is made around the body except in an opposite direction; then back along the spine again to a point just forward of the hips when another hitch is made around the body in the same direction as the one around the neck and in the opposite direction from the one around back of the shoulders. About 30 or 40 feet of one-half inch rope is snugly adjusted and the bull is in an open field or yard with plenty of room, let one man who is used to handling the bull hold him by the staff and two or three men pull on the rope when usually without much trouble, the bull will lie or fall down. Then place a wooden block, as large at least as four by four inches, under the hoof to be sawed off, and with a sharp strong saw, with medium sized teeth and plenty of set, saw the hoof off so that it will be in the shape it should be.

A little care is needed to find the exact place and not saw them close enough to bleed and for this reason it is best not to saw them too short the first time. Saw them off at the heel as well as at the toe of the hoof and this will have much to do in keeping the bull's legs sound and free from blemishes and therefore add to his long usefulness.

The Value of the Tread Power.

Nothing is more important and more often neglected than exercise. This is one of the things that there is one best way to do and that is in a tread power. Any cross bull or one hard to manage can be easily quieted and easily handled if given plenty of work in a tread power. I have had a tread in my barn in which the herd bull has been worked to run the separator, twice a day for twenty-one years with not over five dollars for repairs. I think it will be good for several more years. In these twenty-one years several bulls that I have purchased, and that have been more or less unruly, have been quieted and made easy to handle by this work. I am sure that a tead powe would be a good investment if you made no othe use of it except te execise a bull. The best powers have automatic governors and these can be adjusted so as to control the motion whether the machinery is attached or not.

One of the difficulties in teaching a bull to work in the power is that it will become wet and slippery sometimes and he will have hard work to walk. Try sprinkling on the power a quantity of dry, fine sand so that it will not get in the bearings at the end of the lags and this will fix it so that he can walk even if it is wet. When you start to work him he should first be tied with a rope around his neck, knotted at the throat and then run through the ring and tied in front in a way that will keep his head up somewhat but will still let him walk far enough back so that if he begins to slack up his hind feet will slip out of the power. Then the person in charge should keep hold of the end of the break beam and let him start very slow at first and he will be inclined to fall back and thus fall out of the power. You can stop the power just when his feet begin to go down over the end. Usually a little slap with the hand will make him step ahead and he will very soon learn what is wanted of him and will go faster and faster, but someone should stand behind him the first time or two that he works and see that he does not back up and fall out and hurt himself. He will very shortly learn to enjoy the work and will look forward to the chance to go into the power for his daily exercise. He will not only be quieter and more kind, but more potent, because of this enforced exercise. I realize that not every farmer who owns a bull will think that he can afford to own a power, though I think they could well afford to.

Exercise in the Yard.

Not having a power, the next best method of exercising is to build a strong yard of logs or planks in which the bull can be allowed to run loose. This should be at least two rods square. Even when provided with such a yard some bulls will take no exercise, simply standing around waiting for the door to open and let them back in their stall; or, if exercising at all it will be attempting to tear the fence to pieces. The best method for getting a bull to exercise under these conditions is to hang a block or stump either from an overhead wire stretched across the yard from posts outside or hung from a log. Most bulls will stand for a long while every day and fight this block.

I once saw a bull that had been used to such exercise for a long while, that as soon as he went out in the morning started in anew as if in a great frenzy and worked until he was actually in a sweat. While not as good as the tread power, still in most cases it will be very effective. This is easily within the reach of any farmer and every bull should have one or the other of these methods of exercise.

While the immediate object of such exercise is to make the bulls potent, kind and quiet, the mere fact that it does make them potent and kind means that more and more of the old bulls will be kept until they have proved their worth. It is indeed a very sad commentary on our business sense and foresight that nearly all of the best dairy bulls have been slaughtered before their worth was known.

The Value of the Mature Bull.

I could tell of hundreds of such instances, but to give one concrete example, the results up to date show that the Guernsey bull, Golden Noble II., was easily the best sire that they have had, at least in recent years, on the Island. Because he was cross and because few aged bulls are kept on the Island he was killed when about two and one-half years of age. He would be but nine years old if alive now and would be worth any price that they might ask for him as he was not only a good sire but a splendid individual.

Another point of great interest is the fact that figures certainly seem to prove that bulls at their maturity are better sires than when young. I have looked up the records of fourten of the most successful sires of the Guernsey breed that were kept until they were really mature buls, and the atached table of what I find will surely be of interest. I am unable to say just how old many of these bulls were when they died as I do not have this data at hand. Under each of these bulls I have given the records of their highest and next to the highest record daughter and placed opposite the age the bull was when he sired this daughter.

Of the 24 cows, not one was sired when the bull was younger than 2 yrs. One was sired at 2 years old, 3 at 3 years, 6 at 4 years old, 6 at 6 years old 2 at 7 years old, 2 at 8 years old, 1 at 9 years old, and 3 at 10 years old.

At least two of these bulls are still alive, Governor of the Chene and Masher's Sequel. There are several other

(Continued on page 746.)

Second Annual Report of United Fruit Companies of Nova Scotia, Ltd.

(Continued from page 719.)

from cars and left standing on the shed floors for hours at a temperature often below zzero.

During the shipment of the early fall fruit, when cars of apples lay on the track awaiting loading, one of the important duties is to have these cars opened up during the cool of the night thereby enabling the fruit to go on board the steamers at a much lower temperature. This of itself may mean several hundred dollars at the final sale of one shipment.

It will be remembered last season that the United Fruit Companies were furnishing over half the apples for a chartered boat, the representatives of the other interests had secretly arranged with the shunters to place their apples alongside of the steamer last in order to get the benefit of the hatch ventilation; this is the most important on outside chartered boats not equipped with the fan ventilation; besides this, the apples are the first unloaded at port of discharge, enabling an early sale when a catchy market might easily mean a few shillings per barrel higher.

It is needless to say your Halifax representative got on to this scheme and immediately reversed the order of affairs.

With the United Fruit Companies handling from one quarter to one half million barels of apples and potatoes, it would be impossible to estimate the value of having them carefully looked after at the port of loading. "A chain is no stronger than its weakest link."

Important as your apple inspector in the Valley, your representative in England, so also is your Halifax office if you want the United Fruit Companies of Nova Scotia to be of a uniform strength.

To show that everything is not plain sailing at Halifax the following letter which speaks for itself was sent from your office there to the Board of Trade

Halifax, N. S., Jan. 3, 1914.

"To Council of Board of Trade,
Halifax, N. S.

Gentlemen:—Through your honorable body we wish to try to eliminate certain conditions that have existed at Halifax for some time, i. e. the delay in getting cars of apples shunted down to tht steamers at deep water.

On New Years Day we had 33 cars of apples coming in for S. S. "Montrose," at Pier No. 3. The first special had 10 cars which arrived at Richmond at 6.40 p. m. Seven gangs or 119 men were ordered to start work on steamer at 7 o'clock. Through some carelessness these cars never got alongside the boat until 9 p. m. which meant paying 119 men for two hours each at .35 per hour to shiver and shake in the cold. While such unnecessary expense had to be paid by the Steamship Company, nevertheless, in the end, it is borne by the shippers of the goods and is always an important feature when discussing future freight rates on apples through the port of of Halifax.

Besides the expense there is the danger from frost during such delay. If the near zero temperature on New Years night had been accompanied by a gale of wind undoubtedly the apples would have got touched with frost.

Now, gentlemen, we respectfully ask you to take this question up and to straighten out a condition that is working against "the good old port of Halifax."

One of the most important ventures of the Company during the past season was the commencement of an official newspaper.

It was felt that this step was necessary as an educational factor, the majority of our membership having a very incomplete knowledge of the principles of co-operation.

It was also felt that some method should be employed to keep co-operators posted as to what was being done by their Central to give them some idea as to the markets and what their apples were doing.

The necesity was also realized of having some means of rebutting many of the false and vindictive reports, which were constantly being circulated, such reports unless promptly dealt with being liable to do considerable harm.

The Co-operative News also provided a valuable medium through which ideas for the improvement of conditions could be aired.

Its columns have also been used as a means of education to our members along horticultural lines and articles by some of our best authorities and specialists have been published from time to time.

The entire cost to the Central Association of this department has been $436.35 and we feel that, considering the amount of good that has been derived and the useful purpose it has served, that money has been well expended.

This department was placed under the control of your Secretary who has every week without a break written one or more articles for its columns.

At present the Co-operative News is run as a part of the Berwick Register which is found to be a most satisfactory arrangement owing to the proximity of the printing office and to the fact that this alows a certain amount of elasticity as to the amount of space used.

It is suggested in some quarters that a paper entirely our own issued fortnightly would be better.

Before our present contract expires the advisability of such an arangement will be considered.

We regret to have to report that we have received intimation from many quarters that, generally speaking, the books of subsidiary companies are not being kept in a manner that is at all satisfactory.

We are afraid that the members and directors of our subsidiary companies do not appreciate the magnitude of the business that is conducted in their offices and consequently make no provision to have competent bookkeepers.

We feel that this is a matter of vital importance as nothing is more apt to wreck the whole Co-operative Movement than the dissatisfaction and suspicion that is bound to arise in Companies where the accounts are not properly kept.

The Central Association supply all necessary books to subsidiary companies, covering records of detail of packing, which, being tabulated are comparatively simple but trouble seems to arise through lack of knowledge as to keeping accounts necessary to the proper compilation of profit and loss accounts and the financial statements of most companies are useless from the point of view of demonstrating the present financial standing of the company or showing clearly from whence revenues has been derived and how it has been expended.

It has been suggested that a Central Auditor should be employed whose business it would be to visit all Companies and instruct managers or bookkeepers and audit their work and thus ensure a uniform system in all Companies and Co-operators a guarantee that their accounts were being correctly kept.

The Provincial Government, in their new Co-operative Act recognize the importance of this and provide for such an official; other Co-operative concerns in Europe employ their Central auditors to audit the books of the share-holding Companies.

We would like to have this matter discussed by the Delegates present and to obtain their views.

The most serious problem that confronts us today is the necessity of more expeditious handling of fall fruit.

We would recommend that a committee be appointed to work with one or more of your officials with a view to submitting to this meeting before it disperses some definite proposal or recommendation to remedy this undoubted flaw in the system of the Central packing.

Your Directors, recognizing the importance of a uniform set of By-laws for all Companies, appointed a Committee to prepare a set that would be suitable.

The Committee which consisted of Messrs. A. S. Banks, F. W. Foster, A. E. MacMahon and your Secretary, found it necessary to make certain amendments to the Act of 1908 before any set of By-laws could be compiled that would be deemed satisfactory.

The amendments that we submitted to our legislators at Halifax and which passed both houses read as folows:—

"Be it enacted by the Governor, Council and Assembly as follows:—

1. Section 14, of Chapter 33 of the Act of 1908 is repealed and the following substituted therefor.

14. The shareholders at any annual meeting, or at a special general meeting called for the purpose, may from time to time make by-laws, rules and regulations not contrary to this Act, or the laws of the Province.

(a) To regulate any matter connected with the internal affairs of the Company.

(b) To regulate the sale, barter or disposition by the Company's Shareholders of fruit and farm produce grown by them.

(c) To provide for forfeiting the shares of any shareholder who violates any of such by-laws.

(d) To provide for the payment of pecuniary penalities by any shareholder who violates any such by-laws, which penalties shall be recoverable on summary conviction; and to alter, amend, or repeal the same. A copy of such by-laws, rules and regulations, certified under the seal of Company and the hand of its President or Secretary, shall be delivered to the registrar who shall register the same, and such by-laws, rules and regulations when so registered shall be in force unless and until altered, amended or repealed by the shareholders in accordance with this chapter, or disallowed by the Governor-in-Council.

An Amendment to a Bill entitled an Act to amend Chapter 33 Acts of 1908 entitled "An act to faciliate the Incorporation of Farmers' Fruit, Produce, and Warehouse Associations."

Add as Sections 2 and 3 and 4.

2. Paragraph (a) of the third clause of the form of Memorandum of Association in Schedule "A" to said Act is amended by adding thereto the following:

"Arsenate of lead, spraying materials, and all kinds of insecticides and fungicides, power spraying outfits, hand pumps and all other commodities or material incidental to the use of the same, nails, pumps, leads, paper and all material necessary for the purpose of packing fruit, and farm produce, flour, feeds and all milling produce, artificial fertilizers of all kinds, seeds, farming implements, tools and wagons and all manner of merchantdise.

3. Paragraph (b) of the third clause of the form of Memorandum of Association in Schedule 2 "A" to said Act is amended by inserting before the word "storehouses," in said paragraph the word "stores" and by inserting before the word "warehousemen" where it occurs therein the words "storekeepers and."

4. Sections 13 of said Chapter is amended by adding thereto the following sub section,

(2) Every Company under this Chapter subject to the conditions of and in addition to all other powers conferred by this Chapter shall, with the Shareholders at a general meeting called for the purpose, have power to borrow money for the purpose of carrying out the objects of its incorporation and to execute by mortgages of its real and personal property, to issue debentures secured by mortgage or otherwise to sign bills, notes, contract and other evidences of or securities for money borrowed or to be borowed by it for the purpose aforesaid and to pledge debentures as security for temporary loans."

The set of by-laws that were subsequently compiled will be submitted to your Directors for opproval in due course.

The Committee appointed last season to investigate as to the best method of utilizing our By-Products (the culls), have carried on some useful investigations.

A report from this committee will be submitted to you tomorrow.

We feel that in the purchasing of supplies your Central Association has again been successful and the whole Valley has saved considerably by its operations.

We need hardly call your attention once again to the great difference today in the prices of fertilizer, arsenate of lead and other commodities compared with the prices maintaining before the growers bought these commodities co-operatively.

We are aware that in certain details improvements could be affected and we trust your Board of Management for the ensuing season will see their way clear to adopt certain suggestions that will be passed on.

Your purchases for the past year have included:

575,000 pulp heads; 35,000 lbs. nails; 67,800 lbs. grass and clover seed; 22-745 lbs seeds various; 48,300 vetches 4,500 bus. seed oats; 2,060 bbls. flour; 19,649 bags of feed; 6,044 tons fertilizer; 104,000 lbs. arsenate of lead; 8,-900 rods wire fence; 1,800 bbls lime sulphur; 2,200 lbs. black leaf 40.

These supplies have cost in round figures $183,000.

Fire Insurance Risks, $450,000.

We had hoped to see more Companies take hold of the feed and flour business.

A considerable saving to members is to be effected by Co-operative handling of these essential products and in view of the large quantity of feed brought into the Valley and the large percentage of the growers who are co-operators a much greater quantity should be handled co-operatively.

It is hoped that arrangements that are now being negiotiated will result in this business being handled in a more expeditious manner than possible heretofore and with even greater profit to our membership but this can only be effected by every member doing

BANK OF NOVA SCOTIA ESTABLISHED 1832

A Safe Place For Your Savings

If you refer to the Government Reports you will ascertain that this institution is one of the oldest established of Canadian Banks, with a Surplus Fund of nearly double its capital and a high proportion of cash reserves. We invite deposits, large and small. 28

The Bank of Nova Scotia

PAID-UP CAPITAL - $ 6,000,000
SURPLUS - - - - 11,000,000
TOTAL RESOURCES 80,000,000

BRANCHES OF THIS BANK in every Canadian Province, and in Newfoundland, West Indies, Boston, Chicago and New York

ACADIA UNIVERSITY
WOLFVILLE, Nova Scotia.

Departments
Arts and Sciences. Applied Science. Theology.

Degrees
B.A., B.Sc., B.Th., M.A., and certificates in Engineering admitting to third year in best technical schools. First year in Medicine, Law, and Theology given as electives in Arts course.

Equipment
Largest undergraduate faculty in Maritime Provinces. Three new and splendidly equipped Science Buildings.

Expenses
Expenses light, and over $1000 given in prizes and Scholarships yearly.

Send for calendar to
GEORGE B. CUTTEN, D.D., Ph.D., President.

ACADIA LADIES' SEMINARY
WOLFVILLE, - - Nova Scotia.
A High Grade Residential School.

The Aim.—To Prepare Girls and Young Women for Complete Living.
The Course.—Twelve, including College Preparatory, Music, Arts, Oratory Household Science, Business.
The Faculty.—Twenty-two Teachers of Fine Personality and Special Training for the Work.
The Equipment—First Class in every respect.
The Location.—Evangeline Land.
The Expense.—Very Moderate. From $185 up, according to course selected.
Information.—Write for Illustrated Book to
Rev. H. T. De WOLFE, D.D. Principal.
Next Term begins Sept., 2nd 1914.

Acadia Collegiate and Business Academy
WOLFVILLE, - - Nova Scotia.
84th YEAR

A Residential School for Boys and Young Men with a beautiful location. Ten experienced teachers, and a very successful record of over 80 years.
Four Diploma Courses Offered.
1.—University Matriculation, in Arts, Science, Engineering, Medicine, etc.
2.—The General Course.
3.—Manual Training (wood and iron).
4. Business Courses.
Necessary Expenses $200.00 including Board and Tuition. For Calendar and other information. Write to Principal

WOLFVILLE, - - NOVA SCOTIA.

his share and buying all his supplies through his company.

It should hardly be necessary for us to urge this when the great savings to be effected are so obvious and which become greater with every member who takes hold of Co-operative buying.

He would like to remind Co-operators that the United Fruit Companeis N. S. Ltd., is their own business and its administration and destiny is in their hands.

By judicious administration it can contiuue to protect and safeguard the interests of fruit growers and be a source of great profit to all.

The history of Co-operative Movements demonstrates the necessity of the careful selection of officials, who should be selected for ability and for trustworthiness alone.

Ninety per cent of the failures of co-operative movements are attributed to affairs being in the hands of incompetents; we in Nova Scotia should benefit by the experience of others and obtain the very best men available; we cannot afford to employ any less.

In conclusion we wish to state that never has the Co-operative spirit been stronger, never have the principles of Co-operation been better understood than today, all of which we attribute to the fact that during the year of which this marks the close the system of Co-operative Centralization for which this company stands has been amply justified.

We wish to place on record our appreciation of the valuable asistance we have received from the management of the subsidiary Companies throughout the season.

This assistance so readily given and the evident desire of all to co-operate has alone made it possible for us to bring our various operations to a successful conclusion.

We leave this record of our stewardship to your judgment and consideration, urging that you press steadily forward with the great work that you have started take advantage of every opportunity that Co-operation provides perfect your organization and the great industry in which you are all so vitally interested will become one of the most profitable in the Dominion.

Controlling the Budmoth.

The one insect which at the present time is causing more loss to the apple growers of the Annapolis Valley than any other is the budmoth. Unlike most of our insect pests the number of budmoths varies very little from year to year. The three species, one very common and two comparatively scarce, have practically the same life histories and can be best controlled by the same sprays.

The experiments recently completed in the orchard of Mr. R. S. Eaton, of Kentville, give us some startling data on budmoth control. The spray at one time recommended for budmoth, to be applied when the buds are opening and the budmoths are eating their way into the bud, is apparently worthless in budmoth control. In one plot receiving this spray only, the benefit as compared with the average of the checks was 4.26 per cent in another plot receiving the same spray only we found more budmoths than in the average of the checks and only 5.9 per cent less than the nearest check. While in another where the early spray was applied in combination with other sprays the benefit was 9 per cent while in another the reduction in numbers was 16.5 per cent. The reason for the failure of this spray to act is the long period, from ten to twelve days, during which the budmoths emerge from their winter quarters, the rapid opening of the bud at this period rendering the spray worthless in one or two days by opening up new surface.

The spray applied two weeks after the blossoms fall is more useful than the spray applied when the buds are swelling but is of very little use in controlling budmoth.

The sprays which control the bud moth are the one applied from one to 5 days before the blossoms open and the one applied immediately after the blossoms fall controlling (applied by a hand sprayer,) 62.89 per cent of the budmoths. These two sprays are of about equal value. The two applied are slightly more than twice as valuable as either if but one is applied. The reason that these sprays are so efficient is is; the budmoth while feeding under cover is occasionally tying down new leaves to feed upon and while one budmoth may tie down a new leaf the day after the spray is applied his next neighbor may not need a new leaf for a week; so the reason for using the most adhesive poison obtainable is obvious.

The best time to spray for budmoth is as we see during and after the damage for the curent season. The main benefit is not derived until the following season.

It was noticed that in most cases in buds infected with budmoth the blossom clusters opened and usually two or three good blossoms appeared; in order therefore, to get the actual damage counts were made in the blossoms after the set took place in 1913.

In 1000 blossom clusters not infected with budmoth 1205 apples were set. In 1000 blosom clusters infected with budmoth 305 apples were set. The set in the infested clusters therefore was reduced 75 percent. The ordinary infestation in unsprayed orchards will run over 40 percent. of blossom clusters infested often going to 60 and 70 percent in varieties such as Ribston, Nonpareils and other rough-barked trees which offer good crevices for winter hibernation. Taking a low estimate of 40 per cent infestation in unsprayed orchards we see that the set of fruit in these orchards is reduced by 30 per cent. on account of budmoth alone. Our experiments show that with a hand sprayer we can eliminate 62.89 per cent. of this loss, and undoubtedly more can be done by using a power outfit. We are therefore safe in saying that two-thirds of this 30 per cent. decrease in set can be saved by two sprays, one from one to five days before the blossoms open and one immediately after they fall.

Now to get down to figures, by these two sprays we can reduce budmoth injury by two-thirds or in orchards previously unsprayed we can in two years cause 100 apples to set where 80 set before or increase our set by 25 per cent.. Estimating therefore that apples are worth $1.00 per barrel on the trees, an orchardist may spend $25.00 for every 100 barels of apples that his orchard will average in applying two sprays, one before the blossoms open, and one after they fall, and be certain that he will get his money back the next year in increased set of fruit.

Twenty-five dollars per 100 barrels for two applications is of course away high. Most orchards in the Valley do not ordinarily cost more than $5.00 per application per 100 barels of fruit average However, the worst orchards, that is those containing old scraggy trees, give the greatest benefit when sprayed as they are usually very badly infested when not sprayed. Any orchardist who is at all in doubt as to whether spraying pays may be certain that the benefit derived from controling budmoth by his two sprays, one before and one after the blossoms, will more than pay for the entire cost of applying four sprays to his orchard. I am not decrying the other sprays in any way; they are as useful as the two here spoken of for other purposes, but we are in a position to state with certainty that we can control budmoth to such an extent in the Annapolis Valey that the benefits derived from controlling it alone will more than pay for the entire cost of spraying.

I need hardly say that it is above all necesary to use the most adhesive poison obtainable such as paste lead arsenate.—G. E. Saunders in Berwick Register.

New Science Building at the Agricultural College, Truro, N. S.

The contract has been let for the new Science Building at the Agricultural College, Truro, Nova Scotia. This building is to be 120 feet by 50 feet, and three stories in height. The first story is to be devoted to Chemistry; the second to Entomology and Plant Pathology and the third to Domestic Science. Hitherto classes in these subjects have for the most part been conducted in the Science Building at the Normal College, but the large increase of attendance at both the Agricultural College and the at the Normal College has made it imperative that a new building be erected on the Agricultural College grounds. In architecture and finish this building will be superior to any of the other buildings which have up to the present time been constructed at Truro, and will, therefore, prove a very substantial addition to the excellent plant on the Agricultural College premises.

The funds for this building have been secured by capitalization of part of the Dominion grant for the air of Agriculture and it augurs well for the future of the Agricultural College that the Federal and Local Governments should co-operate in the development of this important institution, which has for its aim the improvement of agriculture in Maritime Canada

When this building is completed the facilities for agricultural education and investigation at the Agricultural Colege at Truro will be largely increased. Up to the present time the officers of the College have not had much opportunity for carying on original investigation work, but the new laboratories and equipment will provide facilities for this. A begining has already been made in the somewhat cramped quarters, but there are great problems to be investigated before full understanding of the agricultural conditions in the Maritime Provinces is arrived at.

As a small indication of what has already been accomplished and what is prospected, the following will prove of interest.

Fundamental work is being done in the Chemical Department where a soil survey of Nova Scotia is being undertaken. In the Annual Report of 1913, the complete analysis of some 86 samples of soils taken in various parts of Nova Scotia is presented, and judging by the facts already arrived at, it would seem that the chemist, Mr. L. C. Harlow, B. Sc. A., will be in a position to give some extremely valuable information to the farmers in those parts of Nova Scotia from which the soils were selected. Perhaps the most striking fact which has so far come out from these analyses is that a large proportion of the soils analysed are slightly acid in character and are considerably below the standard of lime content. A good productive soil should contain from 5 p. c. to over 1 p. c. of lime. The average of the uplands and intervale soils so far analyzed by Mr. Harlow indicates a little less than 3 p. c. of lime, which goes to indicate that lime may prove of great value in the improvement on the soils of Nova Scotia.

In comparison with the above figur es, the average of sixteen marsh soils analysed indicates 75 p. c. of lime and these marsh soils are all productive. In view of the above facts, much interest is attached to the experimental work which is now being carried on in many parts of Nova Scotia, in the application of ground limestone of which there are many deposits in the Province.

However, it is not our intention in this article to fully discuss the question, but merely mention the line of investigation that has been taken up and which will be rapidly rushed forward when the new building is completed.

Equally important lines of investigation work are being taken up in Entomology and Plant Pathology and in connection with the various problems of plants, soils, insects, etc., etc., and as a result we think that the Nova Scotia Agricultural College is going to contribute more and more to the building up of agriculture in the Maritime Provinces.

It is extremely satisfactory to observe the rapid increase in attendance at this institution, which has accomplished so much for agriculture in the East. It is less than ten years since the atendance in the regular course, was only 17. Now it is well over the century mark. During the same period, the atendance at Short Courses has increased from 68 to over 350.

1914 promises to be the most succesful year in the history of the institution and we, therefore, urge all the young men of the Maritime Provinces to write to Principal Cumming at Truro and secure a calendar which gives full information in regard to the courses which will be conducted during the ensuing year.

Regularity

of the bowels is an absolute necessity for good health. Unless the waste matter from the food which collects there is got rid of at least once a day, it decays and poisons the whole body, causing biliousness, indigestion and sick headaches. Salts and other harsh mineral purgatives irritate the delicate lining of the bowels. Dr. Morse's Indian Root Pills—entirely vegetable—regulate the bowels effectively without weakening, sickening or griping. Use

The Awakening of Joe Beaton

THE kindly beams of the ever faithful sun was shedding its warm rays over all nature as it had done for thousands of years in the past, and on this beautiful spring morning in the month of June it had not failed to be punctual to the dot of peping through the dingy window of Joe Beaton's small printing office, where Joe almost as punctual as the sun, sat at his desk writing editorials for the paper.

He had been editor, proprietor, office boy and soul of the 'Nova Scotia News' for over twenty years. He had worked hard and had given his life to bring his paper up to a place of prosperity. It had never been in a successful condition, and it was not in its present condition that he took pleasure.

In his rare moments or reverie, his mind would wander back to the night when he counted out the purchase money and closed the door upon the former broken spirited owner of the paper.

He locked the door, he remembered, and in the close, rank, inky smell of the composing rom, lighted only by a solitary feeble kerosene lamp, how he stealthily, like a shame-faced lover, crept about the room caresingly running his hand over the dusty forms, and after a general survey of the room sat down at a pine table, which served as the editorial desk, and wrote his first leader.

Twenty years before Joe Beaton had walked into the village a penniless, ragged, silent boy, of fourten.

From some source he had inherited a keen desire of bettering his condition.

Boys of his age are apt to think it an easy thing to go out in the world and earn their own living. But they often find themselves in difficulty, possibly in want.

To be sure, his scheme was not as romantic as that of some boy's, who leave good homes armed with revolvers to hunt for Indians. If a real Indian, in his war paint should suddenly make his appearance, he would put to flight a hundred of such boy hunters.

Joe Beaton was not as well fitted as the great majority of boys to make his way in the world. He lacked the advantages of an education. But he was full of confidence, as most boys are, and posessed the determination to raise in the world, which is often lacking in boys blessed with good advantages, and who often throw them away.

A boy being thrown upon his own resources is not only required to have, for his success in life, thrift, application and industry, but good health, and a firm trust in the guiding hand of our Heavenly Father, which is the only safe guide for a successful life.

Joe Beaton had managed, often by some unboyish effort, to get a living, and a scant education. His craving mind gleaned from every printed word that came his way.

At eighteen he was a stable boy, reading Herbert Spencer by the light of a smoky lantern, and admiring his secret ambition to own a newspaper. At thirty, by careful management he had managed to save enough money to buy the miserable equipment that made up the 'Nova Scotia News' printing outfit, which was being hastened to an early grave by lack of support, and the persecution of a local rival.

As Joe Beaton sat at his desk writing editorials, this fine spring morning a woman partly opened the door and bent her slender form in the half open doorway.

"Joe," she said, and at the sound of her voice Joe rose and turned toward his wife. In her face there was such a look of strain and fright that he said hastily, "What is it, Mary ?"

She was almost breathless, as if she had been running, and the warm sun of the spriug morning had brought color and prespiration to her usual colorous face. Her eyes searched the room despairingly. "Have you seen Johnnie?" she whispered.

Joe Beaton shook his head irritibly and turned to his desk.

Mrs. Beaton sank upon a chair as if hope and strength had left her.

"Oh, Joe," she cried, "I don't know what Johnnie has done, but I am afraid"— "Afraid of what?" Beaton asked. His voice was harsh but a look of dread crept into his eyes.

"Is it unusual to have him spend the day the dear knows where?"

"No, but—Mrs. Foster told me that Jones store was broken into last night and a lot of things taken. She said some boys were suspected, and I fear Johnnie may be in it too." And Mrs. Beaton buried her face in her shawl to conceal her grief, and her husband gnawed at his moustache while his face set in lines of bitterness.

"Well," he said at last, "There is no use of your crying after all; this latest affair is not so unexpected is it?"

The woman winced at the tone, but like a flash she remembered what little interest he had taken in his boy. Deep in her soul she felt her husband was to blame. The tears dried in her burning eyes. Raising her head with reproach burning in her expression, said:

"Johnnie has always been a good boy to me. I offered him what money I had to get a pair of shoes and he wouldn't take it. When he had work in the factory last summer he gave me money for a new dress. And when I was ill he sold his rabbits to get me a bottle of wine. He's got a good heart, and he'd be a good boy today if you'd take a little interest in him. Have you ever taken any notice of him Joe, but speak discourageingly to him if his work didn't please you? Did you ever pay him when he set type in the office here all Christmas vacation? He was trying to be a good boy then, I knew it—but what ever sit down of an evening and help help did you give him? Did you ever sit down of an evening and help him with his lessons, or pay any attention to his schooling, except to sneer at him when he didn't pass? You know how he loves dogs and horses. If you would let him have a pet of some kind instead of punishing him when he hung around the livery stable, he'd be a better boy to-day."

Her shaking hand caught a faint sob as she uttered the last words. The restraint of years had given away to something fierce and primitive, which the Creator has put in the heart of every mother had conquered the mild commonplace wife. Stinging truths, which all her maried life she had only dully realized, rushed into words, shaking her with their new intensity. She lost the usual courticies for the man before her. If he sneered she did not hear him, her eyes swam in a hot mist of tears.

"You've buried yourself in the paper," she cried.

"You've spent your money on it. You'd eat and sleep here if you could. You care more for one of those machines here than the welfare of your son. Your heart's got room only for the paper. Your a selfish and hard man, Joe Beaton, and your son's a thief because you have neglected him and allowed him to grow up without your kind sympathy and advice I—I— Oh, Johnie, my Johnnie!" she gasped, as she hastily rose and closed the door behind her, before the man stirred.

The silence caused by the departure of his wife fell upon Joe Beaton like a pall. He pushed the paper away from him, which lay before him on the desk, and sat unconscious of the hours as they passed, staring into the shadows of the dingy room, while the memory of his boyhood days stirred within him so strongly that the hours slipped by unheeded. He was aroused at last by the clock striking eleven, he doubted the accuracy of the hour the faithful clock had tolled out. Puling out his watch he glanced at it, reached for his hat, and went out.

News of the robbery of Jones' store began to circulate, and afforded a new topic of conversation among the village folk. Some of the stolen articles had been found, and the arrest of the boyish thieves immediately followed. Most of them were boys of questionable character and their connection with the affair caused little surprise. But when the name of Johnnie Beaton came out the town was shocked as he had always been looked upon as a boy of good habits.

Joe Beaton soon returned. Seating himself at his desk, he pulled a writing tablet towards him. What he felt in the heart of him, people never knew.

In a quarter of a column he gave the events of local interest, an account of the robbery and the names of every boy connected with it, following with a half column of advice to fathers

Perhaps not a person who read it, would feel its under-current of misery, but it was there, running through each line, a bitter tide of self-accusation, the writing of it had been like salt in a wound.

How true it is, as George Eliot says "Conscience is harder than our enemies." He drew the copy sheets toward him and took up his pencil, but in a moment he cast it aside and fell to staring into the dark corners again.

He was haunted and hindered in his work by a dim sense of melancholy, the cause of which eluded him.

He had no fear of the opinion of any man, and yet this escapade of his son, had stirred undreamed of depths of unhappiness Certain of his wife's words mingled with obscure fragments of thoughts and memories possessed his brain. The fire of his defiance died; something stirred within him, which was like the blind groping of feelings and instincts long repressed. His thoughts sped back to the day his son was born, to the pride he had felt and then forgotten in the stress of his fight for place.

Many other things he had sacrificed and when life was two-thirds gone, he was just beginning to count the cost of what he had thrown away.

His thoughts came back to the present, he saw where he had

His thoughts came back to the present, he saw where he had made a mis take in the past, and resolved to do differently in the future. Carying out this decision he went bail for his son, and pleaded his youth.

That evening he asked his son to come over to the office as he wished to see him there.

A sense of inability fell upon Joe Beaton's heart.

In one of those moments of clear vision, that comes once or twice in a lifetime, he realized that his own son looked upon him with alien eyes. Whose was the fault ?

The truth plucked at his heart and he knew the answer.

The seconds rushed into hour—long minutes, while he searched for the words he knew he must speak then or lose forever, what had become suddenly precious above everything.

He had sunk so deep in his unaccustomed thoughts that he did not hear the door open, and he started, when his son entered. He looked at the boy's face, there was no help in it His eyes dropped to the ragged condition of the boy's shoes. As the man looked at them, a recollection, swift and cutting as a kuife within him. He had once seen his own feet clad like that once, and they were wet with the dew and muddy with the soil of the plowed field.

A painful crimson flushed over his face, but with that moment the way cleared before him.

"Johnnie," he said, and the boy's eyes darted toward his father's face, with a look of fear and doubt.

Nothing in Joe Beaton's life had hurt him like that look, but he did not draw back.

"Johnnie," he said again, "will you come over here, I want to tell you something."

The boy stumbled silently into the chair opposite his father's and Joe Beaton began to speak, simply, as if thinking aloud but with his eyes fixed on the boy's face.

"I'm going to tell you something, Johnnie," he said. "and I've never told anyone else before, so that you will understand."

"I took something myself once that didn't belong to me, and I want to tell you about it."

The boy's eyes gew large with wonder and perplexity, and the sullen look died out of his face as he listened.

"I was born on a farm, John, a miserable, hilly farm, all stones and stumps. Before I was ten, I began to hate the farm and its work, and the lonesome life. I had to work harder than you have ever done. Though I was younger than you are now, and we were so poor that I had to stay out of school a good deal because I hadn't decent clothes to wear, but all of that came to an end when I was fourteen.

My father had been to town one day and after supper he sat down by the table to count out the money he had got for a load of vegetables he had taken with him. I stood watching him for a time and finally I said, father, how much of that are you going to give me? I can see now, how my father stared at me, and can hear, just how he said: 'How much do you pay me for your keep?"

A sense of indignation and injustic rose within me. I couldn't stand any more. You see I never had any wages and I had worked almost as hard as a man, I forgot everything except the sense of my being wronged. Without a word I left the room.

The next day, my father sent me to market with a load. After disposing of the vegetables, I returned the horses to their stables and made out into the road. I never stopped until I got six miles away to a railway station. I never saw my father again.

The next morning I took a freight train to this place, it was only a very small village then, and it wasn't easy for a boy to get his living. I got my breakfast for cutting up some wood. I got my supper by cleaning out a furnace. In winter I shovelled snow, in summer I mowed lawns. I sold papers, I drove delivery teams, I broke stones on the road. I was ragged most of the time, and I don't think I had much to eat, but I never took another cent that didn't belong to me, John, and I sent the money back to my father, that I took from him that night."

A swift flust swept over the face of the boy. He had listened like one fascinated against his will as his father talked, but the last sentence threw him back upon himself again, and a look of shame took the place of the interest he had shown. His father noted the expression and with a pang of regret he realized that he must go on.

"I was almost thirty before I could save enough money to buy this paper, and when I got it, I had to fight so hard to keep it there was no time for anything else. When you were born I supose I was glad, but there wasn't time to think even about you. The old enemies of the paper followed it to me, and plenty would have been glad to see it go to the wall.

I used to think sometimes if I could hold on until you got old enough, I should have someone to help me. But someway, I—I— Well, perhaps I'm not an easy man to work for.

Your mother says I'm a selfish man, and wrapped up in the paper I know she is right. I haven't had much time to help either of you. Money is always scarce it seems and perhaps in the fight for it, I've forgotten what made me run from home when I was a boy like you."

Joe Beaton relaxed a little from the strain the foregoing had given every nerve, and siting back in his chair he said:

"Now, Johnnie, I'll tell you, Lawson leaves Saturday. "I'll give you the same wages I've been paying him, if you'll take his place and do his work. I hope you will, John. And I think, if we go at it in earnest, we will show the country a paper that no one can beat."

Johnnie was moved at what his father had said, he had never talked so kindly to him before, he looked at the floor with trembling lips, he felt encouraged that his father had taken such unusual interest in him, he also felt ashamed and overwhelmed with a sense of his own wickedness, but in his heart there sprang up a new adoration, he could have gone down on his knees, but instead, being a noble boy, he brushed away the tears that swelled his eyes, saying:

"I like the work and I guess I can do it, I'll try and do my best."

It was long past the usual closing time, and Mr. Beaton rose to prepare for home, and as they walked home together that memorable night each felt that a new life had dawned upon them.

Joe Beaton saw as never before, the mistake he had made, and resolved to lead a new life.

Johnnie began work in his father's printing office the next morning, so as to acquaint himsef more fully with the routine of the work before him, before Sam Lawson, the foreman took his departure.

Johnnie entered into the work with a will and being a fairly good type setter, got along splendidly.

Soon a marked improvement began to be noticeable in the paper. The circulation began to increase. Extra work came in for the job printing department and the staff had to be increased to keep pace with the growing trade. And as the Editor often confesed, all this success and prosperity was due to "The Awakening of Joe Beaton."—R. E. Caldwell, Annapolis Co., N. S.

The Cow is Not Always at Fault.

When the returns from the dairy business are not satisfactory it is not at all unusual for the owner to make the complaint that his cows are poor and for his friends to advise him to obtain better ones. The explanation is plausible and the remedy is easy to suggest, but it often occurs that the explanation is not correct and the remedy is impracticable. It is much easier to blame the cows than it is to carefuly investigate the cause of their short comings and it is pleasant to do this than it is to admit that the owner may be more deserving of blame than are his cows. But easy and pleasant ways are not always the right ways. They sometimes lead those who follow them far astray

Comparatively few cows have ever reached the limit of their possible productiveness. The great majority have an actual and a potential accomplishment, what they did and what they have the capacity for doing. The quantity of milk which they yield is below, and in many cases it is far below what it might and ought to be. If the animals are judged by their present productiveness they must be ranked as poor cows. But if possible yield is made the basis of judgment I am perfectly satisfied that many of them will go into a higher class.

It is perfectly natural that the owner of a cow that never yields more than a very moderate quantity of milk should be dissatisfied with her. But in a great many probably in the majority of cases, much can be said in behalf of the cow. She has never been given any special care and attention. She has never been placed under conditions which would enable her capacity for milk production to be determined. No intelligent and consistent efforts to find whether she can do better than she has done has ever been made. It is true that she may not be a valuable milk producer, but it is not fair to the owners to condemn her as inferior until she has had a fair and adequate test. She should not be put in the class of poor cows until well directed efforts for her improvements have been made.

Whenever conditions are at fault, they should be corrected and the cow should then be given a fair period of probation. If this is done it is not at all improbable that a good part of the blame for the short coming of which he has complained should be placed on the owner rather than on the cow.

There are various ways in which conditions may fall below a proper standard. There are farms on which the cows should be better protected against sudden changes of temperature from extremes of heat and cold, and from exposure to storms. During warm weather if there are no trees in the pasture some kind of artificial shade should be provided so that the cows can get away from the direct rays of the hot sun during the middle of the day. Hot weather has a more or less depressing influence on stock of all kinds and when cows must stand it without protection and be tormented by flies there is always a decrease in the milk yield. In the winter time good warm well ventilated barns are of course very esential. All causes of discomfort should be removed as fully as posible. It is useless to expect that a cow will do her best if she is not satisfied and contented.

On many farms the principal efforts for improving the conditions and thus increasing the productiveness of the cows should be directed toward the feeding. Changes along this line may be made with great advantage. They may involve the giving of larger quantities of food or the use of more expensive materials in the ration. Or they may require the use of the same materials in different proportions or some change of food stuffs which will not increase the cost of keeping.

On some farms where the convenience of the owners is regarded as of greater importance than the welfare of the cows greater regularity in the times of feeding would be of marked benefit. The water supply, too, is sometimes at fault. Where this is deficient or the quality of the water is poor the yield of milk will be only moderate and the character of what is produced will probably be bad. In cases like these all adverse criticism should be withheld from the cows and be bestowed upon the owners. The only profitable course to take where the dairy does not yield a fair profit, is to find out whether the cows are inherently and consequently hopelessly inferior or whether their low rate of production is due to the conditions under which they are kept. If the conditions are not favorable the first thing to do is to improve them. Then if the cows seem to be well and are contented with their surroundings but still fail to be productive, careful experiments in changing their food should be made. The present rations may keep them in good health, yet may not enable them to produce large quantities of milk. Or the kind of feed may be sufficient to maintain the cow and leave a surplus from which milk can be made

Used on Canada's Greatest Industrial Plants

It's worth noting that the largest firms in Canada specify Brantford Roofing for their new plants. The great works of The R. McDougall Co., of Galt, Ont., shown above, were roofed entirely with Brantford Roofing.

It was chosen for its well-known enduring qualities and because it represented to the shrewd business men at the head of The R. McDougall Company, the best roof-investment money could procure. They sought a roof that would be proof against heat, frost, wet, fire, acids and destructive gases such as are given out by the locomotives that pass the plant many times daily.

Brantford Roofing

met all these requirements, and at the same time had a reputation for durability unknown to inferior roofing.

When men who want the best buy Brantford Roofing—when it costs no more than ordinary roofing—when it is the safe roofing for you to invest in for the purpose of protecting your possessions, isn't it worth your while to know all you can about it. Write to-day for our big FREE book, containing samples and money-saving facts for your information.

Our new patented appliance for laying Brantford Roofing is worth investigating. Positively prevents buckling or expansion.

Liquid Manures for Farm Crops.

The fertilizing values of liquid manures is appreciated to a much greatextent nowadays than it used to be. Farmers and gardeners are usualy quick to recognize its importance and all kinds of appliances have been devised to conserve it and distribute it for the benefit of crops. Plenty of natural liquid manure is produced on the average farm. The cattle, horses, sheep and pigs all add to the supply, Generally, however, this valuable and very rich fertilizing material has been and is now in some cases, allowed to drain away into the ditches around the yard. Very feeble attempts have been made to preserve it undiluted by rain or exposure to the elements. Latterly, however, I have noticed that many progressive farmers have sunk tanks in the ground or have dug clay-lined pits for the purpose of storing this liquid manure. Pumps have been put in, and every facility has been given to the careful storage and economical distribution of this valuable product.

The liquid manure produced in the farmyard should be carefully collected and stored not only because it is a valuable fertilizing material, but also because of sanitary reasons. I have seen many dung yards where the floor or ground was quite porous. so that all the liquid drainings from the byres and stables were quickly lost. To remedy this, one should remake the floor with a well-beaten layer of clayy, and, as a further safeguard, a good covering of rubble should be placed on top. A cement or concrete floor is naturally expensive. Do not forget that the floor should always have a decided slope toward the centre of the yard, and away from the byre itself. If a tank or pipt is to be put in for the purpose of storing liquid manure it should always be situated at the back of the cowhouses or stables, and at least seven or eight yards away from them. Flagged drains must be laid between the pit and the buildings, and the former should of course be large enough to accomodate the liquid drainings from all of the live stock on the farm.

What is liquid manure? As ordinarily understood, it consists solely of the liquid excrement voided by cattle and horses and other stock. Commonly it is known as urine and it has been demonstrated that the urine of a cow is richer and more valuable as plant food weight for weight, than the soil excreta or dung which is mixed with the straw and litter or bedding materials that is used in the cowsheds. The cows produce "liquid manure" which, on the average contains 0.8 per cent of nitrogen, 0.7 per cent. of phosphoric acid, and 0.6 pepr cent. of potash. The urine of the horse and sheep is somewhat richer in nitrogen and about the same in potash while that of the pig is richer in phosphoric acid but poorer in nitrogen and potash. The nitrogen in liquid manure is very active and most easily available. It is however, very easily lost owing to a process of fermentation, which causes the urea of the liquid to change into ammonium carbonate, which is a volatile substance. If gypsum or superphosphate is sprinkled in the urine, however, this loss of nitrogen will not take place so easily.

The liquid excrement from any animal consists chiefly of that part of the food which has been digested, but which has not been retained in the body. Nitrogenous foods are a most important part of the diet of cows and horses. Generally these nitrogenous constituents are grouped under the term "albuminoids," and the organic nitrogen which is at once the most costly and the most important manurial ingredient in these nitrogenous foods is passed from the animal's body to a greater extent in the urine than in the solid excrement.

The value of a liquid manure as a fertilizing medium can be very easily appreciated by anyone who has taken the trouble to study the root growth or habits of plants. It will have been demonstrated that the extremities of the roots always strike downwards into the subsoil below in search of the three essential forms of plant food. nitrogen, phosphoric acid and potash. These different constituents are usually present in the soil in a liquid form, and therefore it is clear that liquid manure of any kind must be a very desirable form of nourishment for growing plants, particularly in soils that are comparatively poor in nitrogen— the most costly of all the three "essentials." The great drawback is that there is so very little phosphoric acid in liquid manure. And besides this, there is admittedly a serious and very rapid loss of nitrogen as soon as liquid manure is exposed to the air.

In addition to the ordinary drainings from cowsheds and stables, liquid manure can easily be made by steeping certain fertilizing agents such as nitrate of soda, sulpphate of soda or guano in water. No more than half a pound of either of these agents should be used with twelve gallons of water. Another very valuable form of liquid manure is that known as soot water. It may be made by steeping a bag containing about six quarts of soot in a hogshead of rain water.

Perhaps the most powerful and concentrated form of liquid manure is that known as sewage liquid, but gardeners and farmers had better give this a wide berth unless there is some convenience for properly diluting it before use. In any case, always apply liquid manure after a shower or rain, otherwise it is apt to scorch all the plants if the soil is dry and parched. Also, never use at mid-day, but only in the morning and evening. For fruit trees, apply liquid manure in weak dressings, only after the fruit is properly set, and not before. This manure will usually prove of considerable assistance in helping the fruit to swell. Peaches or nectarines seem to derive more benefit from dressings of liquid manures than any other fruit trees. Soot water is good for all garden crops, especially green crops.

Humane Treatment in Summer.

It must be remembered that the summer is always a season of more or less discomfort for the farm stock as well as for individuals in the household.

Everything that is under your care, the horses, the cows, the hogs, chickens—in fact, al forms of live stock that are kept upon the farm—deserve your attentoin and protection against the discomforts just so far as it is possible for you to give it.

The greatest profit is derived only when the stock is kept where there is the least discomfort and annoyance—the least friction to be overcome by the animal in its fight for a living. If cows are forced to fight flies all day, if they are forced to stand in the hot sun and drink water from a slimy pool they will not have the opportunity to turn so much of this rich grass and succulent food into milk. The cow that has little to do except eat and make milk will be more contented and will make a better profit than her sister, who is kept under different circumstances.

With the horses, it is a little different, for usually the men work with them all of the time and they are wise to the discomforts and the dangers that are incident to excessive heat. Thus horses are usually protected but the cows are turned into the pasture, and forgotten until night.

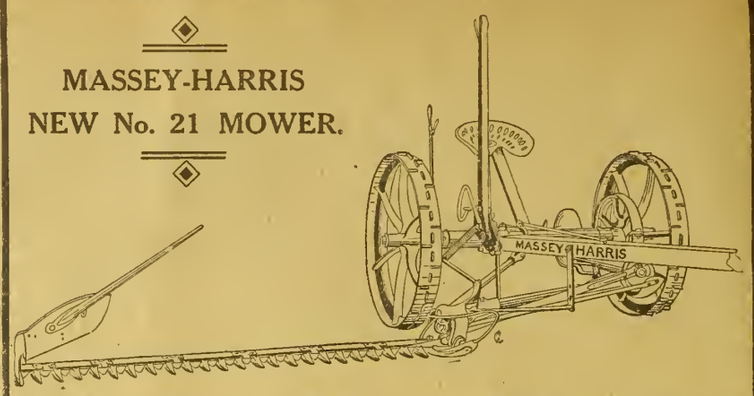
The same things are true in raising hogs. No hog can make the best gain unless provided with plenty of shade as well as good feed. The small chickens and the old hens that are forced to lie around in the intense heat without being given any shade will not make the best growth or yield the best profit.

It is possible in all of these cases to provide shade if it is not done by nature. If the hog yards and pastures and chicken yards are not located where there are trees, a shed may be improvised which will provide a comparatively cool place in any kind of weather and it will protect from the excessive heat of the sun.

Another thing that must be borne in mind is the value of pure water. Every form of live stock on the farm must have this in order to keep the constitution and vitality at the right degree of efficiency. Pure water is necessary for the health and development of an animal. This does not mean that the stock wil have to hunt the sloughs and the pools and the slime covered ponds for their drink. There should be easily accessible a tank of clear, pure water directly from the well.

The third point in this consideration is in regard to flies. Much can be done by the use of fly repellent and fly traps to protect the stock from this pest and if such provision is made the profit wil be increased. Remember to keep all the cattle and all the stock that is under your care during the summer humanely. It will pay.

MASSEY-HARRIS
NEW No. 21 MOWER.



A Big New Mower
for Heavy Cutting

Wide Tread—Wider than on any other Mower—ensuring steady running and overcoming side draft.

Improved Clutch and Throw-out Device.

New Simplified Lift—Attached direct to the Frame—Pole may be removed without affecting the lift or any other parts.

Push Bars are especially heavy and stiff, have Screw Connections at both ends and both Connections are machine-fitted.

Hinged Coupling has long broad Bearings and heavy Pins, doing away with any looseness of the Cutter Bar.

Lift Spring is placed at the rear, giving a direct connection, and is easily accessible for adjusting.

The Sections are longer than on any other Mower, giving longer cutting edges and greater clearance.

Special Circular tells all about it.

Killed by Lightning.

Are we looking closely enough to our losses caused by lightning? Farmers each year suffer severe losses on account of stock being killed by the lightning. What can be done to lessen this loss?

Generally the animal dead from lightning is along the fence row or in the barn. Very seldom do we find one dead in the open field on account of being struck by lightning.- Observations and inquiry show that but a very small proportion of the farm fences are grounded. It is a small outlay of either time or money to place ground wires on your fences thereby reducing your loss from lightning to a minimum.

In building a new fence run a wire from the top of the post to the bottom, securely stapling the wire on the fence so that it will come in contact with the ground wire on the post. Place these posts on which the ground wire is stapled every five or six rods in the fence. The danger of stock being killed by lightning is very small in pastures which are enclosed with fences in which the steel or iron post is used. These posts act as ground wires

The old-fashioned lightning rod was practically no good, but the rods now in use, properly placed on the buildings and properly grounded, are efficient. Without a doubt many a disastrous fire has been prevented by their use

The Only Method of Valuating Dairy Cows.

A dairy cow's value is largely based on her ability to produce at the pail. The introduction of the weigh scales, and Babock test to the dairy world has revealed this fact. These same little

instruments have brought forward more startling conclusions than this. Many dairymen hesitate to undertake this work on account of the initial expense of three of four dollars for the necessary outfit and the extra trouble occasioned by its use.

This is a distinct example of folly. Untested cows have been bought and sold in absolute ignorance of their value as producers. A few months' test has added $50 to $100 to some cows' value, because their productive power was made known.

This vital fact should not be overlooked. Hundreds of poor cows are being kept to-day at huge expense of whose low value the owners are also probably ignorant. Yet a three dollar outfit would help discover them soon turning the present loss into a distinct savings. Thanks to the small expense many dairymen are now making an additional income of three hundred dollars from twenty cows, because the poorest have been discarded. It will abundantly pay every dairyman to keep dairy records.

The Budmoth Meeting.

The Budmoth meeting held in the Hilcrest Orchards, on June 26th was a success. About 125 of the cream of the Valley were present, including S. C. Parker, F. M. Chute, A. S. Banks, and about 50 more of the same type, a fine crowd. The two plots nearest the house were showing up finely, one sprayed 4 times with 16 p.c. Budmoth in it, while the next plot, unsprayed, had 66 p. c. of the blossom clusters infested. In another plot sprayed before the blossoms once and again immediately after the blossoms fell gave 17 p. c. budmoth, showing that the early spray when the buds are bursting only killed budmoth in 100 blossom clusters in that one case.

Again checking the early so caled "budmoth spray" with the check; the plot receiving it gave 60 p. c. budmoth the nearest check 66 p. c. or practicaly no benefit. In the ttwo plots which everyone saw, the sprayed plot set about twice as many apples as the unsprayed, due to budmoth only, for the whole orchard received the same spray this year. the benefit in budmoth coming from spraying in 1912 and 1913 The budmoth cannot be killed in time to prevent injury for the current season Spraying this year controls the budmoth for next year, but does not prevent injury for this year.

The difer nce in sets in the Wagner Orchard at R. S. Eaton's, bears out in a striking way the figures taken in regard to the set being reduced by budmoth.

A man can apply 4 sprays complete lime and sulphure and be sure that the next year he will increase his set by controlling budmoth enough to more than pay for his entire spraying. He will also control codling moth and the fruit worm every year in each orchard Tent Caterpillar, Canker worms, Tussocks and Browntails when present, and in spot years will control the spot.

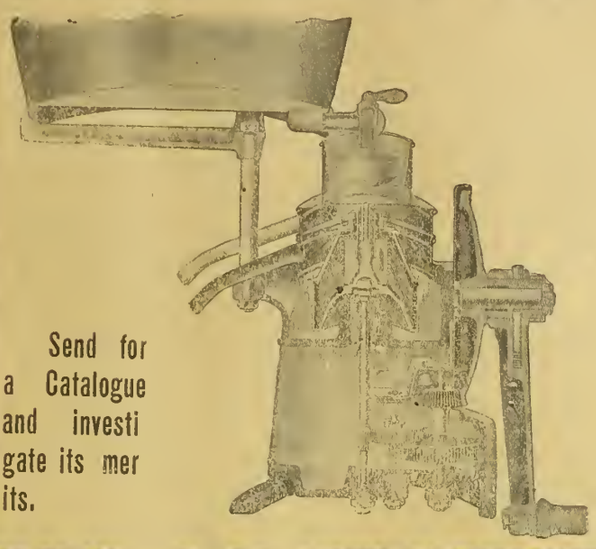
If spraying is to be regarded as insurance against spot it is free insurance for it pays for itself and more, too, by controlling budmoth every year in every orchard in the Valley. No man should mourn as many are doing that he has sprayed carefully, and then we had not enough rain to develop spot in any orchard, and his neighbor who did not spray has as clean apples as the one who sprayed The man who sprayed has more than paid for his spray by killing the budmoth. He also controled coddling moth, fruit worms, browntail, canker, worm, and tent caterpillar free.

Mr. Geo. E, Saunders, in charge of the Bridgetown Entomological Laboratory, who conructed the experiment, writes:

"There is no doubt that a man pays for his entire spray and more too, by controlling ever present budmoth, and the talk of spray being an insurance against spot is misleading many men who are sore because they have sprayed, and their neighbors who did not, had clean fruit. I want them to know they are money in pocket as it is so they will not stop spraying for I want them to spray so as to control browntail."

Points of Excellence Embodied in

THE PREMIER CREAM SEPARATOR



Send for a Catalogue and investigate its merits.

Self-balancing Bowl, easily and quickly cleaned.

Rustless Aluminum Discs, few in number, yet providing ample skimming surface.

Automatically Oiled Neck-bearing.

Machine-cut Square Gears.

Revolving Spindles, all enclosed, and running on ball bearings and in oil.

Working parts easily accessible.

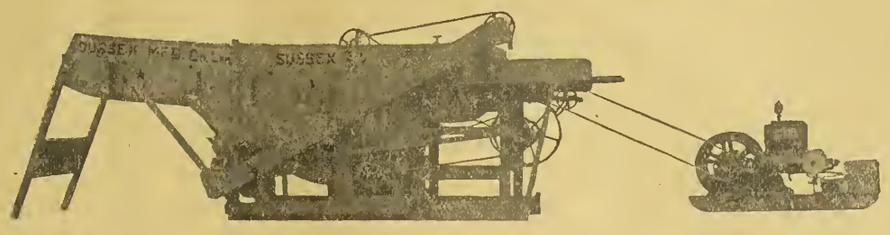
Thoughts of Threshing Suggest at Once the "Little Giant"



The "Little Giant" hardly needs an introduction in the Maritime Provinces. It's the Thresher that every operator aspires to own.

Reasons: They are almost numberless. Economy in power, easy operation, great strength in construction, excellence of material used, are but a few of the qualities which make selling the "Little Giant" such an easy matter. More "Little Giants" are used in the Maritime Provinces than of all other makes combined.

The "Little Giant" two horse thresher can be operated with engines of from two to four horse power. The four horse power requires from four to seven horse power. All threshers are supplied with or without Tailings Elevator, Straw Carrier and Bagger and Trucks.

We guarantee every Machine. Fully tested before leaving Erecting Department.

We also manufacture Hay Presses, Tread Powers, Wood Cutters, Grain Grinders, Feed Boilers, Root Pulpers, etc.

Free Catalog for the asking.

The Sussex Manufacturing Co., Limited, Sussex, N. B.

Consignment of Sheep

The S. S. Soestdijk of the Furness Withby Line, reached port this morning from Rotterdam, bringing 100 Siberia bred sheep which were a long time overdue. These animals have been the subject of much comment for some time back in the press and otherwise. It is said that the sheep are to be distributed amongst the agricultural societies over the Island. The Soestdijk was nine days coming from Rotterdam. She is bound to Philadelphia where she will proceed after she lands the government sheep.—The St. John's Telegram.

Samuel Dick e & Son were away from home when we called. The young stock in the barn looked well and the herd of black and whites at pasture looked good to us from the road. Cobequid Farm has an air of prosperity about it that comes to all who consiestently follow in the paths of the dairy.

Try an Ad in the FARMER.

THE HORSE.

Stable Equipment.

Apart from the harness and saddlery required for horses in connection with their actual work, many articles have to be provided for their use in the stable. The principle items comprise such indispensable things as the headstalls, grooming tools, rugs, rollers, etc., while there are certain other requisites which may or may not be added according to the class of horse concerned. Thus for wagon horses, including trappers, hacks, carriage horses, and the like a considerably more elaborate equipment is usually called for than in carthorse stables, in which the requirements may be cut down to a minimum, though even in these it is desirable that they be well found in regard to the more essential articles. Briefly, to consider the various items of stable equipment we have, first of all, the headstall for tying up the horse. Leather head collars are in all cases to be preferred as being the most practical and durable. Those made of webbing, while cheaper, cannot be recommended, for not only do they tend to wear out quickly, but they are not strong, a horse, if so minded, readily being able to break one of its kind by throwing itself back in its stall. It is, however, useful to have on hand one or more web halters with a rope attached forming a running noose with its noseband, to slip on a horse's head quickly on occasion or to put on underneath the bridle when taking a horse to the forge and for similar occasional purposes. They often come in handy. A special kind of carthorse collar—less elaborate than ordinary patterns in use for nags, and having neither a forehead band nor a separate throat latch—is commonly used in the case of carthorses while sometimes the latter are secured by means of a simple collar strap which buckles round the neck instead of with a proper head collar. To tie up the horse, either a chain or a stout leather strap, or a combined strap and chain or a rope may be used but the last is not to be recommended, not being durable enough and being liable to break. For carthorses a chain is the best as being the strongest.

Grooming.

Of the grooming tools required, the most important are the body brush, dandy brush, and curry comb. In addition to these there are the following:—Water brush, mane comb, hoof-picker and sweat scraper. A complete set of these various articles should be provided in the case of nag horses, one set for each groom or attendant, and preferably there should be a couple of water brushes, one to be kept entirely dry, the other being wetted when necesary. Stable rubbers, for rubbing down and drying the horse, and a large sponge are also needed, while a chamois leather to put a finishing gloss on the coat is another item that is more or less essential. In the carthorse stable, on the other hand, we do not need such a long list of things, and here it suffices to supply body and the dandy brushes, curry comb and mane comb. Body brushes vary much in price, ranging up to 7s. 6d. for the best An inferior quality is quite good enough for carthorses, but to turn nags out in first-class style a brush of good quality is essential, costing, say, not less than 6s. for the poorer brushes do not produce the same gloss on the coat. Yet another accesory to be provided in connection with grooming is a small brush for applying hoof-dressing to the feet.

Clothing.

Next we come to the clothing. In nag horse stables there should be, at any rate two rugs for each horse, one thicker one of wool for autumn and winter and one of lighter material, either woollen or twill—preferably the first—for summer use. In well-appointed stables it is usual to have special night rugs in addition to the others, so as to save the latter. For night use, jute rugs, wool lined, are very suitable, and they have the advantage of being extra durable. Besides these in regular use some spare horse blankets ought also to be on hand. As regards carthorses, these are more often than not left unrugged, excepting if clipped in the winter, when it is esential to clothe them, and on farms especially it is not usual to rug them, as this would make them tender and cause them to feel the weather too much. But even when the horses are not kept rugged, it will be desirable to have some horse blankets available, for there is sure to be some call for a rug on occasion, in cases of sickness, for instance, etc. For van horses, tradesmen's cobs and ponies, and such like, jute rugs answer well enough. When rugs are worn one roller per horse must be provided, and in other cases there should be a roller to go with each blanket on hand. The most durable and strongest rollers are those made entirely of leather, and where utility is the prime consideration and not smartness of appearance, this kind is certainly to be preferred to those made to match the rug they go with.

Suitable Tools.

An important group of requisites to be provided in every stable are the usual stable implements, including manure and hay forks, the first four-pronged and the latter two-pronged—shovels, brooms, buckets, corn measures, and corn sieve, the last being for sifting the food before it is placed in the manger. It is generally considered the proper thing to have wooden buckets in a well-appointed stable but galvanized ones answer equally well, and in certain respects, indeed, prove more practical. Besides the buckets used for watering the horses, there should be one or more others for washing purposes. Then there is the corn bin, which should be of galvanized iron, this kind being rat and mouse proof, which wooden bins are not.

Bandages.

This pretty well completes what is needed in a carthorse stable, or when van horses, etc., are kept, but in the case of nag horses we should further provide some sets of woollen bandages while linen bandages (one pair will be enough for three or even four horses) too, will be useful on occasion though they are not actually essential. One or more so-called watering bridles, too ought to be on hand to put on a horse when taken to the forge, and for similar purposes. Knee-caps are another requirement. In well managed stables, grooms always look for a manure skip to remove the droppings immediately they have been voided. An important accessory, finally, is a clipping machine, and even in a one-horse stable this appliance should be of the power pattern. To clip by hand is old-fashioned, though a small pair of hand clippers comes in useful for clipping the lower part of the legs, ears, etc. Another article it is always advisable to have on hand is a drenching bottle for adminisetring liquid medicine and drenches.—English Vet.

Feet of Foals Need Special Care.

The great importance of properly caring for the feet of foals is entirely overlooked by the majority of those who raise them. A few give the feet some little attention and possibly one in one hundred fully appreciates the great value that should be attached to this feature of colt life while in the formative period. Many of the defective formations later found in mature horses (defects which mean loss of dollars at selling time) could have

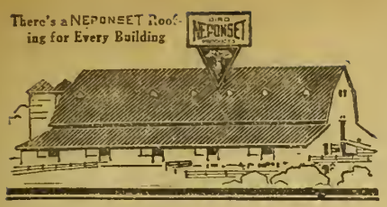
There's a NEPONSET Roofing for Every Building



Learn this by heart:—

Only Slowly Made Roofings are Slow to Wear Out

We do not trust to bought felt—the foundation of roofing—we make our own from all-rag fibre, no cheap stock.

Asphaltums, good and bad, *look alike.* Trained chemists select ours and blend them to stand torrid heat and Arctic cold.

We give ample time to tests and inspections at every step of manufacture. That is why Neponset Paroid wears so long, is so truly economical, resists sparks and embers.

Surely send for our ROOF BOOK—free.

been effectively corrected had they been cared for at the proper time. Without naming all defects or deformities which can be easily corrected if taken in time, I will mention a few of the more common ones.

Toeing.

The front feet, instead of being well formed and standing straight and true in perfect alignment with the ankle and pastern, turn out; the pastern is out of true, the inner quarter of the hoof almost straight up and down and the outer side of the hoof or wall of the foot extends entirely too far out. This condition, which is at once unsightly, not only interferes with locomotion but detracts many dollars from the intrinsic value of the animal. While speaking of crooked pasterns and ill shaped front feet, I need only add that "toeing in" is simply the reverse from "toeing out," and carries with it the same bad results. Both of these deformed conditions in nearly every instance cause interfering, and paddling, and in a mature horse are almost impossible to cure, although in the hands of a competent blacksmith, they may be corrected to a certain extent. Both of these defects could have been entirely done away with had the feet received the proper treatment at the right time.

If the foal shows a tendency to toe out from the first the hoof as it grows should be trimmed close on the outer half allowing the inner to grow longer and carry the greater weight; this done while the foal is taking on weight will not alone change the angle of the pastern, but the form of the foot as well, and it is more than interesting to watch the improvement and how quickly it rewards your efforts Treatment for toeing in is simply the reverse to that of toeing out, and much benefit may often be derived from shoeing the foal when only a few weeks old with a light plate shoe,. using of course, very small nails and putting it on with great care letting it extend slightly beyond the hoof where you wish to produce the greater bearing and the direction in which you wish to train the foot and pastern Whether one depends entirely on simply trimming the foot, or uses a shoe, the foot should receive attention every month at least until such time as the defect has been corrected.

A too straight pastern can easily be corrected by keeping the hoof cut as low as possible at the heel and allowing the toe to grow as long as possible. A foal that shows a tendency to too great a slope of the pastern should have the hoof trimmed as closely as possible at the toe, using great care at all times to leave the sole of the foot perfectly level and true

For some unexplainable reason the forward or front feet seem to be heir to most of the deformities yet it is not uncommon to find a crooked or imperfectly formed hind foot. Their treatment consists simply of common sense trimming, leaving a bearing at foot and cutting away that which is growing in such a way as to add to the defect you are working to correct.

The work of correcting imperfections in feet and pasterns of the foal can hardly be started too early. More satisfactory results can be had in the first six months of its life than in any like period later. All the bones of the foot and pastern being soft and practically in the formative state are easily influenced and their final shape and condition can be controled by following the treatment outlined. In conclusion I woud add that it is well to not force the growth of the foal with defective feet or pasterns; the less weight in flesh it has to cary the more rapid will be the improvement, and no mater what kind of a colt you are raising its added value will more than repay you for the slight trouble you take with it and should it be a pure bred one, the benefit in dollars to you of course is far greater.

Giving Drenches to Horses.

By "drench" is meant a copious dose of fluid medicine. These are now used less often than formerly. Many veterinary practitioners prefer to give small doses of medicine in a capsure or by means of a half-ounce hard rubber syringe. But colic drenches and pint or quart doses of raw linseed oil are still given to horses. Cows too are often physiced with a quart or two of epsom salts solution, while sheep and lambs are given gasoline mixture for worms and hogs now and then squealingly object to a big dose of castor oil or some such purge.

Before giving a drench be sure that it is needed, that is a sane and safe dose and one that will not scald the mouth and throat. Like the delicious lump of candy sometimes accidentally swallowed by the schoolboy, the drench cannot be recovered when it once has passed the portal of the gullet. Many a horse has been badly scalded by an insufficiently diluted dose of turpentine or aromatic spirits of ammonia or chloral hydrate, and other animals may be hurt in a like manner.

Back the Horse into a Stall

The drench is to be given by way of the mouth; never by way of the nostril. Medicine poured into the nostril tends to flow into the lungs, where it will be sure to set up irritation and cause mechanical bronchitis or pneumonia. We have known of many an animal being killed in this way. The best method of drenching a horse is to back him into a stall. place the running noose of a small soft rope around the upper incisor teeth under the lip, throw the free end of the rope over a beam, elevate the head and hold it by means of the rope at such a height that the medicine will stay in the mouth and be swallowed. Now stand on a box or chair and pour the medicine into the horse's mouth from a strong long-necked bottle, in doses of about two-ounces at a time until all has been swalowed. Do not grasp and squeeze the throat to make the horse swallow, and do not pull out the tongue. These acts hinder swallowing.

If the horse does not swallow readily tickle the roof of his mouth by rubbing with the neck of the botle. If this does not suffice, pour a teaspoonful of cold water into the nostril, and swallowing will instantly occur. When drenching a cow put the medicine into a long-necked bottle. Confine the cow in a stanchion. Stand on her right side. Pass the left hand over her face and into the left side of her mouth to steady the head, which is to be held in a straight line with her body. Now pour the medicine slowly into the right side of the mouth. Let her head down instantly if she coughs.

A drench is given to a sheep by means of a bottle or a drenching horn. The animal may be straddled and its head held in a straight line. The dose must be given very carefully to prevent choking. A hog may be drenched from a bottle to the neck of which a piece of rubber hose has been attached; or cut a hole in the toe of an old shoe, let the hog chew on it and at the same time pour in the "dope." The hog may have to be held by means of a rope noose fited on the upper jaw.—Dr. A. S. Alexander.

Salt Necessary for Work Horses.

Don't neglect to salt the horses about once a week. It is better to keep salt always before them as they know better how much they need and when they need it.

Don't urge your team into a forced and unusual gait; and it also worries them to be forcibly held back. If you want the best work from the team let them keep their own gait. For this reason it is well to train a team to walk the right gait while they are colts.

Don't forget that kindness pays very big dividends in the upkeep of a horse. It keeps him in good condition on les food, thus saving on the feed bill; it enables him to give better service increasing profits in this way; and a horse brought up in the atmosphere of kindness will sell better at a higher price, as he is nicer appearing, more sound, gentle and reliable, than a horse brought up under more adverse circumstances.

Handling Shy Horses.

It is very provoking to have a horse on the farm that is shy and hard to catch. This trouble is often the result of improper training when the animal is young. Kindness is necessary in order to break a horse of this habit. Never hit him when he is turned out in the pasture or when he is caught. A good plan is to feed him something every time he is caught. It is a good plan occasionally to bring the horses in from pasture and put them in the barn when there is no work for them to do. It requires a good deal of patience to cure a horse of shyness but it pays.

POULTRY

Tuberculosis in Poultry.

For the benefit of our readers and especially those who may have affected flocks, we are publishing the following extract from a bulletin on "Farm Poultry" by Prof. M. C. Herner of the Manitoba Agricultural College:

Tuberculosis is a disease affecting only old birds or stock that is fully matured. The germs of this disease may be in the ground surrounding the poultry house, or in the house itself. They gain entrance through the food, drinkink water or by breathing. Birds suffering from this disease void the germ in the droppings, and these getting mixed with the feed are taken into the system and thus it is transmitted to the rest of the flock. The symptoms of this disease are a pale comb, the bird loses flesh rapidly, usually has diarrhoea, and in the later stage it wil be lame in one leg. The bird may die in the course of a few days or it may linger for three or even four weeks, in which case it is practically nothing but skin and bones. On opening the bird the liver and spleen will be found to be covered with raised whitish spots, varying in size from a mere point to half-an-inch in diameter. In very extreme cases tubercles may be found along the entire alimentary canal, and also on the bones in various parts of the body. Unlike human, or bovine tuberculosis the lungs are very seldom affected.

There is no cure for the disease. It is simply a question of keeping it in check as much as possible by observing absolute cleanliness in all details of poultry management. Kill off all the sick or affected birds and bury them deeply, and cover them with lime or better still, burn them. Clean out the hen house thoroughly and whitewash it with whitewash having a five per cent. carbolic acid added to it.

Clean out and disinfect all the nests, drinking pans and so on Put in a layer of fresh earth, sand or gravel, and use an abundance of air-slaked lime under the roosts at all times. The land surrounding the poultry house should receive an application of air-slaked lime, be cultivated and a crop grown on it. Provide plenty of light in the hen house and feed only good wholesome food. The disease is seldom met with in the winter time, but is usualy most active in the late summer months. While the disease cannot be cured, still by following these suggestions it may at least be kept in check to a certain extent.

Poultry Policy of the Experimental Farms.

The poultry policy of the experimental farm system is to conduct experimental work with poultry along the breeding, rearing and feeding lines ; the encouragement of the farmers and poultrymen generally to improve their strains of fowl, and the development of economy in methods of general management. Work along these lines is being caried out at the Central Experimental Farm at Ottawa and the branch farms and experiment staticns throughout Canada, results of which will be published and distributed at frequent intervals.

New Equipment.

Equipment is being provided to make it possible for the division to carry out this policy. Besides the original plant at Ottawa and its various types of colony houses, brooders, incubators, etc., aditional land was added to the plant last year, and this year ten acres more are set apart for special experiments with turkeys and water fowl. Modern buildings are being built, a new experimental breeding house is just completed, as are also a cockerel house and an experimental feeding and suply house. This year will see the completion of an administration building, and before another spring the old permanent buildings that have been in use for twenty-five years will be removed and the plant will be up-to-date in every respect.

At the branch farms and experimental stations the poultry plants are large enough for one man to manage. Housing accommodation is provided for from 100 to 400 head of laying hens Only two or three of the best varieties of utility fowl are kept and tests are being made to find out the type of house best suited to the climate and conditions as well as the most suitable makes of incubators, brooders and other poultry apliances.

Experiments of a general character such as breeding, feeding, diseases, etc., are being conducted at the central plant of Ottawa, where a larger staff and equipment is available, while those experiments of a local or provincial nature are carried on at the outlying farms and stations.

Among the most important of these experiments are those relating to the breeding. Already a number of egg-laying strains are being developed, and just as soon as one or more of these strains are established, cockerels will be supplied to the branch farms and experiment stations. Each year the males bred at the central farm from heavy laying strains wil be sent to the outside plants and will there be used as breeders, and as it is generally recognized now that the male is responsible for the transmission of fecundity this system should be the means of developing a high producing flock at the branch farms and from these flocks, cockerels, also pullets and eggs when available, will be for sale. Breeding stock and eggs at present are not being sold from the central farm, as both are required for experimental work.

Another very important class of experiments that is being investigated is that relating to poultry diseases. The annual losses due to chick mortality are very large and the turkey crop almost threatens to extermination if something is not found to stop the ravages of black head. The investigation of the latter is largely the reason for the acquisition this year of the new park of ten acres at Ottawa.

Housing, incubating, brooding, rearing and feeding problems as well as a host of others are being investigated. In fact anything that is of interest to the man or woman who keeps poultry is of interest to this division. New ideas in management, new "secrets", new appliances etc., are being tried out and will be reported.

It is not the intention to print bulletins or even large pamphlets, but rather circulars or leaflets that can be published often enough to be fresh. A number of these are now in process of preparation and will appear from time to time. As usual, letters asking for definite information are always welcome, and where a phamphlet does not give the required information a personal letter is gladly written.

Bacterial Enteritis.

Bacterial enteritis usually shows up in its worst form at the summer's end, though it can come at any time. It is often mistaken for blackhead or cholera, but the bacillus causing the intestinal inflammation isolated and examined under the miscroscope, shows to be of somewhat different character from the bacillus causing these other diseases. The germ causing the enteritis multiplies in the intestines and it fills up the blood throughout the body, causing a quick or at times slow destruction of the blood, added to the intestinal inflammation. The sick birds are dull, listless, hate to move about, are not hungry, though very thirsty. The birds may die quickly at the onset of the disease, and the disease may spread no further than the farm where it starts. Later cases will linger, often for four or five weeks the bird losing nearly all of its flesh. There will be a greenish diarhoea sometimes showing blood toward the end. Young birds are most susceptible. Ducks wil take it from the chickens; pigeons will not take it; rabbits inoculated with the germs show no results; chickens fed the germs in ordinary food will not take the disease, but fed to them in animal food or foul water, wil soon show the symptoms. Inoculated by the germs through the skin they die in four or five days. This shows that the bacillus spreads first among the chickens through foul water or animal fod. Without disinfection or eradicating means it will often stop short and die out, but not until it has taken from 50 to 80 percent. of the flock. To get rid of the disease in the speediest way, don't wait a day in cleaning up and using disinfectants in houses and on the grounds. Make the fowls drink from scalded vessels, the water pure, changed often and charged with ten drops of sulphuric acid to each gallon of water, or any other disinfectant that you know to be good.

Quarantine or kill sick birds. If you treat the sick, let it be done away from the flock. Give one grain soda, three grains subnitrate of bismuth, 2 grains of powdered chinchona bark, 3 times a day. This is to check the diarrhea. After the diarrhea has been checked give a good poultry tonic. This last should also be fed to the flock at large Give turkeys sick with it the same treatment.

Small Hens of the Breed.

The Kansas Farmer, in a late issue has an excellent article on the layer of any breed showing up as a rule below standard weight from three-fourth of a pound to often as much as three pounds, and asks: "Are we not bringing the standard too high as to weight in our laying breeds, not that one would encourage breeding the small specimens of the breed, but we might overdo the mater the other way, and by breeding overweight for the standard breed out profitable production? In fact, we know ourselves of a breder of Bared Plymouth Rocks who has always made it a boast that his fowls weigh from one pound to three over standard weight. At present he is disposing of that flock because it does not produce enough eggs to pay the cost of their production. All of the phenomenal prize-record laying hens were under weight. Lady Showyou, White Rock, 281 eggs first year contest, weighed but six pounds. The highest record ever made by a Barred Rock was from a hen one and one-eighth pounds under weight. (We do not know the weight of Lady Morley, the champion Nova Scotia hen.) The best record made by a Black Langshan was made by one two pounds under weight; the Black Orpington, two pounds under; Buff Orpington, two pounds under, and so on in varying number of pounds under, through Wyandottes, Leghorn, Minorca and other breeds."

The above is given because complaint so often comes in this wise: "I cannot get my flock up to the standard weight and my neighbor, with Barred Rocks, which are listed lower in the standard than the breed I keep, puts it all over me when it comes to selling

PEERLESS PERFECTION
It's made right—from high grade material. In the construction of our PEERLESS FENCING we use open hearth steel wire. By this process impurities are removed from the metal, thus eliminating one of the chief causes for the rapid rusting of fence wire. PEERLESS is guaranteed to give you satisfaction. Send for catalog. Agencies nearly everywhere. Agents wanted in open territory.

his birds by weight." This statement based upon facts from laying contetsts should lead you to compare the laying quality of your below-the-standard flock with that of your neighbors. Your flock may be of a heavy laying strain and this kind is often under the weight. I have a laying strain of one of the breeds listed to weigh eight pounds for the hen when adult. At first it worried me because so many of my finest specimens and best layers would not reach this weight. When I realized why, I ceased worrying. Better plenty of eggs than a mere couple of pounds of meat.

Co-Operative Egg Marketing Essential to Success.

The egg is at its best when just laid and the longer it takes to place it in the consumers hands, the less it is worth. Eggs when prepared for market, should be spotlessly clean. They should be packed in clean cases, of which the thirty-dozen size is preferable. Absolutely clean fillers and cardboards should be used. The quality of the eggs should be unquestionable. It is only in this way that a good trade can be worked up.

The egg industry in Denmary has been enormously improved owing to the aplication of the principle of co-operation to the colecting, grading, packing and export of the eggs. The great progress of Denmark during the past fifty years may be at once attributed to the wonderful system of education available for its people and to the extent to which the principle of co-operation has been adopted in every part of the country and in every phase of its national industry.

Co-operation in the marketing of poultry products and in buying poultry feeds is one of the chief essentials for success in poultry raising This country should take up in earnest the organization of egg circles, where the eggs are candled and graded at the egg depot and sold in the best market Where creameries are in operation, eggs could be colected on the creamery routes and egg depots established, at the creamery The farmers cannot expect to get much better prices for their eggs until they market them in better shape The heavy loss to the country in marketing eggs is largely due to the farmer's neglect in colecting the eggs regularly and in marketing them sufficiently often Co-operation whan properly carrried out, will overcome to a large extent the undesirable conditions in marketing the poultry products

Rearing of Ducks.

A subscriber wishes to know what is the best food for ducks after they are hatched, where and how they should be kept, and which is the best mother for ducklings, a duck or a hen.

Ducklings do not require feed for about 36 hours after leaving the shell. They will be perfectly well with the hen, or in a warm broder. Stale bread moistened with milk is the best ration for the first thre days. With this water must be provided in a shallow dish, deep enough for them to bury their beaks, but not deep enough to swim in. They should be fed five or six times a day. Although the water fowls, young ducks should not be given an excess of water, nor should they be left out in cold rains, so as to get a chil. A constant supply of water, deep enough to bury their heads is all that is required while young. About the fourth day cornmeal or oatmeal mixed with wheat bran and soaked in milk and water, should be added to the bread, a litle at first, and gradually increasing the mixture until at the end of the first week the ration is wholly composed of meal and bran. To this should be added a little coarse sand, which experienced duck raisers claim is very important in order to raise healthy ducks.

Green feed also, is necessary, no mater how much grass may be at hand Some of the delicacies most enjoyed by ducks are lettuce, corn, alfalfa, beet leaves and kitchen scrap. The "greens" should all be chopped before feeeding.

Ducks wil soon leave the hen, and will feather out at about five weeks old From this time on half their ration will be picked up on the range. They relish worms, insects and green feed. No better ration can be given than soaked bran, wheat middlings and the corn or oat meal. When raising ducks for market it is not necessary to provide a swimming pool, as experienced men claim that they will not take on flesh as rapidly when given free access to a pond. This is desirable, however, for breeding stock.

A hen is a better mother for ducklings than a duck.

Poultry Suggestions.

Human sympathy to the birds comfort amounts to dollars and cents.

Clean the nests occasionally and put in a fresh supply of nest material.

Uniform nest boxes add to the attractiveness of the house.

White diarrhoea is contagious among young chicks.

The purchase of a few baby chicks from some fine pen of birds will make a splendid start if you care to start in July.

If your breeding pens were properly bred and mated, you need not be surprised to find some of the chickens developing into better specimens than their parents.

Watch the chicks closely and mark the ones making the most satisfactory growth. Select the ones that are plump, full breasted and in good proportion. You will not care to keep those that grow leggy and have thin breasts.

Never, under any circumstances, keep more birds than you can take care of well.

Green food is necessary for all ages of poultry but doubly so for the little chicks. Water and green food are cheap and very important.

Be sure the baby chicks have plenty of exercise. Keep them busy and hungry.

Keep the hopper full of dry mash all of the time.This gives the chickens an opportunity to balance the grain rations fed.

Remember full fed chicks are paying chicks. It pays big dividends to hurry their growth.

Always practice absolute cleanliness in feeding.

Cull the flock closely. Keep the best and prepare the rest for market.

Enrich the garden plot with the poultry droppings.

Constant thought and judgment are necessary in poultry raising.

Summer Houses for Poultry.

As the weather gets warm, the poultry house should be ventilated to its utmost. A roof as a protection from storms is about all the shelter poultry need during the warm weather. If your house does not provide ample ventilation for warm weather, close it up and build a cheap shed for the hens. This shed need not be elaborate

A few posts put in the ground to suport the roof is about al that is required. If in an exposed location, it would be advisable to board up the northern and western sides. In most localities, however, this would not be necesary as the shed could be built on the eastern or southern side of the barn. The open sides should be inclosed with poultry netting to keep out prowling marauders.

Poultry Notes.

The soil in the poultry run is better to be of a porous nature preferably of a sandy type.

In locating the sight for the poultry building it is well to select a spot where there wil be a natural drainage away from the building.

It is estimated that the cold-storage establishments of Ontario and Quebec lay away annualy in the flush egg season from six to nine million dozens of eggs.

When in Truro last week the Editor of The Maritime Farmer visited Dicksie Land Farm. Hugh Dickson's steading crops are looking well in Dicksie Lanh. Mr. Dickson has 20 acres under garden truck and field roots. At the time of our visit Mr. Dickson had six men busily engaged thinning turnips. The garden truck plots are the picture of thrift and good management. The Guernsey herd is looking well and doing well at the pail. The young heifers look particularly promising. Tne Dicksie Land Guernseys will be at the fall fairs this year stronger than ever.

"SUCCESS" :: By J. Lee Flewelling

In one of the large villages, which line the banks of the Hudson River, some fifty miles from New York City, at the time our story opens, lived Dr. Ruddock, and his little family, consisting of his wife, and a little boy, the latter at this time about ten years old.

Dr. Ruddock had a good country practice, and was a skilful doctor, and one who would in all probability, made a name for himeslf had he gone to New York City, where his talents would have had wider scope, but his beautiful wife loved Marlboro, where she had always lived, and as she had never seemed very strong, Dr. Ruddok feared to try the experiment of transplanting her to the hothouse of a city life, dearly as he would have wished to be located there himself.

Then again, their little boy Charlie, the sole fruit of their union, whom both so fondly loved, was growing to be a manly little fellow, the high altitude of the village with its bracing air, seeming each year, to make him more rugged and activ, and in his earlier years his father feared that he had inherited the weakly condition of his mother.

These were considerations that induced Dr. Ruddock to curb his natural ambition to rise in his profession, and brought him to think that the Marlboro situation might be the best for them

Charlie had been going to school for some four years and he was a bright, little fellow, and had much help from his mother at home, had made such rapid progress that he was already in the fifth grade, and brought home excellent monthly reports from his teacher

There is not usually a great deal of ready money among the poorer people of a country village, and these seemed to be the people in Marlboro who had the most need of our dotor and as he had a widely extended practice he had a great deal of hard work to do without a corresponding renumeration for the same, so that at the time our story opens, he had only been able to save about $500 over and above the expense of living, and this amount he had deposited in the bank at Newburg that quaint litle town, which was the headquarters of Washington at one time. during the war, and which still retains in good condition, the little stone cottage in which the great general and his staff then stayed and which is now full of momentos of the war period.

Many a night after he came home from a long, hard drive and was quite worn out and should have been restfully sleeping, he heard the little clock chime the hours while he lay awake, planning how he might best arrange for his boy's future.

Having had to restrain his own natural ambition, bythe force of circumstances, he was most anxious that Charlie should have advantages from which fate had debarred him.. With much gratification had he witnessed the expanding and developing of the intellect of his boy, who was a hand some young fellow, with light curling hair like his mother's and with the dark brown eyes of his father, and who gave promise to becaome a more than ordinariy clever young fellow.

One day having been called to a patient in the chief hotel in Newburg, as he stepped into the office on his way out, he was surprised to meet there, an old college chum, whom he had not seen for years and whom he was heartily glad to meet again

During the conversation which folowed, he learned that his friend was selling stock in the Gold King, a mine situated in Colorado, of which the doctor had heard considerabe , but to which, up to this time he had given no attention. "I tell you, what it is, John, I have at this time the option of one thousand shares, which a man purchased of me about a month ago, and on which he now wishes to realize. He paid me fifty cents a share and is now willing to sell for the same amount as he has other uses for the money here invested. I think he is very foolish as the mine has been paying large dividends—one percent. per month at the present time, and I am confident the same stock will sell for a dollar inside of twelve months, the way it is now booming"

"In the years that I have been here" said Dr. Ruddock "I have been able to save only five hundrer dollars, would you advise me to risk it in this investment ?"

"I certainly think," said his friend, "it will be the best investment you ever made"

After some further talk, Mr. Chipman agreed to hold that certain amount of stock subject to his friend's order until the following day.

That night the doctor thought much of the matter turning it over and over in his mind, and again robbing himself of his needed rest.

It is a pschological fact, hard of explanation, that any matter which worries one, seems to most effectually get its work and banish sleep at about three o'cock in the morning. Any one who has had business troubes will attest to this fact. About this time Dr. Ruddock woke, thinking over and over this matter unti the morning; thinking of the money that might be made by this means thus securing to his wife and boy the advantages which come from wealth, and which he so longed to have for them.

By morning he had fuly made up his mind to venture the few hundred dollars he had saved, in the enterprise, immediately after breakfast, without consulting his wife for he seemed to know that she would oppose this scheme, he drove down to Newburg, and announced to his friend that he had decided to take te stock.

As soon as the transfer of stock could be made, he withdrew his money from the bank and paid it over, and returned home, the proud possessor of one thousand shares of Gold King. In just three months from that time he received a letter from his friend stating that he was offered $100.00 per share for the same stock, it having boomed even beyond expectation—"I would advise you John to take this offer, you will thus clear $500.00 on your investment, and I have not full faith in that the future of mines will be as rosy as the present. Answer by telegram, and if you sell, meet me at 29 South Street to-morrow, to which place you may address your telegram."

Dr. Ruddock had full faith in his friend, and so answered, "Yes, I will sell."

The following day the Doctor went to New York, completed the arangements and on his way home, stopped off at Newburg and deposited one thousand dollars in place of the five hundred lately withdrawn. Already in imagination the doctor saw himself the rich man he longed to be.

As Charlie stood in his favorite attitude, leaning against his father's shoulder, after tea, that night, Dr. Ruddock told him that he hoped to be able to send him next year, to the collegiate school at Milton, where boys were fitted for college. "That has been my ambition for you all along, but I could not quite see my way to it, but I guess luck is turning our way."

"Is your practice increasing, John?" asked his wife. "I have noticed that you seemed more cheerful of late, and I have not heard you bemoan the fate of a poor country doctor for some time."

"Oh, things are looking up a little, dear," was the ambigious reply.

Some months subsequent, there appeared in Milton, where Dr. Ruddock chanced to be on profesional business, another agent, for the great scheme of extracting gold from sea-water this time. We know it now as an exploded scheme, which wrecked many men, but under the eloquent tongue of Mr. Perkins, it seemed most plausible. "All men know," he said, "that the streams which come down the sides of the hills and the rivers which run into the ocean, all carry much gold in solution so that the ocean water must hold vast quantities of gold and the only difficulty is how to extract it."

"The originator of this company has devised a simple means of doing this, and the company has all the stock sold, with the exception of a two thousand dollar interest, which I am now offering. The company has already been incorporated, and next month will begin operations at or near the Maine seaports. No more stock will be offered, and as the company is a rich one and does not wish to have too many stock holders, this lot will only be sold en bloc."

As the chance of selling did not seem over good, the agent readily agreed to wait a couple of days, until he should hear from Dr. Ruddock, before disposing of the same.

Again our doctor had one of his sleepless nights, new visions of increasing wealth, came to him, and he longed to try his luck, as he termed it once more.

Now it became necesary to take his wife into his confidence. So, after breakfast, after Charlie had left for school, he said to his wife: "Ida, I wish you would come to the study for a few moments, I have something I want to tell you about."

Here he told her how he had all along been dissatisfied with his position in the village, thinking that he was cut out, as he expressed it, for better things, a more lurative city practice ; but knowing how hard it would be for her to leave the old home, and fearing for her health if he made the change, he had been in a measure content to remain at the village for her sake, and degenerate into an ordinary country doctor. He also told her about the investment he had made some time before, and the splendid results; and explained to her very fully the new investment that was now offering. I have often, he said, thought of this same thing myself, there is litle doubt that the ocean water does contain in solution, a vast amount of gold, and it seems that an eminent scientist has perfected a scheme of extracting this gold and there is a chance for all who hold stock in the company to become fabulousy rich. As I have shown you I have already one thousand dollars in ready money, and should you consent, I can put a mortgoge on our place here for the other thousand, but, of course, cannot do it without your aid, as you would have to sign the deed of mortgage.

His wife could not see the matter just as he did, and thought it would be quite enough to risk the thousand dollars, without imperiling the home, but said she, "I have the fullest confidence in your judgment, John. and will do as you think best. Perhaps, we had better as is said, sleep on the matter, and leave our decision until to-morrow."

On the strength of this understanding, Dr. Ruddock felt justified in telephoning to Mr. Perkins, that he would call on him at Milton at two o'clock the next day and to hold the stock for him until that time. As one can readily guess. this the agent agreed to do.

The first thing in the morning after breakfast was over, the doctor broached the subject again and his wife said in reply, that while she would not have possible gain for herself and Charlie; yet she could not but consider that the obtaining riches would make matters much easier and pleasant for him, the doctor, that she would pocket all her scruples and do as he wished."

"Where," she asked, "do you expect to get the money."

"Lawyer Toole," he said will be quite willing to advance one thousand on a place that is worth twice that."

"Oh, John," said his wife, "I dread to be in the power of that man — he

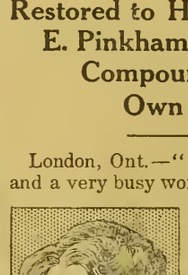
Better Than Spanking.

Spanking does not cure children of bed wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

FARMER'S WIFE ALMOST A WRECK

Restored to Health by Lydia E. Pinkham's Vegetable Compound — Her Own Story.

London, Ont.—"I am a farmer's wife and a very busy woman. Last summer I was taken with severe pains in my back so bad that I could not get up or scarcely move without pain, and my periods were painful. My husband called in a good doctor and I was under his care for some time, but he did me little or no good.



One day a friend of mine told me to try Lydia E. Pinkham's Vegetable Compound as she had been greatly helped by it. I began taking it and soon got well, and my periods became natural again. Since then I have had perfect health. In fact I have never felt so well in my life. Lydia E. Pinkham's Vegetable Compound is a medicine many women need. If you think this letter will help other women please publish it."—Mrs. K. C. YOUNG, Tambling's Corner, London, Ontario, Canada.

Women who suffer from those distressing ills peculiar to their sex should not doubt the ability of Lydia E. Pinkham's Vegetable Compound to restore their health.

If you have the slightest doubt that Lydia E. Pinkham's Vegetable Compound will help you, write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass., for advice. Your letter will be opened, read and answered by a woman, and held in strict confidence.

would not hesitate, should things go against us, to turn us out of house and home."

"Never fear, dear," said the doctor, "he has a certain amount of respectability to maintain, and would scarcely dare to show so much injustice and if the worst comes, I still have my practice to depend upon."

When he called on Lawyer O'Toole, he found him most affable and he said most certainly, doctor, you can have the money and by 12 o'clock, as you wish. I will despatch my clerk with a check to draw the money at once, and will have time to prepare the document and come up to the house for your signatures by the time he returns. So, if the demand is somewhat sudden, I tihk we can have it by the time you specify."

At eleven o'clock, promptly, Lawyer Toole called, "with the deed of mortgage," as he said rubbing his hands, "all ready for signature. My clerk has not got back yet, but he will be here by eleven, there, I see him just turning the corner now—he will be here inside of five minutes and that will be as soon as you can have your signatures affixed and the acknowledgement made."

The doctor ran his eye over the document, which like most of the kind drawn up by a lawyer, was unnecessarily long:

"Why, what is this," the Dr. said: "I did not agree to keep the house insured in your favor and the mortgage covers all the goods and chattels in the house and barn as well as the premises. You know well that this house and lot is worth twice the amount you are giving me, and alone, should be ample security for your money."

"Oh, well, doctor, it is our custom to include these things and as you will no doubt redeem your property in a short time, it doesn't really matter much and there woud not be time enough now to rewrite it."

"If my wife were here, and knew these things were included, I doubt if she would be willing to sign and I could not blame her; but the case is urgent and there is no time to spare, but, I shall remember you in the future, Mr. Toole, and shall risk my property in your hands as short a time as possible. There is my signature, and I acknowledge that to be my hand and seal. Then stepping to the door, "Ida come here a moment'"

"My husband tells me you want my signature to some document Mr. Toole Have you read it, John, is it all right?

"Yes," with white lips.

The acknowledgcment was duly made, before the young man, Mr. Toole's clerk, who now came in for that purpose, the thousand dollars paid over and Lawyer Toole, seemed to slip out of the door, climbed into the wagon with his clerk and the horse was put down the steep hill at a clip that threatened to endanger their necks He seemed to want to get from under the influence of Dr. Ruddock's stern eyes.

The doctor's horse was soon on the road to Milton, which he reached before 2 o'clock. The deal was closed, and when he started for home, he was the possesor of a large interest in the Ocean Gold Scheme.

The hills of Marlboro as I have intimated, are very steep, so much so, that double seated wagons as well as truck wagons are rigged with a brake, which the driver can apply to the hind wheel, by the use of his foot

It has always been supposed, that Dr. Ruddock's horse, must have stepped on a rolling stone, when going at a fair pace down one of these steep hills, the one that approaches the factory near the boat landing at Marlboro for, sometime afterwards, the horse was found with one front leg broken, making vain efforts to get on his feet and neighing pitifully. and the body of our poor doctor lay not far away, with the neck broken, as it was afterwards discovered. He must have fallen on his head when the horse went down.

The first to discover the accident was a farmer, who was taking a load of poplar to the factory. He gave the alarm and kind friends, for the doctor was a universal favorite, took charge of the body, and after dusting the clothes, and washing the dirt from the face and hands, started a mournful procession towards his late home. Mr, Meredith, an old friend of the doctor's went ahead to break the sad news as gently as possible to Mrs. Ruddock, and was agreeablg surprised to find that she made but little lament. but it was that her grief was too deep for words. When they brought the body into the house, as she placed her hand on the doctor's cold brow, she gave one moan and sank to the floor. She never regained consciousness.

"Heart disease," so said the Newburg doctor who was hastily summoned.

Hundreds gathered from all parts of the country, to attend the double funeral, unusual sympathy being aroused by the exceptionally sad circumstances.

Poor Charlie was left a penniless orphan, in his twelfth year, for under the mortgage, Lawyer Toole took possession of the homestead and all its appurtenanes and the shares in the "great scheme for extracting gold from sea water were worthless, the great bubble had already bursted. A meeting of the villagers was held to see what had best be done for the orphan boy.

A farmer, named, Selden, who lived about forty miles further up the Hudson, on what he termed a back-settlement farm, agreed to take charge of th boy and send him to school, giving him, as he said, his food and clothes, for the help he could render about the house until such times as he would be old enough to look out for himself. This offer, they thought it best to accept, as none seemed to care for the burden of an extra boy, and after extracting a promise from Mr. Sheldon to take good care of him, they placed Charlie and his few personal belongings in Mr. Sheldon's wagon and saw that worthy drive off though not without the shedding of some tears by the sympathizing women present.

When the forlorn boy, reached his new home, tired and sore, from his long journey in the farm wagon, he was far from pleased with the prospects.

The farm buildings were old and rough, and Mrs. Sheldon received them with anything but graciousness. After she had heard her husband's account of how he came to bring the boy, "much use he will be to me," she said, "another back to clothe and another mouth to feed."

In the years which Charlie sppent with the old couple he was compelled to assist Mr. Sheldon with the farm work each summer and only sent to the village school during the winter months.

As he was an ambitious boy he made the most of his opportunities and having a good teacher, who was soon much interested in him, and lent him books and assisted him in every possible way, he still made good progress in his studies. The spring of the year which he was sixteen saw him a sturdy, handsome young fellow, in spite of the fact that his clothes were anything but good, being made over, as they were , from the disused ones of Mr. Sheldon. He never had a suit of new clothes in the whole four years that he spent with the old couple. Still

"Home's Warm Welcome"

THE worries of a day at business, and the chill discomfort of a stormy journey homeward at its close, make home's warm welcome doubly grateful. Cares forgotten, mind and body alike relaxed and comfortable, you feel GOOD.

Not the least of those things that contribute to the pleasure of this home-coming is an

ENTERPRISE
Hot Air
Blazer Furnace

It supplies the physical warmth that makes your body feel so good. And all day it has been keeping wife and children cozy and comfortable—supplying them with warmed, FRESH air, and protecting them from colds and headaches.

You can install a Blazer for less than it costs for a hot water system, and operate one for much less than it costs to heat the house with stoves. Each Blazer is sturdy and strong, and built to last a lifetime. Most good dealers handle Blazers. Drop us a postcard and we will give you the name of the one nearest you.

FOUNDRY CO. SACKVILLE, N.B.

his life had not been wholly unhappy. He and the other boys of the school managed to get a good deal of fun from swimming, boxing, trapping and such other things as boys find most entertaining. In all of these sports, Charlie took a prominent part, and had such a powerful stroke that few of the boys cared to put on the gloves with him unles he promised to "go easy"

One warm day in early spring Mr. Sheldon and he were putting a large stone on the drag, to haul it off of a piece of ground they were gong to plow, when the stone, slipping off the side of the drag, bruised Mr. Sheldon's foot somewhat. It was his own fault as he did not lift enought to keep his side up, but, as usual, he chose to blame Charlie for the accident, and, madened perhaps with the pain, gave the youug fellow a cuff alongside the head, the first time he had gone far enough to strike him. He had no sooner done it, than Charie, now a strong young fellow with muscles like iron, gave him a shot under the ear, that sent him reeling backwards.

When the old man regained his senses, our hero said to him, "in all the years I have been with you, you have treated me most shabbily. my living has been a poor one, you have put me at the worst kind of drudgery, you made all my clothes from your own old cast-off garments, and you always seemed to begrudge me my winter's schooling; and you and your wife have been surly and ugly. I have never had a pleasant word from you since the day I came here, and I put up with it al. You never struck me before; that is the one thing I won't stand. I am done with you now. I will uever darken your door again.. I am going to look out for myself after this."

"I'll have the law of you, for this," said the old man. "You'll find you can't run off just as you like."

"You had better just leave the law alone, and me too," said Charlie.

"I'm going to face the world and work for myself now, and I never want to see your face again." So saying, he put on his coat, jumped the fence with an agile bound and started down the highway which led to the river.

He arrived at the long wharf at Roundout, just as the steamer Albany on her way to New York, hove in sight up the river

When the boat was moored to the wharf, Charlie went on board and he made his way up to the pilot house, where the Captain was.

As soon as he saw that officer, (and he knew him by the name in gold letters on his cap), he said:

"Captain, I want to go to New York and I have no money, can I do any work that would pay for my passage?"

The captain looked at him with a quizzling glance: "Running away, eh? Why didn't you sneak aboard and steal your passage, as many of the young fellows do?"

"Because I'm not a sneak, Captain", said Charlie, looking him squarely in the eyes, "and if one of your boys had been where I've been for this last four years, you would have wanted him to run away long before this."

Charlie said this in such a modest yet manly way, that Captain Fownes, who was a most kind-hearted man, was at once interested.

Pointing to a stool he said, "we will be here for about fifteen minutes — sit down and tell me your story, I can see that you will tell a straight story, but boil it down boy, boil it down."

Charlie understoor what he meant, and gave a short succinct account of his life, from the days when he lived in Marlboro, his father's and mother's pride, up to the present time.

"So said Captain Fownes, "you are Dr. Ruddock's son? Many a time he went up and down the river in this boat. I remember him very well and I also remember the whole circumstances of his being killed, and the double funeral, and of Lawyer Tooles dispossessing the young heir, and I am very glad my boy to have it in my power to give Dr Ruddock's son a lift I believe he would have done the very same for my boy, had our circumstances been reversed."

When the boat got under way, again, he had Charlie do some steering under his direction and was pleased to see the readiness which he showed in the work. Why, Charlie, he said, jokingly, I believe in a short time you would be able to take this ship thro' alone.

When dinner was called, the mate came and took the wheel. "Come, Charlie," said the Captain, "let us go to dinner." When they came to the saloon, he said to the steward (all of the waiters aboard this boat were colored people), "I want this young man on my right."

"Yes, Captain."

To sit at the right of the Captain, is considered the highest honor of the dining-room. The Captain's placing him there, insured for our young friend that his wants would be well attended to, and as our hero had had nothing to eat since the early morning, he did full justice to the good things placed before him, and there are few boats, ocean or river, that set a better table than the old Albany.

When they had returned to the pilot house, and the Captain was enjoying his cigar, he turned to Charlie and said: "Well, now; my boy, that you have had a good dinner, we had better come to some understanding about the future. You say you are going to New York to look for employment, what do you expect to do when you get there?"

"I don't know, sir," said Charlie, "but in the big city, there must be a place for such as I. I am willing and able to work. I only ask for a place to start and a chance to work up. I know that I am unused to the work as I will find in the city, but I am willing to start at the bottom but I don't intend to stay there."

"Well said, my boy," said Captain Fownes, "you'll be all right or I'll miss my guess and I very much doubt if the temptations which come to the young men of the city, have much effect on you—the grand qualification for success in a city life, is to learn to say no, to things that lead to folly."

About 6 p. m. the Albany aried at her dock at 23rd Street, as Charlie was walking off the gang plank, having previously thanked the Captain, for his great kindness, the Captain called to him to wait, he wished to see him. As soon as he was at liberty, he said:

"Now, young man, come with me." They walked to Broadway and took the trolley car to Pearl Street. Here they alighted and after walking some distance came to a large wholesale warehouse, with "Price & Co." on the door. Inside the noise was almost deafening, a hundred hammers seemed to be going at once.

(To be continued.)

The First Convention of P. E. I. Women's Institute.

The first Convention of the Prince Edward Island Women's Institutes was held in the Assembly hall of the Prince of Wales College, Charlottetown on June 29th.

The first session was presided over by Mrs. J. A. Matheson, who welcomed the large number of members present in a brief address in which she emphasized the possibilities of the "for home and country" moment.

Mrs. Matheson said:

It gives me much pleasure to preside over this opening meeting of the first annual convention of the Women's Institutes of this province. It is an event full of great possibilities for the future of our people, especially to the young and rising generation.

Of late the question of women's rights has been forced to the front in the Motherland by a frenzied zeal and acts of violence tending to delay rather than advance the cause. We hope to pursue a different course and not only improve the condition and bring about results which will not only improve the condition of women, but will be for the greater good of the children, the men and women of tomorrow.

In looking over the reports of your Women's Institutes and getting some idea of the scope of your work, it seems to me it must tend for good in all departments where women's work is needed most,—first, in the home, then the school and then the social life of the community. It is needless for me to remark that the home in the centre of our work, the heart of the country,—from thence the best inspiration comes. There are matters that will take up your attention, but at present I will deal with one wnich to me is of the greatest importance,—I refer to the schools. There is spent the greater part of the life of our children. We as mothers should see that our school-houses are kept clean and sanitary, and the surroundings as attractive as possible. In the past, in a great many communities, the school has been overlooked and neglected. Anything will do so long as it has walls and a roof. Sanitary conditions are unthought of, and as for beauty in connection with education, why, the matter is unheard of.

Every day we hear more and more of the necessity of sanitation in the prevention of disease, and the cleanliness of our schools should be quite as important as in our homes. No one can do good work in unhealthy surroundings. I cannot emphasize this point too much. If the Institutes now established will make a special effort during the present year to raise the sanitary condition of the schools, they will be pioneers in a much needed reform that will soon remove the reproach from our Islann that the school-house is often the meanest, most ill-kept building in the community. Our hearts should be in the schools:—our greatest treasures are our children, and where our treasures are there should our hearts be also.

Hon. Murdoch McKinnon, Commissioner of Agriculture, then addressed the meeting shortly, congratulating them on the great development they had made. He said that the women's inst tutes were a factor of vast importance in the educational problem which the province had to contend with. In the past they had been guilty of one serious omission, and that was that they had not solicited the valuable help which the women, by these institutes, had proved themselves eminently capable of lending. He did not think that any system of education in the province would be complete without the women's institutes, and that was abundant reason why they should be given a hearty welcome. The Department of

The St. Lawrence Flour Mills Co., Ltd.
Montreal

Agriculture would do all in its power to assist these institutes. There were formerly five school inspectors, whereas at the present time there were ten, the amount of work done by them being thus far more efficient than formerly. And they could see how much more still the inspectors could accomplish if they were given the full support of all the women's institutes. He hoped the proceedings would 'nterest all who were present and would as a result inbue them with such enthusiasm as would enable them to return and do as well as or even better than they had previously done.

Mrs. J. W. Kier, of Mapleque, in a few interesting remarks replied to Mr. McKinnon's address. She felt honored, she said, to represent the delegates of the Women's Institutes of Prince Edward Island and to reply to Mr. McKinnon's very excellent address. Mr. McKinnon had said many good things about them and she hoped they would be able to gleam from the proceedings of the convention ideas which would help them to live up to his good opinions. She hoped they would be able to make their institutes the medium of knowledge and culture. In regard to the schools, the inspectors were somewhat inclined to dwell too much on the fa lings of the teachers instead of telling them how they codld remedy their faults. She thought that this matter might be considered. The teachers, she thought, needed help. She thanked the Department of Agriculture in the name of the delegates, for the hospitality that had been extended to them. She spoke very feelingly about the hospitality of Prince Edward Island too. When she came here nine years ago she received such kindly treatment and such friendliness that she thought that there was no people as good as Islanders. She did not know such things could exist. "The women are all so good and kind here to one another," concluded Mrs. Kier, "and your country is so good, that I sometimes think you don't half appreciate what you have got."

SECRETARIES' REPORTS.

The reports of the secretaries of the various institutes were read. They, without a single exception, showed an increase in membership since their organizations and the keynote of everyone was a better sanitary condition of the schools throughout the country d stricts as a retult of the influence on teachers and parents which the institutes had exercised.

The question of supplying drinking fountains and individual cups to the schools was raised in several of the papers, and it was stated by one of the members that a good fountain could be had for $5.

READING.

The president, in commenting on the excellent reports which had been read, mentioned a matter of great importance and one which should receive carful attention. Mrs. Mathieson referred to the question of reading. She insisted on the necessity to a proper education of the reading of good, sound literature, and not the worthless novels which too many were fond of reading.

On the invitation of the Commissioner of Agriculture Messrs. Boulter and Crockett, two school inspectors who were present addressed a few remarks to the meeting, congratulating the Women's Institutes on the good work which they were carrying out, Mr. Boulter emphasized the importance of the drinking fountain and individual drinking cups. He said the institutes would be able to do an unlimited amount of good if they were fully supported by parents and teachers. Up to the present there was lacking the sympathy of the homes, and he had occasion to state at one school that they would never get where they would like to be in the matter of education until the women had more to say in school affairs.

Mr. Crockett said it seemed to him from the quality of the work that was being done, that the women's institutes, if they continued as they were going on at present, would render unnecessary any school inspectors at all.

There then followed an interesting demonstration in dressmaking, in which Miss S. A. Roper gave a practical lesson in the making of skirts and other articles of feminine attire. From 5.15 to 6 o'clock the time was occupied by a business meeting which was conducted by Mrs. A. E. Dunback.

The evening session was presided over by Hon. Murdoch McKinnon, with the Premier, Hon. J. A. Mathieson, and Mr. R. H. Campbell, B. A., Superintendent of Education, on the platform. Valuable papers were read by S. R. Jenkins and T. F. E. Robins and Miss W. T. Graham, Superintendent of the P. E. I. Hospital.

Following this was a general discussion, led by Mr. R. H. Campbell, B. A., Superintendent of Education. Mr. Campbell spoke on the value of medical inspection and favourably commented on Dr. Jenkins paper. He prophesied that medical inspection of schools was a matter not very far distant. He referred to the amount of sickness which was prevalent as a result of carelessness, which could be remedied by proper medical inspection. He laid stress on the need of greater care in the preparation of children for school; they could be kept dry, clean and comfortable.

The Premier in the course of the discussion congratulated the Women's Institutes on the great work they were doing and appealed to them to co-operate with the inspectors. The Government, he said, would do all in its power to further the movement. They should not, however, be in too great a hurry, but should see that everything they did was perfectly done.

TUESDAY MORNING'S SESSION.

At Tuesday morning's session presided over by Mrs. S. R. Jenkins, Mr. F. F. Smith, B. Sc., gave an entertaining lecture on the subject "School Gardens." He referred to the matter as it was dealt with in other countries, stating that there was hardly any important European nation in which this movement had not been greatly developed. Emigrants from those countries showed a surprising skill in gardening, and this was undoubtedly to be attributed to the school garden work in the lands from which they came. In a country like this, where the agriculture possibilities were so great, it would seem that this school garden work should be made specially prominent. One difficulty that presented itself was this, that in many cases the school grounds did not afford space for any attempts in this direction. It had been suggested that the women's institutes might frequently use their persuasive powers to good advantage in securing the aid of public-spirited farmers in granting the use of sufficient land for a term of years. Probably, if the land could be available for five years the success of the movement at the end of that time would ensure ite continuance after that. As most of the rural schools of the province were small, the size of the plot need not be very large. There should be provision for a small individual garden for each pupil; for the younger pupils, at least it need not be larger than 4 x 10 feet. Mr. Smith developed on this subject in an interesting manner.

Professor W. Davidson gave a practical lesson on school gardening, taking his hearers out to a splendid plot of vegetation on the ' College grounds.

Miss Hortense Phillips gave a practical address on "Home Decoration" and her efforts were highly appreciated by her large audience.

The following are the resolutions of the Women's Institutes arrived at at their business meeting.

RESOLUTIONS.

Report of the Resolutions Committee:

Whereas we have reason to feel grateful far the advancement which the women of Prince Edward Island have made in the Women's Institutestes movement; Resolved, that we express our appreciation of the work accomplisheh, and extend to Honourable J. A. Mathieson, Premier of Prince Edward Island, and Hon. Murdoch McKinnon, Commissioner of Agriculture, and the officials of the Women's Institute branch of his department thanks for their noble service and untiring efforts for the advancement of good health, better homes and better schools, throughout the rural sections of our province.

FIELD WORK.

Whereas, realizing that our province has yet considerable territory where there are no women's institutes; Resolved, that we recommend to the Department of Agriculture that the women's institute movement be extended as much as possible during the coming year, and urge upon the public in general the benefits to be obtained from these organizations.

SCORE CARDS.

Whereas, score cards have been arranged for the judging of bread, canned fruits, canned vegetables, jellies and preserves: Resolved, that these cards be put into general use.

EDUCATIONAL COURSES.

Whereas, we realize the great benefit to be derived from instruction in household science and manual training: Resolved, that we urge the members of the women's institutes to use their influence in securing the introduction of these courses upon the school curriculum of every rural school throughout the propin(e.

Whereas, considering the growing interest in the excellent results from the short courses given in the past by the Department of Agriculture to the women in the province: Resolved, that we express out heart appreciation to thase officials for their valuable assistance; and Resolved, that we ask the Government for their favorable consideration for the continuance and extension of the work; further Resolved, that we ask the Gov ernment for their co-operation in the granting of the services of capable instructors to the womens institdtes for short courses in dressmaking and home nursing during the institute year 1914—1915.

WOMEN'S INSTITUTE PIN.

Whereas the desire for an institute pin has been expressed by members of the institutes of the province. Resolved that we ask the Government to advance a sufficient sum required to purchase these pins, the same to be placed to the credit of the institutes on payment of same by members.

Whereas this meeting has been enjoyed by all: Resolved, that we extend to the offieers in charge of the convention our thanks for their ex-

What's Being Done to Put the Home on a Business Basis.

(Continued from last issue.)

First of all, the efficient attitude of mind for the housewife and homemaker is to realize that, no matter how difficult and trying are the household tasks and burdens she finds placed upon her, there are positively ways to meet and canquer them efficiently—if she approaches these problems vigorously, hopefully and patiently.

Secondly, that far from being dull drudgery, home-making in all its details is fascinating and stimulating if a woman applies to it her best intelligence and culture.

Third, that no matter how good a housekeeper and home-maker a woman might be, she will be eager, not only to try, but to persistently keep on trying, to apply in her home the scientific methods of work and management already proved and tried in shop and office throughout the world.

If housework is drudgery to a woman it is only because that woman has not in her mind the conception of mental interest which lies within her work. She sees nothing more to conquer in it; her mind has become fatalistic concerning it. She refuses to avail herself of the improved equipment and efficient methods of human labor which the outside world is evolving, and she does not delve into the mysteries and unsolved problems of her own sphere. She does not know that her lack of analytical interest is part explanation of her fatigue and dislike.

The art as well as the science, of homemaking, if followed out on an intelligent basis, is the most all-satisfying, broadening, and stimulating career open to any women, and one which offers her widest talents their most varied scope. Home-making is broader and more inspiring in its opportunities today than it ever was. In fact, home interests have already been extended into the field of municipal politics, education, economics, chemistry of food, hygiene, sanitation, etc., but the great mass of women have not followed them. Like hens with ducklings, they are dissat sfied to stand alone in their oldfashioned kitchens and homes, but yet hardly dare follow their ducklings into strange elements! The home has grown faster than they!

Of course, many women disparage any serious effort to revolutionize home work. There have been many critics of "efficiency" in the household. Magazines have printed humorous skits and stories telling the sad adventures encountered in "standardizing Lizzie" or making "motion studies," of minding the baby. I have laughed at them all and welcomed them all, and was, if anything, sorry that the magazines and newspapers were not full of more of it! None would deny that the home is still operated on more or less medieval lines, or that vast number of women yearn to get away from its chains: but with the familiar human conservatism, they fight or ridicule remedies proposed.

On the whole the critism has been slight and far between, for the good practical sense of women who think at all, is interested in the very logical idea of using the successful science of mastering work outside the home for mastering the work inside the home.

As Frank Gilbreth, of whose pioneer work in factory motion study we have already spoken says; "Housekeeping is an industry which embraces a variety of activities and, like all other industries, it can be well managed or badly managed. The saving of strength of the housekeep-

86 Pages of Personal Advice
Free To Any Man

MY DEAR READER:

In the handsomely printed little book or private pocket compendium for men (containing 8,000 words and 40 half-tone photo reproductions), which I publish and gladly forward by mail, free, sealed to any man anywhere in the world who sends me the free coupon below. I have included certain parts that contain some very important advice or suggestions of a strictly personal nature which, I believe, cannot be found in any of the Private Hygiene books for men that are now sold at high prices all over the country. It will thus be seen I have endeavored, through the medium of my free book, to give my readers absolutely free of cost really MORE, in some respects, than others offer and make a large charge for. All you have to do to get this free book of mine is to use the coupon below, or if in my neighborhood, I extend an invitation to you to call at my office. Please remember that this free offer involves absolutely no obligation on your part, and there is nothing whatsoever for you to pay and nothing whatsoever for you to buy in any way, unless you should decide at some time in the future that youwould like try one of my mechanical VITALIZERS (described below). but that rests entirely with yourself. Over a million of these little free books have now been sent to men who wrote for them as I want you to do, and who live in all parts of the globe. I publish this free book in English, Swedish, Danish, Finnish, German, French and Polish, bnt I always send the English edition of course, unless otherwise instructed. Kindly use the little coupon.

SANDEN, AUTHOR.

MANLY, VIGOROUS MEN RULE THE WORLD

In reference to manly strength, I believe it is now more generally acknowledged than ever before that the manly man stands back of all that makes for progress, development and achievement in the world, a truth which any of us can easily verify if we but look about us with impartial eyes.

As a matter of fact, the man who is debilitated, unstrung and enervated cannot, for perfectly obvious reasons, expect to approach those real and masterful attainments which seem but a natural and easy accomplishment for him whose nerve force, brain power and manly strength are perfectly normal. Hence, we acknowledge the debilitated, weakened man to be handicapped in every walk of life where real manhood counts, yet it would indeed be cruel of me to here so state the fact in public print were I not of the honest opinion that there is every hope for the unmanly man to restore himself to a state of health and vigor, if he but clear his mind of abnormal fear, and then make a fair, square effort to redeem himself.

There are two specimens of humanity for which I have no earthly use. One is the man who, though now strong and vital, yet plunges into dissipation and excess with the certain knowledge of his unmanly fate. The other is the man who, though knowingly debilitated and enervated, makes no effort to get away from his life of dissipation and wrong practices. As a matter of fact, there is no hope for either of these unfortunates But for him who acknowledges his errors, who may come to me and say, "I have paid the penalty of my past follies, but I am THROUGH with my life of dissipation, and I am going to make a manly effort to restore myself," to such a man, I carea not what his physical condition may be, I can say in all truthfulness, "You, my friend, are on the right road to new strength and new manhood", for he really is, and there is no doubt about it.

I make a little appliance that I call a VITALIZER, which I designed to aid just such men who seek manly strength. I am not offering this VITALIZER here for sale, but merely suggest that you, reader take this opportunity to learnall about what this little appliance is doing today everywher e throughout the world; then, if in the future you want to use one yourself and will so write me, I will gladly make some liberal proposition whereby you may have one to try. The VITALIZER is fully described in one section of the free book which the coupon below entitles you to.

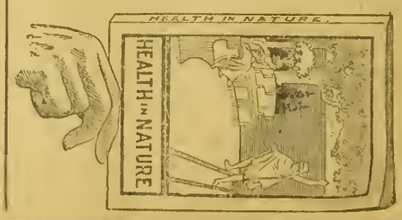
The VITALIZER is made up in a very light form weighing only several ounces, and you wear it on your body all night. It generates a great, soft, pleasant FORCE which I call VIGOR, and which flows in a continuous stream into your nerves. organs, blood and muscles while you sleep. I am satisfied in my own mind that I have access to a great POWER in this little VITALIZER which in the future will be more and more relied upon all over the world in the treatment of debilities and nerve weaknesses.

With special attachments which carry the FORCE of the VITALIZER to any part of the body, it may be used by women as well as men for he treatment of rheumatism, kidney, liver, stomach, bladder, disorders, nervousness, lack of energy, etc. Therefore. please send for the book today, or if you happen to live in or near this city, I should be very glad to see you in person. Office hours, 9 to 6.

WHAT THE FREE BOOK TEACHES YOU

The little free illustrated book of special private information, referred to above, is meant really to be a self guide for all men through the years before and after marriage and onward to a ripe old age. It is written in perfectly plain language, entirely free from technical terms, so that any one may easily grasp the full power of its good advice from two or three careful readings. It attempts to point out a safe road to new manhood or new manly strength, and as such is dedicated to mankind generally. One part of this book fully describes my little VITALIZER referred to above.

Remember, as soon as the coupon below is received I agree to forward to you one copy of this illustrated booklet, absolutely free of charge and in a plain, sealed envelope, so that it will come to you privately, just as you receive any sealed mail.



DR. M. F. SANDEN CO.,
140 Yonge St., Toronto. Ont.

Dear Sirs—Please forward me your book, as advertised, free, sealed.

Suffered with Palpitation of the Heart and Nervous Trouble

Mrs. John Dennison, Combermere, Ont., writes:—"I cannot praise Milburn's Heart and Nerve Pills too much. For years I suffered with palpitation of the heart and nervous trouble, so that I could not lie down to sleep. I tried almost all other medicines, and got no relief, until I was advised by a friend, who had been benefited by your pills, to try them, I did so, and after taking four boxes I found I was almost cured, and I am going to continue taking them, for I never got anything to do me so much good. I would advise any one troubled with their heart or nerves to do the same as I am doing."

Milburn's Heart and Nerve Pills are 50 cents a box, or 3 boxes for $1.25; at all dealers or mailed direct on receipt of price by

Toronto. Ont.

er, the finding of time for rest and recreation, as well as the right use of money expended for the household, depend in a large measure upon the skill of the housekeeper and her efficiency as a manager and as a worker. It would seem that principles that have proved of use in the scientific management of commercial industries might have application to the business of housekeeping.

"There is undoubtedly a waste of time, energy and money, resulting from imperfect organization, or from the absence of organization of the work of the household."

Mr. Gilbreth again, speaking before the American Home Economics Association at Lake Placid in 1912, has suggestively outlined the two basic plans of management of all human business, in a way which has significance to the work of woman. He says:

In all organized work there are two plans of management. The first of these represents what is variously known as military, or traditional management. Under this plan each man is responsible to one man only above him, and is in charge of all below him. Thus it is the custom for any man to come in contact with only one man above him, the line of authority being single and direct. Traditional management has been used for centuries in military organizations and political organizations. The division is by men, or by grades of men, rather than by functions.

Under the military plan the worker receives orders directly from eight different foremen. It has been said that no man can serve two masters and this is true even in scientific management. But under scientific management the worker does not serve eight masters, nor eight functional foremen, but, on the other hand, he receives help from eight different foremen or teachers. In this way his case is not very different from that of the student who receives instructions from eight different professors, in eight different studies.

The military or traditional plan of management is outgrown in industry—it is also being outgrown in the home. The woman must have more sources of management knowledge—there must be more available sources of personal efficiency counsel, such as business and industries are now organizing for themselves.

Lectures on domestic science and home efficiency have increased by the hundreds; in fact, interest in domestic science courses and lectures was a forerunner of the efficiency idea. Next in importance, perhaps, has been the development of the pure-food movement. It has been brought home to the American woman that family efficiency is dependent on healthful cooking and on knowledge of food values. Efficiency in buying has been further stimulated by the formation of such organizations of club women as The Housewives' League, Consumer's League, etc., which try to obtain closer co-operation and less waste between the producer and consumer, and in the social and economic sense are working toward the same ideal of more scientific management of the home.

As evidence of the great interest in bringing the home to a more scientific basis there have been innumerable articles and speeches from experts on the "budget" plan of effecting home economy. The methods followed by governments and corporations have been noted, and the same methods adapted to the handling of home finances. Instead of guesswork and slouchy accounts, the home-maker is being shown how to proportion her income to the various departments of operating expense—rent, food, shelter, and clothes—and by business discipline to keep within the "appropriations."

IMPROVED EQUIPMENT.

The increasing demand among householders that hand labor shall be replaced by machinery, just as it is done in the factory, has created an immense market for the manufacture of labor savers and devices for the home. Some one has suggested that there is a new egg-beater born every minute! Certainly the number of devices and apparatus is greatly increasing—quite beyond the bounds of reason. It is quite certain that women overbuy in household equipment of the cheaper kind, and neglect to buy important and efficient equipment of good quality. There are a great many splendid time and labor-saving articles for the home which are comparatively unknown, but which deserve wider use and appreciation.

WHAT THE SCHOOLS ARE DOING

The domestic science schools are now turning their attention more to the practical side of their work, making it rather the application of practical knowledge than the art of "teaching teachers to teach teachers."

This is evidenced by the large number attending summer classes at Teacher's College, Columbia University; and one of the most significant of all tendencies is the number of actual housekeepers who are attending school in spare time trying to bring more science and intelligence into the management of their homes.

Out of one class of forty at Teacher's College, it is authoratively stated "that twenty-five were either housewives, or were taking the course expecting to use this knowledge in their housekeeping. A few out of that number were teachers, too, but were working out as a sort of a side issue efficiency problems while they kept house. The number of housewives attending this institution is increasing—those that come for but one course or two, as they are able—hoping to become enlightened on some of these difficult household problems."

More than 200 persons took brief courses for home use in some household science subject last year in the School of Household Science and Arts of Pratt Institute, Brooklyn.

Running water on the farm

A Fairbanks-Morse Pneumatic Water System like the one pictured here, can be quickly and easily installed on any farm.

It will furnish you with an abundance of running water for the bathroom, kitchen, laundry, stables, creamery, and for sprinkling the lawn and garden. At the same time it affords you ample protection from fire.

Can be inexpensively operated by hand, motor or small oil engine.

The "Handy" force pump which is a part of this system is easy to operate and will last for years. Tanks are made of boiler steel tested to a pressure of 125 pounds. Any size from 220 gallons up. Send for free booklet, "Fairbanks-Morse Water Systems."

We can supply you with farm engines from 1 h.p. up, sprayers, lighting systems, farm scales, hand and power tools, etc. Particulars on request. Address Dept. 44

THE PROBLEM OF THE FARMER'S WIFE

Typical for the increasing attention to the needs of the home-maker among universities is the work at Cornell and the University of Wisconsin. Wisconsin offers courses to housekeepers, first, in connection with the Farmer's Institutes, of which forty-four are held every year throughout the State under the direction of the Board of Agriculture. Then, there are short courses lasting from three days to a week, held under the auspices of the Agriculture Extension. In these, the farmers have lectures and demonstrations. Every year, beginning the last week in January and lasting through the first week in February, the College of Agriculture holds a two weeks' short course for farmers and farmers' wives. The attendance last year at the Women's Course in Home Economics at the University of Wisconsin was between 600 and 700.

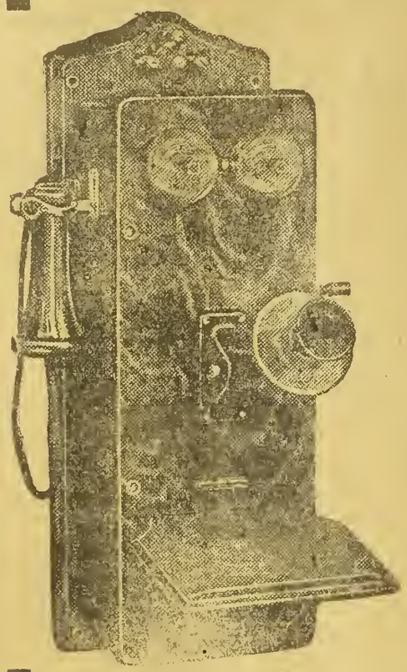
Most significant of all, perhaps, is this now fast-increasing interest in the rural woman's problems. It has been remarked many times that while governments—both State and National—spent actual millions upon decreasing the toil and increasing the results of the man's work on the farm, nothing has been done for the farm woman. The farm kitchen is still in the archaic wheat with the cradle scythe—but the barn is full of wonderful new machinery! The cooking is no better, while the cooking utensils are practically unchanged.

As a matter of fact it was the Western agricultural colleges, trained to be alert for the modern and the scientific, which were among the first of all educational institutions to give welcome place to domestic science courses. The buxom corn-belt farm girls learned how to "balance a meal" before the pampered daughters of New York and the East knew there was such a thing. The practical side of life has always appealed to the mid-Western rural folk, and they were not slow to use their opportunities.

We may, therefore, look for a science in the farm kitchens as well as on the farm fields, in the work of the vigorous generaeion. Already the new Secretary of Agriculture has announced an intention of giving serious thought to the problem. It will be a great social blessing, for it is true that farm women have suffered a greater share of insanity that any other class of women, due to but one thing—monotony; brainless effort—unused mental faculties.

In a degree the same problem of monotony and aimlessness which scientific management has had to deal with in the shops is one of the most serious which the application of efficiency has to deal with for home women. It cannot be denied that the task of stimulating women in individual homes—where there is no competitive spur, no organization, and no required discipline and accounting—is a big one. Cynical editors of great women's periodicals openly say that women over thirty-five are hopeless—they can't be budged by any idea or prod; that only the younger generation is responsive. But the women under thirty-five are counted by the million, and they have the next generation in their keeping. To win them is to establish the new home-making—the life for woman freed from demeaning house drudgery—the opportunity to give thought and care to the wider range of interests which it is now certain will be a woman's future sphere. She will follow the old home interests out into wider life where they have scattered, and she will be as she always has been, faithful first to home and family interests, once she has found the key to her own personal development to meet her greatly changed enivronment. And that key I firmly believe to be the application of Emerson's twelve principles of efficiency.—Christine Frederick in Every Woman's World.

Independent Systems Constantly Growing



The number of municipal, government and independent local telephone systems in Canada is constantly growing. The independent telephone movement, in spite of tremendous opposition, is a huge success. If your locality is without telephone service, write us and we will tell you the steps to take to organize an independent telephone system.

We are the largest Independent Telephone Manufacturers in Canada. We carry complete stocks of guaranteed telephone materials, and can make shipment within 24 hours after receipt of order. Our telephones are superior to others in design, material and workmanship. Send for Free Trial so that you can test and compare with others.

Ask for No. 3 Bulletin—containing the latest information about building telephone lines—Also No. 4 describing our magneto telephones is free on request.

Let us quote you on your year's supply of dry cell batteries

cellent programme, and those taking part in the same, for their valuable addresses.

Whereas the Prince of Wales College Hall has been placed at our disposal for the convention: Resolved, that we extend to Dr. S. N. Robinson our appreciation of the kindness in opening its doors to us and in other ways adding to the pleasure and convenience of those in attendance. (Sgd.) A. Ethel Dunback, Chairman; E. M. Wright, J. W. Kier, and W. W. Crosby, Committee.

In the absence of Miss Carrie Holman, the president of the Prince County branch of the Canadian Handicrafts Association, Miss Helena McDonald read an interesting letter in which Miss Holman expressed her sincere appreciation of the good work of the Institutes and wished it abundant success in the future, Miss Holman's letter was listened to with marked attention and enthusiasm, and was of a nature to inspire the members with an adequate appreciation of the enormous amount of good which may be the outcome of their efforts.

At the close of the meeting Mrs. Wright expressed her appreciation of the excellent work which Mrs. Dunback and her assistants were doing and moved a vote of thanks, which was unanimously carried.

A Remarkable Operation.

Charles Pickney, Melbourne, Yarmouth, the well known breeder and exhibitor of Devon cattle successfully underwent one of the most, if not the most, remarkable operations, ever performed by medical science in the Peter Brigham hospital, Boston, a few days ago. For some months past Mr. Pickney had been suffering from what was supposed to be paralysis. As the disease grew worse he was advised to get away for treatment. He went to Boston and entered the hospital, where a most rigid examination by means of the X ray and other devices was made, but nothing could be found. They advised an operation and he consented, with the result that Dr. Harvey Cushing, assisted by Professor Councilman, the great pathologist, have made the mark of a new era in medical science.

An incision was made near the spine and the fifteenth vertebra was removed, but no obstruction was found. This was replaced and the same treatment was given the fourteenth and so on up to the sixth and still nothing was discovered. Fearing that the continuance of the operation along these lines would prove fatal, that process was stopped and a probe was brought into use which located an obstruction at the fourth vertebra. On removing this section of the spine a small tumor the size of an olive was found pressing against the spinal cord. This was taken away and now Mr. Pickney is on the complete road to recovery.

EVERY FARMER SHOULD KNOW

how to make the most money out of his land. If your Fall Wheat crops have been diseased and poor, there is a seed dressing that will ensure you a better field at trifling cost.

CORVUSINE D.G

prevents ground rot, assists germination and is an excellent smut dressing. Corvusine is NOT poisonous, birds and animals will not touch it, and it has none of the dangerous features of bluestone and other obnoxious chemicals. 1

This glove is of fine lisle thread, with two dome fasteners, and raised points on backs. **Sizes 6½, 7, 7½ and 8. Black only. To clear at half price. Per pair 23c**

THE T. EATON CO LIMITED
TORONTO - CANADA

Canning and Preserving Hints.

Add ¼ currant or rhubarb juice to the strawberry juice for jelly. The flavors combine very nicely.

Boil together until tender ripe tomatoes, okra and corn, with water enough to cover, add salt to taste, and can and seal while hot. This is nice to use for vegetable soup.

When canning tomatoes save some of the juice to put in with the canned corn. It is a perfect preservative and much to be preferred to certain health destroying acids frequently used. Pack the corn closely in the cans, fill with strained tomato juice, and seal and boil 1 hour. Tomatoes and corn spoil more easily when exposed to the light.

C. A. Archibald is planning to devote his undivided attention to his magnificent herd of Shorthorns. And is therefore gradually reducing his Ayrshire herd. When Mr. Archibald first started in the dairy business he was only eight years of age when he drove his first load of milk to Truro. He has driven many loads of milk since then and he now feels that with the high demand for beef cattle he can dispose with the labor incident to the care of a large dairy herd. Mr. Archibald has always stood in the front ranks of Shorthorn breeders in the Maritime Provinces. He has raised and sold many good ones.

Thought She Would Lose Her Little Girl

From Severe Attacks of Summer Complaint

Mrs. Wm. Hirst, 194 Palmerston Avenue, Toronto, Ont., writes us under date of January 23rd, 1914.

The T. Milburn Co., Limited,
Toronto, Ont.

Dear Sirs:—"Last summer I had grave anxiety for my little girl, who was just one year old in July last. She had constant and severe attacks of summer complaint, and it seemed to drag on her so long despite the many remedies I tried. My neighbors told me she had grown so weak they thought I would loose her. One night while nursing her an old friend of mine happened to come to see me, and after telling her about my baby's lingering illness she asked me to try Dr. Fowler's Extract of Wild Strawberry. I sent a little girl to our drug store and bought a bottle, and after having given the baby one dose I noticed a remarkable change, and after giving her three or four doses she was well again, and began to walk, which she had not been able to do prior to her attack. She is now a fine healthy child, and I owe her life to that kindly advice of an old friend. I would advise all mothers to give "Dr. Fowler's" a prominent place in their medicine chest."

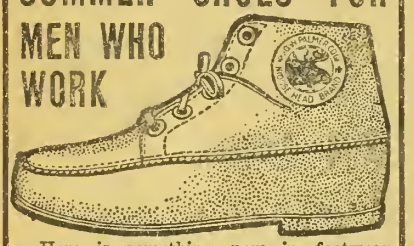
Yours truly,
(Sgd.) Mrs. Wm. Hirst.

When you ask for Dr. Fowler's Extract of Wild Strawberry see that you get it.

It Has Been on the Market for Nearly Seventy Years. Don't Accept a Substitute.

The price of the original is 35 cents, and is manufactured only by The T Milburn Co., Limited, Toronto, Ont.

SUMMER SHOES FOR MEN WHO WORK



Here is something new in footwear specially suitable for farmers, woodsmen, millmen, trackmen, laborers—all those needing strong yet light, cool, easy shoes. These are made on good-fitting right and left lasts from our famous oil-tanned Skowhegan waterproof leather with waterproofed sole leather outsoles and solid insoles.

Palmer's "Moose Head Brand"
"SUMMER PACKS" and "HARVEST SHOES"

are light weight, comfortable, durable working shoes for spring, summer and fall wear. Sold by leading dealers everywhere. If your merchant does not carry them write us, giving his name and address, and we will see that they are placed within your reach. Made 4, 6 and 9 inches high. 19

Dysentery is often serious and often a dangerous disease, but it can be cured. Chamberain's Colic, Cholera and Diarrhoea Remedy has cured it even when malignant and epidemic. For sale by all dealers.

Artificial Breeding of Mares.

The practice of impregnating mares by hand rather than by the service of the stallion is a comparatively recent practice, but one which is growing in favor as those who adopt it become more efficient in the operation. The idea is a simple one. It is this, that in the service of a stallion there is a sufficient quantity of semen to safely impregnate a large number of mares if this semen were distributed. Artificial impregnation then is simply the operation of distributing the stallion's semen among several mares rather than leaving it confined to one. The ease with which mares can be handled makes the operation of artificial impregnation quite feasible, and the demand for the services of the best stallions is frequently so keen that it is found good policy to save the horse's energy as far as possible. The extent to which a stallion may be used is not definitely settled. Many horses are given a cover every two or three hours, some three or four services to two a day or ten a week is growing. . When the object is to save the energy of the horse and to settle from one to two hundred or three hundred mares in the breeding season the practice of artificial impregnatian must be followed.

For the purpose of artificial impregnation certain devices are made. These are an extractor for drawing the semen from the mare which has been covered, capsules or impregnators to contain the semen and transfer it to other mares, hot water boilers, towels, gloves, etc.

In extensive artificial breeding operations other instruments will be required, such as microscope, thermometer, speculum, impregnators if capsules are not used, breeding hobbles and materials for testing and treatment for unhealthy condition of the female organs.

When one is going to do artificial breeding either on his own mares or for customers he should arrange to have an umber of mares on hand at the barn. Then one mare, preferably one with a foal and in good health, is given the natural service. The others have previously been examined and the condition of their organs noted. Mares that are diseased, as indicated by unhealthy discharges, should be set aside for further treatment. Those whose cervix (mouth of the womb) is grown over should be opened up and everything made ready for quick, accurate work. The details of the operation when capsules are used are well described by the "American Breeder" as follows:

BE CLEAN AND QUICK.

Every breeder should have a provision for boiling water and a place in which to wash his hands, and a good number of clean towels. This preparation is absolutely necessary whether artificial breeding is done or not. No mare should be opened up until the hands have been thoroughly washed with soap and water, and rinsed in sterilized (boiled) water. Do not use any antiseptics or grease during breeding operations of any kind. The hands should always be washed before being inserted into the next mare, whether it is for the purpose of examination or inserting capsules. A number of small towels should be on hand and they should be sent to the laundry after being used once. This will not be very expensive for the towels are small.

An old wash boiler can be used for boiling the water. Another large vessel with a cut-off valve in it should be located within easy reach so that the hands can be rinsed under the stream without much waste and not contaminate the water. All

SYNOPSIS OF CANADIAN NORTH-WEST LAND REGULATIONS.

THE sole head of a family, or any male over 18 years old, may homestead a quarter-section of available Dominion Land in Manitoba, Saskatchewan or Alberta. The applicant must appear in person at the Dominion Land Agency or Sub-Agency for the District. Entry by proxy may be made at the office of any Local Agent of Dominion Lands (not sub-agent), on certain conditions.

Duties—Six months residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres, on certain conditions. A habitable house is required in every case, except when residence is performed in the vicinity.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead Price $3.00 per acre.

Duties—Six months residence in each of six years from date of homestead entry (including the time required to earn homestead patent) and 50 acres extra cultivation.

A homesteader who has exhausted his homestead right and cannot obtain a pre-emption may take a purchased homestead in certain districts. Price $3.00 per acre.

Duties—Must reside six months in each of three years, cultivate 50 acres and erect a house worth $300.

The area of cultivation is subject to reduction in case of rough, scrubby or stoney land.

W. W. COREY,
Deputy of the Minister of the Interior.

N. B.—Unauthorized publication of this advertisement will not be paid for.—58783.

If you are a housewife you cannot reasonably hope to be healthy or beautiful by washing dishes, sweeping and doing housework all day, and crawling into bed dead tired at night. You must get out into the open air and sunight. If you do this every day and keep your stomach and bowels in good order by taking Chamberain's Tablets when needed, you should become both healthy and beautiful. For sale by all dealers.

of this preparation is necessary for natural service breeding. No breeder can expect to have the best results without making examinations.

All the mare owners present are instructed to hold their mares and assist each other during the breeding operations. One man should hold the mare's head while a neighbor holds up one front foot. When the breeding work starts they should lead their mares up close to the work and have the mares take their turn rapidly. It is best to have a box with a few capsules in it near the door where the neighbors can examine them; then they will not interfere with the clean capsules.

Ask those present to do their visiting after the breeding is done so as not to interfere with the rapidity of the work when it is started.

The semen extractor is sucked full of boiling water and squirted out several times; then it is rinsed in boiling water and laid in a galvanized pan 40 inches long, eight inches wide and six inches deep. This pan has been scalded and is now full of sterilized (boiled) water at 100 degrees. A bowl, preferably of earthenware, holding about a half a gallon, should also be scaled out and placed in the pan in which the water should be kept at 100 degrees. If the one who handles the stallion is to do the breeding he should thoroughly wash his hands, then put on a pair of white cloth gloves (that can be bought for ten cents) which have not been used since being boiled. He should have several pairs of these so as to have a clean pair each time.

AVOID SUNLIGHT.

The helper (who may be a visitor) is instructed to thoroughly wash his hands and bring the semen extractor and the cup, both full of warm water at 100 degrees, when the stallion makes the service. The one doing the breeding can remove the white gloves, take the cup containing the warm water, which has kept it warm, and throw it out so as to catch the semen in case any is spilled or withdrawn. If it is caught in the cup the extractor is quickly emptied and sucked into it. Then proceed with the breeding. If no semen is withdrawn the water is emptied out of the semen extractor and the operator then proceeds to get the semen from the mare. After the semen is sucked into the extractor the long point is quickly removed; a plug is inserted into the extractor, which retains the semen. The extractor is then inserted into the vagina of the mare, where it is sure to retain the proper temperature. More failure in artificial breeding have been caused by not keeping the right temperature than from any other causes excepting the presence of disease.

The helper (whose hands are washed clean) is then instructed to hold the extractor in the vagina of the mare. A number of capsules have been placed on a clean towel and a portion of the towel has been thrown over them to keep them free from dust. The caps have been removed and the operator holds the capsule in a shaded place while the helper fills the capsule half full. If the semen should come too fast it can be sucked back into the extractor and cut off. The helper then should put the extractor back into the mare while the operator quickly places the cap on the capsule and closes his hand about it so as to keep it warm and away from the direct rays of the son. Breeding can be done successfully even on a very bright day, provided the direct rays of the sun do not strike the semen.

The operator should wash his hands before breeding the next mare, so as not to carry infection from one mare to the other. If a doubtful mare is bred with a capsule she should be bred last. The mare upon which the natural service is to be made should be a mare with a colt by her side, if ipossible, because she is usually healthy and free from disease. She should also be gentle. The helper should be instructed how to insert the extractor into the mare so as not to cause the mare to be excited. If the semen is taken from the uterus there is very little necessity for rebreeding the mare which has been served. If the semen is caught in a bowl or taken from the vagina, then it will be necessary to breed that mare also with a capsule.

The Natural Temperature Semen Extractor practically does away with the chances of the semen getting too hot or too cold. Most breeders who have failed have cooked the semen. The semen should never get below 95 degrees or above 101 degrees. There is no reason why practically every breeder in the country cannot make a success of capsule breeding if he will follow these rules. A little thought on the subject will save the ordinary breeder hundreds of dollars in money, give him and his breeding stock a better reputation and be an advantage to his customers.

BREEDING WITHOUT CAPSULES.

If the breeder does not care to use capsules and prefers to use the instrument known as the artificial impregnator, he proceeds in very much the same manner as for capsules, but instead of transferring the semen

BRAS D'OR LAKES, CAPE BRETON

Canadian Government Railway's New Publication: An Excellent Folder.

Railway publications rank high in publicity literature, and the Canadian Government Railway's Cape Breton folder will take a foremost place in the 1914 productions.

Bras d'Or, or "Arm of Gold," suggested a design for the cover, and one which the combined skill of artist, engraver and printer have successfully carried out in the reproduction by the quadricolor process of a beautiful sunset scene of the Bras d'Or Lakes near Baddeck.

Last year a landscape artist prepared for ; the Railway a realistic topographical map of this beautiful section of Nova Scotia embellished with typical inserts of sea bathing, trout, tuna and sword fishing, and miniature views of Mulgrave, Sydney and Baddeck. The painting has been prominently displayed in Toronto, Montreal, Ottawa, Sydney and at the present time is on exhibition in an important throughfare in Boston. Wherever shown it has created a wonderful interest, resulting in numerous enquiries and actual ticket sales to this glorious summer country.

The make up of the Bras d'Or folder permits an exact production of this painting, the six page centre spread being entirely used for this purpose. The descriptive portion of the folder is profusely illustrated in half tones of very fine screen, and tells the reader how to reach Cape Breton, and just what he may expect to find there.

"The Cape Breton of today is a land of summer loveliness, a vast island wherein are other isles innumerable. Its shores are washed by the billows of the Atlantic, and by the Gulf of St.Lawrence. The shining waters of the Bras d'Or Lakes divide it in twain, and provide a spacious water way through the interior. There are too, numerous rivers, streams and fresh water lakes. To this variety Cape Breton owes much of its charm; nothing is monotonou nothing tame, and on every hand the scene is calculated to fill the mind with emotions of the keenest pleasure. No pen can adequately describe the scenery around the Bras d'Or."

The Strait of Canso—an ocean bye way—Mulgrave, Port Hawkesbury, Mabou, Inverness, St.Peters, Arichat, Whycocomagh, Baddeck, Grand Narrows, The Sydneys, Mira Bay, Louisburg, the possibilities of the development of the Islann, its agricultural outlook, its attractions for the devotee of the rod in ocean, lake and stream, and for the yachtsman and hunter, are briefly described. A list of hotels with their accommodations and rates, is also included, altogether making perhaps the most interesting publication the Canadian Government railways has as yet produced—and they have done much excellent work in this direction.

A free copy can be obtained by writing the General Passenger Agent, Moncton, N. B.

Advertise in the Maritime Farmer

from the extractor to the capsule the impregnator is used to extract the semen from one mare and carry it to others. In either method of cleanliness, exactness of temperature and healthy mares are necessary to insure success.

Frequently mares are brought and returned to a stallion which are not healthy in their genital organs. Some mares have a sticy, yellowish discharge, others have a white discharge which is not natural, others seem to be healthy but do not get settled. These latter may have the mouth of the womb closed by a growth or the womb may be diseased. When the womb is cloased it may be opened by inserting the hand and forcing down the growth. Most stallion men frequently do this operation. If there is no growth some other treatment may be required. In cases of unhealthy discharge the nature of this should be determined by the use of litmus paper. This can be had at drug stores and is blue in color. When brought in contact with an acid substance it turns red. The idea then is to use this paper to find out if the mare's discharge is acid or not. To do this hold a piece of the paper against the neck of the womb. If it turns red the womb should be flushed out with a gallon of warm water, which has been boiled and reduced to 110 degrees and had added to it four teaspoonfuls of baking soda. If the paper does not turn red in a discharging mare the womb should be flushed out with a gallon of boiled water to which has been added eight teaspoonfuls of common salt before boiling. To flush out the womb use a hose made of pure gum rubber about three-eighths of an inch in diameter and five feet long, a funnel to fit the hose and a large cup holding one gallon of water. The water used in flushing out mares should be about 110 degrees, as it will cool a little in passing through the rubber tube. No water should ever be used in a mare at less than a hundred degrees.

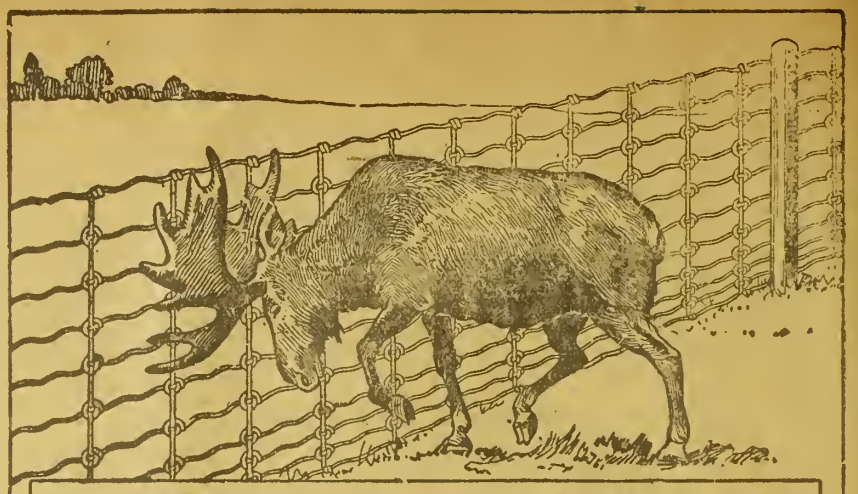
Before the uterus is flushed out the hose, funnel and gallon cup should be put in the container and boiled in order to destroy all infection. This should be done before each treatment, so as not to carry aoy infection from one mare to another. The hands should be washed; finger nails trimmed.

A gallon of fluid should be prepared at the proper temperature for each case. A helper should be instructed to pour the fluid in the funnel, holding the fluid well up so as the hose is filled with fluid the end to give the desired pressure. After of the hose should be bent sharply so as to make a cut-off and not allow air to be injected into the womb. Insert one finger into the uterus over the front end of the hose and let the fluid flow into the uterus. Fill it full, but in case the uterus should be unduly large one gallan is not enough to fill it, siphon the fluid out before the hose is empty by lowering the outside end of the hose, keeping the finger over the point of the hose to keep the membranes from clogging it. In the event that only the vagina is effected it alone should be irrigated, but this is not often found. ...

IODINE AND YEAST TREATMENT

Breed the mare in about an hour after treating her.

Mares which do not respond to the above treatments may require something to give a healthy condition to the lining of the womb and for this purpose flushing with an iodine solution has been recommended. This is made by adding a teaspoonful of tincture of iodine to the gallon of warm water as before. After flush-



This Fence Has Vast Strength

For a fourth less than the price we pay, we could get hard-drawn steel wire. But that kind, though used in most other wire fence, hasn't the *life*, the springiness, the strength we insist on for Maritime Wire Fence.

• • • •

So we make this fence of extra-heavy hard drawn steel wire of nine-gauge. Constantly we test it for quality. And so we *know* this fence has *more* strength than it probably will ever need.

• • • •

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime Fence is far longer—and the fence surely reliable.

• • • •

On this extra-quality wire we put a smooth, even heavy coat of galvanizing. We put on more than enough—that's our way. You gain by the longer life of this better fence. And we lock laterals and upright wire rigidly, yet springily, with a cross-leverage lock that simply CANNOT let go under the hardest strain.

• • • •

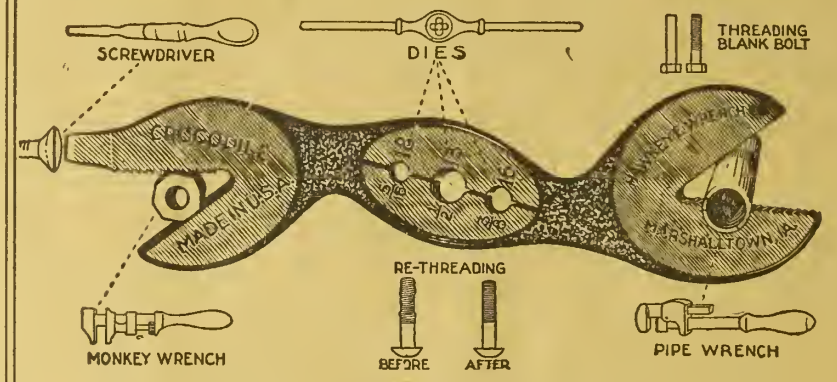
You can bank on the strength of this fence Make the test for yourself and your neighbors. Then get the agency—it will pay you well. Address

NEW BRUNSWICK WIRE FENCE CO., Ltd., Moncton, N.B.

MARITIME WIRE FENCE

The Crocodile Wrench

An All Around Handy Tool for the Home, Farm and Shop



Six Handy Farm Tools in One

The Crocodile Wrench is drop forged from the finest tool steel and scientifically tempered. Every wrench guaranteed against breakage. It is 8 1-2 inches long and weighs ten ounces.

A pipe wreuch, a nut wrench, a screw driver and three dies 5-16, 3-8 and 1-2 inch for cleaning up and re-threading rusted and battered threads, also for cutting new threads on blank bolts. Dies will fit all bolts used on standard farm machinery.

Teeth and dies are case-hardened in bone-black, making them hard and keen.

The dies on this wrench alone would cost $1.50, and would be worth more than that to every farmer, as they would often save valuable time, besides an extra trip to town for repairs.

Sold everwhere for 75 cents cash.

How to Procure a Crocodile Wrench

On receipt of $1.00 we will send you the Maritime Farmer for one year and also one of these Crocodile Wrenches. New subscriptions will date from time of receipt, renewals from date of expiration of present subscriptions. Send us two new cash in advance subscribers to the Maritime Farmer at 80 cents each and we will send you a wrench for your trouble. Or for 75 cents cash we will send you a wrench.

The Maritime Farmer, Sussex, N. B.

ing with this leave for three weeks and then use the salt solution once a week for three weeks and breed he again. This treatment is recommend ed for mares that abort.

In some cases of mares failing to get with foal, what is called the yeast treatment is given. This is as follows:

Mix an ordinary two-cent cake of yeast to a paste with a little warm water, and allow it to stand for 12 hours in a moderately warm place, then stir in one pint of freshly-boil-ed luke warm water, and allow it to stand for eight or twelve hours. The mixture will then be ready for use. After flushing out the passage with warm water, inject the entire solution of the yeast cake into the vagina with a large syringe. Make the solution when the animal is first coming into heat, and make the injection from one-half to one hour before breeding. This treatment is not infallible, but favorable reports are often heard concerning it.

Where Mothers Fail.

I have read with interest the story, "The Lord Giveth," and will say from the point of view of a farmer's wife with thirty-five year's experience that the story is no fancy sketch or outburst of some discontented wife, but only a very common one—and one that thousands of farmers wives here in the United States could dupli cate from their own experiences, and that without exaggeration.

But this is not as it should be, and husbands are not altogether to blame for such a condition. If I may venture an opinion, I must say I think our educational system is greatly at fault, as far as our girls are concerned. It has so happened that Ihave held the office of either clerk or director in several of the school districts in which we have resided for a number of years, and so have kept in touch with schools and school girls.

I hope that my observations are quite peculiar, and that they would not apply to other places than those I have seen. But I am sorry to say the school girls I know are almost without exception much more interested in what they wear than in school work. While the poor teacher is trying to drive a few practical ideas into their unwilling intellects, they think only of having a "good time."

Some may thus in time acquire a fair idea of arithmetic and algebra, but none could mend a pair of stockings decently if their lives depended on the task. Some are quite well versed in physiology, but could not wash np the breakfast dishes and put the kitchen in order if they were given the entire forenoon in which to complete the task. Very few of them could wash and iron their own frocks. And what is sadder than all, they would think themselves very much imposed upon if they were asked to do so much for themselves. However, they see no reason why mother should object to putting all her time to just such tasks for them.

And believe me, there little heads are well filled with silly and all too often unclean "love stories"—stories that give them a very false and foolish conception of life and its duties. I believe this condition of things is largely responsible for many of the unhappy marriage and divorce cases that we have to our shameful credit.

What we need more than anything else, beyond the cleaning out of the liquor traffic, is a general house-cleaning in our literature and music (?) so-called. Music is the language of purity, and to most Christian people it is actual sacrflege to see it applied to such senseless and often "smutty" things as many of the present day "popular" songs advertise.

Dear sisters, what ever else we do or do not do, let us try to teach our daughters the duty and sacrifice of wifehood and motherhood.Every girl should be made to no that marriage is a life of beautiful sacrifice, so far as women are concerned, whether they know the multiplication table or not. If we can do this they will not be so blindly eager to assume the responsibilities for which they are so sadly unfitted.—Mrs. Winnifred Ash ley, Idaho.

The Editor of The Maritime Farmer while in Dorchester last week took occasion to visit the Penitentiary farm. Our genial friend Mr. Andrew McPherson, the farm manager, was not at home at the time of our visit but in company with one of the guards we went around the farm and through the stables.

The farm crops are looking well and the general condition of affairs show that Mr. McPherson is making good as chief of the Agricultural department of the institution. In the stable we saw some nice pure bred and high grade short horn cattle and in the piggery near by are a lot of handsome Yorkshires. Warden Pipes and his assistants are keeping matters in ship shape in and around the institution.

A visit to East Court Farm the steading of Mr. John Retson, Truro, found the farm crop and Ayrshire stock in prime condition. George Retson, a brother, purchased a farm a year or two ago at Brookside abaut a mile distant from East Codrt and he too is breeding Ayrshires and Leicester sheep. Together these enterprising young Scotchman form the firm of Retson Bros., whose stock is also well known to visitors to the Maritime Fairs. Another brother to these young men is Mr. Will Retson, the painstaking herdsman at the College Farm, Truro.

Parents Take Warning.

How many parents fall into the habit of thus deceiving their children, by indiscriminately promising to give them the things they ask for, with no honest intention of abiding by their word. It is so easy to stop a child's teasing in this way, so easy to put them off until that "more con venient season," which never comes.

And so, too, with the repeated threats of punishment which parents make—which is only the negative side of their promises—and then fail to carry out. It is difficult to conceive of any method better calculated to karden a child in wrong-doing and make him proof against correction.

There is one kind of promise which ought never to be exacted or given, and that is death-bed promise. It is selfish on the one hand, and foolish on the other. Of all times in the world, the hour of death is the last time of alj—when the emotions and effections of human nature are at their highest tension, while the understanding and abeyance—for the making of solemn and binding vows. Such promises, however sincerely given, are usually soon repented of and broken, and it is better, therefore, not to make them.

Aims and Purposes of the Handcraft Guild.

It is with keen regret that Miss Hunt and I are both unable to attend your convention. I feel there is no more advanced work being done in Canada than the formation of Women's Institutes for the mutual benefit and co-operation of women in their numberless duties and interest. We should be very proud that the Island is in the foreground in this up-to-date movement. Without doubt Women's Institutes, when they will have fully developed, will be a power in the country. For all the really vital questions in a community must be taken up by women: health and anitation in the home, proper food and clothing for the family, education and recreation for the young—and for the old too for that matter, for we never outgrow the need of education and play. We of the Handicraft Guild feel that this is an opportune time to bring before you the aims and work of our society. From the last annual report of the guild let me read its aims "The Canadian Handicraft Guild is an incorporated Association organized to encourage, retain, revive and develop handicrafts and ; home art industries throughout the Dominion:

To prevent the loss and deterioration of these crafts; to preserve knowledge and skill possessed by new settlers; to aid new comers during tne early trying days of their settlement in the new country, while providing them for a market for good handiwork:

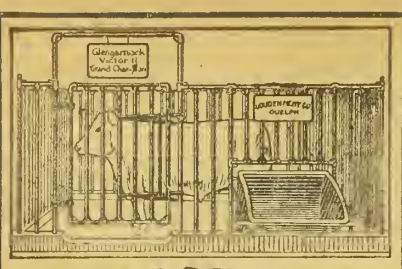
To encourage industry and thrift in the homes of the people making their work profitable and honourable by means of exhibitions of the products of their skill, thereby increasing contentment in their homes and augmenting the assets of the Dominion;

To educate the public to the value of good handiwork by holding and taking part in Exhibitions at home and abroad and by other means thought desirable;

To send out among the workers teachers and supervisors to keep up the standard af excellence;

To keep records in order to prevent the extinction of any arts or crafts."

The headquarters of the Guild are at Montreal where a shop is maintained for the sale of work. Last year something over $8,000 was paid to workers. There are five branches of the Guild, at Vancouver, Edmonton, Winnipeg, Ottawa and Summerside. Our branch has been organized for five years. This last year we paid $71.55 for work which seems perhaps, a small amount, but we have not yet got in touch with the women throughout the province, and this we hope to do through your aid. We have offered special prizes at the Seed Fair for original designs in rugs, and we have brought out a



LOUDEN

Sanitary

Steel Pens

— for —

Bulls, Cows, Calves and Hogs

Comfortable, Permanent, Secure

THE best animals in the country are stabled in LOUDEN pens, because the owners appreciate the convenience and protection secured, and the animals the comfort and freedom so necessary, when they are continually shut up.

Louden pens are constructed of the best tubular steel, and dust and germ proof malleable couplings, finished in aluminum. For quality, strength and service they lead.

HYSLOP BROTHERS, Limited
Dept. R TORONTO, Canada

book of vegetable dyes which may be had from Miss Hunt, Summerside, for fifteen cents a piece.

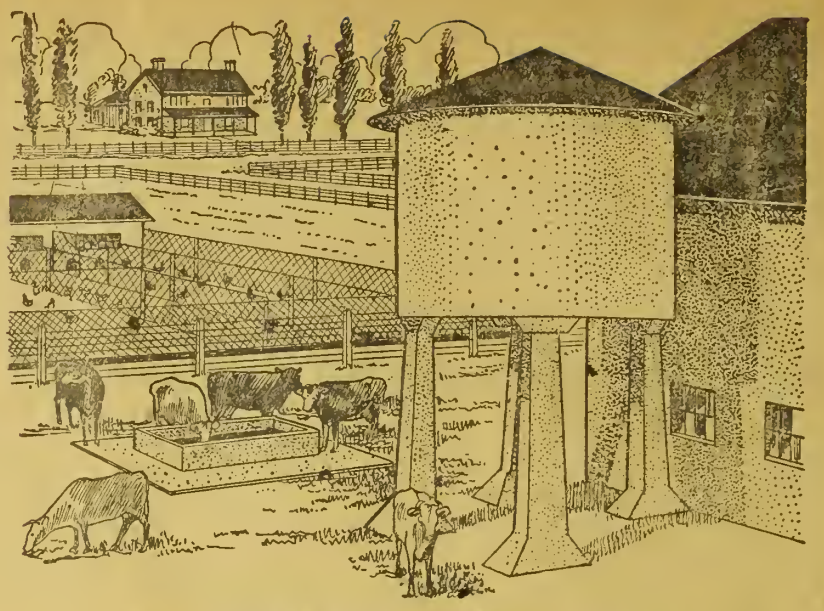
The special aim in our branch of the guild is to encourage weaving of all kinds and hooking of rugs, not to sell them for the profit of the makers—though this is part of our work—as to bring into the home the satisfaction of doing original work, and to encourage the use of the home made things in the home. Wealthy people are ready to pay any price to get hand work for furnishing their homes, and yet here on the Island, where the best homespuns and hooking can be done, how many of our homes are furnished with machine-made carpets, curtains, etc. If you will look at the sample of homespun work here I think you will find the colors and designs much better than you will find them in the shops, and again the colors are fast as only vegetable dyes have been used. Now that we have learned that bare floors, either hardwood or painted or varnished soft woods are more sanitary than the heavy carpets we used to see everywhere it is a comparatively easy matter to make pretty, simple rugs to add to the beauty and comfort of the room. Let me urge that you make your own designs and have them simple. Nothing could be uglier or more unsuitable than the usual mat designs one buys in the stores. Ferns and maple leaves often growing out of the same branch and roses decorating stumps of trees. One's eyes should not be drawn to the floor of the room by the brightness of the colors on it, nor does one want to step on bunches of flowers much less on animals spread out on many of the rugs one sees. All decorations of the room, rugs, coverings, curtains and paper should not be of soft inconspicuous colors.

Mrs. Kier gave at the Seed Fair in Summerside last Spring, a most instructive and interesting paper on color and designs on rugs. She accompanied her talk with demonstrations of colors and combinations and suggestions in design that proved most helpful to all who heard her. Already we have sent a great many rugs to the shop in Montreal for sale and they tell us that from no where in the Dominion do they get such good hooking as they do from us. In fact one of our rugs was chosen to be sent as a gift to Queen Mary on her Cornation. I might also mention that the lady who furnishes and decorates all the big C. P. R. Hotels in Canada told me that she could never get enough of our rugs. The only criticism they made is sometimes of the designs and that is always when there is evidence of a design not being original at all or being copied from such complicated wall paper or other unsuitable pattern. This is not a fad, this demand for hand made work, there is the best of reasons for it, the work is better for it the articles wear longer, does not fade and when vegetable dyes are used the colors are soft and a beautiful tone. And how much more pride and interest one takes in the furnishing of one's house when every detail of the work has been carried out in the home and one has not just gone to town, and in the confusion of numberless samples, finally manages to choose something which never looks the same after it has come home. I have spoken principally of hooking, because at present it seems to be the chief handicraft carried on by women. It seems most unfortunate that weaving has become almost a lost art on the Island and yet in Quebec it is a most flourishing industry. What little I have seen of the Island work it is quite as well done as any of these samples we have been sent from Montreal. Here we have curtains, bed spreads, table covers, couch covers, catalogue rugs, practically everything that is necessary for furnishing the home outside the furniture itself. In this respect I should go back to the good old times when a girl's "hatching chest" was gradually filled with such things, in preparation for her marriage, less was spent then on the back and more for the comfort of the home.

We are opening a Shop in Summerside of Handicraft work and hope in time to fill it with work made wholly by Islanders. I hope any of you when visiting Summerside will look in at our things. We also hope to have at the Confederation Celebration a display of handicraft work made on the Island. If any of you have any work that you would care to show we should be grateful for the loan of it. Kindly write to Miss Hunt or myself and we will arrange about exhibiting it. It is most desirable that we should have as good a showing as possible at the Celebration, as it is expected that a great many visitors will be here at that time. Now that I have given you the aims and purposes of the Handicraft Guild, it would be a great satisfaction if your Institutes would consider taking up the work. Should you do so and wish for any help from the Guild either in arranging for meeting with you or for sending an exhibit of work kindly have your secretaries communicate with Miss Hunt.

My faith in the value of this work is my justification to you for taking up so much of your valuable time and I sign myself with many thanks for your attention.

The foregoing is a letter written by Miss Carrie E. Holman President of Prince County, P. E. I. Branch of the Canadian Handicraft Guild, and read at the First Annual Women's Institute Convention, Charlottetown, P. E. I.



Concrete Tanks and Troughs Never Rot or Leak

THE most practical tanks, whether for water or sewage, are built of concrete. They never rust, rot, dry out or leak. They never need new hoops or paint. They last a lifetime and seldom require repairing, which makes them the cheapest tanks that can be built.

Clean, Sanitary Watering Troughs

are just as necessary as the animals that drink from them. The farmer's best interests are being served when his stock is insured a plentiful supply of clear, clean water from a trough that is permanent and sanitary.

"What the Farmer can do with Concrete" is the name of a handsome free book that tells all about concrete tanks, watering troughs and other uses of concrete that will save every farmer many dollars. Write for it to-day.

Farmer's Information Bureau

PURE BRED SIRES

THE LIVE STOCK BRANCH

Dominion Department of Agriculture.

WILL PURCHASE during 1914, a number of CANADIAN BRED Stallions, Bulls, Boars and Rams.

Animals must be of right type, in good breeding condition and of the following ages.

Stallions, three to five years.
Bulls, not under one year.
Boars, not under six months.
Rams, not under six months.

All stallions will be purchased subject to veterinary inspection and bulls subject to the tuberculin test.

Breeders in Eastern Canada having CANADIAN BRED male animals for sale, filling the above requirements and registered or eligible for registration in the Canadian National Live Stock Records, are requested to communicate with the Live Stock Commissioner, Department of Agriculture, Ottawa.

The purchases of stallions and bulls will be made during the current spring months. The purchases of rams and boars will be deferred until the autumn.

Communications must state age and breeding of animals offered and price asked.—60271.

'SILVER LACED WYANDOTTES"

Stock and Eggs for Hatching for Sale.

The Silver Laced Wyandottee is a breed combining quality and beauty, prolific layers, fine table fowl and rank high among breeders of poultry.

The Magnolia Poultry Yard's stock of Silver Laced Wyandottes were winners of first breeding pen at the Amberst Fair in 1913, among strong competition. This is only one of the reasons why you sbould buy this stock. The work is personally supervised by the owner, and the stock this spring has never been in better condition. Some of my customers have reported 100 per cent. hatches from eggs purchased from me this spring.

Write for information and get your pick of the stock now.

Practical Care of the Dairy Bull.

(Continued from page 721.)

bulls that are well along in years that might be added to this list, notably Glenwood's Mainstay, that is still in active service at 15 years of age. and King of the May in active service at 11 years of age. Nearly all of the daughters of each of these bulls have made their records as heifers and have not been retested. However, a daughter of Glenwood's Mainstay is now under test at Mr. Marsh's, making over 800 lbs. fat, and she was sired when her father was eight years old. King of the May has had but two mature daughters tested but his best daughter, Langwater Dorothy, with 781.65 lbs. fat, was sired when he was five years old and the next best daughter, Langwater Hope, with 773 lbs. fat, was sired when he was five years old.

These figures should be conclusive proof of the value of a mature sire and well worthy of careful study by breeders of dairy cattle everywhere.

Some one wil at once want to take the opposite side of the argument and say that some young bulls have also sired great cows, but if they die young no one can tell how much better cows they might have sired if they had lived. If middle aged and still alive, no one can tell how much better daughters they may yet sire.

The Proved Sire Worth $1,000.

From calfhood on, give your bull the best of fed. care and exercise, and do all that you can to help further the movement now being pushed to see that no young or midle-aged pure-bred bull is allowed to go to the slaughter house until he has proved that he is a failure as a sire. Trade bulls with your neighbors if necesary to keep them alive, and when a bull has proved to be a sire of remarkably good cows consider him worth at least $1000 to the dairy industry of your comunity. See that he is kept alive and in active service as long as he is usable. No other one thing will more largely tend to the betterment of dairy production of our cows than this good care and preservation of our best dairy sires—C. L. Hill in Hoard's Dairyman.

The Cow is Not Always at Fault.

(Continued from page 725.)

While the cows are on the pasture little attention is paid to their feeding so long as the grass is abundant, but in adition to the grass other feed can be given with benefit. I have for years practiced giving my cows some ground grain in addition to pasturage and I am sure I have been well repaid in the increased quality, and quantity of the milk. It is from liberal feeding that a large part of the profit of the dairy comes. If one has cows that are only paying their way, or perhaps not quite doing that, it will be well to try all reasonable means to increase their production. If this is done I am confident it will be found that in most cases the capacity for production is much greater than has been suposed.

Cows that have been regarded as hardly up to the average may develop into superior animals and the apparently poorest one may prove to be well worth keeping. This, however, will not be the universal experience. Some cows canot respond to even the best directed efforts to make them more productive. They are lacking in capacity to such an extent that they are hopeles subjects for a profitable dairy and the sooner they are made ready for the butcher the better tho interests of their owners will be served.—John Underwood.

AYRSHIRE STOCK FOR SALE

Pure Bred Ayrshire Stock or Legible for Registration. Call and look the stock over. Long distance Phone at farm

Theory Versus Practice in Soil Analysis

Why Chemical Analysis is Not Always Reliable and How Farmer May Make His Own Tests

By A. C. Hartenbower in Twentieth Century Farmer

TWO farmers were overheard a few days ago arguing the question of the actual worth of a chemical analysis of soil; one was insistent that such an analysis by an approved chemist would give him a direct clue to the adaptability of his soil for producing certain crops, while the other was equally insistent that there was nothing to such an analysis Which one was right? Is it true that chemical analysis of a soil has some definite value to the general farmer? Or, in other words, can such analysis serve as guides to the fertilization of soils in order to increase their productivity?

The history of the making of chemical analyses of soils is interesting because it shows how agricultural ideas in this line have changed during the last fifty years When Chemistry was first considered in its relation to agriculture the idea gained ground that it would be a comparatively simple matter to determine with accuracy the exact requirements of any soil. Conditions appeared to warrant that idea. The first thought was by analyzing the plant and determining the amounts of the essential plant food elements that were used in its development under different yields and conditions, a good idea could be formed of the power of any soil to produce crops. Then by having an analysis made of the soil to determine the elements that were present and comparing that with the analysis of the plant, the farmer could tell definitely how much his soil lacked in any one or more elements for producing any certain crop. The idea sounded good. It rapidly became considered that the farmer, by having his soil analyzed, could determine exactly what it needed in order to give him maximum crops. He could add one or more fertilizers in accordance with the needs of the soil as shown by the chemical analysis.

Practice and Theory Differ.

But practical experience in this respect, as in many other things connected with the farm. did not bear out the theoretical ideas. Farmers noticed that when they had analyses of the different types of soils on their farms made the actual crop-producing power of the soils was not always what might be expected from the indications of the chemical analyses of those soils. The heaviest producingg soils often showed up poorer when chemical analysis were made than the less productive one and, what semed more odd, was the fact that oftentimes the lowest producing soils contained such large amounts of plant food thet they could produce crops almost indefinitely if the plant food alone was decisive. The investigators saw that they must carry on more extensive experiments in order to arrive at any practicable conclusion.

Today it is well known that there are two kinds of plant food in the soil, viz: available or usable plant food, and unavailable or unusuable plant food. The amount of each of these kinds helps to determine the productivenes of any soil. When a man sends a sample of soil to be analyzed he should remember that the chemist will be unable to tell with any accuracy, the condition in which each kind of plant food is present in his soil. The results of the analysis may show that there is a great sufficiency of all of the esential plant food elements, and still he will be unable tn produce the crops that bring him profits. Unavailable, or unusable plant food is almost worthless until it has been changed to an available, or usable form.

Must be Available.

A crop demands for its development food that is capable of being disolved in the soil moisture, or, in other words plant food that is soluble, and thus can be carried by the soil moisture into the plants. There may be thousands of pounds of plant food, and still if this is insoluble in the soil water it is useless as far as crop production is concerned. To summarize: The chemist in this case can only determine the total quantity of plant food present, not with accuracy the amounts of each of the available and unavailable plant foods present.

It is wei known that the amount of available, or usable, plant food in the soil is determined largely by the physical condition of the soil. In soils that are in poor physical condition the amount is low, and vice versa. The chemist in his laboratory does not know the physical condition of the soil which he analyses. It may be cloddy or in such other condition that it would be impossible to grow a crop on it, and stil the analyses would show up well.

Personally, I think that in most cases, for the general farmer of the middle west and southwest with his generally fertile soil, a mechanical or a physical analysis of his soil has greater actual value at the ppresent time to him than has a chemical analysis. The amount of each of the different groups or sizes of soil particles, together with a consideration of the amount of organic matter present would give any crop gromer in those sections a better idea today of his soil's power of production than a mere chemical analysis.

When Analysis is Valuabble.

A chemical analysis of a poor soil, however, that is in good physical condition may have value. The principal value lies in the fact that when certain chemical element is woefully deficient or extremely low in any soil the chemist will be able to tell that. In this way, of infertile soils that are not infertile because of poor physical condition the chemist can give the farmer an idea as to what mineral plant food is necesary. Moreover, if the amount of all of the essential plant foods is shown to be high from the results of the analysis the farmer may so change the analysis, the farmer may so change his system of cultivation by including fall plowing, etc., as may render the unavailable plant food available.

Another point must be considered in determining the productivity of any soil, and that is the character of the subsoil which underlies it. Most soils are rendered productive for certain crops because they are underlaid with extremely desirable types of subsoil, desirable either from the chemical or physical standpoint. The amount of plant food drawn up from the deeper soil layers and subsoil many times makes a soil a good alfalfa producer, for example. In judging of the value of any soil from a chemical analysis alone, no idea can be formed of the effect that the subsoil may have on the crop-producing power of the soil. With out this a one-sided idea is necesarily formed.

One of the factors most deficient in soils in the central west and the southwest is decaying vegetable or animal matter—that is, organic matter. Many of our farmers who are not receiving the crop yields that they feel they should receive from their fields make up their minds to have chemical analyses made rather than to look into the amount of organic matter in their productive and unproductive soils. On many farms the plowing under of the small amounts of green crops and the crop residues would change conditions and oftentimes render relatively unproductive soils productive.

Test Your Own Soil.

If the farmer is desirous of determining in what plant food element or elements his soils are deficient, the most practical and best method to use is to make a simple field test. Such a test is easily and cheaply made. Any farmer can do it, and from the results obtained determine his needs, if any, in plant food. In making such a field test the farmer shonld lay off such small plots as he will need and apply different plant foods and combinations of the four most commonly deficient plant foods, together with different amounts of them. Nitrogen, phosphorous, potassium and calcium (lime), are the plant foods most often deficient. Two or three of the plots should be untreated, or kept as check plots. To one plot, for example, nitrogen could be applied; to a second, phosphorous; to a third, potasium, and to a fourth, lime; to a fifth, a combination of nitrogen and phosphorus, etc., until the different combinations, together with a fertilizer embracing the four plant food elements named have been tried, such a simple test would give the farmer a direct clue to the element needed to bring up his crop production in any were needed, on the soils on which the test is made. Why not try such a test?

To summarize: A chemical analysis of a soil may show the deficient elements when the plant food content is low, but it cannot be taken absolutely as an accurate guide to the plant food requirements of any soil It is better for the farmer to make a simple test of the fertilizer requirements of the different soil types found on his farm

Successful Dairying on Eastcourt Farm

John Retson
Proprietor East Court Farm, Truro, Nova Scotia.

While in Truro a week or two ago, we availed ourselves of the opportunity to visit East Court Farm, the steading of Mr. John Retson, one of the popular firm, Retson Bro., Ayrshire Breeders.

We found Mr. Retson just as we like to find every farmer we visit—busy—he was clearing new land to make more and better pasture room for his fine Ayrshire herd.

East Court Farm is located about one mile from the Nova Scotia Agricultural College, Truro, and directly across the road from a portion of the Colege farm.

Mr. Retson was born in Ayrshire, Scotland, and was the eldest son of Mr. George Retson, of Gardrum Farm, who was a wel-known farmer and stockman.

About thirteen or fourteen years ago Mr. C A. Archibald, Bellevue Farm, Truro wrote to a friend of his in Scotland, asking him to get him in communication with a good stockman, who would be willing to come to Canada, and assist in the care of his Shorthorn and Ayrshire herds. Mr. Retson was on his way to Canada. He assisted Mr. Archibald for eighten months, and at the expiration of that time went to Ontario to take charge of Mrs.W. E. H. Massey's Dentonia Park Farm, herd, where he remained for two years From Ontario he went with Mr. Geo. Wiliam Ballon, Pine Lane Farm, Middleton, N. Y., where he spent one year as herdsman and a second year as the manager.

He then went back to Scotland for six months, during which time he formed a connection with Mr. Alex. Hume the well-known Ayrshire importer and breeder, in the business of importing Ayrshire cattle from Scotland to Canada. Mr. Retson handled the purchasing end of the business in Scotland, while Mr. Hume looked after the sales end in Canada. They made two importations. The first importation resulted in financial success. The second importation arrived in Canada at a time when there was a slump in cattle prices owing to the off season in crops and to avoid selling at a possible disadvantage, Mr. Retson purchased East Court Farm and set up business for himself as an Ayrshire breeder. He had known all about East Court during his stay at Bellevue and his brother Will, who had been herdsman on the College Farm, Truro, for the past twelve years, had kept him in touch with the condition of affairs in Nova Scotia. The second importation in 1908 consisted of thirteen head purchased in Scotland on the producing records of their ancestry. With these, a manure fork, a shovel and two buckets Mr Retson arrived at East Court and from this beginning has sprung up the East Court herd so well and favorably known in the tests and at the various Maritime exhibitions.

He was joined in the business by his brother, George Retson, who had spent one year with Mr Alex Hume and another year at the Government Farm, at Truro and thus the firm of Retson Bros. was founded. Another brother, Jim Retson was with them for awhile, but on account of ill health he returned to his home in Scotland, where he and another brother are employed as district representatives of an organization somewhat similar to the Canadian Cow Testing Association.

In the fall of 1913 Geo. Retson purchased a 100 acre farm at Brookside, about a mile distant from East Court, and to it he transferred his share of the live stock and there he breeds a nice line of Ayrshires and Leicster sheep. The breeding at East Court and Brookside are along the same line and the stock of both farms is still known to the general public as the Retson Bros herd.

East Court Farm consists of 160 acres on a two-slope ridge. The slopes face to the north west and south east. The former is a sand loam the latter a clay loam with natural drainage. A magnificent panamora spreads out to one's gaze in all directions where the surrounding country may be seen for many miles in all directions. Of the 160 acres, 80 are cleared for tillage, the balance in rough pasture and gradually it is being cleared. In the pasture fields the surface is rich in vegetable mold.

The rotation followed by Mr. Retson is as follows: Oats, potatoes or turnips, oats seeded with 8 lbs. clover and 10 lbs. timothy per acre. Hay, and in sections where a second hay crop has been cut if the time is not available to plow for grain growing purposes it is top dressed with stable manure and allowed to grow hay for another year

While at East Court we were shown a field on which Mr. Retson is conducting a rather interfesting experiment. One-half of the field was plowed last August, immediately after the grass had been removed and seeded down with buckwheat. The buckwheat made rapid growth and when it was nearing the flowering stage, late in the fal it was plowed under. The other half of the field was also plowed and topdressed with stable manure and this spring the whole field was seeded with oats on the same day. At the time of our visit the blade on the plot where the buckwheat had been plowed down was far superior in point of growth and richness of color of leaf to the weaker are not so highly colored blade on the manure treated plot. We will try and give our readers the results at harvest time and in the mean time we ou hear from others who have had experiences along this line.

Before coming to Canada John Retson had owned, fitted and shown the champion bull at the Kilmarnock and Fenwick shows for four consecutive years.

The East Court Ayrshires looked well at pasture at the time of our visit. In the herd are representativs of the Clerkland, Gardrum, Glen Shamrock, Glarclaugh and Dalmustumock families. Mr. Retson plans to have his cows freshen in the early fall so that most of the milk is made during the winter season The cows are dried off during the latter part of July and the first of August until they again freshen about the last of September and October. In this way there is very little work to be done in connection with the dairy during the busy haying and harvesting season

Since last December Mr Retson has sold eleven head of pure brrd Ayrshirs—all to Nova Scotia parties at fairly remunerative figures. He finds that there is a big demand for purebred stock.

A careful record is kept of all farm transactions and operations so that leaks in the revenue are easily detected and quickly remedied. Records of each and every cow's performance at the pail and in the test is kept.

Mr. Retson plans to do as much of the farm work as he can without the aid of hired help. He plans his work so that he is not over rushed at any time. When he finds that a busy season with a lot of work is at hand he hires a man while the rush is on.

Mr. Retson is well satisfied with Nova Scotia as a country in which to live. He is making good and he and his wife and lusty young son are a happy, contented looking trio.

What is Your Profit on Your Oat Crop?

C. O. Cormer, of Purdue University writes:—

"Statistics for the last ten years show that the State has produced on the average 30 bushels of oats per acre The average price for the same period has been about 35 cents per bushel, the average gross returns per acre being $10.50. We know that many farmers are raising 50 to 60 bushels per acre right along while many more are raising less than the 30 bushel state average.

Cost of Production.

"Fair estimates show that it will cost in the nelghborhood of $5.50 per acre to grow a crop of oats, not counting anything for land rental. In fact, the statistics gathered in 1905 from farmers over the State give the average cost of producing an acre of oats as $5.53. If we add to this sum $5.00 for rent of land, the production cost amounts to $10.53 per acre. We readily see that the returns are entirely used up in paying for raising the average crop. Some are certainly making a profit, while many more are certainly losing money when they raise this crop under present conditions.

Causes of Poor Yields.

"There are several causes for the low yields of oats in Indiana, principal among which are unfavorable seasons, poor soil treatment, and poor seed. Oats is naturally a cool weather crop and any season which is hot and dry will not produce a very large crop of oats of the best quality. The soil treatment and cultural methods for oats on the average farm fall far short of what they should be. Anything seems to be considered good enough for oats and they are managed in a slipshod way.

Preparing the Ground and Seeding.

"The ground should be put in a loose, level well pulverized condition, with no clods as large as one's fist. After the ground is properly prepared, care should be taken to properly distribute the seed. There are ways in which the seed can be distributed on the ground as uniformly as with the drill but there is no way in which all the seed can be sown to the same depth, except by the use of th drill. In a dry season the plants, from seed lying near the surface, will be quickly affected and will produce less than those starting from a point lower down in the soil. However, this article is intended to discuss the seed factors particularly.

High Yielding Variety.

"Among the causes of low yields which the farmer can overcome, is the use of a variety poorly adapted to the climate in which it is being grown. The Station variety tests covering a period of nine years show that the average yield of the ten highest yielding varieties is 12.3 bushels more than the average of the ten lowest yields. This difference is sufficient to pay for nearly half the cost of producing a crop.

Faning the Seed

"Experiments have shown that fanning the seed results in an increased yield of from one to three bushels per acre. The advantage comes in the removal of a large amount of dirt, chaff, and sticks, which if left in the seed clog the drill work or fail and prevent the proper distribution of the seed. Another advantage [illegible] which is not great in labor or money, is the removal of a large number of weed seed. [illegible] can be largely cleared out by weeds and the quality considerably injured after harvest by weeds causing heating moulding and discoloration of the seed Weeds contribute much to small returns from growing oats

Treat for Loose Smut.

"Another cause of low yields and one which can be cheaply prevented, is the infection of the seed oats with loose smut. The yield is frequently diminished as much as 20 per cent. Fifty cents worth of formaldehyde and one dollar in labor will treat enough oats with which to sow 20 acres. How can we treat the oats? Mix one pound of formaldehyde with 50 gallons of water. This is enough to treat 50 bushels of oats. Spread the oats out in a thin layer, moisten with the formaldehyde solution by means of a sprinkling can and shovel over horougnly, making sure to distribute the moisture to every kernel. Then pile up and cover with a canvas and leave for four hours. The oats is then ready to spread out to dry, after which the seed may be sown. It is well to thoroughly disinfect the sacks, bins, and drill to prevent reinfection.

Rate of Seeding.

"Frequently low yields are caused by too small an amount of seed per acre being sown. Station experiments show that the best yields are, on the average, obtained from sowing from two and one-half to three and one-half bushels of oats per acre. The average of four years work at the Indiana Station to determine the best rate to seed oats shows the use of three bushels per acre to have produced three bushels more than that produced by any other seeding.

"When the farmer has sought out the most prolific variety, prepared the seed in every way to guard against a poor stand and disease, and has properly attended to the soil and seeding, he has done what he is naturally expected to do in raising oats, and then he may expect to get profitable returns."

Labour Saving Haymaking Methods

Editor the Maritime Farmer:

We notice at this season, many articles in the different farm papers, on the best methods of curing hay. Some of these methods are practical and and many of them call for so much hand labor as to be out of consideration by the average farmer. No other crop grown on the farm is so dependent on the weather for its food value as is the hay crop. It matters not how carefully we cultivate, seed and manure the ground, if we have a wet haymaking season it will be hard indeed to house hay of the best feeding value.

I do not attempt to dispute the fact that the generally recommended method of cocking hay will make the best quality, that is the small amount that we may be able to handle by this slow process, while the hay is at its best. I think it a better plan to practice a system by which we are able to house the entire crop in good feeding condition, rather than a small portion of it in ideal shape and the greater part left so long that it is past its best feeding value and impossible to make it into even fair feed. It is all right to do all farm work the best possible way, if you have the time and necesary help; if not, plan to use fast working machinery.

Every farmer should have at least a hoisting gear of some sort for unloading. This is not an expensive method of handling the hay in the barn. Then if any considerable acerage is grown a six foot mower is slow enough.

We use such a machine and find a side delivery rake and hay laoder almost indispensible. We mow every morning and haul in evrey afternoon that weather permits. Five or six acres of good average hay can be handled a day with two men and a boy.

We do not let the hay lie in swath very long. A team is started even before the mowing is finished if the weather is hot and the hay tossed up in neat small windrows, there is a lot of heat in the earth at this season and the hay will cure fast enough without any more exposure to the sun. The folowing day we start the loader as soon as the mowing is finished. Timothy and other grass will make all right without turning unless cut very green, in which case we run the side-delivery rake as often as necessary to toss the windrow over. Clover, usually, has to be turned several times. By this method we can house good hay that will feed out green, and we are not nearly so liable to get caught in a rain as if we coiled and left it one day longer. Cut one day and haul in the next is a safe and rapid way of handling this crop. If a rain threatens in the morning we either haul in or coil instead of cutting, depending on the condition of the hay. With a side delivery we can make hay much more quickly than by using the dump rake, as by the former the hay is tossed up lightly and left resting well up and loosely on the ground presenting a very neat apearance, resembling a roll of carded wool. In this position it catches much more wind and dries faster. It is also handled easier by the loader and if care is taken in the raking the loader will gather the windrow up so clean that it is impossible to tell where they lay formerly and if the builder is careful no second raking is necessary.

Many farmers object to using a hay loader for the reason that they find it hard to level the loads from it. These men, I think, must either try to load too fast at first, or else do not use it long enough to get thoroughly acquainted with the machine. A fast walking team will certainly hustle a man some if kept steadily at it; but there is no reason to drive a man too hard. One man is plenty on the load. A second is liable to get a fork tine in him if the ground is rough and the wagon rocking much. However, a resourceful man will soon learn how to construct a frame on the wagon, suitable for his purpose and, with patience, in time he will be able to build hay very fast.

A neighbor of mine uses a specially big rack-like frame about as wide and high as a medium sized load. One man drives and builds the load, or what little building is done, which only amounts to stopping the team occasionaly to level it down. Two teams are used and while not very large loads are hauled they are loaded very fast. I have known this man to put up anywhere from 80 to 100 tons of hay in 10 days, with one man and a boy, or three hands in all. It was an unusually fine season, but this quantity could not be handled in double the time by hand with this number of men.

There are few more necessary implements used on a farm than a hay loader. A side delivery rake is also a good second, but not absolutely necessary. Considering the nature of the hay crop and its liability to damage it is most important that we have implements to rush work with when the weather permits. While this may seem an expensive machine to many farmers few indeed there are, who have not lost the worth of one many times through damaged hay t hat the loader would have helped them save.

To the man who grows any quantity of hay from year to year, it will soon pay its cost in wages saved, besides being always on hand where required and not liable to leave on short notice.—W. M. Lea, Victoria, P. E. I.

COMMERCIAL FERTILIZERS

Phosphoric Acid.

If the element phosphorus becomes deficient in the soil, the total supply can be increased only by making an actual application of some kind of material containing phosphorus.

It is well to bear in mind that about thre-fourths of the phosphorus required for ordinary grain crops is stored in the seed or grain, while only one-fourth remains in the straw or stalks. Consequently, when corn or wheat is sold from the farm thre-fourths of the phosphorus required to produce the crop leavs the farm in the grain.

When the crops are fed to animals, especialy to growing animals or milk cows, from one-fourth to one-third of the phosphorus contained in the feed is retained in the bones, flesh and the milk, while about three-fourths is returned in the manure.

The total phosphorus content of the soil on any given farm may be increased by the purchase of stable manure, or by using manure made from purchased feeds, especially from grains or other concentrates, as bran, oil meal, or gluten meal; or we may purchase steamed bone meal, which is made from the bones of cattle, etc. Slag phosphorus from the steel works, if the slag contains sufficient phosphorus to make it valuable, or natural rock phosphate deposits in certain places, where this mineral is benig mined and ground in large amounts. It may be noted that the original stock of phosphorus naturaly in the soil is ground rock phosphate.

Potash.

Potassium, like phosphorus is a mineral element contained in the soil, and if the supply in the soil is deficient it can only be increased by a direct application to the soil of some material. As a matter of fact aside from peaty swamp lands and some very sandy lands the potassium, contained in most soils is practically inexhaustible.

Peaty swamp soils are frequently exceedingly deficient in both available and total potassium as compared with normal soils, and where the supply of farm manure is limited, commercial potasium salts may be applied to such land with very great profit Potassium sulphate and potassium chlorid (frequently, though incorrectly, called muriate of potash), are the most economical and satisfactory commercial potassium fertilizers. Kainit is sometimes used, but it contains only 10 per cent of potassium, while potassium sulphate usualy contains 40 per cent, and potassium chlorid contains about 42 percent. of the element potassium.

The Phosphoric Acid and Potash Supply.

The amounts and availability of these two mineral elements of plant life vary greatly in soils. It is evident that the lands from which crops have been harvested for a series of years, and those which have been devoted to pasturage, must contain less of these minerals than they did when first reclaimed from a state of nature and this is true even when the most painstaking effort has been made to return to the land the refuse material an manure resulting from crops and animals, for it would be imposible to return al that has been removed, since there would be no object in harvesting crops or keeping animals unles their edible or comercial parts were used or sold. Therefore, no matter how economically the native supply of these elements have been made gradually available, the time must come, sooner or later, when the native supply will be so diminished as to require additions from outside sources, if full crops are to be maintained.

Husbanding the Mineral Plant Food.

The problem which should first arrest the attention of the husbandman is, how much phosphoric acid and potash must be carried in the soil, and how much may be taken out without reducing the reserve below the profitable standard. And it requires no little skill to solve the problem. This is followed by a question equally difficult How best to make available, how to capture and hold the mineral matter, which it is proposed to remove? Shale drain tiles or plants which are able to thrive on "tough" food and to transform it into that which is "tender," or better implements of tilage, one or all, be used to force the harvests from the "face sweating, stubborn glebe?" How far shall we go in our endeavors to make the dormant minerals soluble ?

If they are made solubble by tillage and other means, they pass but a short way into the soil before they unite with bases, and again become insoluble. Shall the effect be produced, only so far with tillage as will give the plant opportunity to set free its own mineral food by the action of its roots; that is make the material in the soil available? The question is not answered when we dodge behind the word "available," for however, available the food may be, if there are not suitable roots and rootlets, or enough of them, to take advantage of the food prepared, or if the rootlets are not made comfortable, the full power of the soil canot enter into the plant

Most soils cary a vast amount of phosphoric acid and potash, much of which, under careless or even ordinary tilage, appear to be nearly or entirely useles.

For a supply of the mineral constituents of plants, both home and commercial sources are open. The home suply is found in the soil and the refuse material of the farm, which later may be augmented by purchased animal foods.

Cultivating.

The next thought is to tickle the soil with tilage, and see if it will laugh with fatness; if it does not apply something which will awaken it more effectively. If by the use of comparatively cheap subbstances such as the lime and gypsum, which we referred to, in our last isues, the phosphoric acid and potash can be ousted and made available more cheaply than they can be bought for the land, then these cheap substances should be used, for they usualy not only set free plant food, but also improve the physical character of the soil, and sometimes serve as regulators of soil moisture.

Since phosphoric acid and potash leach out of good soils in only extremely small quantities, it would seem at first thought that the presence of a living plant would not be necesary to conserve them, as in the case of nitrogen; but if these minerals have been made available by tillage or by amendments to the land, and if not used, they tend to become unavailabie again as time passes.

Why Does the Laying Hen Have a Red Comb?

Poultry keepers have long known that hens' combs do not always present the same appearance; a considerable increase in size takes place when the period of laying approaches. Mr. Geoffrey Smith, a British investigator, has been making precise measurement on young and adult hens, at different times and he shows that the comb increases practically to double the size or more during the period of laying, without a simultaneous increase in the weight of the hen. Mr. Smith found that the increase in size in the hens' comb was due to a fatty deposit, and he gives the following explanation:

During the time of laying the blood is charged with fatty substances, which accumulate in the ovary, where they enter into the composition of the yolk of the egg; the excess of these substances is deposited in the comb, and thus contributes to the accentuation of secondary sexual characters.

CREATING COMMUNITY SPIRIT.

The most important factor in making a success of life is for the individual to have a clear understanding of what we are here for. Civilization is a matter of evolution. First we had the savage state in which man lived for his own and to destroy all others. Then the state of live and let live; but now we have arrived at the state of live and help live. Our idea is that a man is to make the most possible of and for himself and the community in which he may live.

I have known some men who were said to be successful, but they had made their success at the expense of the community. Our idea is the Acadian: "There the richest was poor, and the poorest lived in abundance."

In modern times how can a man give expression to his obligations to his community? By improving himself and his home, showing an interest in the roads, the schools. and the churches. Some may not think tuat support of the church is indicative of a man's interest in the community, but we have noticed some prosperous communities and on inquiry found that the people had a peculiar religion and they all had it and it was not a Sunday affair but an every-day religion. During the Russo-Japanese war the Japs went to their death as no other people ever did. Why? That was their religion. We have heard the praises of the farmer-soldier sung; but it is said the Russian peasant (a farmer) does not make a good soldier. Why? He owns no home and has no religion.

Some years ago I heard a financially prosperous man say, "I can't be religious myself, I believe in supporting the church and helping other people to be religious. A church in my community is worth a judge on the bench and a dozen policemen,"

The modern school idea is to train the pupil to use himself. Roads are to facilitate transportation to market, to school and to church. A community is measured then by the character of its people, their homes, their roads, schools and churches. The problem, then, in a country community, is to show a farmer that a school will be helpful to him on his farm; that the church has a religion which, if he gets it good and strong, will help him to raise a bigger crop of corn and there-by he can have a better home.

In order to avoid jealousies that might arise between neighbors, each must be convinced that the succese of the one is not at the expense of the other, but will be helpful to the others. The first step then, in creating a community spirit, is to get the preacher and teachers imbued with the idea, that it is their duty to help the farmers in their district.

At one particularly good farmer' institute the first man to greet me was the minister. I learned that he had a large congregation and I learned that he circulated the petition for the first farmers' institute. That minister did not himself undertake to teach his congregation farming; but he knew that to be good church members they must be good farmers, and he took the lead in securing agencies that would be helpful to them on their farms.

Teachers may complain about parents not taking an interest in the school, but if the farmer finds out that the pupils are figuring on how much it cost, him annually to maintain fences on the farm or what the profit is on his old brindle cow, and if he is feeding her a balanced ration, or if their flock of poultry is profitable or not, then he will begin to take an interest in the school and begin to think of methods by which he can help that school; and finally he must be made to feel that the condition of his farm and home is an index to his mind and character, and that a failure to make the most of himself and his farm injures the value of all the farms in the community.

A CREED FOR THE COUNTRY BOY

I believe that the country which God made is more beautiful than the city which man made; that life out of doors and in touch with the earth is the natural life of man. I believe that work with nature is more inspiring than work with the most intricate machinery. I believe that the dignity of labor depends not on what you do, but how you do it; that opportunity comes to the boy on the farm as often as to the boy in the city; that life is larger and freer and happier on the farm than in the town; that my success depends not upon my location, but my self; not upon my dreams, but upon what I actually do; not upon luck, but upon pluck. I believe in working when you work and playing when you play, and in giving a square deal in every act of life.

NECESSITY OF UNDERDRAINAGE.

It is a matter of common observation that at a certain depth pelow the surface the subsoil is full of water, supplied by rain or melting snow which has soaked through from the surface. The upper limit of this saturated area is known as the "water-table." Ordinarily plants will send their roots down till they reach this water-table and no further. This is becouse the roots can grow and thrive in earth which is merely damp, but not in earth that is full of water as to exclude air. This fact has an important bearing on the question of underdrainage.

In spring after the melting of the snows of winter, the water-table, on poorly drained lands, is very near the surface, but, with tne oncoming of dry weather, it is rapidly lowered, too rapidly in fact, for the growth of roots to keep up with it. The plants sown in spring are thus apt to be left high and dry, with shallow root systems, and largely dependent on whatever rain may fall during the summer months for their supply of moisture. If, however, there be sufficient underdrainage, either natural or artificial, the water-table will be much lower in spring, while the plants are germinating, and the roots will grow down to it, and in this way occupy a much larger feeding place. Hence the resulting crop is larger and finer and better able to resist drough.

Unless the surplus water is removed by drainage, it must be brought to the surface by capillary attraction and then evaporated. As evaporation absorbs heat, this process reduces the temperature of the soil and leaves the land cold and raw. Drained lands, therefore, are warmer than undrained, and as, moreover, they are more quickly put into workable condition in the spring, the crops on such lands are the first to ripen and the most likely to escape frost in the fall.

That underdrainage pays handsomely in earlier' bigger and more hardy crops is not only demonstrable by theory, but has been amply proven in practice. The most enthusiastic advocates of underdrainage are those who have done most of it.

WHAT COLLEGE FOR THE BOY.

"Shall I send my boy to college or keep him at home?" This thought is uppermost in the minds of many fathers just now. Every normal father desires the welfare of his children, but he knows that some boys are spoiled by being sent to college, whereas other are just as surely spoiled by being kept on the farm. How shall he decide?

There is one sure, safe test—watch the boy! If he shows decided interest in definite direction, give him a chance in that direction. Many a boy cut out to be a merchant, or a lawyer, or a doctor, fails because his parents force him to take up something else. Many another fails at these and other "clean hand" work because he should have been a farmer. Why? His heart is not in the work.

Every normal boy is fitted by nature for some one thing better than for anything else. This is the father's cue. If he has the stuff in him he'll find a way to higher training. The boys who go of their own choice to college and work their way wholly or in part almost invariably do better than those who follow a flower-strewn road prepared by their parents.

Farm boys who do not show a decided "bent" had best attend an agricultural college, whether they work their way or not, because they will there be in contact with farm subjects and farmers' sons. Furthermore, tne modern "farm college" gives a decidedly broader, more practical general course of study than do those colleges which give a little veneer of dead language, "arts," and science which rubs off with the first contact with the world. The farm college every time for the farm boy, except the one determined to be a lawyer, a doctor, a clergyman or something else as definite!

How a "Cost Department" May Transfer a Farm

The following little story written by Mr. Bramhil, a senior student at the O. A. C., and published in the Christmas number of the O. A. C. Review, illustrates the value of a cost department so nicely that we reproduce it herewith in full.

"From a financial standpoint, Dad had been a failure all his life. He was one of the pioneers of the country, was reeve of the municipality for years, and no new policies were ever introduced without consulting dad. He had three sons and two daughters. One studied law, the other medicine; my two sisters were married off, and I the youngest, was left home on the farm. Long before I was 10 years of age my feet were so tough that I could go in the oatfield bare-footed. I was a lazy little rascal, my father said, and my greatest ambition was to learn to run an automobile and become a chauffeur for some rich young lady. Dad was determined I should stick on the farm, but mother said I looked like a young cherub, and she was sure the Lord meant me for the ministry. Mother's will prevailed as it usualy did, and accordingly I was sent into town to the high school, dad declaring that it was a shame to waste good money on such an idle little scamp.

"Three years at high school succeeded in smothering the last spark of affection for the farm. I received a week's suspension for stealing apples, and dad determined it would be useless spending any more money fitting me for the ministry, so I was left to shift for myself. I picked up the city paper, and saw an advertisement: "Wanted—Cost Clerk in manufacturers' office." I applied for the position and received a letter asking me to call at their office in the city. I showed dad the letter but he shook his head, and reckoned that a cost clerk must be a shark of some kind. Mother said she knew that Sonnie wouldn't do anything wrong, and that if I could once get a start it would only be a few years before I would be president of the concern. Mother triumphed again and acordingly my trunk was packed, and with tears of blessing, I was sent off, my canvas telescope well packed with cake and apples.

In the City Office.

"Fearful and trembling I stepped into the office of that large manufacturing concern, and was shown into the manager's office. He asked me a few questions, and finding I did not know anything, decided to hire me. I did not sleep much that night. Before six o'clock I was awake and excited over the novelty of my coming duties.

"Half an hour before the appointed time I was down in the office. When the stenographers came down they started to flirt with me. I turned crimson, and wondered what mother would think if she could see me among these bad girls. I imagined I would have to get out the balance sheets, dictate letters, and consult with the directors as to the ways and means of increasing the efficiency of the plant. Imagine my disappointment when I was made to hunt through the dusty files for old repports and letters. By night time I was dusty, dirty and tired, and had not such a favorable impresion of office life. I managed to stick to the job, and after a month of hard, dirty work, was put on one of the ledgers. I stayed at this all winter. Often at night my head would swim and my back would ache, and in my dreams figures would appear in an endless confusion. When spring opened up, I used to sit in that stuffy office and long for the green fields at home.

Back to the Fields Again.

"Meanwhile things were gong badly on the farm. Dad had raised a mortgage to build a new house. Then three of our horses died, and along came an off year in crops. Dad's health broke down. He could not meet his payments, and the farm was to be sold. This nearly broke mother's heart, and I was sumoned home. It was 16 months since I had been out in the clear open fields. Everything seemed to take on a new life. The calls of the barnyard seemed like sweet music after the discordant noises of the city. The day I sugested to dad that he give up the active management of the farm, and turn it over to me. Dad laughed and mother cried, but finally they decided to let me try it.

"That first week on the farm I did a good deal of thinking. Other people had made money on the farm; why hadn't dad? He used to work long and hard, but it was really mother who kept the house with her butter and the chickens. I decided right there and then that what dad needed was a cost department. I didn't know very much about farming, but somehow or other it seemed to me our 10 cows wern't producing enough milk for the food they consumed, and our steers were long, bony brutes, hard to fatten. A few years before, a farmers' institute chap had lectured in the schoolhouse on dairying, and warned everybody of the profits to be made in that business. Dad thought his opportunity had come and crossed our good Durhams with Jerseys. As a result our cows were a bunch of nondescript mongrels of all shapes, sizes and colors. Now this is where Dad made a great mistake. The dairy business is a specialized business, requiring men of a certain temperament and training. The farmers in our locality were not suited to that business, and attempts to introduce it generally resulted in failure.

Expensive Cow Boarders.

"I got out a pencil and did some figuring. Our cows averaged 2,900 lbs. of milk a year. At 15 cents a gallon this gave $43.50 a cow. From a report of the agricultural college, I figured out the average cost of feeding these cows for one year was $57.10. It did not take a Pierport Morgan to see that dad's profit was on the wrong side. You will wonder why dad did not go into the receiver's hands long before. For the simple reason that the cows charged too little for their board, dad waited on them himself and had mother and the kids to help. I decided right then and there to clean out the whole bunch of scrubs and work into some good Shorthorn cows of a dairy strain.

"Next I investigated the feeding of the steers. Dad used to let his steers grow along till about two and one-half to three years old, and then fatten them off for market. I figured out that the steers which dad sold for an average of $75, had cost $65 to produce That left a profit of $10 a steer for 3 years' labor A butcher would quit business if he couldn't make 20 per cent on his selling price, and his labor would only be a matter of a few hours. Dad only received a little over 10 per cent. for three years' labor. In a report of the Dominion Experimental Farm, I found that up to one year of age it cost $5.50 to produce 100 pounds of flesh; from one to two years it cost $6.05, and from two to three years, $7.05. I figured out that a yearling steer weighing 1000 lbs., would cost $55, and at eight cents a pound, would bring $80, leaving a profit of $33 for one year's labor. A two-year-old weighing 1,500 lbs., would cost $85, and at eight cents would sell for $120.00, or a profit of $35.00 This meant a return of $2 for the extra year's labor, and the privilege of hearing your steers bawl every morning for a year. I saw where dad made his mistake and determined to shove the young calves right along and get them into the market at from 12 to 15 months.

Calf Rearing Methods.

"I still continue to raise the calves on skim milk by restoring as nearly as possible the qualities contained in new milk. As a substitute for the milk fat I use flax seed meal. It contains a high percentage of starch and has a high rate of digestibility, with a nutritive ration nearly the same as whole milk. The milk is always fed sweet and warmed to about 95 degrees F. I let the calves nibble at rolled oats at about three weeks of age and give them just about all that they will eat. I also get them used to alfalfa hay as early as possible. It is surprising how soon a calf will learn to eat. The calves are kept on milk for a couple of months, and gradually worked into a ration of ensilage, chopped oats and barley, and plenty of alfalfa or clover hay. By forcing the feed I find it an easy matter to produce a 1,000 lb. steer at 12 to 15 months.

"I have now all the farm organized on the cost system basis. My 10 Shorthorn cows of a milking strain last year averaged 8,000 lbs. of milk, and gave me a net profit of $500. I made a profit of $300 on the steers and the hogs, sheep, poultry anr orchard gave a profit of $700. This made a total net profit for the year of $1,500, which is not bad for a 100 acre farm. In five years I have paid off the mortgage, improved the buildings, equipment and herds, and I now have an option on another 100 acres, and intend to increase farming operations, ever keeping in mind the importance of a cost department on the farm."

SOCIAL CONDITIONS OF FARM LIFE

In treating of this subject it seems quite necessary to bring it before you under several sections such as:

1st. The conditions that have gone by. The old friendly spirit of former days is dying out and there is more of a tendency for families to live to themselves.

It was quite customary twenty-five, thirty and more years ago for people to drop in on their neighbors for a friendly chat, for an hour or so, or for even a day of social intercourse. The babies and youngsters would be weighed and what fun that was for we juniors, when some particularly unruly child was being weighed. This was one of the scenes in our old home for there was always a standard for the weighing and a child of some age to be compared with those of the neighbors. But this weighing was only a side issue of the programme. Conditions for growing best crops and stock was a topic of much concern. Whose cows were doing best? Who had the best sheep and best pigs?

Co-operation in working was more common than at present. Plowing frolics, frolics in clearing fallows or new land. Barn raisings and many other kinds of work was performed by getting the people of a district together. And at these frolics, farm, social and political topics were always discussed

Then people began to copy the manners of socialism of their town and city folk, with the result that since "Charlie went a courting and brought a wife from town,", it is quite impolite to go visiting without a special invitation, and when some of us who go for a friendly call do so in a realy old-fashioned way, it is almost said that such people go poking into other people's business.

What a terrible rut, some people who think that only they are the one great IT, have gotten into.

But let us deal more with present day duties. Not long ago a preacher, in his sermon, told how in many cases, Christ was being organized right out of the Church, and it is just as true that sociability is being organized right out of farm life.

II. Time and Place.

The time must suit the habits of the people. Some might manage to meet in the afternoons, to nearly all, the evening would be most suitable; and for the place, either in the home or in public buildings, in cold weather, and some favorable outdoor locality would be ideal in the summer season.

III. How.

Discussions upon various topics and readings, dialogues, etc., all of which would help draw people together..

Under this sub-section, discussions could be ppepared, interesting addresses upon "How to Improve Farm Life." What breeds of stock, crops, etc., are best suited to our locality. Are the breeds of stock that are best suited to our conditions best suited to our market conditions? Many, many other topics can be thought of.

In debates we could mention various phases in politics; the duties of farmers in relation to politics. Should farmers enter parliament? Most decidedly I say no to this.

Then there is that great question of Women Suffrage. And again the present agitation, reprocity. Reciprocity, it seems is only sociability between nations. If sociability is best for farm life why not best for nations?

Then in regard to the recitations and readings. It is realy shocking to find how very few either country or city, can make a creditable showing in this accomplishment.

Another phase in improving social conditions, is that very few, probably not more than one present of the people in rural districts can lead or carry on a business meeting of social or religious matters Even the Normal graduate seems practically helpless in regard to the mode of procedure. And, let us not forget the soothing effect that music has upon many minds. It is uplifting if of the right kind. In our various moods, various tunes, quick or slow music, balance the strained nerves. Only a few days ago, a hard working man, who serves the public, said that many times when he becomes bothered by some disagreeable customer and when other things are not going just right, he goes to the gramophone, puts on a certain record, and by the time this one tune is played his mind has assumed its normal condition.

Vocal music has its bebneficial effect also.

In speaking of the gramophone it seems only right to mention this wonderful piece of mechanism in playing a part in sociability, either on the farm or in the city. A good gramophone is a great help in an entertainment. But let us not overlook the fact by using one of these talking machines, that our own arts may be allowed to remain undeveloped. Surely it would be better to develop home genius than to bring in too much outside accomplishments. Then there is that other wonderful machine, the telephone. Now almost indispensible to country life. It is valuable in many ways and a curse besides

IV. Effects.

Well, if we would let the proper effects affect us our farm life would become so uplifting and pleasant that we would soon discard the usual methods

(Continued on page 776.)

HORTICULTURE.

Plant Lice on Currant and Gooseberry Bushes.

Every year appeals are sent in to the various agricultural experiment stations concerning deformed leaves in the spring. The fresh tender leaves are wrinkled, curled and otherwise stunted and distorted by plant lice that have over-wintered on the bushes in the egg stage, thus being ready to attack the new growth as soon as they hatch in the first warm days. As their life histories has not been worked out, during the season of 1913 the Department of Entomology of the Maine Station paid considerable attention to the group of plant lice or aphids that attack the currant and gooseberry. They were found to be particularly difficult to study from the fact that a single collection frequently contained as many as four species with their innumerable progeny harmoniously feeding in mixed colonies on the same stem and leaves. Thus it was no easy matter to isolate the different species for the purpose of rearing the successive generations.

In all eight species were found to be present in Maine. The worst of these, a grayish species, we have called the "white cornicled currant aphid"* on account of the milk white color of the two tubes near the tip of the body. As these insects reproduce rapidly the colony soon gets too numerous to be sheltered by a single leaf so it scatters to infest the growing shoot and under side of fresh leaves. A thriving colony will distort the stem seriously and cause the misshapen foliage to cluster in a dense protecting mass. It occurs on both currant and gooseberry.

Associated with the species just mentioned is the "green aphid of the gooseberry,"** a pale aphis found on the gooseberry, much to the detriment of the bush.

A third plant louse comon in Maine upon currant in spring is probably the same as one found on sow thistle and lettuce during the summer† Like the species previously discussed, this aphid winters on the currant in the egg stage, the spring generations feeding upon the sap of the growing leaves. The colections I have made from the flowering currant have been mainly from the under surface of the leaves which their presence causes to curl and cluster though not in such a dense mass as those infested by Aphis varians. They are sometimes also found on the stem.

During the last of June winged and wingless females and young can still be found upon the currant. The winged females apparently take flight to lettuce, sow thistle and probabbly to related plants, although I have not succeeded in making the transfers live under control conditions.

It is interesting to notice that another curant and gooseberry species‖ is indistinguishable from a lettuce aphid and is probably a summer migrant to that plant. It is an alert, glistening bristly species. The apterous viviparous females are green and without any markings. The winged viviparous females have the abdomen heavily marked with irregular black transverse bars.

With two species of plant lice migrating back and forth from currant to lettuce it is thus apparent that it is advisable to clear out lettuce in the vicinity of this fruit before late summer, care being taken to leave on neglected lettuce stalks about for the development of aphis This is as much for the sake of the lettuce as the currants for although these green plants lice are not poisonous, most of us prefer our salad served without them.

It is no uncommon thing to find currant leaves puffy with reddish or yellow blister-like deformations. These are the home of Myzus ribis, a delicate little aphis not so serious in its work as varions because it attacks directly only the leaves but still troublesome enough to interfere with the proper functioning of the leaves, cause premature ripening of the fruit, and as one currant grower in the State puts his complaint against the species: "though the fruit holds on, the plants are hurt to a certain extent and look very anoying."

The stem-mother, or form hatching from the over-wintering egg, attains its growth in Maine about mid-May. This insect is very pale green with green spots in two longitudinal rows on the dorsal surface. Like the other apterous forms and nymphs the stem mother is rather thickly beset with capitate hairs shaped like minute pins, with points attached to the body.

The immediate progeny of the stem-mother are apparently partly winged and partly wingless, since I have taken colonies as early as May 20 containing the stem mother surrounded by nearly mature apterous forms and individuals with wing pads. The apterous females and young of this species are ordinarily pale clear lemon though sometimes nearly water white. and these small pale insects would have to be very numerous to be found if it were not for the telltale danger signal of reddish puffs which give evidence of their presence.

In life it is distinguished from the species next discussed by being characteristically lemon and being more flatly appressed to the leaf. The two species are frequently intermingled upon the same leaf and are very likely both confused under the name ribis.

Collections of Myzus from gooseberry and curant in Maine show two closely allied species. The differences though rather slight and for the most part relative seem to be too constant to admit of interpreting them as varieties of a single species.

I have never taken any lemon yellow specimens of the second species.‡. The apterous viviparous females are greenish water white and longitudinal median and lateral lines (three in all) of vivid green. The winged female is very pale green with three vivid longitudinal lines as mentioned for the apterous form and a few blackish transverse markings on caudal half of abdomen.

Collctions of woolly aphis§ curling the leaves of English elm, Ulmus campestris, were made in Maine during the summer of 1913. The life history of this species as worked out by European entomologists has been found to include a migration to currant and the gooseberry bushes upon the roots of which the summer generations feed. ...l migrants are produced which return to the elm and the insect over winters on this tree in the egg stage. We have as yet no record of this insect as occurring upon gooseberry or currant in America, but the summer stages will no doubt be found to infest these plants here as in other countries.

Aphid Control.

In recent years tobacco extracts have rapidly taken the place of other sprays for aphids. It should be remembered that this is a contact insecticide and kills only the insects actually touched. It is, therefore, necessary to be very thorough in the spraying.

Formula—Tobacco Decoction.

Tobaco stems or tobaco dust ¶—2 pounds.

Water—4 gallons.

Put the tobaco in the water, enough to cover, which may be either cold or

Fruit Growers and Farmers should not miss the Greatest Fruit Show in Canada. Write for Prize List.

W. M. Carruthers, Sec'y, Kentville, N. S.

hot. Place over the fire and when the water has reached the boiling point remove some of the fire and allow the water to simply simmer for fully an hour, when the liquid is ready to be drained off, diluted to the above proportions and applied. Boiling violently drives off the nicotine.

If whole-leaf tobacco is used, prepare as above, using one pound of tobacco to each four gallons of water.

No lime or other alkaline substance should be added to the tobabcco while cooking. Apply at once, or within a few days after making, if possible.

Certain reliabble extracts such as "Black Leaf," "Black Leaf 40," and "Nikoteen" are on the market and can be secured through local druggists..

Directions for use come with the products There is nothing to do in the preparation of these extracts except to stir the contents of the can before pouring out any quantity of dilution.

Tips of branches bearing leaves which have been curled by aphids can be dipped into a pail of tobaco decoction long enough for the solution to penetrate. Such a method as this is of course only applicable for a few treasured plants and bushes.

Sometimes underspraying is a necessity, and for this purpose a sprayer should be fitted with an upturned elbow and a nozzle of the Vermorel type so that the under sides of the leaves can be reached.

Inspection of Potatoes.

The Department of Agriculture of the Province of Nova Scotia has issued a circular dated June 5, 1914 which reads as follows:

Dear Sir:—On April 22 1914, the Board of Agriculture of Bermuda passed certain regulations prohibiting the importation of potatoes unless accompanied by a certificate that such potatoes are free from powdery scab or other dangerous potato diseases. I enclose an extract from these regulations which will be of interest to those catering to this trade.

Regulation 4, Section 3;—"No potatoes will be permitted to be imported to these Islands from the Province of Nova Scotia in the Dominion of Canada unless such consignment is accompanied by a Provincial or Federal certificate that such potatoes are free from any suspicion of any contamination from powdery Scab or Black Wart and each package shall have plainly marked thereon or on a label affixed thereon or attached thereto the number of the certificate under which it is so certified."

Regulation 6;—"When a barrel or a package is found to contain over one-third of any of the following classes of potatoes, the inspector, or assistant inspector, shall order that it be sorted and again be submitted to him for inspection after all potatoes of the classes mentioned have been discarded:—

(a) Small potatoes, that is, potatoes under one inch in diameter.

(b) Potatoes in a diseased condition.

(c) Potatoes that are not the type or variety they are represented to be.

Discarded potatoes of these classes shall not be sold or used as seed potatoes."

In order that the Nova Scotia growers continue shipping potatoes to Bermuda, it is necessary for the Provincial Government to undertake inspection of all potatoes destined for this market. This will necessitate the appointment of an expensive and a highly trained inspection staff, as a single mistake on our part would forever close to us the Bermuda market. To help cover the heavy expenses which such an inspection entails, it has been found necessary to impose a small inspection fee.

While those interested in this matter will naturally desire that the inspection fee be kept as low as possible it must be remembered that the work is undertaken solely in the interest of the growers and that even a large fee could not begin to cover the total cost. The sum suggested is that of three cents per bushel, which we submit for your fair consideration.

If you are interested in this matter, the undersigned will be glad to hear from you.—Wm. H. Brittain, Provincial Entomologist, Truro, N. S.

Fourth Dominion Conference Fruit Growers.

The Minister of Agriculture has called a Conference composed of delegates from the various provincial fruit growers' associations to meet in Grimsby, September 2nd, 3rd and 4th, to discuss subjects of vital interest to the fruit growing industry of Canada. It is expected that certain standards of packages, grades of fruit and methods of transportation, etc., will be recommended for adoption for the whole country. The object of the Conference is largely that the Minister may come in direct contact with the representatives of the fruit growers and shippers, and discuss with them methods whereby the fruit growing industry may be developed in the best possible way.

Delegates have been appointed from the Maritime Provinces as follows:

Prince Edward Island— Murdock McKinon, A. E. Dewar, Theodore Ross, Charlottetown.

Nova Scotia—S. B. Chute, S. C. Parker, Berwick; F. W. Bishop, Paradise; Prof. P. J. Shaw, Truro; W. W. Pineo, Waterville; A. E. McMahon, Aylesford Manning Ells, Port Williams; W. H. Brittain, Truro.

New Brunswick—C. N. Vroom, St. Stephen; A. G. Turney, S. B. Hathaway, W. B. Gilman, Fredericton.

Pollinating Apple Varieties.

The interesting experiments at the Washington station with apple pollination continue to be of keen interest to growers everywhere. The station at Pullman has been engaged for several seasons in the study of orchard pollination to determine what varieties of apples are self-sterile and need fertilizing by others. Much of the work was done in local orchards, but the latest report includes several orchards at Opportunity. The important point is that of the 19 varieties tested Rome Beauty and Baldwin were the only varieties which gave any promise of being able to produce a crop without cross pollination. These set much less fruit than when crossed. Ben Davis and Wealthy were found slightly self-fertilized. Greening, Spy, King, Delicious, Wagener, etc., failed to produce any fruit from self-pollinated blossoms. In most cases the station finds that varieties which blossom at the same time will cross polinate successfully and as a rule set more fruit than the same varieties when self-polinated. This matter of pollination in the orchard has received too scant notice at the hands of eastern growers. Strawbery growers have profited by the knowledge for years, but apple growers have taken only a mild interest in cross pollination.

That Barrel of Apples.

"I wish to speak to you about that barrel of apples I bought day before yesterday," said the kind-looking old gentleman.

"You'll have to see the clerk who sold them to you," the grocer answered very snappishly. "I don't know anything about them."

"But I desire to say to you personally that—"

"Now, look here; I can't be bothered over every pound of sugar or pint of cider or barrel of apples that my clerks sell. Just see the young man who waited on you. He's around somewhere."

"Yes, I see him there at the back of the store; but I really thought that it was my duty to tell you about it. You see—"

"If I stood around listening to everybody who comes into this store to complain that they've bought something they didn't want, or that they've been slighted, as they think, by the clerks, I wouldn't have time for anything else. You'll please excuse me. The clerk will hear your complaint and if there is anything that we can do you may be sure it wil be done. But we can't take back a barel of apples after they have been out of the store two or three days You can surely see that if we did our business in such a way—"

"My dear sir, I don't want you to take back the apples and I haven't any complaint to make. I merely wished to tell you that I found the apples at the bottom of the barrel to be just as big as the ones at the top. I believe in the principle of giving praise wherever it may be fairly given and I stepped in to order another barrel but I see you're too busy to bother with such a trifle this morning, so I wil be going.

Grates are extra durable. Coal grate is duplex. Wood grate is the most modern type.

DAIRYING.

Excitement Bad for Dairy Cows.

While dogs save many steps in getting cows from the pasture they usually do more harm than good. Where there is one dog that will drive stock quietly and peacefully there are ten which will get them too much excited. If we could measure in dollars and cents just what it costs to get milk cows excited, few of us would have a dog on the farm, at least for getting the cows.

Last summer I was talking with a neighbor farmer and discussing dairy problems in general. He kept a dairy of about twenty-five cows and arranged his work so that he churned once daily. One thing he could not understand, he said, was what made such a variation in the churnings from day to day. With the cows on the same pasture and getting the same general treatment, he said some days his shurnings would be five pounds less than on other days.

At first I could see no obvious reason why there should be such a variation from day to day. Then he invited me to go with him to the pasture to see his cows. On the way I noticed he had to drive them along the road for a short distance and past a corn field. As it was along in the afternoon and about chore time, he decided to drive the cows to the barn. The dog was with us. In going past the corn field they were inclined to try to get into the corn and each time the dog was used to shase them out. The cows were afraid of him,, and would run to get out of his way whenever he barked.

I suggested to my friend that his dog was what caused the variations in his churnings, but at first he disputed the point. I told him some days the cows would go along the road and not try to get into the corn and that on these days he would get normal churnings; that on the days he dogged his cows out of the corn there was a faling off. While he didn't believe there was anything in my explanation, he said he would test the matter. He strung some wires along the road which would head off the stock, and kept the dog in the barn at cow time.

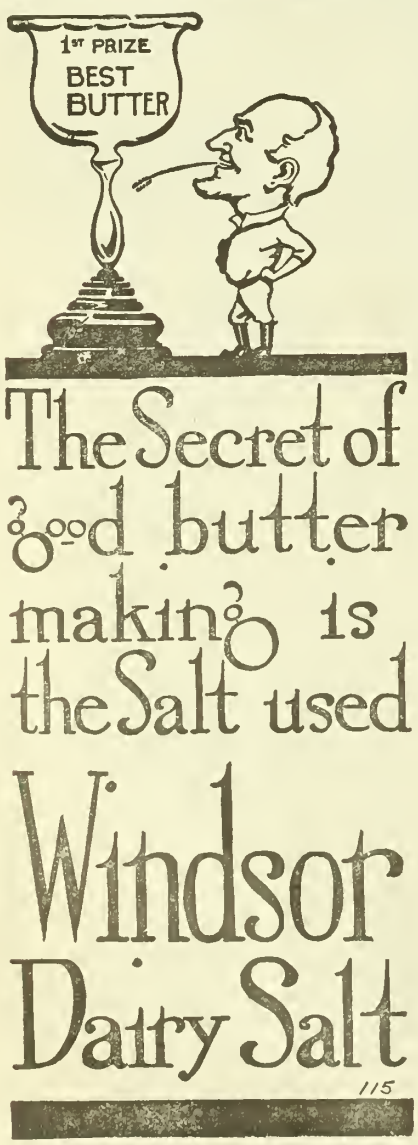
A few months later I was talking with him again and asked him how he was coming with his churnings. I was not surprised when he said there was almost no variation from day to day. There never was more than two pounds difference, but before it would vary as much as six or seven pounds. It was an object lesson to myself as well as to the other man. He gave up using the dog as he saw he could well afford to take the time either to get the cows himself or let his hired man take the time to do it. When the cows had been dogged, resulting in a loss of five pounds of butter in his case, the cost of the excitement was close to a dollar and a half in butter.

Dairy cows, especially the best ones, are exceptionally nervous animals. Secretion of milk is largely a nervous prpocess, we are told, and it is only natural to suppose that fright or excitement will prevent normal working of the organs that secrete the milk. Sometimes a sudden fright will temporarily check the flow of salvia in our own mouths; on the other hand, influences such as the odor of or even thinking of something good to eat will cause "our mouths to water." The same things which will retard the flow of salvia in our mouths wil retard the secretion of milk with the cows.

Where the barn adjoins a pasture, cows will usually come of their own accord at milking time, if they are given a few handfuls of grain at each time. They learn to look for it and beb regular in coming for it. It will be far sheaper than depending upon a dog.

I believe it pays to feed the grain at milking time rather than before or after. I know one dairyman who makes it a practice to give each cow her grain just before she is milked. This makes a few extra stepps but he says he knows it pays him mighty well for the extra time required. Before a milker sits down to a cow he gives her whatever grain she is to have so that she can be eating it while he is milking her. Then when he is ready for another cow he does the same thing. This keeps the cow quiet as she is much more concerned in her grain than in stepping around out of the way

One thing which should beb discouraged and not alowed is rough handling of the cows. While it is provoking to have a cow kick over a pail of milk, it wil do little good to kick her or pound her over the back with a milking stool. It only gets her excited and makes a bad matter worse. When a cow kicks there is generally a cause, which may be sore teats. An application of a good healing salve will heal the wounds and be the dest remedy for breaking the practice. A milker's finger nails should be short so that they will not irritate the teats.—Walter J. Lawrence.



Keeping Herd Records.

Lea & Clarke, Victoria, P. E. Island, write:—

We have been doing considerable official testing the past winter, both in the R. O. P. anr R. O. M.

"A 3-year-old, "Ruby Nig", gave 16.555 lbs. milk in the year and 750 butter, freshening again at 4 years she gave 564 milk and 25¾ lbs. butter in seven days.. We think this is the largest official records for both year and week made by any cow of the age, any breed, in the Maritime Provinces, the yearly record being one of the best for that age, in Canada.

"Miss Rooker Posh" gave 402 milk and 16.½ butter in seven days and since Nov. 9th to the end of June, has given over 10,000 lbs. of 3.5 milk. This heifer was just 3 years, 3 months old at beginning of the test.

"Beauty Rooker" made 326 milk and 15¾ butter in seven days and is now nearly 9,000 lbs. milk since Nov. 17th, averages over 3.5 fat aged 2 years, 10 months.

"Nellie Rooker" gave 299 milk and 12¾ lbs. butter in seven days. under 3 years and only five days after calving; she is over 8,000 milk to end of June, and tested from 3.6 to 5.0 percent. fat these heifers have four months yet of their year to milk and baring accident will make very large records. They, with many other good ones, are sired by our Ida Rooker's 2nd Vale, one of the very best breeding bulls in Canada, as his get are almost all (both grades and pure breds) show heifers of high quality and invariably better producers than their dams. He has now four daughters in R. O. M. and wil soon have several more also several with the herd to qualify in R. O. P.

We have recently purchased the entire herd of high-class Holsteins of J. M. Laird & Son, Kelvin Grove. These are a superior lot, several bred in the noted herd of James Retter, and several from Riverside. Included is a two-year-old daughter of our young bull, that was sweepstekes female at Charlottetown, as a yearling; also Ontario Maid, that won the 40 hour dairy test, same shom. in class of 12 aged cows, after being in milk six months. Other grand untested cows are included that are capable of making big records and will be heard from later. The young things are especially well grown and reflect credit on their feeder. They are sired by an aged bull used for several years in the herd of Harding Bros., Welsford, N. B., and a grand sire of quality stock. He is yet active as a yearling and is included in this excellent lot.

The Dual Purpose Cow.

Kimbell's Dairy Farmer says:—"Taking advantage of the present high prices of beef and the indication that there is to be a beef shortage in this country advocates of the dual purpose cow proclaims her to be the great source of meat supply. Their argument is based upon the belief that this is a beef eating nation, ever will be and it is the farmer's duty to produce beef for the consumer regardless of whether the venture is profitable to him or only to the stockyard interests, the packer and the retailer.

"It is true that the consuming public should have beef. Likewise it was true a few years ago that the cities of the United States should have libraries and it has ever been true that colleges should be endowed. With millions of dollars Carnegie made available the library and Rockfeller and the others have endowed the colleges That the acts of these public spirited men are comendable is beyond controversy. Their names will live throughout history as benefactors of a great nation, Even the instigators of the cry that the American people must have beef are public benefactors, for it would be a calamity were there to be a beef shortage over a long period in this country.

"There is no doubt that there should be beef. The question involved is merely whether or not the general rank and file of farmers on high priced land, operated with high priced labor, resulting in high priced cattle foods, can afford at this time to become philanthropists and furnish to the consuming public meat products regardless of whether or not there are profits in the business for him or whether all, or at least a lion's share of the profit which the consumer is no doubt paying, goes elsewhere.

"This is a suggestion for consideration. Every farmer, before succumbing to the glittering generalties being presented at this time through the columns of so many agricultural papers, pertaining to the greatness of the dual purpose cow, should with pencil and paper make his own determinations as to whether or not under his conditions there really are certain profits in feeding beef cattle under existing conditions.

"It must be remembered that cows present their owners with little crooked leged calves and not two-year-old 1,600 pound steers. To determine whether or not there is profit in producing beef, one should take into consideration the cost of insurance on the cow, interest, taxes, cost of feed in addition to all returns yielded by her and then figure the cost of developing the baby calf into a mature, ripe, marketable steer. Perhaps it will pay, but one should be sure of his figures and quite certain that two years from the time the calf is born the market price of the beef cattle will not have been manipulated as it has been so many times in the past.

"We are prepared to admit that as a stepping stone from extensive to intensive farming the dual purpose cow may be advisable for the general farmer. Furthermore, for the one who would be a philanthropist having in mind the feeding of a hungry people, and providing work for the unemployed regardless of securing profits for himself, even though his efforts make profits for others, the dual purpose cow is better by far than no cow."

Cows That Wear Well.

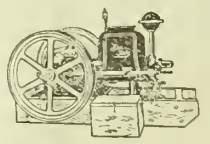
One of the many advantages reaped from systematic cow testing is the fact that it not only detects cows of indifferent value (saving dairymen the burden of providing for worthless cows, instead of their having good cows to support them), but also it has frequently discovered valuable cows. For instance, a farmer at Ennismore, Ontario, had a small, undersized, native cow, which he intended to sell, not placing much value on her. But cow testing showed that she is one of the best in the herd both for milk and fat production. Don't sacrifice the good cows.

This recalls another cow at Ayers Cliff, Quebec, bought at auction for $28.00 because no one knew her value. Indeed, she was put in with three others as the four poorest in the herd of the man who was selling out. The present owner believes in cow testing, and has refused $100.00 for her; she gave 322 pounds of fat in 7 months.

The men who have built up herds that average 8,000 or 9,000 pounds of milk per cow are just those men who

"STA-RITE"
GASOLINE
ENGINES

always do "*stay right*" because we have done away with a lot of springs, hooks, trinkets, etc., common and troublesome in many makes of engines.



When you get a "*Sta-Rite*" you are sure that it will always be 'on the job" when you want it—"*they stay right*" and "*Sta-Rite*."

Mail the coupon at the bottom for the book that tells you why.

If you are interested in a Separator learn about the *Empire*—or, if your herd is small the *Baltic*, the smallest of which sells at $15.

know, through having proved it, that cow testing pays. Your cows may be like fancy china, of very fine appearance, but they may not wear well. But the tested cows, that do produce, that do wear well, may bring you in sixty or seventy dollars each during the 7 months' factory season.

A Big Difference.

A factory patron may think and even remark "I guess my cows average about as high a test as Brown's, so it doesn't make any difference whether I have them tested or not."

Let us examine that a moment. If a man is content with only a fair yield per cow, where is general improvement to come in? Surely we are not going to remain satisfied with what a neighbor's medium cows manage to produce! Will that not kil all ambition ?

If it is found that in another section the average yield per cow is 150 or 250 pounds of milk higher, should not the endeavor be made to raise the standard of production for each of the poorer cows ?

Again, the yield of milk may average the same at two different factories, but the average yield of fat may be four to six pounds more. So if there are only 200 cows sending to the factory, there would be a difference in the output of over fourteen hundred pounds of butter in one month.

So it does make a difference what a patrou's cows test. Why view with complacency any "average herd, some cows of which give only a small yield of milk testing only 2.9 or 3.1 when the herd might quickly be graded up and have each cow give 5 or 6 pounds more fat per month ?

It makees a big difference to you personaly as a live, up-to-date, progressing dairyman, a difference in the capacity and value of your herd, a difference in your support of the factory, and a difference in the possibility of increased output of your factory at a lower cost.

It will pay you well to test each cow.

Men Well Satisfied.

Speaking of his experience with cow testing for three years one farmer near St. Hyacinthe, Quebec, recently expressed himself as very well satisfied. He had good reason to be, for in June this year his 9 cows averaged 1,203 pounds of milk each, a total of 10,830 pounds. Three years ago the average was only 823 pounds, the total only 7,411 pounds.

In other words, his income from the nine cows was thirty-four dollars greater in one month this year.

Instances very similar to this may be found in every county where cow testing has been taken up intelligently Near Listowel, Ontario, is a herd of 16 cows that gave on the average 2700 pounds of milk more per cow than 3 years ago. The adition of four hundred and thirty-two dollars per year to one's income, without increasing the number of cows, is a substantial and tangible result of intelligent weighing and sampling.

Again, at Wooler, Ontario, is a herd now giving 8,307 pounds of milk per cow, an increase of almost 3,000 lbs. per cow.

Record forms for milk and feed, and a herd record book, will be supplied free on application to the dairy commissioner, Ottawa.

Where the Money Slips Away.

A cow that will produce 5,920 lbs. of milk and 205.8 lbs. of fat in the year and make an annual net profit of $28.14 is worthy of a place in a good herd. A cow that produces only 2,690 lbs. of milk and 89.3 lbs. of fat, netting her owner a loss of $3.16 a year is not worthy of a place in any herd.

Both of these cows with the records we have given are found in the same herd in Peterboro Co., Ont. The one is a profitable animal, the second is a losing proposition. And yet their owner has no way of detecting where his money was going until he took up cow-testing.

Other cows in the herd returned net profits as follows: $22.44, 26.34, 17.94, 8.69 and 2.29.

Think of it! Waiting on a cow for 365 days and only getting $2.29 for your trouble. Is it any wonder that Mr. C. F. Whitley is firm in his belief that cow-testing is the most important and most needed work in conection with dairying in Canada ?

The Man and the Cow.

In the literature sent out regarding May Rilma, the Guernsey cow that has broken the world's record, the American Guernsey Cattle Club gives due credit to the man who has handled and fed her, Albert Van Tuinen. It was a remarkable achievement for a cow to produce 1,073 pounds of butter-fat in a year, but even the best cows could not do it without the proper care and attention. The dairyman has a right to share the celebrity of his charge. The milk from the farm where May Rilma is kept retails for 12 cents per quart, and it is figured that she therefore bbrought in a year's income of $1.200, an income many a man would be glad to earn. Out of this, of course, must be deducted her care, etc., in figuring the profit she brings her owner.

About Shipping Cream.

When shipping cream to creameries, set the separator so that the cream tests about 30 per cent. The creameries prefer cream of this richness, because it is just about right for butter making purposes. When you ship cream testing 40 or 50 per cent. you lose a certain amount of butter fat by the thick cream sticking to the inside of the can, and you run a risk of receiving a smaller test. With very thick cream testing is a little more difficult, the reading is apt to be charred and the slightest mistake in weighing the sample makes a bigger difference in the reading than when the cream tests around 30 per cent.

Of course. the mistake may be in your favor, but the risk isn't worth it.

A Cow That Paid.

"Can I afford to invest in pure bred dairy stock?" a visitor to the Guelph Winter Fair asked J. L. Stansell, Elgin, Co., Ont.

For answer Mr. Stansell got out pencil and paper and figured out just what he had made out of a three-year-old heifer he had at the fair. Here are his figures.

450 lbs. butter at 30c a lb., $135.
One bull calf, $150.
Prize money, $130.
Skim milk and manure, $20.
Total, $435.
Less keep, $50.
Profits, $385.

In addition, this heifer of Mr. Stansell's calved twice within a year, and her second calf, a heifer, Mr. Stansell would not sell for less than $150.—In Farm & Dairy.

Stock Notes.

Milkmaid 4th, owned by A. McRae & Sons, East Royalty, P. E. I, dropped another beautiful heifer calf a few days ago. The Milkmaid family is adding every year to its fame. Last year Milkmaid 4th qualified for the Record of Preference although in her 15th year. Her daughter, Milkmaid 7th, holds the Canadian record and the daughter of Milkmaid 7th has completed a test which will place her in the forefront of the Canadian Ayrshires. The official record has not yet been received by McRae & Sons. This daughter has also dropped a very promising calf so that McRae & Sons are building up a family which is making their name known al over the world.

LIVE STOCK.

Why he Chose Berkshires.

Peter Brodie, the noted breeder of Berkshire pigs. of York, P. E. I., started breeding operations about twelve years ago by purchasing a purebred sow from Snell & Lyons, of Ontario. This sow proved a good investment and won twelve 1st prizes and one 2nd prize in her show ring career of eight years.

Mr. Brodie says:—"The reason why I selected Berks was that I considered them the best pasture hogs and because they can stand hot weather well and are docile and easily fed. I imported four purebred boars from time to time as I do not believe in cross-breeding and inbreding. A young sow should not have her first litter until she is 15 months old and I prefer to breed the young sows to old sires."

Fitting Weathers and Lambs for Exhibitions.

Fitting live stock and showing at the fairs demonstrates the possibilities in well bred and well selected animals, when brought to the highest condition by proper feeding and fitting. Showing superior animals is the best kind of advertising a stockman can employ.

Careful selection of the wethers to be fitted is the foundation upon which all the work of feeding and fitting depends. The individuals for the show ring should be rigidly selected from the offspring of choice ewes of good breeding and milking qualities mated to rams of pronounced merit.

Feeding for the show must begin early and at no time should there be a lack of suitable feed and pasture to keep the sheep growing and thrifty. Care is necessary in getting them properly started on feed. The wethers should be kept gaining gradually and never crowded.

The value of various grain rations for fitting yearling wethers was studied at the Wisconsin station in experiments covering two periods of three years each, the wethers being shown at the International Live Stock Exposition and judged both on foot and on the bblock. During the second of the two year periods bran was added to the grain rations to lessen the difficulty of keeping the wethers on feed. The wethers were kept on grass pasture without additional feed from about May 20 to August 1, when grain feeding began. Until November 1st they were turned to pasture every day the weather permitted. The roughage fed during the trial, in addition to pasture consisted of hay, cabbage and roots.

The wethers fed peas, oats and bran were awarded first place in the carcass competition between the various lots each of the three years of the second period and were also awarded the largest number of individual prizes at the show. Though peas were comparatively expensive, they produced firm flesh of high quality and also made good gains. They are therefore highly recommended for show fitting when when fed in combination with oats and bran.

Barley, oats and bran ranked second in the carcass competition between the lots, and also in number of individual prizes awarded in the open classes.

Barley and oats stood third in point of prizes won at the show and also ranked third in the carcass competition. This ration produced the lowest gains of any fed during the second period.

Corn, oats and bran and corn and oats produced the largest and most ceonomical gains, but, with a few exceptions, the wethers fed this ration were inclined to be soft and over done. Carcasses from the lot fed corn, oats and bran were never awarded prizes in the regular carcass class.

Whole oats fed alone are a most excellent feed for sheep which are well advanced in flesh, but, as a rule, for sheep being fitted for fat classes they are too bulky to insure the desired finish.

Show wethers must be carefully trimmed so that they will appear at their best in the ring. After the last trimming, neat fitting blankets are put on to protect their fleeces.

It is more difficult to fit the wether lambs than yearling wethers. The lambs are taught to eat grain and clover or alfalfa hay as early as possible by means of a lamb creep. Abundant exercise and plenty of green feed help to keep them in good growing condition throughout the fitting period.

For a few days before the trip to the show the sheep should be fed less green feed, and the total amount of feed given at the last meal before the shipment should be reduced about one-half. During shipment and after arrival at the show careful provisions should be made for their comfort.

To Stop Cow from Sucking Herself.

I once owned a cow that sucked herself. She was the best cow I ever owned (and I have owned more than one cow). She was too good to go to the block. I tried everything I knew or could hear of, all to no purpose. She could get around any of them, except one that was cruel. It punished me to see my favorite cow punished so cruelly. A little sawed off, crooked legged bony shanked, Welsh boy, came to help me with the dairy work. He said: "I fix dot foolish cow, I makes him thinks some uder things but dot foolish bizeness."

He buckled an old horse collar around her neck "wrong side to" as he expressed it. The bulge or shoulder pad toward the head, but the wise cow was not to be cheated out of her favorite beverage. He took two collars and sewed them together and put them on her; that got her tag. To my knowledge she has not sucked herself from that day to this. When she goes to the stanchion we take it off. When she came out we put it on.

I have tried it on more than one cow one collar usualy does the work, but if one won't do the work, try two. They are light and will not anoy the cow very much, just makes her thing that something funny has happened, and shakes her head in disgust, snorts a little and blows her nose for spite. If they tend to iritate the skin on neck wrap them in a soft cloth.—Dairyman.

To Eliminate Flies Keep the Stables Clean.

If live stock owners kept their barnyards and stables clean, so as to prevent the flies from breeding in the manure and filth, it would be much easier to keep this pest under control. Time spent in this way will be paid by the increased comfort of all animals. The fly canot be controlled about the barns by merely removing the manure. All yards should be graded to prevent the formation of puddles, where flies and mosquitoes will multiply. If the puddles cannot be drained or filled, a little kerosene poured upon the water will kill the imature mosquitoes. The windows of the stable should be properly screened. This will keep out the flies, add to the animals' comfort and lessen the amount of feed necessary to keep them in good condition. Ordinary mosquito netting tacked on the windows wil suffice, but light frames covered with fly screening, which cost only a trifle more, are better. If well taken care of they will last for years.

Screen doors for a stable, while more inconvenient than screen doors for a house, will be found useful to exclude the flies. Screens on the doors and windows of the milking stables will keep out the flies, as well as sesure light and ventilation. Burlap, which is used so often, darkens stables and hinders the circulation of the air. If the manure is not hauled out at least once a week, it should be stored in screned enclosurers where the flies will find it difficult to obtain admission.

PEERLESS PERFECTION
It's made right—from high grade material. In the construction of our PEERLESS FENCING we use open hearth steel wire. By this process impurities are removed from the metal, thus eliminating one of the chief causes for the rapid rusting of fence wire. PEERLESS is guaranteed to give you satisfaction. Send for catalog. Agencies nearly everywhere. Agents wanted in open territory.
THE BANWELL-HOXIE WIRE FENCE CO., Ltd., Winnipeg, Man.—Hamilton, Ont.

Several fly repellants to be brushed or sprayed on animals may be bought at $1.25 a gallon approximately. They are successful to a certain extent, but usually they keep the flies off only a few hours. Often they are used to keep the flies off the cows during the milking time, or are used on the horses during the noon hour when they are resting and eating, if there are no screens. These preparations are applied to the hair by brushing or spraying though only a thin coat must be given. One gallon wil give many applications to one animal. If the number of animals to be treated is not large, it is usualy cheaper to buy a commercial preparation. If there is a large number of animals, a fairly satisfactory mixture made be made at home.

The following preparation has been recommended as an inexpensive one, and as satisfactory, probably, as the commercial mixtures; coal tar dip, any kind, one pint; one-quarter bar ordinary laundry soap; one pint of oil—fish, linseed or kerosene; fiften pints hot water. This should be mixed thoroughly to form an emulsion and should be applied as a thin coat by a brush or a spray.

Stockmen will Show Market Types at Fairs.

To illustrate types of profitable and unprofitable farm animals, the Wisconsin Live Stock Breders' Association is preparing an exhibit to be sent to the county fairs throughout the state this fall.

The exhibit wil consist of representative specimens of the kind of animal that put money in the farmer's pocket; and also give examples of the sort that give no return for their feed. Beside a blocky, flat backed beef steer will stand a rangy, scrawny scrug and the prize ewe will scornfully keep company with a thin, neglected sister of unknown origin. The whole purpose of the exhibit is to imppress upon the breeders the type of animals that it pays to fed.

Prominent in the profitable and unprofitable animals' exhibit will be "Mack" the famous Percheron gelding owned by Armour & Company and known as the "Ideal Horse." Although he is fifteen years old and has seen nine years of hard service on the streets of Chicago, "Mack" is absolutely sound and has not a single blemish. He is said, by horsemen, to be a fine example of a gelding that brings high prices on the city markets and that is best able to withstand the strain of working on paved strets. He stands 16.2 hands high and weighs about 1800 pounds.

Letters from country fair officials have been pouring into the offices of the Live Stock Association, assuring the association that they are anxious to have the exhibit and will give it a prominent place at their fairs.

Black Teeth in Pigs.

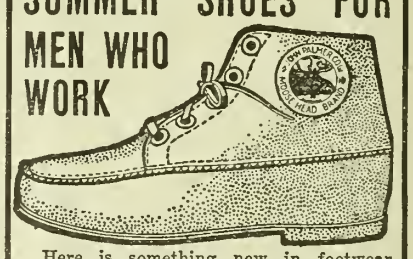
As regards the detrimental effect of black teeth in young pigs, I may say that during my 20 years experience as a swine grower I have never drawn teeth from a pig. I will admit that I may sometimes have erred in this respect. However, whenever I had an animal of this class that did not thrive I found the trouble to be back of its teeth. I have examined a number of authorities on this subject and I find that the majority of these, when dealing with the ailments of swine, make no reference to black teeth.

Dr. MacIntosh, Professor of Veterinary Science in the University of Illinois, says that "the majority of the profession do not consider black teeth to be a disease which is capable of causing death. In the majority of cases they seem to do no harm to the animal's health. If it is discovered that a hog has a decayed tooth and is suffering because of it, it should be removed. I can advise swine breeders not to trouble themselves if they notice their pigs having discolored teeth."

Dr. G. A. Waterman, in his work entitled "Practical Stock Doctor," says, in substance "many pigs have black teeth. These usually drop out of their own accord and cause no injury. Some teeth, however, when being pushed out by the succeeding tooth, adhere on one side and either point outward and cut the lips and cheek or point inward and cut the tongue. The irritation occassioned by this prevents the animal from masticating its food properly and it does not thrive. When this is the case, the tooth should be removed."

I may add that I have discussed this subject personally with a number of veterinarians and the opinion is almost unanimous that black teeth of themselves cause no injury to the young pig Dr. Waterman's view comes the nearest to the popular idea of any that I have read or heard expressed by a veterinarian.—W. F. Stevens, Alberta.

SUMMER SHOES FOR MEN WHO WORK



Here is something new in footwear specially suitable for farmers, woodsmen, millmen, trackmen, laborers—all those needing strong yet light, cool, easy shoes. These are made on good-fitting right and left lasts from our famous oil-tanned Skowhegan waterproof leather with waterproofed sole leather outsoles and solid insoles.

Palmer's "Moose Head Brand"
"SUMMER PACKS" and "HARVEST SHOES"
are light weight, comfortable, durable working shoes for spring, summer and fall wear. Sold by leading dealers everywhere. If your merchant does not carry them write us, giving his name and address, and we will see that they are placed within your reach. Made 4, 6 and 9 inches high. 19

"I was cured of diarrhoea by one dose of Chamberlain's Colic, Cholera, and Diarrhoea Remedy," writes M. E. Gebhardt, Criole, Pa. There is nothing better. For sale by all druggists.

Cutting and Curing Alfalfa Hay.

For general purposes it is advisable to cut alfalfa hay when about one-tenth in bloom. The earlier it is cut after blooming starts the better will be the quality of the hay for cattle and hogs. When cut for horse feed, it is perhaps better to let the crop stand until from one-fourth to one-half in blossom. It is not always possible to judge from the stage of blosoming the proper time to cut the hay crop in order to secure the maximum production and at the same time the best quality of hay. It is usually a safer practice to be governed in time of cutting by the development of new shoots from the crown of the plant. When new shoots start to develop and have reached a growth of an inch to two inches the hay should be cut. It frequently happens, due to unfavorable weather conditions, that alfalfa is checked in its growth and blossoming is retarded. When the weather again becomes favorable, these young shoots will start from the crown of the plant and the alfalfa should be cut regardless of the stage of blossoming.

Alfalfa hay is easily injured by rain and care should be taken to cure the crop if possible without getting it wet. However, a rain or two does not necessarily ruin the crop. It is a good practice in putting up alfalfa hay to cut it in the morning of a good curing day, rake into windrows with a side-delivery rake in the late afternoon. allow it to lie in the windrows over night, and bunch with a rake the next morning after the dew is off. The hay should be ready to put into the stack or mow by the second afternoon. The hay should not be allowed to cure too long in the swath, for too many leaves will be lost in raking and handling the crop and the leaves are the most valuable part of the plant. Besides, when the alfalfa is raked before the leaves are entirely cured, they continue to draw moisture from the stem and thereby insure a more uniform curing of the crop. It is not profitable under certain conditions to attempt to cure alfalfa hay in the cock except where rain is inevitable. The hay should then be put into small cocks that will shed a certain amount of the water and that will permit the hay to dry out rapidly when the weather clears.

Alfalfa hay is sometimes baled direct from the field. It is possible to handle alfalfa in this way during the drier portion of the summer, but it is most impossible to secure hay of the best quality by this method. Hay cure in the field dry enough to bale will lose a great many leaves in handling, while hay baled when it contains sufficient moisture to handle without loss will usually mold in the bale unless extremely dry weather follows. It is very seldom possible to bale the first cutting of alfalfa from the field. The safest practice is to stack or mow the hay in a barn or hay shed.

Acorn Quality Corrugated Iron

Insist that your dealer or builder supply you with ACORN QUALITY corrugated iron. It is the best by all tests. Mills, elevators, barns and other buildings covered with this iron have been protected from all the weather elements for years.

This iron, stamped with the Acorn trade mark is guaranteed by this company to give the best of service. We stand back of every sheet that goes out.

In one month last year we shipped out over 60 carloads of sheets to farmers in Ontario alone—which goes to show that the farmers know a good thing.

Our catalogues givs you full information ahout the sizes of sheets and how to erect. Write us and get our literature—address your nearest branch or agency.

Kendall's Spavin Cure

It takes away the pain and stiffness from Sprains and Bruises—draws the soreness out of Strained Muscles and Tendons—CURES Spavins, Soft Bunches and Swellings. Used for two generations by two nations.

KATRINE STATION, ONT.,
"I have use Kendall's Spavin Cure for a Bone Spavin of 4 years standing, which has entirely cured the lameness and greatly reduced the swelling. Another bottle of the Spavin Cure, I am sure, will complete the cure." HOWARD BROCK.

$1.00 a bottle or 6 for $5. Sold by dealers everywhere. Write for free copy of our famous book—"Treatise On The Horse." You will find a need for it every day.

DR. B. J. KENDALL CO., ENOSBURG FALLS, VERMONT, U.S.A. 95

Packing Sheepskins.

Following is a good method of packing sheepskins for despatch to market:—

Three battens (3 in. x 1 in.) should be placed longways of the top, and three on the bottom to keep them flat, and fasten them with three bands of hoops. To save freight fairly light wood for the battens should be used. Skins should be packed dry and flat, in pairs, pelt to pelt, with the bellies slightly folded in to keep the package as square as possible. Ears and tags should be carefully removed before packing. If the ears are left on and folded in they often, owing to heating, damage the pelt. The advantage in packing the skins flat is that the most valuable portion, viz., the middle, does not get injured by hooks, & c., in the handling. When the skins are folded in the middle, as is generally done, they are often torn by the hooks, and this, of course, lessens there value, whereas, when packed flat, even if they are slightly torn at the edges, no great harm is done. Presses used by shippers for packing skins in the manner proposed should be large enough to hold at least 4 cwt. bales. The brand and number of the bale should be placed on one of the battens.

RED ROSE TEA "is good tea"

THE HORSE.

Umbilical Hernia.

Subscriber of Albert Co., has a horse colt, about 6 weeks old, ruptured in naval. It may have been that way when foaled but did not notice anything wrong until about 2 weeks ago, and the enlargement seems to be increasing.

Please advise what treatment is necessary to overcome the trouble, and should it be attended to at once or left until the colt gets a little older or the weather colder?

Ans.—A rupture of this kind is technicaly known as umbilical hernia and is often seen in foals. It frequently disappears by the time the animal is a year old; previous to that time the enlargement may be blistered, some cases recoverong from that treatment; if, however, it persists beyond that age stated, a good surgeon should be employed.

A good blister is made as follows:
Red iodide of mercury, 1 dram,
Vaseline, 1 ounce.

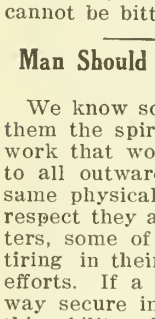
Mix well before applying. This may be left on and allowed to peel off. Keep parts oiled after the third day. Clip the hair off the surface on which it is to be applied. Keep the animals' head tied, so that the blistered parts cannot be bitten.

Man Should be Kind to the Horse.

We know some horses have born in them the spirit and stamina to stand work that would kill others endowed to all outward appearances with the same physical characteristics. In that respect they are not unlike their masters, some of whom seem almost untiring in their physical and mental efforts. If a breeder could in some way secure in all the colts he raised this ability—determination or grit or whatever we may call it— his colt would sell above all others and his fame as a breeder would become widespread. We can breed in that direction, but to often the individual with a "yellow streak" wil crop out, a horse that wears out early in life. It seems to be a matter of disposition, which the breeder cannot in all cases control.

But not all rests in the horse. Some men seem naturally able to get more out of the same horse than others. One man will take a horse on an all day's drive and bring him in without a wet hair on him, eager for his oats, to all appearances having enjoyed a day of light exercise instead of hard work. Another will take the same horse over the same route, water at the same troughs, feed at the same places and in the same way and bring in his horse at night too tired to hold his head up, and seemingly not caring whether he has oats or sawdust for supper. The difference is of course in the men, the natural horseman, no doubt easing his horse unconsciously when he is tiring and always working him at the gait to which he and the conditions are the best suited. The "horse killer" urges his horse forward at the exact time he is practically winded and generally, but unconsciously too, adds burdens, when the horse's efforts should be eased. The difference in results follows.

There are some things any man can do to increase the efficiency of his horses, and at the same time look to their comfort. The horse gives everything, asks nothing. Economy if not humanity, demands that we feed him enough so that he can do the work asked of him ; that we water often; and that we give him rest. To aid the horse in his work we can in the first place see that the load is properly placed. This depends of course on the size and shape of the wagon-bed and wheels. Every driver can tell when his load is properly balanced and distributed. Then we can see that the harness fits, that chafing does not take place. And we should know what is a day's work and not expect more. We can prevent lunging ahead and "throwing" backward, yanking, yeling, and other aggravations that work on the nervous system of a horse and thus tire him. We can warm our horse up slowly and cool him off the same way, and water often, especially in hot weather. If we put forth no efforts to see that the horse works under good conditions we have no right to expect and demand good, efficient service.



ABSORBINE
TRADE MARK REG. U.S. PAT. OFF.

will reduce **inflamed, swollen Joints, Sprains, Bruises, Soft Bunches; Heals Boils, Poll Evil, Quittor, Fistula, or any unhealthy sore** quickly as it is a positive antiseptic and germicide. Pleasant to use; does **not blister** under bandage or remove the hair, and you can work the horse. $2.00 per bottle, delivered. Book 7 K free.

ABSORBINE, JR., antiseptic liniment for mankind. Reduces Painful, Swollen Veins, Goitre, Wens, Strains, Bruises, stops pain and inflammation. Price $1.00 per bottle at dealers or delivered. Will tell you more if you write. Manufactured only by

Crooked Foals.

Some foals come into this world so wobbly and misshapen about the legs that it would seem almost impossible for them ever to straighten up. Most of them do, however, manage to come right, though it takes some of them far longer than others to do so. As a general rule there is no cause for alarm, even if a foal is so crooked in his legs, as to promise deformity, but when the pastern joints are so long and weak that the youngster breaks back onto the ground with the bottom of the ankle joint, it is well to give some support. This may be done by fitting a piece of moderately stiff leather around the leg and lacing it up so as to give the required support to the joint too weak to bear the strain. In such case line the boot with wash or chamois leather and observe carefully that it does not gall or abrade the leg anywhere.

It is quite a trick to fit one of these boots to the leg properly, and hence when a foal fails to straighten up off the ground it is best to seek the aid of the veterinarian. Sometimes all that is required is to feed the foal a little warm new cows' milk two or three times a day so as to increase its strength more quickly. That is usually preferable to boots or any other similar contrivance, but there are times and cases where artificial aid is required. A little phosphate of calcium added to the milk or drinking water is also beneficial to foals, as it is to children. Sound, plump oats bruised and the shucks sieved out are also great helps as soon as the foals are able to eat and limewater never comes amiss. When feeding cows' milk to weak foals never forget to ad limewater at the rate of three or four desertspoonfuls to the pint. It helps to keep the stomach right.

After foals born with crooked legs have straightened up and their hoofs have hardened they should be matched most carefully and any tendency of the feet to grow uneven prevented. A touch or two with the rasp on the feet of a foal wil often keep him from going unsound and make a valuable horse of one that unattended aright, might readily have degenerated into a valueless nuisance around the farm.—John Mason.

To Break a Colt of Kicking Habit.

A colt is less likely to kick when first hitched if it is thoroughly ground broken, that is, driven on foot by the trainer with a pair of long reins. These reins, 20 or 25 feet in length, may be made from 1-2 inch cotton rope. Splice a good snap in one end of each rein and turn back the other end to make a hand hold. Put on the breaking harness and run the outside rein through the shaft tug, leaving the inside one free. Drive the colt in a circle first one way and then the other, and gradually acustom it to the reins on the hindparts. Colts are much more easily taught to stop, start and turn properly, if handled this way than when hitched to some kind of vehicle the first time the harness is put on.

This method does not always suffice; probably the "runing W" is the best means of corecting this vice. To use it, one needs an extra strong cart and a good set of harness. Have a heavy belly-band made with three 2-inch rings securely fastened to it. This belly band may be strapped to the shafts after the colt is in them. Buckle a strap with a ring fastened securely to it to each fore pastern. To use with this outfit get a trip-rope; ordinary cotton sash cord will do. First run the rope through the near ring in the bellyband, down through the ring in the strap around the near pastern, then up through the middle ring in the bellyband, down through the ring on the off pastern and then tie the end of the rope in the remaining ring on the bellyband When the colt kicks a quick pull will bring him to his knees. Unless one works on a soft sod, the knees will need to be protected by pads. Do not hold the colt down too long, or he may get into the habit of sulking. A strong kicking strap is always convenient when a colt is being worked.

Pasturing Colts.

One of our subscribers says that he has raised colts for several years and while his farm is fenced with barbed wire, he has never had a colt cut by wire. He atributes this to his practice of turning the colts in the pasture with its mother when a day or two old. He claims that the colt will run into the fence at some time or other, but seldom more than once. When very young it cannot run fast enough to cause serious injury, but if left in the stable until older it is likely to be seriously injured by running into a barbed wire fence.

Experienced horsemen who raise a large number of colts do not deem it advisable to run heavy and light colts together in the same pasture. The light colts have more life and go in them and literally run their heavier mates to death. Too much runing is not good for the draft colt and where colts are together, the heavy youngsters invariably attempt to follow the lighter foals on every run.

A little longer noon hour during the hot weather, with the harness and other encumbrances removed will assist the horse in going to the field in better shape for the afternoon's work.

Prayer of a Horse.

To Thee, My Master, I Offer My Prayer:—

Feed me, water and care for me, and when the day's work is done provide me with shelter, a clean dry bed and a stall wide enough for me to lie down in comfort. Talk to me. Your voice often means as much to me as the reins.

Pet me sometimes, that I may serve you the more gladly and learn to love you.

Do not jerk the reins and do not whip me when going up hill.

Never strike, beat or kick me when I do not understand what you want, but give me a chance to understand you.

Watch me, and if I fail to do your bidding, see if something is not wrong with my harness or my feet.

Examine my teeth when I do not eat, I may have an ulcerated tooth, and that you know is very painful.

Do not tie my head in an unnatural position, or take away my best defense against flies, or limit my range of vision by blinders, so that I am frightened by what I cannot see.

And finally, O my master, when my youthful strength is gone, do not turn me out to starve or freeze, or sell me to some cruel owner to be slowly tortured and starved to death; but do though, my master, take my life in the kindest way, and your God will reward you here and hereafter.

You will not think me irreverent if I ask this in the name of Him who was born in a stable. Amen.—Author Unknown.

Improper Use of Drugs.

Frequently drugs are administered by people without any knowledge of their action. One individual only recently asked what he should give his horse when aconite and nitre had failed to cure. It is always best for one to know the action of the drug before it is administered to livestock. A thoroug study of the symptoms of the animal should be made before any drugs are given. Just because certain drugs have succeeded in some neighbor's horses, there is no reason they will cure yours. To ilustrate—a horse is suffering from colic. A dose of opium would be correct to give if it is spasmodic colic, while if the patient has impaction of the bowels a dose of opium would only pack the bowels all the harder. A dose of aconite should never be given when the heart is weak and slow, for the reason that aconite depresses the heart and will cause death. On the other hand, aconite would be the proper drug to give when the heart was beating full and strong and very rapid. A comon mistake is to give horses sweet spirits of nitre when suffering from frequent urination, as this drug is a diuretic or increases the flow of urine. It only aggravates the trouble in this particular case.

In diseases of the respiratory tract when the high fever has caused constipation one should never use aloes on acount of the danger from superpurgation. Raw linseed oil is preferable as it is much safer.

Horse Notes.

Fewer horses and more horse power is an alteration that might profitably be made on many farms. A good horse is a source of revenue but a poor one dissipates the time, energy and capital of its owner.

When the mare is first put to work or the young foal is being weaned care should be taken to enclose the young one in a safe place. A young active foal oftentimes does itself injury by jumping higher than its owner expects it is able to do.

In choosing farm horses it is well to remember that the labor we employ to direct their efforts is oftentimes valued very high, consequently, it is good busines management to selct the kind that wil convert the skill of the driver into more accomplishment.

During hot weather, when the horse begins to lag, droops his head or pants very hard, he should be stopped at once. It is quite likely that exhaustion from heat and labor has taken place and unless proper treatment is applied the results are often fatal.

Often there are shade trees scattered over the place which appear a proper nuisance when ploughing or cultivating, but during the hot summer they may be of inestimable service, under which to wind the team or men. The sight of a driver reclining peacefully under a shade tree while the team is suffering without protection from the sun is deplorable and if drivers understood how their team appreciated a little shade while being rested, they would be more willing to share it.

Fall fairs call out a number of untrained, refractory colts. When the judge desires to see them walk they will trot, when he wishes to see them trot they will walk on their hind legs or go broad-side to the judge and spectators. All of this is unpleasant and unsatisfactory both to the exhibitor, and to the judge. A little handling, and a little intelligent training will instill in them a knowledge of what is required and the result will oftentimes be more satisfactory to the exhibitor and plasant to the judge.

For Scouring Foals.

An English writer discussing scouring in foals says that when the trouble is due to the dam's milk from the mare getting over-heated, the best treatment is to give the mare half a gallon of barley. If this fails, the scouring is probably due to other and more serious causes. It will be a safe plan to give a dose of castor oil and linseed oil mixed pending professional advice.

The same writer recommends the following substitute for mare's milk for orphan foals:

New milk, one quart; separate milk, one quart; Demarara sugar, eleven ounces; water sufficient to make up to one gallon. A quart of this mixture should be given at intervals of four hours at the temperature of fresh-drawn milk.

Trim the Feet.

Watch the colt's feet. There is always a tendency towards too much growth of hoof and this should be avoided by a judiciouh use of the rasp from time to time. The wall of the foot is the only part that needs attention. It is said that the breaking away ot the wall due to over-growth, and lack of attention is one of the causes of splints, side-bones and ringbones in young colts.

A Reader, Kempton, N. S., writes:—Kindly inform me, through your valuable paper, if it is considered good business jurgment to insure a valuable mare, or are the rates so high as to be beyond value or protection?

Ans.—We believe in insurance on life and property from the viewpoint that it is better to carry it and not need it, than to need it and not have it. We would most assuredly insure a valuable mare. The rates are not abnormally high, varying in price in accordance with the hazardousness of the work at which the mare is employed. Agricultural horses are insured for about $4.00 per $100 value. The drivers range higher, while insurance for horses for lumbering purposes cost about $12.00 per $100.Then there is a policy to cover mare during foaling period. There is also a class of insurance for stallions and foals. Horse importers usually insure their horses for a term of months from time of the purchase until possible date of sale. If it is a wise act for the importer to insure it is well for the farmer to do the same.

POULTRY

The Poultry Policy of the Experimental Farms.

The poultry policy of the Experimental Farm System is to conduct experimental work with poultry along breding, rearing and feeding lines ; the encouragement of the farmers and poultrymen generally to improve their strain of fowl; and the development of economy in methods of general management Work along these lines is being caried out at the Central Experimental Farm at Ottawa and at the Branch Farms and Experiment Stations throughout Canada, results of which will be published and distributed at frequent intervals.

New Equipment.

Equipment is being provided to make it possible for the division to carry out this policy. Besides the original plant at Ottawa and its various types of colony houses, brooders, incubators, etc., additional land was added to the plant last year and this year ten acres more are set apart for special experiments with turkeys and water fowl. Modern buildings are being built, a new experimental breeding house is just completed as are also a cockerel house and an experimental feeding and supply house. This year will see the completion of an administration building and before another spring the old permanent buildings that have been in use for twenty-five years will be removed and the plant will be up-to-date in every respect.

At the Branch Farms and Experiment Stations the poultry plants are large enough for one man to manage. Housing accommodations is provided for from 100 to 400 head of laying hens Only two or three of the best varieties of utility fowl are kept and tests are being made to find out the type of house best suited to the climate and conditions as well as the most suitable makes of incubators, brooders and other poultry appliances.

Experiments of a general character, such as breeding, feeding, disease, etc. are being conducted at the Central Plant at Ottawa, where a large staff and equipment is available, while those experiments of a local or a provincial nature, are carried on at the outlying farms and stations.

Among the most important of these experiments are those relating to the breeding. Already a number of egg-laying strains are being developed and just as soon as one or more of these strains are established, cockerls will be supplied to the Branch Farms and Experiment Stations. Each year males bred at the Central Farm from heavy laying strains will be sent to the outside plants and will there be used as breders, and as it is generally recognized now that the male is responsible for the transmission of fecundity, this system should be the means of developing a high producing flock at the Branch farms and from these flocks, cockerels, also pullets and eggs when available, will be for sale. Breeding stock and eggs at present are not being sold from the Central Farm, as both are required for experimental work.

Another very important class of experiments that is being investigated, is that relating to poultry diseases. The annual losses due to chick mortality are very large, and the turkey crop almost threatens extermination, if something is not found to stop the ravages of black head. The investigation of the latter is largely the reason for the acquisition this year of the new park of ten acres at Ottawa.

Housing, incubating, brooding, rearing and feeding problems as well as a host of others are being investigated. In fact anything that is of interest to the man or woman who keeps poultry is of interest to this division. New ideas in management, new "secrets", new appliances, etc., are being tried out and will be reported.

It is not the intention to print bulletins or even large pamphlets, but rather circulars or leaflets that can be published often enough to be fresh. A number of these are now in process of preparation, and will appear from time to time. As usual letters asking for definite information are always welcome and where a pamphlet does not give the required information a personal letter is gladly written.—By F. C. Elford, Dominion Poultry Husbandman.

The Summer Egg Crop.

We have been accustomed in the past to look upon egg production in the winter time as the most important feature of the egg business, but now the high price of eggs and the increasing demand for the same causes us to turn our attention to other periods of the year.

Egg production throughout the year might be plotted in a curve. It starts low down in November and December, rises to its height in March and April, in the natural hatching season and it falls off gradually during July and Aug ust until it practically ceases in the latter part of September and October. The only way to over-come the deficiency in the fall seems to be by the hatching of very early pullets. This is not practical for the farmer. He can, however, improve production in the summer and in the following lines I shall endeavor to show how.

Of course we desire to have pure-bred stock. There is no excuse for anyone keeping a mongrel flock at the present time. The question of stock is not quite so important for summer work as it is for winter work, yet it is important. For the latter it is absolutely necessary that we have early hatched, fuly matured stock, but for the former much of that stock that was not mature enough for winter work, will be available for summer work. It does not as a rule keep over, yet there is much of it in the country.

The most important feature in summer egg production is cleanliness. In many instances it is the presence of filth, insects and disease that drives the hens outside of doors. The houses must be kept clean and cool. The droppings must be cleaned out regularly, and the litter must not be allowed to become damp and sour. Dropping boards should not be used unless they are cleaned off every day. Where no dropping board is used, cleaning twice a week will do, but oftener will be better. It is a good plan to scatter clean, fresh soil around where the droppings will fall, for soil is an excellent deodorizer and disinfectant. When allowed to remain too long the accumulated droppings dry out and become excellent breeding places for lice and mites.

The litter on the floor is of importance. Straw or marsh hay may be used if it can be readily procured, but it becomes dirty quickly. Some use shavings or soil, but these are not very satfactory if it is intended that the grain be fed inside. The house should be whitewashed. It makes the house much more brighter and light is one of the best disinfectants we have. Some object to the dust, but the dust is what is wanted. Lice and mites breathe through pores in their skin, and the most effectual way to combat them is to clog up those pores with dust, oil, etc. This is why whitewash is used on the walls and the oily disinfectants on the roosts and nests.

The drinking utensils, the troughs, the hoppers, the nests should all be kept clean. The nests must be cleaned from time to time and plenty of clean, fresh hay or straw added. Much profit is lost to the farmer by having dirty nests. The hens refuse to lay in them, the eggs are lost. With no litter in the nest many eggs are cracked or broken, their contents smeared over the other eggs, and the nest material made foul and dirty. Such will taint the eggs every time and load them with bacteria which cause early decay.

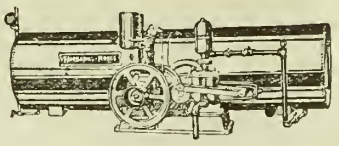
The question of the fed is important. The amount of corn in the ration should be reduced in warmer weathed. More wheat and oats may be used, preferably a little of both if the market prices will allow.

A dry mash should be placed before them. It may be hopper fed and good results obtained. It may consist of varying amounts of several ingredients but one composed of the following will give very fair results: 2 parts bran, 1 part corn meal, 1 part midlings, one-half to 1 part linseed meal, and 1 of beef scrap. It is well also to supplement the dry mash with an occasional wet mash, say from two to three times a week. A meat mash made thus: Boil some cheap meat until it is well broken up; take an ordinary 12 quart pail, place in it about two quarts of corn meal, pour the boiling liquid very slowly over it. Stir till the meal has taken up all the moisture it can, then add about three quarts of bran and stir. It may take more in which case add bran until the whole has a consistency of brittle dough. If the birds have free range (and it is preferable that they should, for no one can get the best results from a bare yard), the use of beef scrap and green food will not be so necessary. If the birds are yarded some provision must be made for green food. Rape is very useful for this. If handled carefully and only the outer leaves removed, it will stay green and succulent for a considerable length of time. As a rule it is wise to supply birds with some shell forming material and grit even throughout the summer months. If they do not need it they will not eat it.

The birds must have water. Watering once in every two or three days will not do. They must be watered daily with good fresh water placed in clean dishes. The dishes are apt to become slimy and ill-smelling. They should be scalded and rinsed out from time to time. The place where the water pail is set is important. it should not be set in a house where all sorts of dirt will fall in. It should not be placed in the sun where the water will become hot. The birds like a cool refreshing drink as well as a man and the water should be placed in a cool, shady place.

Birds do enjoy a shady place in the summer under the trees, in a raspberry patch, in an asparagus patch or in the corn. They seem to enjoy a low, thick, shade the best, and if it is convenient either their house should be moved to the shade, or the shade should be moved to them by planting the above mentioned crops.

Some will say, yes, if we do this our birds wil lay in such a place. They will not lay any quantity if one provides proper quarters without doors. A clean, cool house, well ventilated, free from lice and mites, darkened nests with clean fresh litter in them, brody hens removed and shut up (nothing breds lice so fast as a bunch of



A Fairbanks-Morse Water System can be quickly and easily installed on any farm.

It will furnish you with an abundance of running water in the house, stable, creamery or wherever wanted. At the same time it affords you ample protection from fire.

broody stuff, fresh water in the clean dishes, and hens continually sitting on the nests), plenty of cooling food, range and green, a nice cool convenient shady nook in which to spend the hot parts of the day. If people will but do this, take pains and have a sympathetic interest in those fowls gather the eggs regularly, discard the cracked and dirty ones, keep the eggs in a cool, sweet place and market them often, they will get more eggs, they will get better prices, their eggs will become known in the community as pure, fresh and as germless as it is possible for them to be.—W. A. Brown.

Chibkens Pay.

There is a class of people who are too prone to say "Chickens don't pay", says an Oregon poultryman. We want to tell you that chickens do pay, if properly cared for, and nowhere can poultry be handled with as large profits as on the dairy farm. The waste and by-products of the dairy farm will greatly reduce the cost of feeding the fowls, and no one feed is better than skimmed milk for chickens of all ages.

There may be some who at some time thought their poultry did not pay them. If so, we can say that they did not give their poultry the same care and attention they are now giving their paying dairy herds. Fowls require proper housing. It is just as esential to give hens comfortable quarters as it is for cows. Keep the floor well littered and feed all grain in this litter to make the fowls work for it. Keep skimmed milk before them all the time in addition to water.

At the present price of feed it will cost a poultryman $1.76 to feed a hen one year. On a dairy farm you can reduce this cost by one-half, if not more, by feeding the waste litter from the barns. This will contain much grains and seeds. In addition, feed the waste vegetables; and you also have the skim milk to mix the mash and for the chickens to drink.

A flock properly cared for will give us ten dozen eggs each year. The average price for eggs in the Sound markets is 30 cents per dozen. Each hen will, therefore, produce $3 per year, which wil leave you dairymen a very handsome profit. The value of 100 hens is about equal to one good cow. Has any one a cow that s doing that well? What will it cost to raise this flock of 100 hens? Nothing! And this is why:

Half the chickens hatched are cockerels. At the age of ten or twelve weeks put these cockerels in fattening crates and feed on a fattening food made of one part barley middlings, one part white shorts and one part fine cornmeal, wet with skim milk so it will be like pancake batter. At the end of from 14 to 20 days you will have a milk-fed chicken that will bring the highest market price of any poultry, and will sell for enough to pay for feeding the cockerels and the pullets to laying age. And when the hens are through laying they can be sold and this added to the profit.

The way to keep the boy on the farm is to give him a personal interest in the farm. The best way to do this is to give him a start with chickens, allowing him all profits from the flock, after paying for al fed2bought for the chickens, and we will assure you that his profits from one hundred hens will clothe him and furnish him with an abundance of pocket money.—Colmans Rural World.

To Shippers of Eggs.

The following instructions to merchants who ship eggs are sent out by the Swift Canadian Co. Farmers may profit by the suggestions:

1. If buying from others, insist on first quality eggs only.
2. Keep in mind the perishable nature of the produce and do not hold eggs, but ship while fresh.
3. Never keep eggs near kerosene, onions, fish or any other strong smelling substence; they readily absorb the odors.
4. Never expose eggs for market to direct sunlight, rain or to extreme heat from any source.
5. Do not wash eggs.
6. All eggs should be shipped in good strong cases, with fillers in good condition, and packed with excelsior flats on top and bottom. Do not use newspapers as flats.
7. Remember that 10 per cent of the eggs produced are wasted due to improper handling.
8. Tag all cases plainly, so as to assure prompt and proper delivery.
9. When shipping, always mail bill of lading, express receipt, and memorandum invoice. Your shipments can then be properly checked and in case a shortage occurs, it will not be ncessary for you to write full particulars after you have received your returns.

Diarrhoea.

One of the most serious diseases that chickens are subject to is diarrhoea. It may be stated at the start, that diarhoea usually results from some error of management, to the feeding of too great a quantity of food, to a poor quality of food, or to foul, filthy drinking water or food. It may also be brought on by exposure to drafts or to extremes of heat or cold.

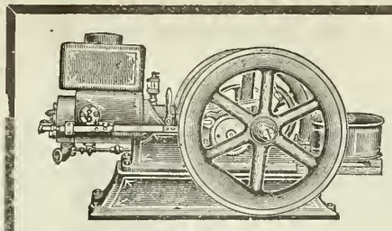
The affected bird has a ruffled apparance, is listless and has no appetite The excrements are watery and of a yelow or greenish color.. When the disease is severe, the droppings may be mixed with blood.

In treating the diarrhoea, the first thing to be done is to remedy the cause. The sick birds should be housed in dry, comfortable quarters While under treatment, the sick birds should be fed entirely on dry food. Green and animal food should not be fed, as these have a tendency to loosen the bowels. A teaspoonful of castor oil or olive oil should be administered daily to each sick bird.

Little Talks on Practical Poultry Matters.

The open-front poultry house still gains ground, but it must be made right. A poultry house 16x25 feet will house a good-sized flock of birds comfortably—100, if they have the chance of outside the greater part of the time; 50 if they must be kept shut up at times for several weeks.

The average hen lays but eighty-six eggs a year. The hen that lays so few eggs in a year isn't much of a hen don't keep too many of her kind. The average hen should not lay less than 125 eggs a year.



Will Save You Dollars Every Year

Sussex Motor Co. Gasoline Engines

They have many points to recommend them.

Are easy to operate, develop more power at less cost than any other make.

Are guaranteed for five years and are sold at close margin.

Are particularly well suited for farm and general work.

Full particulars in our Free Catalogue.

We want reliable men to sell Sussex Motor Co. Gasoline engines.

THE SUSSEX MOTOR Co., Ltd.
SUSSEX, N. B.

Stationery and Marine Engines, Wood Cutters, Grain Grinders, Gasoline Ice Cutters, Cream Separators, etc.

If you will notice the market reports of some large cities, you will see this item: "Forty cents for strictly fresh eggs; 16 cents for dirties and checks." You are to blame for some of this last—the dirty egs, anyway. Look out for the nests.

Turkeys drink more than chickens, so don't forget their watering pans. Some people believe that a poult should not be given water the first three or four days of its life because they so often notice the turkey hen pushing them back from the water in a stream. She is quite likely ordering them back until she investigates for snakes or turtles lying in wait.

Get Rid of Old Hens.

Now that we have convinced you that it is not wise to keep a lot of cock birds eating valuable grain during the summer, we take up the cry "To the Market with the Old Hens."

Hens over two years old begin to decline in producing power. They rarely lay as many eggs as in their pullet and yearling stages. Providing that they have been marked with a toe punch in the days of their youth, detection of the aged "matrons" will be a comparatively easy matter.

Before the old hens, the surplus young stock and the male birds are sent away to market, they should be kept in a small pen at least two weeks to increase their weight.

A suitable ration for this period consists of three parts corn meal, one part middlings or low grade flour and one part bran, with enough skim milk added to make a crumbly mash. The owner should never forget to provide fattening fowls with plenty of pure water during the warm days. Feed all the birds will eat twice a day and allow access to a supply of cracked corn.

Pointers on Feathers.

The tail and wing feathers of turkeys are used mostly in making dusters.

Feather boas are made from white chicken feathers curled with hot irons.

Milliners buy white chicken wing and tail feathers, and many white turkey feathers, which they either curl or let straight and dye different colors.

Muffs, fans and featherbone also call for the use of feathers.

In handling turkey feathers, an authority says the body plumage should be kept separate and the long wing feathers left by themselves. The tail feathers should also be divided from the rest; it does not take very many of these to weigh a pound.

What dealers call "skirt" feathers are those just in front of the large, stiff tail plumage.

Turkey wing feathers have a special classification.

In shipping, the tail plumage is generally made up into a special bundle.

Pointers are stiff feathers from three to six inches long.

If the feathers are "quilly" (that is, if there are many stiff ones among the body feathers), there is a reduction of price in the market.

Chicago and Cincinnati are good marke ts for chicken feathers, most of the middle states' shipments going to those cities.

It is estimated that five chickens will yield a pound of feathers.

"SUCCESS" :: *By J. Lee Flewelling*

(Continued from last issue.)

Some of the men seemed to be opening large cases, some were nailing, others up, while others were hastening about, with their arms piled full of dry goods of different kinds.

Glancing round, Captain Fownes led the way to the large office in the rear of the warehouse. When they reached this and the door was closed behind them it seemed to shut out all the noise and Charlie noticed that they were in a large and well-lighted office, fitted up with more than ordinary care. Beautiful pictures being on the walls, as well as useful calendars and maps, and the whole office showed an artistic taste in its furnishings.

A man of about 60 was sitting at the office table writing. As they entered he rose and met the Captain with outstretched hand

"Glad to see you, Captain."

"Look here, Penio," said the Captain in his bluff way; "Can you lend me that busy ear of yours for a moment?"

"It is always at the disposal of my friend, Capt. Fownes."

"Well; first let me introduce my young friend here. I know that like myself, you will not judge him by his clothes. This is the son of Dr. Ruddock, who was killed by falling from his horse, up at Marlboro, some five years ago. As he was a physician of some note, and the city papers had a full account of the affair at the time, you doubtless remember something about it."

Mr. Pineo nodded. "Sit down young man.."

Then Captain Fownes, with a vividness that surprised our hero, gave a full account of his life from the time of his parents' death, up to the present. I ran across him at Roundant, and I brought him down in my boat."

"Now, Pineo, I want to know if you can make room for him in your establishment?"

"What can he do?" was the practical enquiry.

"Nothing, and everything," was the reply, that is to say, he knows nothing about the work, but as he told me is willing to commence at the bottom, but says he don't intend to stay there"

"All right—that's where I commenced myself, and that simplifies matters very much. My foreman just told me today that we needed another hand to help in the opening of the cases—one of our men being laid off through illness, and we can put him to work at once, if you wish."

"All right, and thank you. I will take him out first and secure a good boarding place for him."

This he did, getting him taken into a private boarding house a few blocks away, kept by a German, with whom the Captain was acquainted. As he did not know what wages Charlie was to get he arranged with the German to be responsible for his board for the first three months, after that said he, "he will be all right. or he is not the boy I take him to be."

"Dot is all right, Captain. I like de look of de boy myself. I thinks you vont have mooch to pay me."

"Now Charlie," said the Captain, when they were again on the street, "we had better see about some clothes."

"Excuse me Captain Fownes," exclaimed our hero. "I am very thankful indeed for all you have done for me, a perfect stranger to you, but I don't want the obligation to become too great. You have got me the chance to go to work and as the work will be of a somewhat rough nature, I would rather just wear the clothes I have until I am able to get better ones for myself."

"All right, my lad, I like your independence."

"Well, you know where the Albany docks, come and see me now and then, and if I can help you in any way, let me know." Shaking hands heartily, the Captain started for the boat. Well, he thought as he went along I do like that boy, he is so manly and he looks one straight in the eyes when speaking with as handsome a pair of eyes as I ever saw in a boy's head.

Our hero, when he returned to the warehouse, was furnished with a hammer and a nail extractor and put to work opening cases Mr. Brown, who assigned him to the work, told him he was expected to work as expeditiously and carefully as he could and that his wages for the present would be one dollar per day.

Charlie was greatly surprised at getting so much as he only had to pay $4 per week for his board this would leave him, at the onset, $2 extra per week. He soon was able to do his work as well as the other men and he was always careful not to split the boards and to pile them up neatly and the nails he always straightened out, if any were bent and had them ready for use again.

As he was more careful in this respect than some of the other men, Mr. Brown called their attention to this fact and asked them to do better.

As we may readily surmise, this had the effect of giving some of them an ill-feeling toward our friend and they were inclined to show their resentment in every possible way.

They dared show no open hostility when Mr. Brown was near, but made things as unpleasant, in a nasty way, as they could. Hurry up buck, one of them would say, in passing or when there was a chance would shy a wad of paper at his head, or play any of the pranks they could, that they thought would annoy. We may well suppose, that these things were most galling to a high-spirited young fellow.

Things reached a climax, when one day in Mr. Brown's temporary absence at the office, where he was often called for consultation. The boys had been indulging in their usual sneering remarks, to which our hero appeared to pay no attention, but when he had occasion to cross the room to get the nail extractor, which one of the men had taken when his back was turned, one of the men tripped him, so that only an agile spring saved him from an ugly fall

Wheeling, he looked the fellow in the eyes, and said, "don't you try that again, or you won't do it for nothing."

"Oh, my," said the man, a big fellow by the name of Mike Daly. "You wouldn't hurt a fellow, would you?" Please don't."

Charlie passed on, got what he wanted and was returning, when the fellow tried to trip him up a second time. Charlie was on his guard this time, and instead of falling, managed to give the advanced leg a pretty good kick instead.

At this, Daly got mad, and he used some pretty rough language.

Charlie laid down the tool he was carrying and turning to the fellows, who had gathered round at the prospect of a fuss, he said: "Now men, ever since I came to work here, for some reason or other, you have all had a pick at me. I don't intend to put up with it any longer. I have tried to do my work right and treat you all civilly and I shall demand the same treatment from you in the future. This trouble has got to end, just here and now. I shall attend to this man first, he seems to be the biggest man of the lot, and any of you will interfere at your peril'" Our hero was already in his shirt sleeves, as he usually worked that way. Turning to Daly he said: "Take off your coat."

"Never mind the coat, my little bantam," said Daly. "I'll soon cut your comb for you."

"Look out there," and Charlie was at him. A few passes, a quick sidestep, as Mike lunged at him with all his might, and he delivered one under that worthy's ear, that sent him reeling to the floor, where he lay for some little time.

"Don't hit him, wait until he gets up," the others shouted crowding in.

"You fellows just keep back. I'm not the kind that hits a man when he is down, or insults a young felow for no reason under the sun, but that he minds his own business."

"You fellows must stand back and when Daly has had enough, I'll attend to any of you that want me. After a time Daly got to his feet again, though still somewhat dazed.

"That was an accidental blow, you young bantam," he said "you can't do that again."

"You had better wait awhile Daly, you are hardly yourself; say when you are ready."

After a while, Daly, who was game, said: "Come on now you dorned clodhopper, and I'll give you what you want"

As our hero sprang at him, Daly struck a blow that if it had reached its mark, would have ended the bout, there and then, this Charlie skilfully ducked and ere Mike could recover from the impetus of the blow, sent one in with his right that caught Mike this time right under the side of the jaw, and he fell, like an ox, under the blow of the butcher's maul. He was so long in coming to, this time, that the other men had to get water and dash in his face and even then it was quite a time before he made an effort to get up.

Charlie stood leaning against a bale of goods, but keenly alert for what might come. But no more was needed

"Be japers," said Mike, "you just gave me what I deserved and did it handsomely too, and there's the hand of Mike Daly if you'll take it and I bear ye no spite for this same, but will stand your friend if you'll have me."

"All right, Mike, friends let it be", and they shook hands.

Then turning to the rest "now, if any of you want anything off of me just step out here."

"Divil the wan of thim, wants anything of that kind, of ye," said Mike. "I can lick any of thim aisy and you have licked me and that ends it."

"All right boys. I bear no malice, but you have got to treat me decently from this out and you may depend on my doing the right thing by you," and Charlie went back to his work as if nothing unusual had happened.

So well and so cheerfully was his work always performed that when he was advanced to positions beyond what some of them occupied there was no murmur, they recognized that he had earned his advancement.

When Charlie had been about two years in the employ of Mr. Pineo, as the latter was passing into the office one day, he said: "Mr. Ruddock I would like to speak to you before you leave to-night."

The other young men said jokingly, "Ha, Charlie, going to get your discharge, eh? We will be sorry to see you go." This in quite a different tone from that they would have used a year ago. Charlie had now become quite popular. He was always ready to lend a helping hand when needed; and often assisted materially with suggestions of an improved way of doing the work. Mr. Brown had come to rely on him a great deal of late.

"Sure me bye," said Mike, "if you get your walking papers, divil the soul of us will go to work tomorrow."

When Charlie entered Mr. Pineo's office it was with little fear of a discharge, for he had the consciousness of work faithfully performed.

"Sit down, Mr. Ruddock. Have the hands all gone?" "Yes sir."

"Mr. Ruddock, Mr. Brown has concluded to leave us. He has beeen offered a much better position than he has here, and I think he does well to take it, and I wanted to consult you about a man to fill his place, a shipping clerk, who will be also overseer of all the work of this large establishment. This is a very important position and

BETTER THAN SPANKING.

Spanking does not cure children of bed wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W, 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

MOTHER OF SCHOOL GIRL

Tells How Lydia E. Pinkham's Vegetable Compound Restored Her Daughter's Health.

Plover, Iowa.—"From a small child my 13 year old daughter had female weakness. I spoke to three doctors about it and they did not help her any. Lydia E. Pinkham's Vegetable Compound had been of great benefit to me, so I decided to have her give it a trial. She has taken five bottles of the Vegetable Compound according to directions on the bottle and she is cured of this trouble. She was all run down when she started taking the Compound and her periods did not come right. She was so poorly and weak that I often had to help her dress herself, but now she is regular and is growing strong and healthy."—Mrs. MARTIN HELVIG, Plover, Iowa.

Hundreds of such letters expressing gratitude for the good Lydia E. Pinkham's Vegetable Compound has accomplished are constantly being received, proving the reliability of this grand old remedy.

If you are ill do not drag along and continue to suffer day in and day out but at once take Lydia E. Pinkham's Vegetable Compound, a woman's remedy for woman's ills.

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

BEWARE OF IMITATIONS SOLD ON THE MERITS OF MINARD'S LINIMENT

Minard's Liniment Co., Limited

"I was cured of diarrhoea by one dose of Chamberlain's Colic, Cholera, and Diarrhoea Remedy," writes M. E. Gebhardt. Criole, Pa. There is nothing better. For sale by all druggists.

there is a good salary goes with it. I paid Mr. Brown $1500 a year and his successor will have the same. There is but one man in our establishment at the present time, who seems to have the qualifications for the position, so Brown says, and I want your opinion of the matter, as it is a most important choice for me."

"Which one of the fellows do you think would suit." Charlie ran the men over in his mind. "I think", he said, "Mr. Brown must have thought of Mark Kely, he certainly has more ability than any of the rest."

"Well," said Mr. Pineo, "what do you think?"

"I am most too young, and have been here too short a time for my opinion to have much weight," said Charlie with a smile.

"Nevehtheless," said Mr. Pineo, "it was to get the benefit of your opinion that I asked you here tonight, and if the man Mr. Brown has selected, is in any way unfitted for the position, I feel that it is your bounden duty to me to enlighten me." As he spoke Mr. Pieno sprang up and walked nervously about the office. "You, perhaps, can scarcely understand how vitally important tnis is to me," and he returned to his chair on the orposite side of the table and looked appealingly at our friend. "Now, Mr. Ruddock, what do you advise?"

"Then, Mr. Pineo, I feel bound to say that I think you have not a man on the force, fit for the position. Mark Kelly comes the nearest and I hate to say a word that will perhaps prevent ment, but he is not at all times reliable."

"You refer to the fact thae he drinks?"

"Yes, sir"

"Your interests require a man to be always at his post, both quick to plan, quick to execute and also one who understands the control of men. Then, again, he requires to know the stock from cellar to attic, otherwise you would not be in a position long, to promptly fill orders.

I think you would be advantaged by going entirely outside your staff and securing a man thoroughly equipped for the work."

Mr. Pineo nodded and lapsed into silence for some moments. Suddenly he asked: "Would you like to know who Brown did recommend?"

"I am sure it must have been Kelly. he is the only one at all fitted for the post, and as I said, I am sory to have to say a word that seems to go against his advancement, but when you asked my opinion I felt that my duty to you required an honest one."

"Right Mr. Ruddock, there have been few times, if any, since you've been here, that you have not been right. Captain Fownes is a very old friend of mine, and when he asked me for a position for you, I would have made one, even if I had to discharge a man to do it. Luckily, we wanted a man for the rough work, the opening of crates, so Mr. Brown had told me a few moments before you came in, so you came opportunely. This you commenced, as you said you were willing to do, at the bottom, and I have had my eye on you ever since. I have noticed that when in a slack time, the others were skylarking, or spinning yarns, you were always looking over the stock and making yourself familiar with your surroundings The office door was ajar and both Mr. Brown and myself watched the deserved punishment you gave Daly, and I was pretty proud of you that day. My boy! I would not like to get a clip from that fist of yours I have watched your course all along. I have even employed means to know how you spent your evenings. When I found that you were taking a course in Science in Cooper's institute I was much pleased. When I learned that you had become proficient in shorthand and typewriting, I was much gratified. When I listened to your address at the Men's Union last month. I was extremely pleased with your remarks; that appeal of yours to the men, to make themselves indispensible to their employers, and there would be no trouble about wages, and no necessity for strikes, seemed to me, to strike bedrock."

I know that you attend Dr. Parker's Church at Brooklyn, and that you are a member of his Bible class. In short, I know nearly all about you since you came to the city. This I have done, partly to please my friend, Captain Fownes, partly at the suggestion of Mr. Brown, and partly to satisfy myself. I may say to you now, that the man Mr. Brown has recommended to succeed him, is Mr. Charles Ruddock, and I may say also, that I heartily endorse his choice.

Charlie sprang to his feet, his face crimson.

"Why, Mr. Pineo, I have been here but little over two years."

"The more credit to you, that you have mastered the business in that time. You have a marvellous gift it would seem in that direction. I don't mind saying to you, that I never saw any young man show such aptitude for business, as you have. There is little doubt in my mind that in a very few years when you have obtained some capital, you will be running a large business of your own, unless you should elect to take an interest here with me."

"Mr. Pineo, you overwhelm me. I have tried to master the business and to always do the best I could at whatever I worked, but I had not the slightest idea, that by so doing, I was preparing myself for further; though," with a smile, "you doubbtless remember Captain Fownes telling you of that remark of mine, that I was willing to start at the bottom, but did not calculate to stay there."

(To be continued.)

Everything you could ask for—
DAYLIGHT OVEN, if required—with heat-proof glass panels in door.
OVEN THERMOMETER, always reliable, and Thermometer guide.
HEAT ECONOMIZER, that holds oven heat when door is open.
CONVENIENT TOWEL RODS, not in the way.
TRIPLE BODY—rolled steel, asbestos lining, outer wall of polished blue steel plate.
REMOVABLE RESERVOIR, without dampers to interfere with baking.
ROOMY WARMING CLOSET, of blue steel, with detachable shelves and tea stands.
CONTROLLER-DAMPER, controlling fire perfectly.

When the Fire is Low

One way to hasten the cooking of the contents of frying-pan or saucepan when the fire is low is to place over it a flat cover and upon this set the teakettle containing boiling water. It is quite surprising how this additional heat hurries the process of cooking, and it is a remedy that is generally at hand.

This method is unusually fine for cooking eggs without turning them, as the heat from the kettle cooks the top of the eggs sufficiently by the time they are cooked on the other side, and the eggs appear more attractive than when turned.

One of the most common ailments that hard working people are afflicted with is lame back. Apply Chamberlain's Liniment twice a day and massage the parts thoroughly at each application and you wil get quick relief. For sale by all druggists.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a **HUMAN REMEDY** for **Rheumatism, Sprains, Sore Throat,** etc., it is invaluable.

Every bottle of **Caustic Balsam** sold is Warranted to give satisfaction. Price **$1.50** per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

Getting Ready for School.

In spite of hot weather most country mothers have to be getting the children ready for school several weeks before it begins, and this is no small task. Children have a habit of shooting up in the summer time like weeds, and they also have the health ful habit of romping, playing and eating fruit, all things that ruin the clothes. Peach stains on frocks and grass stains on knees are the bane of most mothers, yet the children must have good times even if it is destructive to clothes to romp and play.

Sad experience has taugnt most amateur dressmakers that it is time and money thrown away to buy lawns or thin materials for school dresses. They are very much reduced in price at this season and the temptation is strong to buy them, but very soon the mornings are cool and the dresses must be laid away for next season, when they will probably be outgrown. The best material for boys and girls are the heavy galateas, stout ginghams, sensible cambrics—all wear-resisting fabrics that hold starch and look well to the end of the chapter. It does look a little cruel to send the children off in hot September in a heaky dress of stout gingham, but always there are a few summer frocks left over—best dresses that must be worn out before outgrown—and these can be saved for very hot days.

For boys stout waists in medium dark colors are best, and these are cheapest when made out of substantial materials. Cheap calico goes to pieces in the first wrestling match and the mother's time and money are thrown away, but good galatea will resist many bouts on the playground and look well always.

Light jackets and wraps made from the worn-out dresses of the older members of the family or from the best parts of the old coats are always needed for school in the early fall. The sudden rain, the veering of the wind to the north or a damp morning will make the thin cottons insufficient for the children's tender bodies, and the wraps should always be at hand. Then with stout shoes and stockings ready and plenty of dark bloomers for the girls and overhalls for the boys the school preparations wfll be out of the way until winter comes. Some mothers allow the little girls to wear gingham all winter with heavy wraps outside, while others use the dark wools and protect them with big ginggam aprons. At any rate the garments made in the fall should have deep hems so they can be let down next spring and there should be ample material laid away for new sleeves. By washing the new piece a few times and hanging it in the sun to dry it will fade out to mach the half-worn garment, and the child will not be conspicuous in a "two color" dress. made in simple style the garments are easy to wash and easy to iron, yet they always look well and satisfy the little lads and lassies for everyday wear.—Elizabeth Oswald.

A Real Lever Simulation

GOLD WATCH FREE.

A straightforward generous offer from an established firm. We are giving away Watches to thousands of people all over the world as a huge advertisement. Now is your chance to obtain one. **Write now,** enclosing 25 cents for one of our fashionable Ladies' Long Guards, or Gents' Albert, sent carriage paid to wear with the watch, which will be given Free (these watches are guaranteed five years), should you take advantage of our marvellous offer. We expect you to tell your friends about us and show them the beautiful watch. Don't think this offer too good to be true, but send **25 cents** to-day and gain a Free Watch. You will be amazed.—WILLIAMS & LLOYD, Wholesale Jewellers (Dept. 69), 89, Cornwallis Road, London, N., England.

The Baby Died.

The hour for the funeral had arrived, and neighbors were coming in to the services. The dead baby lay in a little white coffin lined with white satin, was dressed in white, and flowers in profusion decorated the room and testified to the sympathy of tne neighbors.

The preacher made a short prayer, uttered a few comforting words, a song was sung, the little baby was born to the white hearse by four young girls in white, and the procession moped toward the cemetery.

The baby had died from intestinal disorder induced by wrong feeding, yet the preacher had said: "The Lord giveth and the Lord has taken away." The doctor told how it all happened. "That baby," said he, "was born strong and healthy. The motner nursed it for weeks, but finding that nursing interferred with bridge and other social affairs, provided a bottle, and when she was absent, her aunt, who lived with her, fed cow's milk. This irregularity of breast feeding soon lessened the amount of the mother's milk and she concluded she would cease nursing entirely. The child seemed to do well on the bottle for a while, but it soon became evident that something was wrong. One time I saw the mother give a piece of rich pie crust to her baby, and I warned her against doing so. She told me she found the infant liked coffee, and a little was frequently given to it. And so, despite my medicines and my warnings in regard to feeding, the child's digestive apparatus gradually broke down. Someone prescribed soothing syrup which contained morphine. Another one recommended aniseed cordial, and so it went; the young mother being willing to depend upon drugs and remedies, but would not practice prevention by feeding rationally. When the digestive machinery was put to the bad the baby finally took dysentery and died." Continuing the doctor said: "I had three infants die of pneumonia last winter, simply because the mother would not give them air enough. In spite of my instructions that plenty of air would make babies strong and protected them against colds and coughs, still they would cover their babies' faces with veils and napkins, keeping the life giving air away. The foolish idea," said the doctor, "wh ch seems to exist everywhere, that fresh, cold air is injurious, must be somehow extracted from the minds whicn hold the same, or else pneumonia dead babies will always be with us.—Dr. J. N. Hurty.

The Summer Diarrhoea of Children.

When the baby has loose green passages, it means that he is sick and needs medical attention. The disease may be mild at first and the baby often shows no other signs of illness than diarrhoea. There may be no fever. Such a baby often becomes dangerously ill in a short time. Send for a doctor.

Sixteen per cent. of the deaths during the first year, and thirteen per cent of the deaths during the second year of life, in Nova Scotia, are due to infantile diarrhoea.

The simplest cases of vomiting and diarrhoea during the summer should not be neglected. Every such case should be treated as an emergency.

Stop the milk at once.

Give a teaspoonful of castor oil, and feed nothing but barley water until the child has been seen by a doctor.

Do not give any cordial or teas or diarrhaea mixtures.

Never give any medicine other than the castor oil to the baby except upon the doctar's orders.

If the baby has fever, it is ill and you should consult your physician immediately.

The Department of the Public Health, Nova Scotia, issues a pamphlet on the Care of the Baby, which may be had free upon application to the Provincial Health Officer, Halifax, or to anv Medical Health Officer

Attractive Dress for Farm Women

Because we live in the country, is that any reason why we should not be well-mannered and attractively dressed? In this community there are several women so gentle and charming, always suitably dressed for the time and occasion, sympathetic and charitable in their utterances; trustworthy, wholesome, dependable women with whom it is good to come in contact.

Perhaps you have read of the delightful ladies of Cranford—they were very dear and very quaint, but just not like our more vivacious ladies of today. Now let me tell you whom you believe in pleasing quite the most—your husband! A young and pretty girl will probably do her utmost to enchance her charms sometimes after marriage she will become shockingly careless and negligent, and soon becomes prematurely aged and faded, because she has not taken proper care of her hair, skin, figure, teeth and clothes. If the husband of this careless woman is a good and kind man, does he not deserve a fairer vision of a wife?

What is really pleasanter than when "running in" on a neighbor at eight in the morning or five in the afternoon to find her neat and clean? Her hair, not pulled back in a tight little knot but arranged in a simple and becoming manner.

My sister visited me shortly after I was married; her hair, naturally beautiful, was arranged in an artistic yet simple coiffure; my husband asked me why I did not dress my "crown of glory" likewise. Now I thought I was "doing" mine in a rather pretty mode, but I soon arranged it differently, and he thought it beautiful, so you see at least some husbands are observant.

Perhaps I am extreme in my desire to please, but when my "dear com-

Now is the Time to Plan for the Summer

Students can enter at any time as we will not this year have any summer vacation, the number in attendance from a distance making it inexpedient to interrupt their work.

Besides, St. John's cool summer weather makes tudy during the warmest weather just as pleasnt as at any other time.

Send for catalogue.

THE ST. JOHN Business COLLEGE. S. KERR *Principal*

panion" (Samantha Allen's name for her better half) does not care for certain dress or hat I, too, loose interest in it. My home dresses are made by a pattern with good lines—generally a little low in the neck and elbow sleeves, the short sleeves being especially good in that you have no inclination to roll them and spoil their freshness. My aprons, unless white and clean, I never wear at the dining table; at the very last moment, if I have prepared the meal, the apron is removed and hung up until I return to the kitchen.

Of course a gingham apron is an honorable appendage to a woman's toilet when "used as needed," , but let your children become accustomed to your making this little change. It will be beneficial; they will see you are quite careful in your appearance at the table and they will begin to think that there must be something manicuring and orderly appearance exacted from them.

At breakfast and dinner I wear my morning dress. In the afternoon, after a refreshing rest (for I arise early and have very busy mornings), I bathe and put on a plain gown but daintier and more dressy than its predecessor. When my husband comes into supper—his day's work on the farm done—he looks at me so approvingly and happily that I am rewarded for my extra laundry work. I keep no servant, and therefore have to be mighty careful to keep clean; there are meals to prepare, children to care for, hundreds of little and big things to do, some gardening and poultry work.

Let me tell you a little more; the consciousness that you are appearing well acts like a tonic and certainly increases your self-respect; you are very much at ease with yourself and everybody else. In the summer I have several very dear friends visit me. They dress well; my dresses are not so rich or elaborate but they look up to date. For going out in the summer season I try to have one thin white dress for very warm days one white linen and one colored linen, these are my "stand-bys"—the ratines this summer are used very much instead of linen.

My husband used to came to supper in the clothes in which he had been working all day—callers came unexpectedly and he had to hurry away to dress. I suggested, (never dictate, dear woman), that if he always dressed before supper he would feel refreshed and delightfully comfortable in his after-supper reading on the porch. So now in the warm season he makes himself quite tidy in fresh negligee and white duck trousers; when callers descend upon us we are both ready to receive.—Charlotte Marshall in N. E. Homestead.

The Proper Care of Honey.

When nectar is gathered it is thin and watery. The heat of the hive, aided by the manipulations of the bees, gradually reduces the nectar to thick, ripe honey. When the honey is ripe the bees seal it over. It is their finishing touch which proclaims that it is ready for market, or for use. While there is an excess of water in the honey, the bees will not seal it. They will leave it to evaporate. The process of evaporation is the ripening process.

After honey has been thoroughly ripened in the hive and is then removed, its future palatableness depends entirely upon the care it receives. Too many look at honey as a simple sweet, live cane sugar, forgetting that its flavor and aroma, are its chief attractions. When first taken from the hives it has very distinctly the flavor of the flowers from which it was gathered. Each variety of blossom gives a distinct flavor. By the tasting of honey, an expert can readily tell from what class of blossoms it was gathered.

Thoroughly ripened honey should be at once put into bottles, cans or barrels, sealed up tight, and put in a dry place. It will of course, soon candy, or crystallize, but the flavor will be retained indefinitely, and the honey can be liquified whenever it is needed for use. Care must be exercised in melting, that the flavor is not injured by the application of too much heat. Of course, the honey will not be burned if it is not heated hotter than boiling water, but the application of so great a heat as this rapidly drives off the flavor. Keeping the package closed and applying a very gentle heat, never above 150 degrees, is the better way. Putting up the honey in such packages as can be easily placed in warm water, makes the liquefying more convenient.

When reliquefying granulated honey, place the receptacle containing it in a vessel of water, place a few thin strips of wood between the nottoms of the two cans. The honey should be kept at a heated temperature for at least three hours, according to size of receptacle, to insure perfect liquefying. Any granules which are not thoroughly dissolved will hasten the solidifying of honey. Light and cold are the two elements which have the undesired effect in aiding the matter. Probably the best condition for preserving honey is to keep it warm, dry and dark, similiar to the inside of a beehive.

Honey has a great affinity for moisture, and if comb honey is stored in a damp moisture through the slightly porous cappings, and become thin and watery. The bulk of the honey will be so increased that it will burst the cells and ooze out. The honey may become so thinned that fermentation will set in.

Cold is also detrimental to comb honey which it causes to candy in the cells. When comb honey is first taken from the hives, it should be stored in a hot, dry atmosphere. Very few people know how to keep honey. The average housewife will usually put honey in the cellar or into a refrigerator for safe keeping, about the two worst places possible. Honey is kept very differently from fruit. If it is thoroughly ripe when taken from the hive it will not ferment unless it is placed in a cool moist place.—F. G. Herman.

DURABLE--Fire grates are three-sided; last three times as long. Shaped in the

McClary's Sunshine Furnace

to grind up clinkers when "rocked". See the McClary dealer or write for booklet. 32

Canning Vegetables.

There is a scientific reason for the failure of all cooks to prepare vegetables so that they may be kept indefinitely in jars for winter use. Most vegetables are rich in starch, and those that are, are never sterilized by one cooking; sometimes this is done by a second, but give the vegetable a third cooking and the contents of the jar will be safe.

The first boiling kills the starch germs then alive, but it does not kill those unhatched, and of those some ripen the second day, to be destroyed by a shorter time of boiling, and then no more will develop. This bit of knowledge was the explanation given by a noted bacteriologist to his wife why her vegetables all spoiled, though she had put them up according to the rule of Mrs. Z, a well-known writer and speaker on cooking. Mrs. Z had advised her to boil them twice, but they had spoiled just the same. Not one has spoiled out of hundreds preserved after the three-time manner.

The writer has canned dandelions and found them delicious in the early spring and late winter. She had such quantities gathered and cleaned that she expected to have at least a dozen jars, but had only four quarts.

After the greens were thoroughly cleaned and washed they were left standing over night in a crock of cold water which served the double purpose of drawing out a little of the bitter and of freshening the drooping leaves. Early in the morning they were put in a kettle with no more water than came out as they were lifted from the crock, and were cooked with no salt until they weee tender—as they were young and small the cooking lasted about half an hour.

THREE BOILINGS FOR SAFETY.

Then they were packed into glass jars as closely as they could be pressed in, jars filled to overflowing, the tops snapped on, and the jars left until the next moroing, when the snap was loosened on the cover, which was not lifted, the jars set on a bit of wood in a kettle filled with water to their necks, and left to boil for 20 minutes. Then the snaps on the jars were fastened and the jars left in the water, though this not absoluely necessary. The same method was followed the next day, and the jars when cooled were set away.

Vegetables cooked in this manner retain all their freshness and flavor for they are never exposed to the air after they are put in the jars. Spinach needs a trifle less cooking, unless the leaves are old, but for canning it is not wise to take old vegetables, and if they have been gathered a day before they are to be cooked, they should always be freshened by soaking in cold water to cover.

The housekeeper who tries to clean and can all the dandelions or spinach to fill more than two quart jars and do the canning all in one day has undertaken too much for the average woman. This rule is also recommended for Swiss chard, beet greens with tiny beets, and many greens to be found wild in the country. Any of them will keep if prepared as thus directed.

There is another method of preserving these things, an old one which some housekeepers might wish to try. Into a stone crock lay a thick layer of any greens, then a liberal sprinkling of coarse salt, and so on until the crock is full, the top layer being of salt. Cover and weight down, and leave until wanted. When the vegetable is to be used it must be removed from the brine, washed in several waters, left to soak over night, and then cooked as if fresh. The odor when the cover is lifted is not inviting, but the greens after the washing and soaking will be found unspoiled. This is not nearly as good a way as the other, as it destroys the delicacy of flavor in the finer greens. Our grandmothers used this for dandelions and string beans. The German method of making sauerkraut is the same as this, only that less salt is used, the cabbage being shredded, and a few juniper berries being added.

For canning beans, they should be put into jars as solidly as possible when snapped, water run on them until there are no bubbles, and the beans are covered, the lid laid on the top, and then the jars set on something to keep them from touching bottom, water added to the neck, and *oen left to boil well for at least an hour. No salt is to be put with them, or with any other vegetable thus canned. Since the writer has ceased to salt tomatoes when canning them, she had none spoil. Fasten the lids of the jars, and next day repeat the process as outlined for dandelions.

Young peas can be cooked this way with hardly any water, but beans do not get tender without it.

Young corn, cut from the cob, is to be packed down with a spoon until no more can be crammed into the jar, no water added, and then cooked an hour or more. There is very little probability of over cooking any vegetable that is canned. Corn is one of the vegetables surest to spoil without sufficient, repeated cooking. It is delicious cooked without any water in the jar, but all the milk of the corn should be added to the contents of the jar.

Squash and turnip may be saved in this way, though one seldom cares to can these vegetables, unless one lives in a city flat and has to can them to keep them from spoiling.

Carrots and peas together can be done in the same way, the carrots cut in dice as small as peas and enough water added to the jar to develop a steam to cook them through. If the vegetables are packed as solidly as they should be in the jar there will be none to much water if it comes to the top. For this, the young, small carrots should be chosen. The combination is very good.

There is a rankness to water in which cauliflower is boiled which makes partial boiling before placing in jars better than cooking wholly in glass, as with other vegetables. The cauliflower, broken in bits, is packed in the jar so solidly that there are no interstices, and then twice heated, as before directed

Acid vegetables like tomatoes, and acid fruits need only one cooking.

Shelled beans and limas are preserved excellently by this method of triple cooking, which in their case is important. Corn and beans (succatash) can be combined with good results in canning.

Corn which has been cooked on the cob can be kept for winter use by drying. It is removed from the cob by picking off in whole grains, and is dried in a very slow oven or in a sunny place. It can then be placed in a bag, tied closely to keep out dust, and when it is wanted for use it is to be soaked overnight, then heated in milk. This is an old-fashioned, but simple way of preserving corn. Unless kept in a dry place it will mold.

Under ordinary conditions one will never care to can potatoes, but out in the mountains of the west, canned potatoes have been of great servcie at times. One may can them by boiling, mashing, packed well in a jar, and reboiling on two consecutive days.

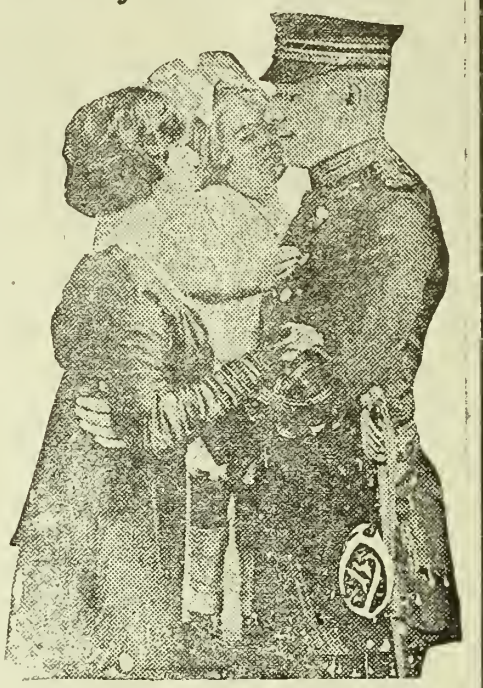
It is not as much trouble as one might think to repeat these boilings, for boiling is what is necessary—not a mere reheating. It will not be accomplished while one is doing up the morning tasks, and the result in winter will be ample compensation for all the work. Only fresh, perfect vegetables should be chosen for canning, for poor articles will not produce good results. Nothing from a garden need go to waste if one will can the superfluous green vegetables, and there is always the best kind of market for home canned vegetables, even more than for fruits.—Dora Morrell, Maryland.

Special Advice For Men

Vitality Restored by New Method

The attached coupon entitles you to one illustrated copy of my pocket compendium and guide for the self-restoration of lost strength. (See description below) Upon hearing from you, this valuable little book of private information for men will be sent by return mail in plain sealed envelope. Please call or write today.

There is a new and marvelous method for restoring lost manly strength, for renewing the vigor of youth, which every man should know of, a self-restorer which operates without the use of drugs or medicines, a new way to treat yourself and by which it is my firm belief any man anywhere who is content to lead a decent life, free from excesses and dissipations may be almost certain to restore his full manly vigor snd strength, if he but makes the little effort that is called for in connection with the use of a little vitalizing appliance which I have patented and am now distributing all over the world.



HEALTH IS HAPPINESS

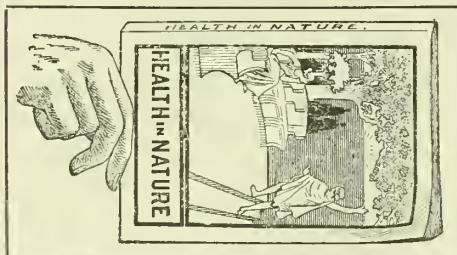
Please remember that a man is not one day older than he actually feels, and therefore no matter what your age, if you are young or elderly, married or single, large or small, if I can show you reader, how you can yourself actually add to your system, nerves and blood the very nerve force or vital vigor which may have been drained away, and which is necessary to make you strong, vigorous, and capable again, then I have shown you the real secret of perpetual youth, and how you can again be filled with vitality and again be just as powerful in your influence and just as thoroughly manly in your capacity as the biggest, fullest blooded, most successul fellow of your acquaintance.

I call my vitalizer a HEALTH BELT because it is worn around your body in the position of an ordinary belt. It sends a great, soft, strength-giving supply of a force I call vitality into your body nights while you sleep. I would like you to call or to write and get my free book, that you may know the whole wonderful account of what my HEALTH BELT is doing for others who were looking for a safe and sure means to restore vigorous health and to rid the body of pains, aches and weaknesses.

Note—My HEALTH BELT, with special attachment, is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, etc.

86-PAGE BOOK SENT FREE

My 86- page illustrated booklet (pocket size) was compiled by me to answer fully and correctly those questions which are asked privately by any man needing new strength and who seeks personal advice pertaining to the ailments and weaknesses he wishes to overcome. The book, fully illustrated, with photo reproductions contains much that a single or married man should know. It also fully describes my HEALTH BELT and tells how you may secure one to use in your own case, should you decide you want to use one. Remember the book is sent absolutely free, in plain, sealed envelope. Why not write for a copy today?



DR. M. F. SANDEN,
140 Yonge St., Toronto, Ont.

Dear Sirs—Please forward me your book as advertised, free.

How to Clean an Automobile.

Cleanliness is half the health," said a famous doctor, and the same can be extended in the fullest sense to the autamobile. Dirt and dust are not only unsightly but also work mischief to the paint and varnish. Aside from the bady the machinery sufferes greatly by dirt adhering mainly to the joints of bearings, gradually entering into them, causing them to come loose and finally reducing the whole machine to a rattling assembly.

The use of soaps and other compounds do, in most cases, the greatest harm, while much rubbing with

Are Your Bowels Ever Constipated

If you wish to be well you must keep the bowels open. Any irregularity of the bowels is always dangerous, and should be attended to at once, for if the bowels cease to work properly, all the other organs become deranged.

Milburn's Laxa-Liver Pills work on the bowels gently and naturally, and will cure the worst cases of Constipation.

Mrs. A. Cumming, Manchester, Ont., writes:—"I have been troubled with Constipation for over five years, and I feel it my duty to let you know that your Milburn's Laxa-Liver Pills have cured me. I only used three vials and I can faithfully say that they have saved me from a large doctor bill."

Milburn's Laxa-Liver Pills are a wonderful remedy for all diseases or disorders of the liver or bowels.

Price, 25 cents per vial, or 5 vials for $1.00, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

the sponge or brush and too little water do the rest of the destroying work. To succeed with the greatest satisfaction I would recommend the following, as the result of long experience in the coach and automobile business. It is being done with great success in all the fine garages in the large cities.

The machinery part of an automobile needs inspection and oiling before every trip, or better, inspection and cleaning should be done at the same time after each trip, this being the best way to make sure of the perfect running order of the car. Gasoline mixed with kerosene applied freely with a common paint brush on the parts loosens and removes greasy dirt that adheres to motor or gear base. A wipe with a bunch of waste cotton or a clean rag finishes it nicely.

WASH OFF MUD CAREFULLY.

It is absolutely necessary, in order to preserve the good looks of the car, that the mud and dirt be thoroughly washed off. After having cleaned the top and upholstery from dust with a leather or wool duster and beaten out the carpets, we remove all the impurities in the body with a dusting brush and begin with the washing operations.

Washing should be done in a shady place to avoid the quick drying of the water on the car that would cause spots in the varnish. A pail, a good soft sponge and a medium-sized chamois skin are needed. Water should be absolutely clean and cold and applied freely over the car to moisten and loosen the dirt.

After moistening the body and gear in this manner proceed with the sponge and pass it over the body easily without pressing on it, dipping and rinsing the sponge frequently in a pail of clear, fresh water. Having washed one side of the body, wipe the water off with the moistened chamois skin without applying any pressure, and we will have a nice clean surface equal to a new finish without any scratches from dust or dirt. The other half of the body is done in the same way.

USE PLENTY OF WATER.

Then wash the running gear, a very important part to be cleaned thoroughly, as the many narrow corners and small parts are places where the dirt accumulates and shows, particularly on dark cars. The wheels and gear are moistened thoroughly to loosen all the dirt, then we pass the sponge over using plenty of water without pressing or rubbing hard. The moistened chamois skin is used for wiping off the remaining water.

It is advisable to have a sponge and chamois skin for use on the gear only on account of the coarser dirt or grease that one is liable to catch when washing around the wheels and greasy springs. The car should be jacked up to allow the wheels to turn at will.

Grease or oil spots on the body panels and fenders should be removed as soon as possible. Use a soft rag upon which pour a few drops of linseed oil,, rubbing easily over the spot without pressing and wipe it off with a dry cloth. On the running gear we may proceed in the same manner, or we may use instead of linseed oil a mixture of raw oil and kerosene.

The top, if made of mohair, should only be brushed, and if of imitatian leather or the like should be washed and wiped dry. If through much use and washing an imitation leather becomes unsightly, the new aspect can be restored by applying with a rag some linseed oil and wiping it dry with another clean rag. The same can be done with the upholstery and cushions of the car, if of leather or imitation. Great care is to be taken to wipe off all the superfluous oil.—P. Wagner.

Water—the Best of all Drinks.

Water drinkers are seldom sick, and the longest lived, other things being equal. Men everywhere are trying to find how to keep well, and live happily and long, yet continually miss the essentials. Few persons realize that artificial drinks fail to meet the daily wants of the system.

A very large number are actually falling behind in health for the lack of pure drinking water to cool and refresh the over-heated blood. Water is frequently repudiated by men and women who seem wholly unmindful that it has advantages for them beyond price.

More than three-fourths of the contents of the body is water, nine-tenths of the brain and nervous system, likewise the blood and other fluids. The daily supply of water required by the averaged sized man or woman varies according to age, work and climate.

There are no known counter-indications to the use of water as a drink. The quantity of water may be whatever the stomach and intestines are able to absorb. It is safe to say that pure water may be drunk at any hour and with hardly any limitations, save such as might be plain to any one.

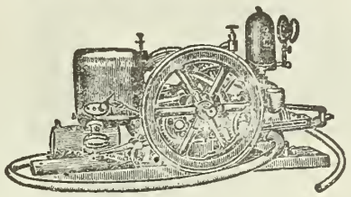
Strange as it may seem, few are aware that clean, pure water has virtues superior to medicated liquids as a life-saving agency. Mineral waters, either natural or artificial, fail to satisfy and are less wholesome than water which holds in solution no foreign element.—From Physical Culture

Foreign Bodies in the Ear.

Except in the case of an insect getting into the ear nothing can or should be done without a doctor. In the case of an insect, to drown it, fill the ear with oil or water, after which it will generally float out. Syringing of the ear afterwards is often necessary. The entrance of insect into the ear may cause intense agony.

"Were all medicines as meritorious as Chamberlain's Colic, Cholera and Diarrhoea Remedy the world would be much better off and the percentage of suffering greatly decreased." Writes Lindsay Scott, of Temple, Ind. For sale by all druggists.

Protect your trees and garden



A Fairbanks-Morse Spraying Outfit offers you the most effective and economical means of destroying insects and of curing and preventing plant and tree diseases.

The spraying machine illustrated here can be used for practically every spray use on any farm, and will quickly pay for itself in improved crops.

You can buy a Fairbanks-Morse or Gould Spraying Pump, from a brass hand pump costing a few dollars up to an engine-operated, truck-mounted outfit of the highest efficiency.

Send for free catalogue of spraying outfits and appliances. It contains much valuable information, tells you what to spray, what chemical compounds to use, how to prepare them, when to do the spraying, etc. We are the largest Canadian dealers in farm engines, scales, and mechanical goods of every kind.

MINUTE VACUUM WASHER

Delivered to you for $1.00

The Minute Vacuum Washer was patented in 1914. It is therefore the latest and best on the market, and yet is being used to-day by over 75,000 satisfied housewives in all parts of Canada. It has *all* the *good qualities* of *all the other washers* and *none* of their faults. It will absolutely do all we claim for it or we will return every cent of your money. We have *confidence* in the washer or else we could not make this offer:

WE GUARANTEE IT

Some reasons why *you* should buy the **Minute Vacuum Washer.**

It is the strongest on the market *because* —it has quadruple turned seams.

Triple rolled and pressed rim.

Costs $1.00 delivered

It is the lightest machine made.

Will do the fastest work.

Does its work in *three* minutes.

A child can operate it.

Your clothes last twice as long.

Your hands do not touch the water. It forces the boiling suds through the clothes, NOT the clothes through the suds

We make this offer for

A SHORT TIME ONLY,

in order to secure agents. **$1.00** is practically *cost price*, and if we were not absolutely sure that we had the best washer made, we could not afford to make this offer. We count on repeat sales for our profit.

SEND TO-DAY—DON'T WAIT!!!

If this publication was not absolutely sure that the **Minute Vacuum Washer** would do all we claim, they would not accept our advertising, and you know it.

YOU ARE PROTECTED

$2.50 Coupon

Send us this coupon and $1.00 cash and we will send you the **Famous Minute Vacuum Washer,** directions for use, and agent's offer, by parcel post, all charges paid, to any address. **Remember** this offer holds good for a short time only. We will send the washer to you no matter were you live by mail for one dollar.

rtise in the Maritime Farmer

The Mother's Mission.

At a recent meeting of charity and social purity associations in Omaha, at which the national authorities on such matters were present, it was a little woman from a small Nebraska town who made the speech that attracted the most attention. Mrs. G. W. Crossland, of Wayne, Neb,, was an interested listener to all that was said. Finally she arose and spoke. "I am not connected with any reformatory institutions," she said, "but I am a member of the greatest institution in this commonwealth, and that is the home." Her talk was not prepared and polished, like most of those preceding her. It came from the depths of her heart. Below it is reproduced in part:

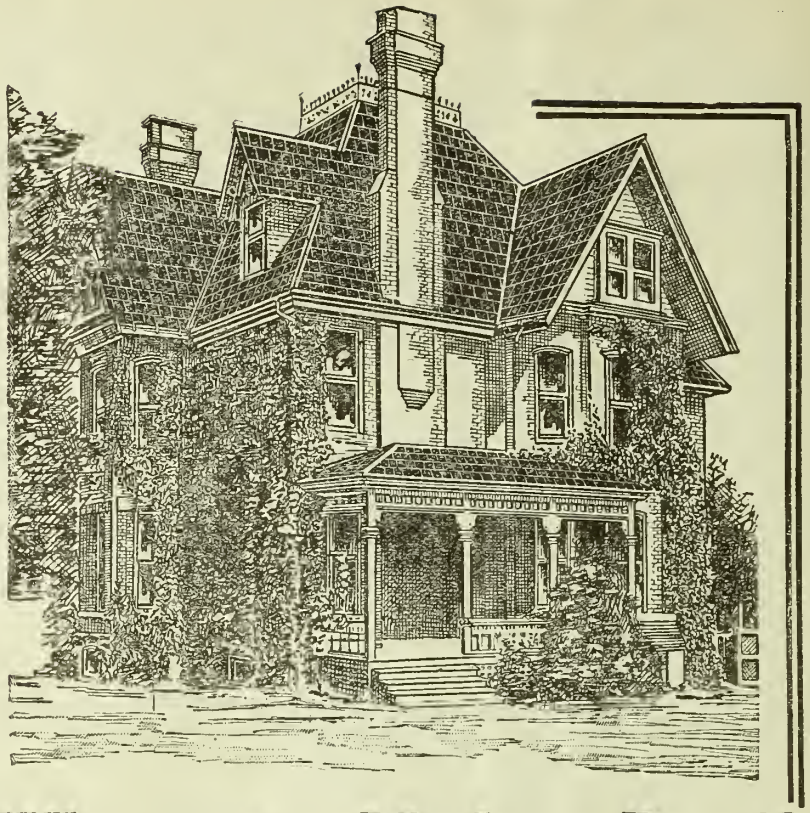
It seems to me as though the American woman of today has in some way lost the vision of the duty and responsibility of the home. The mothers think their life work is wash ing dishes and cooking and feeding the body—I want to say to them that their life work is doing much more vital and important things. Their life work is the training of their children, for they have them from the time of their birth all the way through, and if they fail in their mission of bringing up these children in the nuture and the rights that belong to them, somebody else must do the work, and that is where our trouble comes today.

I would just like to say to the mothers here today that you have got a man's job, and it is a 'mighty big one at that. I am not one of these elderly ladies who has no boys to raise, I have four boys. I know what I am talking about. My boys have heard all the sacred things of life in their home. They did not have to go out on the street and hear whether the stork brings the baby or anything about that. I want to tell you mothers that it is your duty to tell them about this. What right have you to send a young man out into the world who does not know anything about the pitfalls and the dangers and the sins and the temptations of life? You are not doing your whole duty when you do it.

I am a woman, I am a mother and I consider that I have a mission in this world, and it is not the mission of scrubbing floors and washing dishes. Those are little side issues. My Mission in this world is to give to the world men who will leave a footprint on the sands of time that will help lighten the load of humanity, that the world may be made a little better for my life that has been lived in the tiny corner of a home. Our Commonwealth is only measured by the happy, prosperous homes.

It takes a great deal of charity to handle a boy, but they are manly fellows, and it is something worth all your effort. Sometimes you have to put your arm around the young man and look him straight in the eye when down in your heart you feel like hitting him a good smack.

Sometimes I feel like opening my home to the mothers and daughters and just talking along this line and seeing if I cannot help them get a vision of the wonderful work God has entrusted to the mother's care." You say, "Well, I cannot do that way." Why can't you? The effort is not great enough. You don't make a good enough effort, because I tell you Almight God will help the mother in every case. If you have a big problem, if your boy wants to keep company with a young lady who s not right, talk to him and persuade him in some way, if you can, not to do so. And when you have done all you can just say to God: "Here, I am in trouble, help me out of this difficulty." The conscientious Christian mother has a hope that some people know nothing about, and when the boy goes astray put your arms around him and make h m believe that he is worth more than anything else in the world. I make a great plea for the American motner to wake up and find that she has a mission far beyond the washing of dishes and scrubbing of floors—the mission of the home. Take a girl and say, "Mother is your friend, even if you do the worst thing in the world," and also tell the girl that mother always has been and always will be a friend that "sticketh closer" than anyone else. This is the mother that has been awakened to her mission.



Why not a Modern Roof?

The old wooden shingle has to go the way of all other unsatisfactory building material and is being rapidly replaced by the twentieth century *Brantford Asphalt Shingle.*

Everyone knows how the old-fashioned wood shingle was high in price but low in quality, would warp, curl, get loose, split and rot. The

Brantford Asphalt Shingle

will do none of these things. It is practically imperishable, although costing little more than wood shingles. Again, you save on the laying, as *Brantford Asphalt Shingles* are easier to lay and can be put on not only quicker, but more effectively. Quite fireproof too, therefore reduce insurance rates. Never need repainting, because colors are permanent and fadeless. *Brantford Asphalt Shingles* undoubtedly make a house warmer and more attractive in appearance. They are finished with a coating of crushed natural rock, in green, red and black. Artistic effects can be obtained without extra cost by using shingles of different colors. Write for free booklet to-day.

'Roof Leak'

For protecting tin, iron, wood or felt roofs. Makes any leak watertight and old roofs as good as new. Write for booklet.

Lightning Rods.

A bulletin advocating the use of lighting rods on buildings has just been issued by the Ontario Department of Agriculture. Prof. W. H. Day, of the staff of the Ontario Agricultural College, is the author of after a series of investigations covering thirteen years, that lightning this bulletin, and he demonstrates rods are the protection that science claims them to be. In Ontar o in 1912 the efficiency of rods was 94½ per cent. from the reports of insurance companies Prof. Day found that in every 200 farm buildings insured, 42 were rodded, which is 21 per cent, but out of every 200 farm buildings struck by lightning only 3 were rodded. In this connection Prof. Day observes "We should have expected 42 if the rods were no good."

Lightning rods in Iowa are recorded as showing an efficiency of 98.7 per sent, and inspected rods in Michigan show an efficiency of 99.9 per cent. Records in Iowa show that for the eight years 1905—1912 the average number of insurance companies carrying risks on rodded buildings was 55. The highest number of companies reporting in any one year was 68 and the lowest 46. The total lightning claims paid by all these companies for the whole eight years on rodded buildings was only $4,-464.30—an average of $10.15 per company per year. On unrodded buildings they paid lightning claims amounting to the large sum of $341,-065.32, which is an average of $75.15 per company per year, and the number of unrodded buildings was the same as the rodded ones.

In Michigan where a company insures only rodded buildings which have been inspected a risk of $55,-172,075 was carried during four years and damage aims arising from lightning during that time totalled only $32.

These and other proofs submitted by Prof. Day are practical demonstrations of the scientific fact that lightning rods properly installed are a protection. In using directions for the proper rodding of buildings the reader is reminded that lightning is electricity. Prof. Day asserts that rods should be in metallic connection with the building and that new insulators should be used. This method of attachment is directly opposite to that adopted when lightning rods were first used.

The following are the names of hides and skins used for tanning purposes:—When a calf is born prematurely, or is skinned whilst very young, the skin is called a "bobby." A skin from 7 to 16 lbs. is called a calf-skin, from 16 to 30 lbs. is called a kip, from 30 to 40 lbs. is called a light leather, from 40 to 70 lbs. is called medium leather, from 70 to 100 lbs. is called heavy leather. The skin from a sheep (with wool removed) is called a "pelt."

In marketing, hides should be classified as follows:—Butcher's hides, yearling hides, ordinary butcher's and farm hides, horse hides, bull hides, calfskins. These may, for sale, be still classified as under:—

Extra stout—60 lbs. and upwards in weight. Heavy weights, picked lots. Heavy weights, good condition. Ordinary.

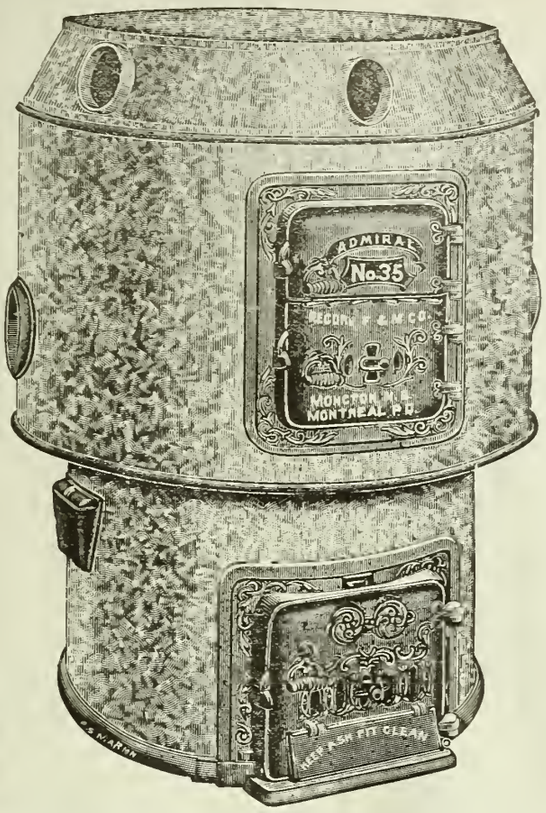
Medium weights—50 lbs. to 60 lbs. in weight. Good condition. Fair condition.

Light to medium weights—40 lbs. to 50 lbs. in weight. Good condition. Fair condition.

Light weights—32 lbs. to 40 lbs. in weight. Good condition. Ordinary condition.

Inferior and faulty.

Dry hides. Bests. Seconds.



Good For Wood and Hard or Soft Coal

This is the furnace you require for all round heating purposes and now is the time to instal it.

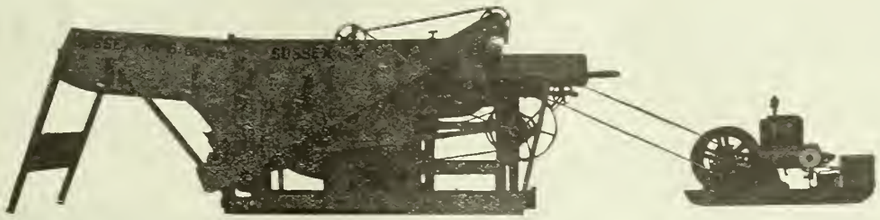
Thoughts of Threshing Suggest at Once the "Little Giant"



The "Little Giant" hardly needs an introduction in the Maritime Provinces. It's the Thresher that every operator aspires to own.

Reasons: They are almost numberless. Economy in power, easy operation, great strength in construction, excellence of material used, are but a few of the qualities which make selling the "Little Giant" such an easy matter. More "Little Giants" are used in the Maritime Provinces than of all other makes combined.

The "Little Giant" two horse thresher can be operated with engines of from two to four horse power. The four horse power requires from four to seven horse power. All threshers are supplied with or without Tailings Elevator, Straw Carrier and Bagger and Trucks.

We guarantee every Machine. Fully tested before leaving Erecting Department.

We also manufacture Hay Presses, Tread Powers, Wood Cutters, Grain Grinders, Feed Boilers, Root Pulpers, etc.

Free Catalog for the asking.

The Sussex Manufacturing Co., Limited, Sussex, N. B.

The N. S. A. C. was looking particularly nice when we visited there last week. Each and every department shows that the men in charge are right on the job. It would pay the farmers of the Maritime Provinces to visit the College Farm as often as possible during the growing season and see how the work is done. The excavations for the foundations of the new Science building is nearing completion and next term will find the College more efficient than ever. Will you be there?

Three Rules for Measuring Hay.

There are two main considerations in all rules for measuring hay, says G. E. Morton, Colorado Agricultural College, first, the method of measuring to arrive at the actual number of cubic feet of hay in the stack, and, second, the number of cubic feet required to furnish a ton of hay.

With regard to the latter, practice is fairly uniform, 512 cubic feet (8 x 8 x 8 being generally accepted as a ton of alfalfa hay in stacks settled about sixty days. Native hay packs more closely, and 422 cubic feet ($7\frac{1}{2}$x$7\frac{1}{2}$x$7\frac{1}{2}$) is a fair amount to allow for a ton. Hay bought in the spring of the year has settled considerably, so that a less number of cubic feet are given for a ton—about 450 cubic feet for alfalfa hay.

The methods of measuring to arrive at the cubic contents of the stack, of course, take the three dimensions, length, width and height, into consideration; but as it is difficuly in actual practice to get the height, the over-measurement is taken instead. The over-measurement is the distance from the ground on one side of the stack, over the top to the ground on the other side.

In taking these measurements it is very necessary to get average measurements, and sometimes where the stacks are very irregular in shape all four sides must be measured in order to arrive at the average width and average length.

Rule 1.—Rule for measuring, small, broad stacks of hay)—One-fourth of over multiplied by the width, then multiplied by the length and divided by 512 (or other divisor agreed upon).

Note: In actual practice I have found this rule very satisfactory for both buyer and seller when the hay is stacked in small, squat stacks, such as are put up by the overshot stacker, and containing from 5 to 20 tons each. Rule 1 is better for the buyer than either rule 2 or 3 when the width of the stack is from one-third to one-half of the over-measur' ment.

Rule 2.—(A Colorado rule for measuring hay)—Subtract the width from the over. Multiply one-half of the result by the width. Multiply the proddct by the length. Divide this product by 512 or other number of cubic feet agreed upon.

Note—Rules 1 and 2 give the same result when the width of the stack equals one-half of the over. When the width exceeds one-half of the over, rule 2 is the best for the buyer.

Rule 3.—(Frequently called government rule for measuring hay)—Add the width and the over-measurements. Divide this by four. Multiply the quotient by itself. Multiply th s product by the length and divide the result by 512 or other number of cubic feet agreed upon.

In other words the rule may be stated as follows: Width plus over, divided by four and squared; then multiplied by length and divided by 512.

Note—This rule is satisfactory for large, tall stacks (25 to 45 tons), because such stacks usually are bigher for their width than smaller stacks. thus giving a greater over-measurement.

Rules 2 and 3 give the same result when the width equals one-third of the over, so that when the width exceeds one-third of the over, rule 2 is better for the buyer.

With ordinary small Colorado stacks, rule 3 favors the seller.

General instructions·

A. Where stacks are from one-third to one-half as wide as they are over, use rule 1.

B. Where stacks have a width more than one-half the over measurement, use rule 2.

C. Where stacks have a width less than one-third the over-measurement, use rule 3.

D. Allow 560 cubic feet to a ton of alfalfa hay settled 30 days, 540 on 60 day hay, 512 on 90 day hay, 48 on hay settled 120 days, 450 on hay bought in late winter.

Tells of Damage That Lightning Can Accomplish.

The famous French astronomer, M. Flammarion, in an article in the New York Herald, gives interesting statistics relative to the loss of life by lightning in different countries, touching upon some of the dangers to be avoided during the storm.

Official statistics, he writes prove that in France there are on an average every year 117 persons killed by this fire from heaven; that is, three dead in every million of the inhabitants! Other countries share with us more or less in this respect. Some pay a greater tribute to Jupiter Tonans, but there are others also which have less to their credit. If we consider the number of persons mortally injured by l ghtning relative to a given number of population, for example a million of human beings, we find that this number, which is three for France, as we have just mentioned, only amounts to 0.36 for England (that is an average of 12.4 victims yearly), two for Belgium and three for Sweden. It rises to 4.4 for Prussia, ten for the United States, Syria and Carinthia and 16 for Hungary.

In 1900 the estimate was seven or eight hundred annually killed by the atmosphereic fluid io the country of Franklin out of 76,000 000 inhabitants. In that year, 1900, alone there were 713. That is an average relatively much greater than the French average and can be explained up to a certain point by the frequence and violence of tbe storms on the other side of the ocean and by the great number of workers out of doors. especially in the fields about the time of the harvests, which is also that when the lightning flash occasions its most disastrous ravages. Perhaps there figures also an element of imprudence on the part of the victims.

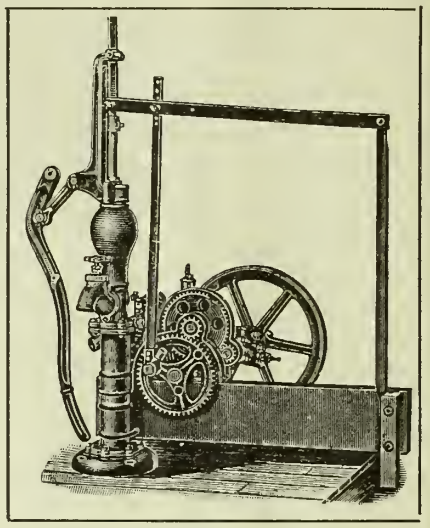
DANGEROUS SHELTERB.

We cannot too often insist on the danger there is, when the storm rumbles, of sheltering one's self under trees, besides haystacks or in currents of air. This has been seen quite recently. In the department of the Doubs last June three workmen busy in the quarries took refuge under a spruce tree during a storm. One of them was killed, the two others were hurled to a distance of several yards. Such tragic accidents occur frequently, in spite of the warnings addressed to those concerned. On the same day, at Maintre, near Chatellerault, in the department of the Vienne, two men at the side of a haystack were thrown over by lightning. The younger man, although not wounded, lost the use of speech.

If certain precautians were observed the damage by the malignant fluid would be less notable. One cannot insist too strongly on shunning exposure out of doors to the loudly proclaimed threats of the thunder, especially in large meadows, across fields or in the woods. While in the case of earthquake it is wise to go out from houses, on the other hand it is better to remain within doors in time of storm. It is also prudent to close carefully doors and windows and not to be near the walls and chimneys. Schercik recommends a feather bed as an excellent refuge

THIS LITTLE ENGINE

is designed to take the place of the man at the pump and anyone who watches this outfit pump water for ten minutes will never again be willing to work the pumphandle. The operating cost is very small and a splendid feature is that this engine can be easily connected to "any old pump." The ladies often start it to pump a single pail of water. They rest while it works.



The Outfit Complete as shown sells for $70.00. The engine alone $55.00. Immediate shipment from stock.

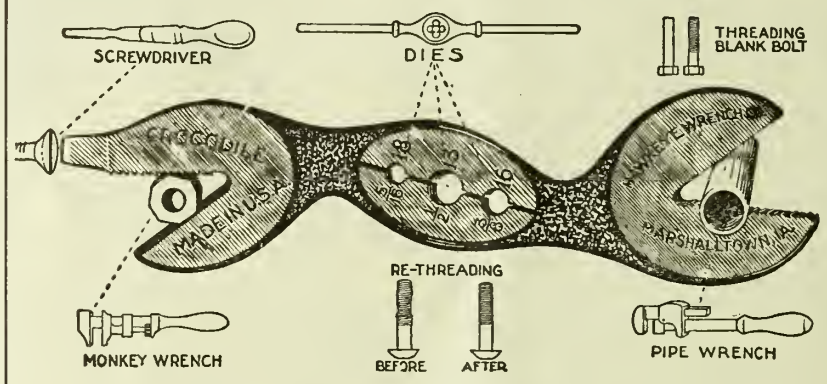
The Crocodile Wrench

An All Around Handy Tool for the Home, Farm and Shop



Six Handy Farm Tools in One

The Crocodile Wrench is drop forged from the finest tool steel and scientifically tempered. Every wrench guaranteed against breakage. It is 8 1-2 inches long and weighs ten ounces.

A pipe wrench, a nut wrench, a screw driver and three dies 5-16, 3-8 and 1-2 inch for cleaning up and re-threading rusted and battered threads, also for cutting new threads on blank bolts. Dies will fit all bolts used on standard farm machinery.

Teeth and dies are case-hardened in bone-black, making them hard and keen.

The dies on this wrench alone would cost $1.50, and would be worth more than that to every farmer, as they would often save valuable time, besides an extra trip to town for repairs.

Sold everwhere for 75 cents cash.

How to Procure a Crocodile Wrench

On receipt of $1.00 we will send you the Maritime Farmer for one year and also one of these Crocodile Wrenches. New subscriptions will date from time of receipt, renewals from date of expiration of present subscriptions. Send us two new cash in advance subscribers to the Maritime Farmer at 80 cents each and we will send you a wrench for your trouble. Or for 75 cents cash we will send you a wrench.

The Maritime Farmer, Sussex, N. B.

WAS ALWAYS TROUBLED WITH BOILS AND PIMPLES

Could Not Get Rid of Them Until He Used

BURDOCK BLOOD BITTERS

All Blood or Skin Diseases are caused by bad blood, and to get it pure, and keep it pure you must remove every trace of the impure and morbid matter from the system by a blood cleansing medicine such as Burdock Blood Bitters.

Mr. A. F. Hopp, Kipling, Sask., writes:—"I was always bothered with Boils, and could not get rid of them, and also had all kinds of Pimples on my face, from early in the Spring till late in the Fall. One of my friends told me about your medicine, and that I had to get something to purify my blood. I got two bottles of your Burdock Blood Bitters, and in a short time I was cured, and I have never been troubled with Boils or Pimples since."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

BUTTER PARCHMENT

Mailed direct to your home anywhere in the Maritime Provinces at these wonderfully low prices :

ONE CENT is all it will cost you to write us a postal, and catalogue and full information will be sent to you **Free Postpaid** by return mail. **Do not wait.** Write it **now.**

HYSLOP BROTHERS, Limited
Dept. R TORONTO, Canada

Mr. W. S. Gunsalus, a farmer living near Fleming, Pa., says he has used Chamberlain's Colic, Cholera and Diarrhoea Remedy in his family for fourteen years, and that he has found it to be an excellent remedy, and takes pleasure in recommending it. For sale by all druggists.

Turley advises travellers on railroads to keep far from the locomotive and to place themselves preferably near the middle of the train. In general, cellars are considered as safe shelters, perhaps not without reason.

DANGER IN FORMING GROUPS.

It is sometimes asserted that silk dresses or wet garments are good protectors against strokes of lightning, and this belief seems justified to a certain point by several authentic observations. In like manner it has been voiced that crowds, groups of persons gathered together during the storm, and the neighboring of animals, especially if they are collected in herds, appear to attract the electric bolts. The number of animals killed by one lightning flash is sometimes very great. Again this year, about the middle of June, in the department of the Landes, lightning set fire to a sheepfold and killed 140 of them. It has caused much greater damage. There is cited the case of a stroke of lightning falling on a herd of 1,800 sheep, throwing 1,200 to the ground and killing 556 in the twinkling of an eye. It should be added that these unfortunate quadrupeds were unluckily penned along an enclosure of iron wire.

Ah! What shall we say of the danger of metalic objects, of firearms and of clock bells and so forth, which seem so many allurements for lightning.

Really it is very difficult and rash to pretend to trace laws for the atmospheric electric fluid. I have under my eyes at this moment a rather recent case which shows us the lightning killing two agriculturists, one a shepherd, from whom it completely removed the cloth, and his dog, all sheltered under the belfry of a church to which it set fire, at the same time breaking the bell in two symmetrical pieces. So do we see it often, tragic or fantastic, sometimes even facetious, as when it rendered mute a loquacious woman, and restored speech to one who was dumb.

Small Water Power Plant.

On Stephen Loines' place near Lake George is a seven-acre pond about 150 feet above the lake. The outlet was a small brook. In the summer of 1902 Mr. Loines built a dam across the outlet, raising the pond about 2 feet. He ran a galvanized pipe line from the dam down the hill side and along the brook. It is four inches in diameter for a short distance, then reduced to 3 inches, and finally to 2 inches, and is about 1200 feet long in all, with a fall of about 110 feet. A 24-inch water wheel of the impulse type is installed in a small power house to which the pipe line runs. The waterwheel develops about three-horse power, and is belted to an electric generator.

According to D. R. Cooper of the New York state water supply commission, this plant is utiltized for sawing firewood to supply the superintendent's cottage and the other buildings during the winter.

A countershaft was erected on the wall in the power house, a building 7 feet by 10 feet in a plan and about 8 feet high. The shaft has three counter pulleys, by means of which the speed of the water wheel may be doubled or trebled. For sawing firewood a leather belt placed on one of the pulleys and run through a small aperture in the side of the power house to the driving pulley on a circular saw, which stands on a small porch at one end of the building.

The superintendent states that by operating the saw continuously for eight hours it would be possible to saw 12 cords of wood, which he estimates to be sufficient to supply his cottage, and such other of the buildings as need wood, for the entire winter. This illustrates very aptly the large amount of work that a small power is capable of doing in a short time.—N. E. Homestead.

Build Concrete Crib Floors and Supports

THEY keep the rats, squirrels and other rodents from carrying away your profits. Millions of dollars are lost to farmers each year through the ravages of rodents in cribs and granaries. Part of this loss is paid by every farmer whose crib floor isn't built of concrete.

Concrete crib floors and supports stop the waste because

They Protect Your Grain

Concrete is strong, durable and clean. It never wears out and needs practically no repairs. It is the cheapest of all materials for cribs and granaries.

Write for this free book "What the Farmer can do with Concrete." It tells all about the uses of concrete and will help every farmer to have better buildings and save money.

Canada Cement Company Limited
713 Herald Building, Montreal

When to Inbreed.

In reply to a question from a subscriber the question of inbreeding is one that can be determined only after a careful study of the individuals involved. It must be remembered that weaknesses and undesirable characteristics are intensified by inbreeding the same as good qualities and desirable characteristics. If the individuals involved are of the proper type and have no particular weaknesses, the intensification of which will result seriously, then it is possible to establish desirable characteristics more easily and much more quickly by inbreeding than by any other method, and this method has been followed successfdlly in some instances. This method has proved advisable only in the hands of intelligent breeders who have given the subject very careful study.

Turnip Growing.

Wm. M. McAdam, Killams' Mills, N. B., who is a successful turnip grower writes: My best success with turnips was a plot of land that had been under a potato crop for two seasons. I harrowed the plot in the fall after the potatoes were dug. In the spring I broadcasted stable manure and plowed and harrowed until it was thoroughly incorporated with the soil. I then furrowed drills and sowed Kangaroo seed. I thinned the plants to one foot apart and cultivated them once. There is no insect pests.

Good Roads Require Permanent Culverts of Concrete.

We manufacture and stock culvert pipe of the following diameters, 12", 20", 24" and 30". For particulars and prices write

Milk Production.

An address by Prof. John M. Trueman, Professor of Agriculture and Farm Superintendent, Nova Scotia Agricultural College, Truro, N. S.

In discussing the production of milk I will begin with the herd. We cannot produce milk economically without good cows. How can we get them? Not by going out into the market and buying them. A few may be obtained in that way. but the price of good cows is too high and the supply too limited to make the method a complete success. If you spend three thousand dollars for 30 cows you woll not be doing any more for the improvement of the herd as far as breeding operations are concerned than if you buy one good bull. In other words, herd improvement can be brought about just as surely and just as quickly by the use of good males as by the use of females. Of course, more rapid progress could be made if both males and females of the right character could be bought at the start. Most farmers are not in a position to invest large sums of money in females, but every farmer keeping any number of cows can afford to buy the best bull obtainable.

Perhaps you will say that money is not available to buy even the good bull. That excuse cannot be accepted. If enough money is invested to maintain ten to fifteen cows or more, then it is imperative that a good male be secured. It would be better to borrow the money and put one or two hundred dollars into a bull containing the blood of high producing dams than to go on using the average bull. Average blood on both sides means average offspring. A superior bull and average cows mean an impprovement with every generation, and before long it will be a superior bull and superior cows.

Having decided to buy a good bull, how can we select him. First, he must be a good individual, showing the typical form of his breed and a vigorous constitution. Second, he must come from a dam that was a good producer. Third, he should be sired by a bull that came from a good producing dam. It is not enough to have the two parents of the bull you are going to buy just what is wanted. Only 50 per cent. of the bulls characteristics on the average, come from his immediate parents. The remaining 50 per cent. come from the ancesters more remote; 25 percent. from four grandparents, 12½ per cent. from eight great-grand-parents, and so on. The only way to be sure of getting good blood in the offspring, therefore, is to ascertain for o certainty that all his ancestors at least the first three generations back were all good. What we want is strong, producing blood in all the ancestors. When we have this there is no pull out or down in the ancestry, all of the animals transmit the same qualities and the offspring must be right.

It has been difficut in past years to secure this kind of stock because records have not been kept and no one could tell us what the ancestry was able to do. Of late years the establishment of the "Record of Performance" tests is giving us much needed information. It is the duty of breeders of pure bred cattle to test their cows, and offer for sale males that will be certain to improve rapidly the live stock in the country. Those breeders should weed out these pure breds as carefully as the wide-awake farmers weed out their grades. It costs money to discard highly bred and expensive animals and the farmer must therefore be prepared to pay a good price for good stock.

The next most important point in producing a good herd is feeding. Vigor and size are two vital factors in dairy cattle. All improved strains, families and breeds of live stock have been developed by the liberal use of food. Keep the calves growing from the time they are dropped. Produce big growthy heifers. Breed them so they will drop their calves at from twenty-seven to thirty-three months old, according to their size. After they are milking, feed them liberally. Nothing is more valuable for the purpose of developing a heifer than a liberal supply of nutritious feed. Instead of seeking for the heifer that can be kept on the least feed try to find the one that will use the largest amount. Other things being equal, the cow that eats the most will make the largest net profit. Given two cows of equal dairy quality, the one larger than the other, the large cow will eat the most, give the most milk and return the most net profit.

Each cow should be fed according to her individual capacity. This necessitates weighing the milk daily from each cow, and keeping track of the feed eaten.

To illustrate the importance of feeding each cow according to her capacity the following illustration is instructive.

In 1909 I had charge of a herd of 25 cows. Two of these cows were Jerseys, No. 25 and No. 30. They both looked like good cows and it would be hard to tell from inspection which was the better cow. That year No. 25 gave 2752 lbs. of milk and ate $87.16 worth of feed. No. 30 gave 6371 lbs. of milk and ate $90.37 worth of feed. Here was an indication that No. 30 was the best feeder and the best producer. The next year. 1910, both cows were fed according to the amount of milk they would produce. Neither one was kept short of feed,,, neither was the feed wasted, one pound of grain, besides roughage, for each three pounds of the milk given. No. 25 gave 6321 pounds of milk and ate $84.41 worth of feed. No. 30, however, kept on eating feed and prolucing milk until she produced 9341 pounds of milk and ate $97.91 worth of feed. She ate half a ton more grain than No. 25 and surely she was an expensive cow to keep. Right here is where the interest lies in this illustration. Although an expensive cow to feed, she produced practically 3000 pounds of milk more than No. 25, and gave a return above cost of $75.89 against $34.14 from the other cow. This illustration could be duplicated again and again from the records of the cow that I have handled during the past 6 years.

In order therefore, to be successful in handling dairy cattle one would put especial emphasis upon the necessity of securing a first-class bull from a superior milking family, upon feeding the calves liberally in order to promote as much growth and vigor as possibble and upon close attention to the individual cow in order that she may receive al the food that she is capable of using to good advantage.

Mr. W. R. Barss moved a vote of thanks and welcome back to Nova Scotia be tendered Prof. Trueman.

A Suggestion to Sheep Raisers

WHY NOT? Save all your dead lambs, by breeding our Karakule-Arabi rams to your flock, you can get $4.00 to $8.00 for their skins. The skin of every dead lamb will bring you a profit where now they are a total loss. If from any cause the ewe dies after 4 months of pregnancy, the Unborn **Baby Lamb Skins often bring from $9 to $15.**

We have a number of Half-Blood, Three-Quarter Blood and Full Blood Karakule-Arabi Rams and Ewes ready for delivery on short notice.

Apohaqui, - New Brunswick.

Agricultural Conference.

A meeting, which means considerable to the agricultural development of New Brunswick was held at Agricultural Office, at Fredericton, July 23rd. The occasion was a conference between the Minister of the Department and the members of the staff.

Those present were.—Honorable J. A. Murray, Minister; J. B. Daggett, Secretary; A. G. Turney, Horticulturist; R. P. Gorham, 1st Assistant Horticulturist; D. B. Flewelling, 2nd Assistant Horticulturist; Robt. Newton, Director of Agricultural Schools; C. W. McDougall, Dairy Supt.; Seth Jones, Poultry Supt.; J. E. DeGrace, Supt. of. Agr. Societies; H. B. Durost, Instructor in Fertilizers and Bee-Keeping; W. D. Ford, Animal Husbandman; B. T. Reed, Field Husbandman; H. N. Flewelling of Dairy Division of the Federal Dept. of Agriculture.

On account of the Summer Science School being in session, at Woodstock, R. P. Steeves, Director of Elementary Agricultural Education was unablbe to be present.

The purpose of the Conference was to obtain the experience of the various members of the staff, that together they might compare notes and devise ways and means for continued devel-

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home tre tment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience,** we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. **If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, failing or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid,** to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured,** my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all.—**young or old.** To **Mothers of Daughters,** I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask** for the **free treatment to-day,** as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309, WINDSOR, ONTARIO

opment and enlargement of the work of the Department.

The session opened at 10 o'clock a. m., and, with only a brief intervale for dinner, continued until evening.

Each division was taken up and was thoroughly discussed.

The staff were of one mind, that the most important thing to New Brunswick today is th proper care of its soil, the conservation of its natural resources and the restoring of the run-out and unbalanced farms.

Under the direction of Mr. Newton, a vigorous policy of education will be instituted, through the schools at Woodstock and Sussex next year, also in farm to farm visitation, with the object in view of bringing about a better cultivation of the soil and a proper rotation of crops.

The drainage work of the Department will be continued and definite steps will be taken to enlarge upon it.

The live stock interests were carefully discussed. It was decided to make the Department a sort of clearing house for live stock. It is proposed to ask all breeders to list with the government whatever animals they have for sale and buyers will be asked to apply to the Department for advice and information as to where purebred stock can be found.

The present policy of the Department will be continued, of giving a bonus upon purebred cattle imported by the Agricultural Societies. A small importation will also be made. It was decided to establish three demonstration flocks of sheep in the province. In the next issue of the Maritime Farmer we hope to make a definite anouncement as to the policy of the Department in this connection. The question of testing cows for performance was gone into at considerable length. The work being done by Mr. Flewelling at Sussex was highly commended. A start has been made in Carleton County and this work will be pushed forward with vigor. The matter of co-operation in this work with the Federal Department will be a matter of consideration later between the two departments.

The question of commercial fertilizer eame in for much discussion. Mr. H. B. Durost is making a number of experiments in the potato districts with home-mixed fertilizer. It was decided to commend the work of the Agricultural Socities United in this connection to the various agricultural societies.

Bee-keeping and poultry raising were also discussed. Some special work will be done next season in the distribution of purebred eggs among the schools. Mr. Jones was instructed to give the question of fattening stations careful consideration and to advise at a later date. The usual encouragement will be given to the bee-keeprs. With the advanced work in horticulture, it is felt that bee-keeping is very important to the province.

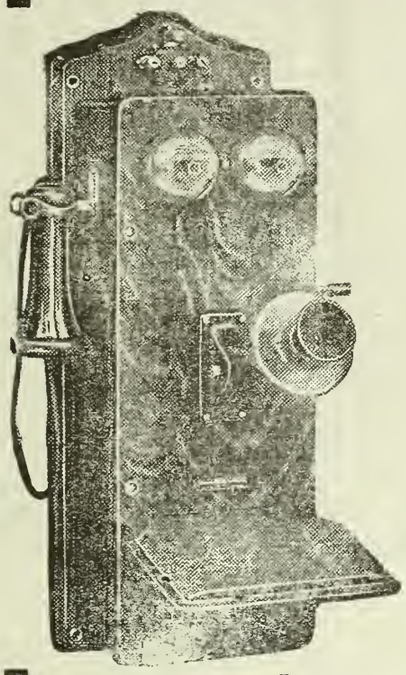
The Horticultural Division under the direction of Mr. Turney, was discussed and the present policy of aid to the horticulturists of the province will be continued and enlarged upon.

So satisfactory was this conference that it has been decided to hold several during the year. The conference adjourned to meet again in October.

What it Cost to Fill a Silo in the Corn Bely.

The cost of filling the silo will vary a great deal upon different farms. The cost of a ton of ensilage depends upon the methods employed in growing the corn and filling the silo. If a man is a good farmer and raises a large crop of corn and the cost is based on the cost of producing an acre of corn, it will be seen that this ensilage will cost a great deal less per ton than the ensilage produ*ed by his neighbor who uses a small amount of corn. Last season I saw one farm where 5 acres filled a 100-ton silo, while on another farm not more than three miles distant it took 25 acres to fill a 100-ton silo. The market value of the land was about the same. It can thus be seen that estimates on the cost of production will vary greatly, probably due more to the amount of ensilage produced per acre than to the cost of filling, although that is no small itemThe variation in estimates will not be so great if it is figured on the basis of the bushels of corn produced per acre, at market value. Professor Mumford, of Illinois, states that corn yielding 42 bushels per acre and worth 35c on the market will give ensilage at $2.-75 per ton. In my own instance, last year where it took 18 acres to fill two silos of 110 tons each and with an estimate of the corn at 60 bushels per acre, at 35c per bushel, and with the labor of filling extending oper a period of four days, and costing $110, and allowing the stalks to be worth $1 per acre on the market, the cost of ensilage at $2.-49 per Haecker of Nebraska Solution bases his estimate upon the cost of growing the corn and statest that ensilage can be grown and put in the silo at $1.95 per ton. Mr. Richardson, of Scott County, Iowa, said it cost him far growing and filling, $1.15 per ton. I believe careful farmers can easily produce ensilage at $2.50 per ton, figuring the cost of the market value of the corn if it had been harvested and sold, and at this rate it is one of the cheapest and best foods in connection with clover hay that can be produced.—C. W. Pugsley.

Independent Systems Constantly Growing



The number of municipal, government and independent local telephone systems in Canada is constantly growing. The independent telephone movement, in spite of tremendous opposition, is a huge success. If your locality is without telephone service, write us and we will tell you the steps to take to organize an independent system.

We are the largest Independent Telephone Manufacturers in Canada. We carry complete stocks of guaranteed telephone materials, and can make shipment within 24 hours after receipt of order. Our telephones are superior to others in design, material and workmanship. Send for Free Trial so that you can test and compare with others.

Ask for No. 3 Bulletin—containing the latest information about building telephone lines—Also No. 4 describing our magneto telephones is free on request.

Let us quote on your year's suppply of dry cell batteries.

Montreal, P. Q.; Victoria, P. C.

SYNOPSIS OF CANADIAN NORTH-WEST LAND REGULATIONS.

THE sole head of a family, or any male over 18 years old, may homestead a quarter-section of available Dominion Land in Manitoba, Saskatchewan or Alberta. Applicant must appear in person at the Dominion Lands Agency or Sub-Agency for the District. Entry by proxy may be made at any Dominion Lands Agency (but not Sub-Agency), on certain conditions.

Duties—Six months residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres, on certain conditions. A habitable house is required except where residence is performed in the vicinity.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead. Price $3.00 per acre.

Duties—Six months residence in each of three years after earning homestead patent; also 50 acres extra cultivation. Pre-emption patent may be obtained as soon as homestead patent on certain conditions.

A settler who has exhausted his homestead right may take a purchased homestead in certain districts. Price $3.00 per acre. Duties—Must reside six months in each of three years, cultivate 50 acres and erect a house worth $300.

The area of cultivation is subject to reduction in case of rough, scrubby or stoney land. Live stock may be substituted for cultivation under certain conditions.

W. W. COREY, C. M. G.
Deputy of the Minister of the Interior.

Social Conditions of Farm Life.

(Continued from page 753.)

of conservation, we would become so broad-minded that we would be surprised with ourselves and surely believe that our lots had been cast in pleasant places. A short poem illustrates present conditions most admirably:

Our Neighbors.

We had some, offish neighbors once
who moved in down the road,
We thought they was about the proudest folks we ever knowed.
And when we'd meet them now and then, we'd hold our heads up high
So that they couldn't snub us, even if they were to try
It realy made me nervous so I just braced up one day,
And reckoned that I'd show them my manners anyway,
So Sunday 'stead of turning round and looking at the view,
I looked at them and said "hallo!"
And they said "How-de-do."
It wasn't the cold and formal greeting that you've often heard,
They smiled and said it heartily like they meant it every word
'Tis serious to reflect on what we miss along life's way,
By just not being social and good humored day by day.
And nine times out of ten you'll find this rule works right and true,
Just tel the world hallo, and 'twill answer How-de-do.

In conclusion I would mention factors that are detrimental to social life anywhere, and of these factors, the principal are jealousy, envy and narrow-mindedness.

Of the first, let us take conditions right in this association. Here we have a very young man as president, are we not very sure that there are older men jealous of such proceedings, and I also know that there are men just past the prime of life, who are jealous of the influence this honorable young man creates in public associations. To my mind, it is much better for the young man or woman to be very enthusiastic, even if in more than one department of the farm branches than to have no enthusiasm for anything except to trade horses and smoke tobacco.

Just a little aside from jealousy, comes envy. It is just as detrimental to sociability as one can imagine, and is often the source of slander and dis reputable gossip.

How much more courage there is put forth in the much abused prizering contests of hard blows, wrestling or running, than there is in the low, slanderous, behind your back, lies of the envious, narrow-minded persons, who can be so sociable to your face, but most abusive when opportunity offers. Yea, open rebuke is surely better than secret love.

Open sociability is what is needed to make farm life more agreeable.—Wm. H. Moore, before Farmers' and Dairymen's Association.

Owing to the abundance of grass-seed, ophthalmia is prevalent in sheep and cattle just now, and as a remedy the following lotion is recommended:—1 oz. of laudanum, 5 drams sul. zinc to 1½ pints of clear water, or 1 dr. cocaine to 5 drams sul. zinc, to the same amount of water. The best method of getting the lot on into the eye is per medium of a sewing machine oil can. The can with a cork over the nozzle. A small wooden forceps, for extracting grass-seeds from the eye is also useful to carry.

Bessie's Mother—Bessie, did you let that Mr. Smuggle have a kiss?

Bessie—Yes, mamma, I did! He saih it would be a good-by kiss and I was just dead anxious to have him go!

"IF ENGLAND DIES, YOU DIE!!"

How Can Farmers Best Help England in Her Death Grip With Europe?

FOOD FOR THOUGHT

"IF England dies, you die." Such was the grave warning uttered in the city of St. John a few nights ago by Sir Rider Haggard, noted author and member of the Dominion's Royal Commission.

Sir Rider has been led to doubt if Canadians fully realized that England is in the death grip of Europe and whether we are sufficiently impressed with the view that this is our war, quite as much as it is England's.

The Maritime Farmer, in its front page article, has been priviliged to deal in the past with purely agricultural matters... Unfortunately, Germany and Austria have decreed that the plowshare shall be forged into the sword and England has been drawn into a struggle greater than the world has yet witnessed.

It is estimated that twenty millions of men will be engaged in this horrible and uncivilized butchery. Already English dead have been accounted for and thousands of brave fellows will follow where the memories of Waterloo and their fathers lead. We in Canada have contributed our first installment to the grim tragedy and the signs point to other thousands who will also go to the front.

Then, what of the morrow? "If England dies, you die," are words which will inspire every Canadian to do the best that in him lies. Already the fields of Europe are being tilled by women. What will the next few months mean to Canada and particularly to the Maritime Provinces. Will the women be working our farms in two, four, six, twelve months hence? These are questions which must be soberly asked and thoughtfully answered.

But suppose Canada does not reach the state where her men MUST go to the front. We still can be of inestimable assistance to the Motherland. Every acre of soil that is possible to prepare should be broken for next season's crop. England is in her death grips. To Canada she must look for food and our duty is to see that the men at the front are fed. There lies our goal.—It is not to be a question this year of best prices in best markets. We are to feed the men in the trenches. Lord Kitchiner is credited with the statement that the war will last eighteen months. These long, dreary months will be pregnant with anxiety, the loss of dear ones, the dislocation of all lines of business and the many other sides of HELL that accompanies war.

The FARMERS of the MARITIME PROVINCES should see to it that the approaching few months are put to the very best use in providing for the LARGEST CROP THAT IT IS POSSIBLE TO RAISE. There will be need for every pound of foodstuff. Canada's offer of five million bags of flour to England was received with joy and thankfulness. It is not the luxuries of life that will be in demand during the months to come but the commonest neces sities. They are produced on the farm. In addition to the food supply for men, the demand for fodder for the tens of thousands of horses at the front will be enormous. Europe, deluged in blood, cannot produce it, and Canada must help. That is why every possible effort should be put forth at the earliest possible date to fit the fields for the crops of next year. No living man knows what the coming months may have in store for us. The summer of 1915 may find the fields of the Maritime Provinces tilled by women and men too old to bear arms. The very produce, which the farmers are urged to make ready for, may be their next year's rations on some distant battle field.

"If England dies, you die," are words which should burn their way into every man's understanding. They are whips whose scourge should awaken us to the realities of the present day situation. Without England, WHAT?.. Where will our home, our liberties, our freedom and everything we hold dear, be? And England is in the death grips. So says one of the foremost men in the British Empire. Already the women of the Tight Little Island have bid Godspeed to husbands, sons, brothers and have, like Spartan mothers of old, exhorted them to be true to British traditions, to that history of wonderful deeds and devotion to duty, which has made England what England is, our protector, our champion.

This is not mere froth. It is the Gospel of to-day that should be preached in every section of Canada. The question on every man's lips should be, what can I do for the Empire. The Maritime Farmer has given the answer in part to every agriculturist in the Maritime Provinces. See to it, then, that, realizing "If England dies, you die," you will give your best effort to sustain a cause, than which there has been none worthier in all history.

The present situation is unique in the history of the Dominion of Canada. It is the first time since confederation that we have been confronted by an enemy whose sole interest is that of conquest. Germany desires not only that her supremacy be indisputable in Europe but she would extend her colonies and thus secure to herself a haven for the teeming millions who have long since overcrowded the Fatherland. Canada, the brightest jewel in the British colonial crown, would doubtless be the first concern of Germany. "Shall we submit?" "Are we but slaves?" There can be only negative answers to both questions. To Canada, in her death grip, England looks for subsistance. We know what the response will be Every acre of available land should be prepared this year for next year's crop. We can at least feed the men at the front, always remembering that grave warning, "If England dies, you die."

The New Brunswick Agricultural Societies United

By A. R. Wetmore, Clifton, Kings County, N. B.

Secretary New Brunswick Agricultural Societies United
Secretary Kingston Agricultural Society No. 23

Editor The Maritime Farmer:—

During the past weeks many inquiries have been received regarding the work which has been done by the "Kingston Agricultural Society" and the work which is to be done by the New Brunswick Agricultural Societies United" in the buying of unmixed fertilizers. The purpose of this article is to place clearly before the farmers of New Brunswick an outline of this work.

It has been felt for years that the farmers of New Brunswick have been paying far too much of their chemical fertilizers. The matter has been discussed at meetings of the Farmers and Dairymen's Association and elsewhere. It has seemed to those who have been spending considerable thought along this line, that co-operation in the buying of fertilizing ingredients and the mixing of those ingredients on the farms by the farmers themselves would be the solution to this perplexing problem.

The buying of ingredients and home mixing is not a new thing and is no experiment. The Agricutural Society at Kingston has been doing this work for its members for twenty-five years or more, and the success which they have attained has proved beyond a doubt that this method is the most economical and most satisfactory way of buying and using commercial fertilizers.

While the Kingston Society has been buying the ingredients and distributing those materials to its members at cost and at a price that enabled the members to use a mixture which gave much better results at less cost than would be possible in using ready mixed goods, yet that cost of ingredients was not as low as was desirable. In the past this Society has been buying the materials from local firms. During the last two years it has been found that the buying of those ingredients from the manufacturers or importers direct would materially decrease the cost.

As an instance of the saving to farmers brought about by the use of "home mixed" fertilizers we have the following: The highest grade complete fertilizer "ready mixed" has been costing the farmers from $38.00 to $42.00 according to the amount purchased. Previous to 1913 the Kingston Society was able to sell to its members ingredients, which when combined gave a fertilizer as good or even better than the ready mixed goods, at a cost of $32.60 per ton.

During 1913, owing to the fact that eight other societies placed their orders with the Kingston Society, which society financed and purchased the materials, the prices obtained were practically the same as prices quoted to the fertilizer companies. As a result, materials to make the highest grade fertilizer were sold to the members of the Kingston Society at $26.00 per ton for cash. To the other societies this price varied with the cost of handling and transportation. To those who had been using ready mixed goods this meant an average saving of about $15.00 per ton or about 37 per cent. The Kingston Society handled during 1913 about $10,000 worth of fertilizer and at the price given, compared with the cost of ready mixed goods, this means a saving to the formers of about $3,700.

This goes to show the benefit of co-operation; thus making possible the buying of ingredients in large quantities, of buying from the manufacturing syndicates direct and of buying for cash.

From the work of the Kingston Society in the past and the good results shown by its co-operation with other societies during the last year came the idea of a Central organization which would render possible the buying of fertilizing ingredients for all agricultural societies in New Brunswick, and thus give the members of any of those societies the adantage of buying a much superior article and at much less cost.

It is hardly necessary to give the various steps taken and the many discussions which took place before a satisfactory plan was arrived at. Suffice it to say that a number of interested men spent considerable time and thought upon the matter. It was finally decided to form a central organization which would be known as the New Brunswick Agricultural Societies United." This organization was incorporated during the last session of the Legislature at Fredericton under a special act as follows:

BILL.

"An Act to Incorporate the New Brunswick Agricultural Societies United."

Whereas, the Agricultural Societies which have been incorporated under the provisions of the Agricultural Act and amending Acts, find it necessary to have a central organization to purchase to advantage fertilizing ingredients in quantities and for other purposes in connection with carrying on of the work of the said Agricultural Societies;

And Whereas, it has been deemed expedient to incorporate a Society for the purpose of purchasing and distributing to such Agricultural Societies the necessary ingredients to make chemical fertilizers and in other ways to assist the farming industry:

Be it therefore enacted by the Lieutenant-Governor and Legislative Assembly, as follows:

1. Austin R. Wetmare, Burrill N. Shaw, Malcolm A. MacLeod, Robert G. Murray, Hastings N. Flewelling and Henry F. Puddington, their associates, successors and assigns, be and they are hereby created and declared to be a body politic and corporate by the name of The New Brunswick Agricultural Societies United, and by that name shall have all the general powers and privileges, made incident to a corporation by Act of Assembly in this Province or otherwise for the purposes hereinafter mentioned, being in this Act hereafter referred to as The Association. The six persons named in this section shall be provisional directors of the association, and Robert G. Murray and Austin R. Wetmore shall be provisional President and Secretary respectively, and they shall hold office until the first annual meeting of the association. The directors shall have full power and authority to manage the affairs of the association subject to the by-laws and regulations, which may from time to time be made, and shall act until the first annual meeting hereinafter mentioned at which time, and each year thereafter, directors shall be elected.

2. The Association is hereby authorized and impowered to purchase fertilizing ingredients and to arrange for the importation, warehousing and distributing of the same to any Agricultural Society, and when authorized by Order-in-Council of the Lieutenant-Governor-in-Council to undertake and carry on any other work or business which may be of advantage to the farming industry.

3. The Association is hereby authorized to obtain credit from any incorporated Bank within the Province, and to pledge and hypothecate such of its property as may be necessary or incident to financing such business.

4. The Association shall file with the Department of Agriculture on or before the first day of January in each year, an account in detail of its receipts and expenditures during the year ending the first day of November preceding, in such form as the Minister of Agriculture shall prescribe."

In order to get the best results it is necessary for each and every Agricultural Society interested to be in a position to purchase through the Central Organization on a cash basis. Regarding the financing of orders for cash I will give our experience of last year and the method will be practically the same in doing business with the Central Organization. The following arrangements were made with banking institutions at St. John, Sussex, Hampton and other places, and these arrangements may be made at any banking institution in the Province that is convenient for any society.

Form of Guaranttee to a Bank.

To the Bank of .....

In Consideration of The Bank of.... .....making advances to ..... either by the discount of negotiable securities, consisting of Bills of Exchange or Promissory Notes, or by overdrafts, or otherwise, from time to time as the said Bank may think fit, ... hereby guarantee payment in full of such negotiable securities or overdrafts, or other indebtedness. This is a continuing guarantee, intended to cover any number of transactions, and .....agree that the said Bank may deal or compound with any of the parties to the said negotiable securities and take from and give up to them again security of any kind in their discretion, and that the doctrines of law or equity in favor of a surety shall not apply hereto. It is also agreed that the guarantee shall be liable for the ultimate balance remaining after all moneys obtainable from other sources shall have been applied in reduction of the amount which shall be owing from .... to the said Bank, but the said Bank shall not be bound to exhaust all such recourse against other parties previous to making demands upon.....for payment, the intention being that the Bank of .....shall have the right to demand and enforce this guarantee in whole or in part from the guarantor whenever the principal debtor, or other party or parties concerned, fail to discharge any obligation they have entered into.

.....
.....
.....

As witness.....hand at.....this .....day of .....

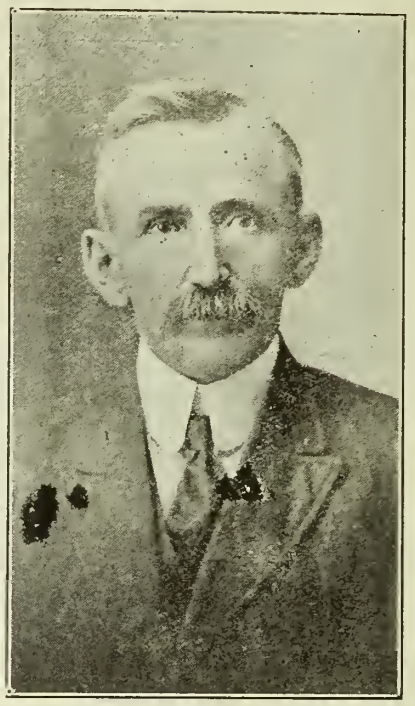
Witness:

This guarantee was filled in and signed by the President, Secretary-Treasurer and Board of Directors of each Society and deposited at the bank. When it became necessary to make payment for fertiizer the Secretary gave the bank the Agricultural Society's note, signed by the President, Secretary-Treasurer and the chairman of the finance committee, for the required amount.

In doing business with the Central Organization the Agricultural Society, in addition to the foregoing arrangement, will furnish the Central Organization with a certificate from the bank with which they are doing their business, showing that the necessary amount is there to their credit and subject to sight draft of the Central Organization on the arrival of their goods

The "New Brunswick Agricultural Societies United" is now a live organization and ready to do business with and for any Agricultural Society in New Brunswick. We would like it clearly understood that the purpose of

(Continued on page 810)



MR. A. R. WETMORE.

The home mixing of fertilizers in the Maritme Provinces has been systematically carried on for a longer period of years by the farmers of the Kingston Agricultural Society than by any other organized body of farmers in these parts. While Secretary of the above mentioned Society, Mr. O. W. Wetmore of Clifton, carried on the good work and on retiring from office his successor, Mr. A. R. Wetmore, the writer of the accompanying article. aud whose photo appears for the first time in the columns of The Maritime Farmer continued the good work and went a step farther in extending the helping hand to other Agricultural Societies in the provinces. His fertile mind originated the N. B. Agricultural Societies United scheme which has been endorsed so heartily by Hon. Jas. A. Murray, Minister of Agriculture and his colleagues in the Legislature of New Brunswick. Mr. Wetmore has given a great deal of his time to the successful organization of the N. B. Agricultural Societies United. As Provisional Secretary, he has worked hard and gratituitously and when the business assumes larger proportions and requires a guiding hand, who will devote all his time to the development of the work we know of no one who is more conversant with the work in all its phase s than is Mr. Wetmore and the N. B. Agricultural Societies United should see to it that he gets the appointment. He will certainly be the right man in the right place. He's a live wire.

Another gentleman who has given considerable of time and attention to the question of cheaper fertilizers for the farmers of New Brunswick is R. G. Murray, L. L. B., of St. John, who owns a nice farm at Loch Lomond, St. John County. Mr. Murray, for many years, has been an able advocate for the farmers. His scheme as originally propounded was for the government to take entire charge of the fertilizer question. He, however, heartily concurs with Mr. Wetmore's plan and as President of the New Brunswick Agricultural Society United, he is using his whole-souled efforts in furthering the cause of which he has been such an ardent advocate.

Milk Fever and How to Combat It

While in Berwick last week we heard Mr. L. D. Robinson of that town relate how he had saved the life of a valuable cow for a farmer in Lunenburg County by applying the air treatment by means of an atomizer, the only available instrument. His success with this case goes to show what may sometimes be accomplished in urgent cases by farmers in the absence of a veterinary by using good judgment and being resourceful.

The following article on milk fever, prepared by Mr. Irving M. Avery, manager of Auray Farms, Sparta, N. J. for the Holstein-Friesian Register will be interesting to our readers:—

"Not so many years ago the words "milk fever" and "total loss," were almost synonymous. This disease was pretty generally considered fatal, and the unfortunate dairyman took his loss resignedly and said "Kismet," or perhaps other words to the same effect. Today, however, the situation is changed and authorities claim that less than 5 per cent, or one out of every twenty only, of the animals afflicted die of this disease; and so this dread malady, which in the past has been the cause of heavy losss in the dairy herds of this and other countries, because of the wonderful efficacy of the so-caller sterilized air treatment, and the increasing familiarity of dairymen with its every day use, no longer has the power of inspiring the fear in the mind of the average man that it once had.

"In a few simple words which every one may understand I will try to call attention to this comparatively new treatment and to consider the disease, its causes and effects. It is almost impossible in a short article of this kind to write anything of any particular interest to experienced breeders or anything that has not already been said, in some form or other, many times before. That is not the idea, but, rather, to outline my own experience as clearly and simply as possible for the benefit of the layman.

"The average man reads about "parturient paresis," or a "plethora of blood plasma containing an excessive percentage of glycogen" and he is apt to become discouraged, and no wonder. Well, all this is only a very high-sounding and rather difficultt way of saying just plain "milk fever", although to be exact, the disease is not really a fever at all, but anemia or lack of sufficient blood in the brain, brought on (or as a tchnical treatise might say, "superinduced") at the time of parturition, or calving, by an excess of blood in the udder with a consequent uneven distribution throughout the circulatory system, resulting in anemia of the brain and a form of apoplexy.

"The theory of successful treatment is so simple as to be readily understood by every dairyman once a clear comprehensive and thorough explanation has been made him. It consists merely of the proper inflation and distention of the udder by pumping in sterilized atmospheric air, thus relieveing congestion and bringing about a return of normal distribution of blood throughout the body. So far as I know, no animals other than milch cows are subject to this disease and it usually attacks only those in the best condition and the heaviest milkers. It rarely makes its appearance until the animal is at her best, usually from about five to seven years of age, and cows having had one attack are predisposed to the disease and more liable to affliction than in the case of those that have never suffered from it. Heifers with first or second calves are almost entirely free from it and I believe it is rarely manifested in cows over eight or nine years old whose milk yield has commenced to decrease somewhat.

"The symptoms are luckily very well defined and easy to reeognize once one becomes thoroughly familiar with them The animal is constipated, because of the approaching paralysis of the bowels; is extremely restless; looks wild and staring from the eyes and, after a time, begins to "weave" and stamp. Later on she will stagger and show signs of increasing weakness, especially in the hind parts, until finally she collapses completely, invariably dropping upon the right side, with the head drawn around to the left and almost touching the hind quarter on that side. Later still, paralysis by this time having become general and if the attack is severe and far enough advanced, she appears to all intents and purposes unconscious and may be handled at will. The eyes are observed to be fixed and glassy, and the body apparently insensible to any pain. The limbs may be placed in any position desired without the least resistance and the victim appears to the inexperienced very close to death. Right here it would be advisable to send an S. O. S. call for a veterinarian unless you are familiar with the handling of such cows and have at hand the necessary appliances and help, in which event expert assistance may hardly be necessary.

"If a competent veterinarian is summoned the proceeding on his arrival will be somewhat as follows: He will first of all order plenty of clean bedding and have th animal propped up from underneath the right side by means of bags filled with straw or some such contrivance, so that she may rest as nearly as possible upon the breastbone, the object being to take the weight off the right lung and thus relieve her respiratory action. Next he will carefully wash the udder with antiseptic soap placing a clean bag or cloth underneath to keep the parts clean; after which he will thoroughly disinfect the parts with a 4 or 5 per cent. solution of lysol, pure carbolic or other equally good agent.

"The apparatus used for injecting air into the udder is very simple and consists of a rubber bulb to be compressed in the hand, next to which comes an air chamber or reservoir of about the same size to regulate the pressure, and then comes several feet of ordinary rubber pipe or tubing halfway of the length of which is included a small metal cylinder filled with carbolized cotton through which the air passes, and on the extreme end of the rubber pipe is fixed an ordinary milking tube. The utmost care should be taken during the operation to avoid all danger of infection and thus prevent inflammation of the udder or caked bag, with the possible loss of one or more quarters later on. This point cannot be too emphatically emphasized. The milk tube should be boiled for at least ten minutes before use and then placed in a jar containing a 5 per cnt. solution of the antiseptic solution at hand and allowed to remain for several minutes prior to insertion in the teat. Be certain to avoid drawing any milk whatever from the udder before commencing operations. In fact, at Auray Farms, we make it a rule never at any time, whether sick or well, to milk a cow completely out until at least twenty-four hours after she has dropped her calf. The resulting complete distention of the udder has somewhat the same effect as the artificial distention by the air treatment and acts as an excellent preventive against an attack of milk fever. In the event of a very large and badly swollen udder a little milk may be taken if the cow seems all right, but only enough to afford relief and she is never milked out clean the first day.

"When all the parts, including the operator's hands and the apparatus itself, have been thoroughly sterilized, carefully introduce the milk tube into one of the teats and commence pumping air into the quarter, meantime tapping and gently massaging the part, so that the remotest recesses may become distended. When all the air possible has been injected, withdraw the tube gently, being careful to pinch the teat immediately upon ite removal so as to prevent any outflow of air. Then carefully tie the teat about in the middle with a piece of hard tape—tie it hard so that no air can leak out. Again disinfect the milk tube by immersion in the antiseptic solution and repeat the operation upon the remaining quarters.

"One good feature and so far as I know the only one, of the disease is this: The afflicted animal either succumbs or completely recovers in a comparatively short time—you get quick action and are not kept long in suspense and there is no tedious convalescence. I have known cases where a cow survived a severe attack and was up and eating hay, apparently none the worse, a few hours after treatment. A great deal depends upon promptness in recognizing symptoms and combating the disease. For this reason every progressive farmer should equip himself with a milk fever outfit and thoroughly familiarize himself with the theory and practical method of treatment, because it is frequently impossible to secure the services of a competent vetetrinarian at short notice. Outfits may be obtained at a very small cost, some, I believe, as low as $3.00 from any reliable dairy supply house.

"Sometimes in aggravated cases if the air becomes absorbed and no improvement is apparent after three or four hours a second treatment identical with the first is necessary. Generally, however, if the case has not been neglected too long before beginning she will get on her feet in a few hours after treatment. The tapes should not be removed at once but allowed to remain in position for an hour or so after recovery, after which time the contracting muscles at the extremity of the teats will retain the balance of the injected air. When satisfied that the patient has completely recovered, and under no circumstances until after about twenty-four hours have elapsed, gradual milking may commence. It will probably be several days before satisfactory results are obtained in the way of milk production—however, it is surprising how quickly cows will sometimes recover under careful handling and come up to their proper milk flow I have had a cow survive a bad case of milk fever and later go on A R. O. test, afterward making a satisfactory record, less than three weeks from the time of being attacked.

"It is somewhat difficult for a progressive dairyman to wholly avoid milk fever. If a cow is to do her level best at the pail she must certainly be well fed up to the time of calving and in tip top condition. This, of course, increases the chances of contracting the disease. On the other hand, by taking away all feed and practically starving a cow for a considerable period before parturition, the chances of milk fever are materially lessened, but at the expense of decreased efficiency, because the milk flow will undoubtedly be somewhat reduced in consequnce and it becomes doubtful if the animal, for that year at least, will ever attain her maximum production.

"In the case of purebred animals intended for A. R. O. work and expected to go on test it is of prime importance that they be in the very best possible physical condition in order to do their utmost in the matter of performance. Therefore, at Auray Farms, we feel justified in running all chances of milk fever for the sake of attaining maximum production; but at the same time we take every precaution to prevent, and, if necessary, to combat the disease. A week before calving all grain feeds except bran are discontinued and the latter is given in the form of a mash, with plenty of salt added. In addition, cooling laxative feeds are given —green grass, green oats of green corn if possible, but if not available we feed a liberal supply of cut beets or beet pulp, etc., and alfalfa or clover hay ad libitum. Also once daily a handful of oil meal, which we consider very beneficial. Immediately after parturition we give a drench of 1½ lbs. Epsom salts with 1 oz. of creolin added which restores the normal movement of the bowels and prevents any fermentation. No feed is offered for six to eight hours and then only a bran mash with oats and salt. The following day, if the animal seems all right, we commence with about two pounds at a feeding of a mixture of equal parts of bran, dried brewery grains and crushed oats; and alter on as she begins to come to her full flow we substitute our regular ration, a little at a time, until finally, after about a week, she is taking 10 to 12 pounds daily of her regular feed mixture. If she continues to increase as she should the feed is gradually increased to corerspond—generally about one pound of feed for every four pounds of milk. We have never lost a cow because of milk fever, although we have had several severe cases. We do not particularly fear it, but we certainly do not welcome it.

"In conclusion, I might add a few "dont's" which I trust will meet the approval of all those experienced in handling milk fever cases and which, I hope, may be of some use to those as yet unfamiliar with the disease and its treatment:

Don't forget to act promptly if you intend handling the cow yourself—send for help p. d. q. in case you do not. Delays are dangerous.

2. Don't attempt to milk out the cow in order to relieve her—it will help a great deal if you resist the temtation.

3. Don't try to give a drench after the cow is down—the muscles of the throat are by then probably paralyzed and some of the dose may enter the lungs with disastrous results.

4. Don't neglect a single precaution in the way of cleanliness and disinfection—a lost quarter or a spoiled udder is too great a price to pay for a little carelessness.

5. Don't think of leaving the calf with the dam after the first symptoms appear—both are better off away from each other anyway.

6. Don't be in a hurry to commence milking and feeding after the cow recovers—give nature a little opportunity to help you.

7. Don't forget to remember next year that she had milk fever the year before—"an ounce of prevention," etc.

BUTTER PARCHMENT PRICES ADVANCE.

The European war has resulted in a sharp advance in the price of butter parchment. Nearly the entire world's supply of parchment comes from Germany and as that country is cut off from the commercial world, it is impossible to get supplies from that source. Germans have for years controlled the pure parchment trade. It is true that a large quantity of good parchment is now produced in the United Sttaes but the quotations there are so much in advance of the German prices that it will cost at least 35 per cent. additional to get the stock landed in Canada. The Maritime Farmer has already been forced to pay considerably more for new stock and the dealers report that the next raise in price will be even sharper. In keeping with the changed conditions, the price to customers has also been raised. The change is not in keeping with the advance promised by leading paper houses. At present, the outlook is that pure vegetable parchment will be a very scarce article within a short time, should the war be prolonged.

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

MEANS TO AN END.

Farmers have earned and are entitled to all the educational assistance that the Goverment, private county and various private agencies offer them. Men can be helped to help themselves. This is the sound theory upon which all social action is based. To receive assistance involves a personal response on the part of the assisted which increases their capacity to think and act. Help is a hindrance only when it accentuates the helplessness of the helped. There are men who would never do a lick of work for something to eat if somebody would feed them for asking. There are others who never do more work than is necessary. Real assistance, flavored with unselfish, human kindness, is one of the finest expressions of good-will; it is a power for good. But in business matters it is not often observed; in this realm service is organized and subsidized. A group of men pay an expert to advise and help them in their professional affairs. This has been done in agriculture. It is a business arangement that should be judged altogether upon its tangible returns. That is why a county agent who can show his employers that he puts money in their pockets each year can hold his job.

All the aids now accessible to farmers are concerned largely with the business of farming; it is the prime purpose of the educational movements under way in agriculture to increase the profits from land and labor. So far as possible farming is going to be practiced as a business. Pecuniary success will be more than it ever has been before its aim and end—unless as men grow their vision widens. In quiet moments, when strong men confess things to themselves, they remember that old question beginning with the words, "For what shall it profit a man," and then another kind of success looms large.

MACHINERY ON THE FARM.

Every farm justifies a careful and judicious investment in farm machinery. Like all other lints of business, there must be observed a carelul and considerate outlay in the running expenses of the farm. There are many farm implements, tools and machinery that every farm needs and must have in order that the work be carried on economically and profitably. More than the real need is a waste and counts against the conserving of economical farm industry.

While it is poor economy to do with out needed machinery, serious inroads and leaks have been introduced into farm management by some farmers in years gone by where a too liberal purchase of farm machinery was indulged in because it could be bought on time. There is such a thing as acquiring unnecessary debt and paying high rates of interest that cripple the business of well meaning and industrious men. Some persons have kept themselves poor and their credit poor by their mania for buying machinery and their careless practices in handling and preserving it after it gets into their possession. Such persons are not very numerous among the farmers of the present day. Yet there are places all over the farming communities where the barn yards, feed lots and orchards are the common storage for the farm machinery, when not in use. Machine sheds are not regarded of any value on these farms. The preservation of the machine has not been taken into account.

It may not be out of place to suggest in this relation that the farmer who treats his machines and farm implements in this way gets but little credi for his intelligence and sense of management. A sane man who would stop for a moment and estimate the cost of a machine shed or two or three sheds, even, conveniently located so as to be easy of access from the horse stable where the teams are kept, and the differences in wear between outdoor and indoor housing of machinery will not argue the case, but provide shelter at once. There is nothing so damaging to the reputation of the farmer as careless, slothful methods and practices in the handling of his business, and in this, there is no better key to the situation than to see the fences and barn yard lined up with machinery of all sorts new and old.

This is now the beginning of the season of farm machinery abuse. Planters, cultivators, mowing machines, horse rakes, reapers, binders, plows, harrows, where are they? Under the machine shed, out in the field where the team was unhitched when the last work with them was completed, or are they stored in the barn yard along the fence to decay and rust and rot under influences of rain, sunshine, heat, cold, etc.

FIXING THE PRIZES.

Under the Caption of "the Slandering Know-it-all" a writer in the Live Stock world, Chlcago threads pretty closely on remarks not infrequently heard at the ring side of our Maritime Shows.

We publish the article referred to on another page of this issue and trust that whom-so-ever the cap fits will wear it.

The inference cast in the second paragraph of the article in question about ewards being "fixed" is always an ugly insinuation. The Maritime Farmer suggests that possibly it would be more satisfactory to the loosers in the showing if the winners had not been apparently too chummy with the judges from the time of their arrival in ihe exhibition town until the time when the stock judging is completed. It would look better and help keep down an onus of the above kind if stock owners would refrain from busying themselves around the judge until he completed his work, we do not for a moment mean to infer that judges are influenced by Individual stock breeders but for the judges own sake as well as for a more harmonious feeling among the exhibitors it will be well for the judges to refrain from holding intercourse with any breeder until their work is completed. We have frequently heard insinuations of this kind in the past when names were freely mentioned, but we believe the extreme friendliness shown by these stock breeders was altogether to a stranger in a strange land due to a friendly rather than to a mercinary motive.

WATCH THE LIVE STOCK JUDGING AT THE FAIRS.

Ere the first September issue of the Maritime Farmer reaches our Subscribers, the Maritime Circuit of fall fairs will be in full swing. St. John Exhibition will be held from the 5th to 12th, Charlottetown Exhibition 22nd to 25th

We have reports from the various fair boards that indications point to a large number of entries in all classes and given good seasonable weather it remains with the farmers of the Maritime Provinces and the citizens generally to help make the various fairs a success by supporting their respective fairs with record attendance. The stock men are coming out in full force and what is more pleasing to look upon than a splendid array of purebred stock ?

In years gone by the ring side at the various exhibitions has not been as well patronized as it should.

Make your visit to the exhibiton something more than a holiday trip make it an educational trip, you can drive a great deal of profit from your visit to the fairs by spending less time around the frivolous features and devoting your energies to the educational features of the show.

Spend some time at the ring side when the stock is being prized. It will do you good.

ASSISTANCE TO AGRICULTURAL SOCIETIES.

We wish to call the attention of the readers of the Maritime Farmer to the contents of a circular recently issued by the New Brunswick department of Agriculture which we publish in full on the following page the contents of the circular as published are self explanatory. Members of Agricultural Societies wishing further information along this line should write to Mr. W. D. Ford, Animal Husbandman for the department and section five must be strictly adhered to.

DEATH OF MRS. HUGH DICKSON.

We regret to chronicle the death of Mrs. Hugh Dickson, which took place recently at her home in Onslow, N. S. Only a few short weeks ago did we meet her at her home looking healthy and happy, little did we think then that our next tidings of her would be the news of her death, Mr. and Mrs. Dickson were married only last september. The Editors of the Maritime Farmer extend to Mr. Dickson, their sincerest sympathy in his irrepairable loss.

Getting Ready tor the Shows.

The preparation of stock for exhibition at the fall shows is an important business. Litlle success in the showring can be expected, even with first-class stock, unless the animals have been taught to make the best of themselves when brought before the judges. An animal that has not learned to walk and stand well, or that is constantly fighting for his head or trying to break away, is likely to hide his best points, and present his weaknesses in prominent form. The desire of the exhibitor is obviously just the opposite to this. He wants his animal to make the most of his good points, and keep his faults as much in the background as possible. There is much that may be done to further this object without in any degree overstepping the line which devides fair exhibiting from dishonest faking.

Schooling Horses.

The training of a horse for show ought to start when he is a foal. The youngster can be haltered and accustomed to being led about, walking and stopping as required. This early handling is half the battle, removing many of the difficulties of further training. Later on the youngster can be taught to move at the walk, trot or canter, as required, for it is important that he should promptly assume any desired pace when called upon in the ring. A heavy horse, of course, is not required to move at a fast pace, but it is essential that he should walk, and trot in easy, well-balanced style, the action being smooth and true. When pulled up, the horse should be taught at once to assume an attractive pose, with the feet set well out before and behind, though without exaggeration. It looks much better if the animal naturally falls into this position than if it does so only after a lot of shifting about by the attendant. Action is important with all breeds, and is largely a matter of breeding, but it can be encouraged where deficient. There are various ways of teaching a horse to pick his feet up sharply, one being to use heavy shoes, and another to exercise in a heavy clay field. The greatest difficulty is experienced with a sluggard, whose tendency is to slouch along. Such a horse is best taken on a long lead, the groom running before, whilst the judicious application of a whip by a runner-up will induce a smarter action. An active, high-spirited animal, is much easier to show well, but he needs to be kept well in hand on a short lead.

Training Cattle.

The training of cattle for the showring consists frequently of frequent exercise on the lead, so as to render them perfectly tractable. They must walk well and stand easily, without any attempt to break away from the attendant. A wellbalanced walk is a natural trait, and is not likely to be produced by artificial means in an animal that is not evenly made, but a good deal can be done to make him show to the best advantage when standing before the judges. Some excellent cattle drop their backs when pulled up. This is very undesirable, as a level top goes far in a ring. Such an animal should be kept on the move as much as possible, and taught to hold his head low when at a standstill, as the defect then shows least. With cattle, a good cost is an important feature. This is induced by keeping in airy quarters, and by frequent use of currycomb and brush. With these useful implements, and a pail of water, the skilful cattleman puts the finishing touches on his charge before entering the ring, and he knows how to make the hair cover weaknesses of back and rump. A great point in showing off any animal to the judges is to know its weak points, and to manage it so that these assume the least possible prominence.

Sheep and Pigs.

The main care of the shepherd should be to teach his charges to lead well. This can be done only by early haltering and frequent exercise on the lead. This also helps to keep the animal sound on his feet and straight on his legs, so that he walks well and stands square. It is by no means easy to regulate feeding and exercise so that a sheep goes well on his feet whilst in high condition. Naturally the fleece comes in for much attention. and lends itself to the covering of faults of form, though these come out readily enough under the hand of the skilful judge. The shears must be used frequently on the fleece as it grows, right up to the eve of the show, as a smart appearance is expected.

Pigs lend themselves less to training for show than any other stock, but, fortunately, less is xpected of them in this direction. They must be driven, for they can hardly be led. However, a good deal can be done to make them tractable to some degree by handling from an early age.—Farmer and Stock Breeder.

The Maintenance Ration.

No subject connected with agriculture has had more attention given to it during recent years, or with bettter results, than has that of animal nutrition, and nowher has better work been done in the matter than in the United States A maintenance ration is one which simply keeps the animal machinery running in good repair without the production of external work or of an increase in body weight. Under normal conditions the first draft upon the food the animal consumes is for such maintenance, for only as the food supplies matter and energy in excess of this demand, which takes fully one-half of the average farm ration, is the production of work, or of body-weight gain, possible. A knowledge of the maintenance ration for animals under diffring conditions is therefore essential, both for the wise planning of feeding methods and for the correct interpretation of feeding experiments. This, therefore, gives interest to a very important report by Dr. H. P. Armsby, of the Institute of Animal Nutrition (U. S.), in which this side of the subject is very comprehensively dealt with.

Loss of Matter and Energy.

Put in as summarized a form as possible, it may be said that the maintenance requirement is ascertained by studying the losses of matter and energy of fasting animals. The results of many investigations indicate that for store ("thin") cattle this requirement is, besides a little mineral matter, one-half pound of digestible true protein. and 6.2 therms of available energy per 1,000 lb. of live weight per day. A therm (equals 1,000 large calories) is the amount of heat required to raise the temperature of 1,000 kilogrammes (2204 lb.) of water 1 deg. C. (1.8 degree F.). A maintenance ration is a ration that exacty supplies to the animal its maintenance requirements. Its quantity and the proportion of its parts must vary with the digestibility and character of the crude protein, and the availability of the energy of the several feeding stuffs of which it is composed, as well as with the live body weight of the animal, assuming other conditions to be equal. In the average mixed ration of grain and rougher food (hay and straw chaff, etc.), the digestible true protein is about five-sixths of the digestible crude protein. The total energy which 100 lb. of various common feeding-stuffs yield upon burning ranges from 170.9 therms for maize meal to 196.7 therms for linseed meal. But much of the total energy is unavailable to the animal because of the portions of the food eaten that escape unburned in the various excreta—22 per cent. of the energy of maize meal, and 55 per cent. of the energy of ordinary hay was thus lost in the average of experiments, while another fraction of the energy developed is spent in separating the digstible from the indigestible food, and is therefore not directly useful to the body proper.

Value of Various Foods.

In this connection Dr. Armsby gives a table showing the available energy, or energy value, for various feeding stuffs. These have a range from 4 therms for mangolds to about 89 therms for maize and gluten meals, per 100 lb. of the food consumed.

The protein requirements probably varies directly with the body live weight of other constituents supply the available energy; but the energy requirements vary approximatly with the surface area of the animal's body, which area is, roughly, proportional to the cube root of the square of the live body weight.

The average stated in connection with maintenance requirement, is for a store ("thin") animal of good feeding temperament, and assumed to stand but half its time. The muscular work required to hold up and move the body affects the energy requirements. A steer produces 28 to 65 per cent. more heat when standing up than when lying down. Again, a restless animal wastes energy. A quiet, pure-bred steer showed an energy requirement of 5.6 therms; and a rather restless scrub steer one of 6.65 therms.

Stall feeding involves less movement than yard feeding, and consequently the energy maintenance requirements are somewhat smaller.

Condition and Age.

Condition also affects the energy requirement for maintenance, fat steers having shown requirements of two or more therms above those for corresponding store steers, the requirement increasing with the fatness. This is thought to be due to the extra weight to be supported and moved, although the point has not to be dtermined with any definiteness. The effect of age is another point not conclusively ascertained as yet, but older animals apparently require less energy maintenance than young, restless animals.

One other minor point, in practical application, remains to be noted, and it is that external temperatures may have some effect upon the energy requirements. Dr. Armsby, however, points out that, since a steer on maintenance ration produces considerably more heat than is needed to maintain the body temperature n air of 60 deg. F. the air temperature may fall much below this point before additional food consumption is necessary for heat production alone.

Assistance to Agricultural Societies in the Purchase of Pure Bred Stock.

The live-stock situation in the province is such that the Minister has decided to continue the assistance to Agricultural Societies in procuring pure-bred stock for breeding purposes, under the following regulations:—

(1) Stock must be bought and sold under the direction of an Agricultural Society.

(2) The Society procuring stock will be required to make an annual report to the Department of Agriculture upon live-stock conditions in its district; (a) the number of pure-bred animals in the district; (b) are pure-breds increasing or decreasing in the district?

(3) Assistance will not be given to more than two breeds in any one Society, one beef and one dairy breed; the breeds to be determined by a majority vote of the Society, at a regular or special meeting, notice of the vote to be taken having been given by mail to each member of the Socety at least one week prior to meeting.

(4) Animals purchased with the assistance of the Department to be sold by auction to the highest bidder, and only members of the Society holding the sale to be allowed to purchase same; or the animal to remain the property of the Society for the use of its members only.

(5) Animals to be bought subject to approval of an officer of the Department, and must be subject to tuberculine test.

(6) Societies obtaining assistance under these regulations to make a report to the Department of cost of animals, expenses incurred in the transaction, and the amounts received from sale of cattle (if sold), certified to by President and Secretary of the Society.

(7) Under the above regulations the Dept. will pay a bonus of 15 per cent of the purchase price of an animal costing $50.00 or under, and 25 per cent of purchase price when above $50.

(8) Not more than six animals to be bonused in one Society in one year.

(9) The bulls purchased under the above regulations to be reserved for use of members of the Society only, and not to be disposed of without consent of the Department.

(10) Notice of desire to participate in the above to be given to the Department before purchase is made.—J. B. Daggett, Secretary for Agriculture.

What Every Man May Do.

Because we have felt that the health of the dairy cows of this country never can be what it ought to be until every man does his part toward that end, on our farm we have done our best to make the surrundings of our stables as good as we possibly could. To this end and we have lifted the floors of our barns so that there is a nine feet space between the floor the cattle stand on and the ceiling overhead; we have put a good cement floor down, covering the feeding alleys, the mangers, the platforms where the cows stand, the drops and the driveway back of the lines of cows; we have put in more and larger windows than there are in any barn I know of in this part of the country, and we have taken every possible precaution to have everything as clean as we could.

It has cost us something to do this, but we cannot help thinking that we will get our pay in the better sanitary conditions of the premises. The way I look at it, tuberculosis is a disease that is not very apt to invade a barn that has plenty of air space and as much light as possible and is kept clean. There is nothing that will help to keep this dreaded disease out of a herd like these three elements, air, light, cleanliness. I believe where cattle have already been attacked by tuberculosis, if a man will clean up his premises, get rid of any individuals that are beyond question too far gone for recovery and himself treat his herd by the application of light, pure air, and ceanliness, he may stay the progress of the disease and soon stamp it out.

Every man may do this. There is no barn in the country that may not be made over so that it shall be light, airy and clean. It takes some time and money to do it, but the satisfaction, as well as the money returns, amply repay for all such work.—E. L. Vincnt in Hoard's Dairyman.

N. B. Government Ditcher.

The New Brunswick Government ditching machine is now operating in Sussex, having come here a few weeks ago from Sunbury County where it had been operating earlier in the season.

Last year the ditcher dug over eight miles of ditches. To date this year, it has dug close on to seven miles. Tile drainage is badly needed on many farms in New Brunswick and we are glad to see some of our Kings County farmers taking advantage of the use of the ditcher. There is hardly a section in New Brunswick but would keep the ditcher busy for a whole season but as it is only used for demonstration work it cannot be left in any one district for too long a period.

Mr. John Woods, a graduate of the O. A. C. is in charge of the machine.

HORTICULTURE.

A Visit to the Valley.

The Editor of the Maritime Farmer paid a pleasant visit to Kentville, Berwick and other points in the Annapolis Valley last week. We are delighted to find that the Valley as a whole is experiencing a season of apparent prosperity. Fruit growers, with a few exceptions, are looking forward to a bumper apple crop, and individual growers are paying more attention than ever to the protection of their trees and fruit from insect and fungus pests so that a large percentage of No. 1 fruit may be harvested.

The hay crop is reported a little light but well up to the average. Breeders of live stock find a good demand for their stock, at remunerative prices.

The potato crop is very promising and altogether the Valley farmers are a happy lot.

While in Kentville we visited the Dominion Experimental Station A great many improvements have been made at the station since we visited there over a year ago. The forest of various native trees is fast giving way to the axe, the stump puller and the plow and is being replaced by rows of fruit trees of various kinds and field crops of grain and roots. The lawns and gardens are looking particularly nice and under the efficient superintendency of Prof. W. S. Blair and his able assistant, Mr. J. Milton Robinson the whole farm is fast becoming one of the most interesting places in the Valley. Considerable work has also been done in the conserving and making the natural park in connection wit hte station more accessable to the public. The park is one of Nature's beauty spots. Visitors of Kentville should avail themselves of the opportunity of a walk through the beautiful glen, the approaches to which are so arranged that the sight-seer may make a round trip of the cultivated and uncultivated areas of the farm.

At Berwick, the United Fruit companies of Nova Scotia have their headquarters and preparations are now being made to handle the big crop that the Valley is producing and which are now nearing the harvesting period.

We chanced to meet Mr. Manning K. Ells, the genial Secretary of the Nova Scotia Fruit Growers' Association at Kentville. He was in town with the last of his strawberry crop and was feeling particularly jubliant over the returns from this lucious crop. From a two-acre plot he had sold enough berries to net him over $1,400 and the demand was far in excess of the supply. He reports a big demand for strawberry plants as a result of his ad. in the Maritime Farmer. He is wearing the smile that won't come off as letter after letter reaches him from customers stating that his plants are giving good satisfaction.

Cultivation and Pruning of the Grape Vine.

In response to the request of a correspondent who asks questions relating to the pruning and culture of grape vines the Queensland Government "Agricultural Journal" published the following:—"The vine will, being a very hardy plant, grow in almost all kinds of soil. The most suitable, however, is a porous, easily worked loam, deep and well drained, subsoil sufficiently retentive to hold moisture to carry plants over a dry spell. In districts of heavy rainfall, (torential rains) and dry districts, too much slope is not advisable, as in one the soil is liable to wash and in the other, too much exposure and drainage is present; therefore, a, level or slightly undulating site is better. "The preparation of the land should be begun in autumn, and the ground should be thoroughly stirred to a depth of 16 in. or 18 in. according to locality and quality of soil. Where gravelly subsoil is closer than this to the surface this depth is not necessary. The depth advocated can be reached by ploughing,, to a depth of 8 in. or 9 in. and then stirring up the bottom of the furrow another 8in. or 9in. with a subsoil, or plough with mouldboard removed following imediately. ',After this the weeds should be harrowed off and the ground permitted to lie during the winter, sufficient working being given to prevent rusting and growth of weeds. Cross plough in the spring and harrow, and, if necessary, cultivate, or roll to bring the soil to the desired tilth.

The soil having been thoroughly prepared, the next thing to be done is to lay out the vineyard. This should be done with a view to overcome disadvantages of the site, to mitigate as far as possible the damage resultant from hail, and to facilitate working. If a level site or slightly undulating one, as previously recommended this will present little difficulty. "If on a slope the vineyard should be laid out across the slope, the longer the rows being the less turning for the teams making working less costly. Should hail storms come from south west then the rows should run north east to south west. In setting out the vines, the distances apart are governed by the climate and method of growing adopted. For a district 8 ft. by 8 ft., ,if grown on stakes; and 8 ft. by between 6 ft. in the rows if trellised. This will give, allowing space for roads, 650 vines per acre, 7 ft. by 7 ft. for staked, and 7 ft. by 6 ft. for trellised vines in medium dry districts; whilst for the moisture districts, 6 ft. by 6ft. is sufficient.

"The planting in square is recommended as if on the bush system, vines can be worked two ways leaving very little to be done by hand.

If narrow rows are planted, it will be necessary to have roadways throughout the vineyard for removal of produce, prunings, etc.

The most economical way to stock a vineyard is by using cuttings, though not so reliable as the putting in of rooted plants. The cuttings, which should be about 15 in. long, should be put in the ground slightly slanting, leaving only one eye exposed, the ground be well firmed round the cutting to within one-third of the top. Following the setting out, it will be necessary to keep weeds down and keep surface of the soil loose to prevent evaporation. Tie up young shoots as they reach a sufficient length to stakes to prevent being broken off by the wind, etc. Prune low the first winter and late as possible.

Winter Pruning.—No fixed time can be stated as when to prune, though June and early in July is preferred by most. In warm districts it should be early, and in places where late frosts are likely to occur it should be delayed as long as possible. The methods in vogue are many, and are adopted according to variety, climatical conditions, and mode of growing.

Summer Pruning.—Suckering and disbudding: Suckers are those shoots which spring from the old wood and are generally unfruitful. These can be rubbed with the hand, which operation should be done as soon as possible after they appear.

Disbudding consists in the removal of shoots on the one-year-old wood not showing fruit, or thinning out.

Topping, which consists in the removal of the end of the shoot is recommended by some authorities, but it is not absolutely necessary under Queensland conditions.

Tying.—This should be done when buds are swelling; the canes are then

Bread like Mother used to make—light, white and palatable—is easy if you use

REGAL FLOUR

Common sense tells you that it is a hopeless task trying to make good bread of inferior flour. You must have the right basis, or baking-day will only produce a batch of failures. Regal Flour is preferred by good housekeepers, everywhere, because its uniformly high quality is a known fact. Get a barrel of Regal from your grocer. If you don't find it all we claim, we'll refund your money.

THE 3 COUNTIES EXHIBITION

THIS YEAR (1914) AT

KENTVILLE, N. S.

OCTOBER 7, 8, & 9

Kings, Hants and Annapolis Counties

Fruit, Farm and Garden Produce; Live Stock, Poultry, Apiary; Fancy, Domestic and Educational Work.

Fruit Growers and Farmers should not miss the Greatest Fruit Show in Canada. Write for Prize List.

W. M. Carruthers, Sec'y, Kentville, N. S.

more pliant, consequently are not so liable to crack. Material for tying; strands from potato bags, old binder twine, rushes, all are suitable. Binder twine or similar material, which is inclined to cut the vines as they grow, will in all probability have to be cut during the summer.

Cultivation.—Summer: Consists in keeping the surface stirred and the vineyard free of weeds. Winter: Ploughing 4 in. to 6 in. deep should be carried out as soon as the pruning is finished, throwing away from the vines. This destroys any surface roots, which are not advantageous, more especially in dry climates, and sweetens the soil.

Bear River Cherries.

Editor Maritime Farmer:—

Enclosed find photo of cherry picking at Hillside Farm, Bear River, July 27th, 1914., B. C. Clark, Prop.

I may say the cherry tree shown in photo was planted by the writer 12 years ago and this year I picked and packed 40 boxes, worth in cash $16.00. —B. C. Clark, Bear River, N. S.

Cherry Picking at Hillside Farm, Bear River, N. S.

Do Caterpillars Think ?

Do caterpillars think? Mr. Fred Enock, lecturing to an audience of children at the London Institution, said that, after 50 years of "grubbing," he had come to the conclusion that caterpillars really seemed to have a conscious knowledge of their own marking and coloration. They had a good deal more sense than most people gave them credit for, and he did not see how people who studied them could arrive at any other opinion than that which he had stated. These remarks were prompted by a study of the ability of the familiar little insects to conceal themselves from their natural enemies, the birds. Mr. Enock showed on the screen a picture of a dead geranium branch, on which there appeared to be nothing but withered twigs. How many caterpillars are there there?" he asked his juvenile audience. "None," answered a skeptical youngster. "Three" ventured another, greatly daring. As a matter of fact, there were eight, and even Mr. Enock had to be careful, in pointing them out, not to confuse twig with caterpillar so close was the resemblance. There was mention of another interesting instance of self-preservation. The caterpillar which chooses a leaf under which to spin its cocoon seems to be aware of the danger of the leaf becoming detached and falling to the ground, thus probably killing the chrysalis. So it takes the precaution of fastening the base of the leaf to the stem by means of silken threads, and then, if the leaf, becomes detached, it merely spins round on the silk, and the chrysalis is saved. Mr. Enock said he had seen this dozens of times, and could come to no conclusion but that the caterpillar was conscious of the danger of the falling leaf.

N. B. Orcharding Possibilities.

One of the greatest assets that New Brunswick possesses is its orcharding possibilities. This fact has only begun to be recognized by our farmers in recent years. A very positive improvement is noticed this year in orchard conditions in this Province. One authority on the subject remarks:—"The prospects for commercial orcharding in New Brunswick are very bright, because of the relatively low price of land here and comparative cheapness of production, together with enormous saving in transportation rates. The apple lands in New Brunswick being from 800 to 3,000 miles closer to the European markets than many other apple producing sections of the North American continent, not only is the cost of transportation greatly decreased but other apples can be placed in the consumer's hands in better condition."

In a memorandum presented to the Dominion Royal Commission by Mr. C. N. Vroom, President of the New Brunswick Fruit Growers' Association, the statement is made that New Brunswick is very favorably situated for growing extensively such fruits as apples, strawberries, raspberries and cranberries. Especially is this true of the southern portion of the Province where the proximity of the sea ameliorates the severity of the winter, and where the more tender varieties of apples may be sucessfully grown, as well as the harder varieties of plums, pears and cherries. Mr. Vroom says that in the past four years about 100,000 young apple trees have been set out in this province, btu the fruit industry is still in its infancy.—St. John Board of Trade Rept.

DAIRYING.

Raise Your Good Heifer Calves.

As every breeder and every thinking farmer knows, a good dairy cow is not an accident but the result of long and earnest effort on the part of the one who produces and raises her. The foundation must be laid in the calf, both in the matter of breeding as well as in the care of feeding.

Too many of our farmers and dairymen are prone to think that they can buy cows cheaper than they can raise them, and the prevalence of this very idea throughout the country has had a tendency to reduce the number and quality of good dairy cows.

Many dairymen are depending upon some one else to raise the cows and sell to them, while they in turn sell their calves for veal. This is very poor business, for many a good row is wasted in this manner. Then it stands to reason that the wise breeder or farmer is not going to sell the best cows he has. No, he is going to keep those for his own use and sell the inferior ones. You cannot blame him, for if he knows which ones are the good ones he naturally wants to keep them for himself. The buyer comes along and he offers the inferior cows for a price. The buyer takes them, because he thinks he is getting the cows cheap, and perhaps he is, but he is getting cheap cows as well. He is not only buying inferior stock, but he is paying the owner a profit on them besides.

Why not keep that profit at home, and at the same time know that you have good cows by raising them yourself? It is a business proposition. You can produce them as cheaply as anyone, and why should you not have a few to sell instead of having to buy them from the other fellow.

Cheese Made with Windsor Cheese Salt brings best Prices

The Cheapest Way to Build up a Good Dairy Herd is to Raise It.

The profit in dairying is very largely dependent upon the qualit yof the cow, and the only successful way to build up a profitable dairy herd, at anything like a reasonable cost, is to raise the cows at home. As said before, if the breeder knows that a cow is good he keeps her for himself, and if he does not know how can the buyer know? Therefore, you are running a risk of getting poor producers when you buy from your neighbors, whereas, if you raise them yourself you know which cows they are from and what to expect from them when they grow up. At the same time you save for yourself the profit that the other fellow charges for raising them.

These facts apply to breeders of scrub and grade cattle, as well as to breeders of pure-bred animals. Any herd can be improved by raising the calves from good, carefully selected cows that have been mated with a well bred bull, provided the calves are properly raised and taken care of a way to insure stamina and vigor.

Some of the Finest Cows in the Country Raised on Separator Skim-Milk.

The cost of raising calves has been greatly reduced since the advent of the separator on the farm, which furnishes nice, warm, sweet skim-milk to feed them on. While it is not every one who can successfully act as "stepmother" to a baby calf, most any of us can learn in a short time to be reasonably successful. Some of the best producing cows in the world were raised on separator skim-milk, and there are thousands of calves that are growing and thriving upon it right now, which goes to show that it can be done successfully.

Good dairy cows are very much in demand all over the country, and there are miles and miles of territory in the Western States that need and must have cows, and there are thousands of farmers in those States who are looking for good cows right now. They need them, and must have them in order to make a living. It is therefore, evident that the demand is not going to abate for some time to come, because cows do not merely happen along when you want them, and they must start with the calf, and it must be reared economically and well. Why sacrifice perfectly good calves by selling them to the butcher when ten times as much profit can be made from them by feeding them skim-milk and growing them into dairy cows?

Stop and think a minute. Why is it better for the dairy farmer to raise his own calves?

1st—Because it is cheaper. He can raise them as cheaply as any one else and save the oher man's profit, if he has warm, sweet separator skim-milk and will use a little care.

2nd—Because he can select and raise the heifer calves that are from the best cows and show promise of making good producers.

3rd—Because he can raise them properly and see that they are kept in a thrifty and growing condition.

4th—Because he generally gets second and third class cows when he buys.

Fat the Only Food Element Removed by the Cream Separator.

Some people have an idea that nearly all of the food value is taken out of milk when the cream is removed, but, on the contrary, it is nearly all left in. The fat can be readily replaced by something cheaper, and the calf will thrive as well on skim-milk if properly fed, as it will on whole milk. Separator skim-milk has been and is being fed successfully all over the country, and from the writer's experience it is one of the most practical and economical ways to feed a dairy calf. Naturally, a calf cannot be expected to thrive on cold, sour milk of any kind, but those who use care and judgment can raise good calves on warm, sweet skim-milk fresh from the separator, and thus at a much less cost than they can be grown in any other way.

The economical thrifty farmer can readily see the advantages of this method over the old way. It is a matter of dollars and cents with him, and when he finds that through the use of skim-milk and a little care he can raise a calf just as well, but a great deal more economically than he has been doing, he is going to change at once. That is a good business, and any level-headed business farmer is going to do it as soon as he sees the advantages.

We would be pleased if some of the readers of the Maritime Farmer would write us their experiences in feeding and raising dairy calves on separator skim-milk, bringing out their ideas of the advantages gained and as near as possible the actual cost of raising calves by this method.—S. E. Barnes.

Special Purpose Cattle Breeding.

In your isue of March 5, under the head, "Dairy Shorthorns and Holstein-Friesians," I see that the qualities of the Holsteins are becoming more generally known in Ontario and that it is getting difficult to find dairy Shorthorns. Farmers are evidently finding that it pays better to veal the male grade Holstein calves, as they are large and of superior quality, and get their milk and butterfat from a special purpose breed whose dairy qualities have been developed continuously for more than a century. If they use the smooth-type of Holstein they could steer the calves just about as well as the Shorthorns.

Prof. Clinton D. Smith found. years ago, that a cow making 25 lbs of butter in 7 days must assimilate as much food as seven steers gaining a pound each day. It would, therefore, be a long and tedious job to develop a large producing dairy strain of Shorthorns, to any number, since for years the use of extreme beef sires has been the practice of most Shorthorn breeders. It would be much easier to develop a smooth, beefy Holstein because with their large frame all that is necessary is to divert their capacity to the putting on of flesh. We understand that connoisseurs cannot distinguish between the good Holland and English beef, as it appears on the English tables. It is easier to retard development than to increase it; therefore, it would be easier to let the Holstein run into a beef animal than to develop a special dairy animal from the Shorthorn. When this is accomplished, we should have, as W. A. Riddel says in the same issue, "a type that is entirely different from that of the dual-purpose Shorthorn"—a special dairy animal devoid of beef characteristics. When fed above a certain point her feed would go to the production of beef rather than to milk and butterfat.

We know Holstein-Friesian cows that made official world's records for milk and butter production, and which have scores of relatives that have produced 15,000 to 26,000 lbs. of milk and the fat for 600 to 1,200 lbs. of butter in a year. These cows weigh from 1,400 to 1,700 lbs. They are smooth in conformation and when dry would finish for the block easily at 1,500 to 1,800 lbs. A few through failure to breed, have gone to the South St. Paul and Chicago markets, and held their own with cows of any breed; the last one sold last month in South St. Paul at $6.75 per cwt., when the top of the market for prime steers was quoted at $7.35.

We have no quarrel with any breed; we as a nation want beef, and if we continue to have beef at a moderate price it must be produced with the greatest economy, largely with breeds especially developed to produce beef. We must have dairy products, and they should be produced with the greatest profit. If veal and beef are a factor, we can breed and develop large, strong smooth, prepotent dairy animals of constitution and capacity. "Specialize for efficiency" is the motto of our day. Then why burden farmers with a dual-purpose cow when we cannot give them a piece of dual-purpose machinery? Judging from the letters we receive the dual-purpose cow produces the no-purpose cow that has lost the farmers of our State millions of dollars. So far as we can learn, she has but one place: when a farmer already has a lot of them and does not feel that he can start over again with pure-bred females of a special breed, he can by using pure-bred sires of one breed continuously, build up his herd either to the beef or the dairy lines.—John B. Irwin in Breeders' Gazette.

What Makes Milk and Butter Yellow.

That rich yelow color demanded by the public in dairy products is primarily due to the character of the cow's feed is demonstrated by recent experiments carried on by the department in co-operation with the Missouri State Experiment station. For some years dairy experts have been studying this question. Their conclusion is that, although to some extent a breed characteristic, the intensity of this yellow color may, within certain limits, be increased or diminished at will by changing the animal's rations.

Chemical tests show that the yellow pigment in milk consists of several well-known pigments found in green plants. Of these the principal one is carotin, so called because it constitutes a large part of the coloring matter of carrots. The other yellow pigments in the milk are known as xanthophylls. These are found in a number of plants, including grass, but are especially abundant in yellow autumn leaves.

These pigments pass directly from the feed into the milk. This explains the well-known fact that fresh, green grass and carrots increase the yellowness of butter, the only standard by which the average person judges its richness. On the other hand a large proportion of these pigments is deposted in the body fat and esewhere in the cow. When the ration is changed to one containing fewer carotin and xanthophyll constituents, this hoarded store is gradually drawn upon and in consequence the yellowness of the milk does not diminish so rapidly as it otherwise would. This yellowness increases, however, the instant the necessary plant pigments are restored to the ration.

Green grass is probably richer in carotin than any other dairy feed. Cows fed on it will, therefore, produce the highest colored butter. Green corn, in which xanthophylls constitute the chief pigment, will also produce a highly-colored product. On the other hand, a ration of bleached clover hay and yellow corn is practically devoid of yel-

low pigments and the milk from cows fed upon it will gradually lose is color. It is, of course, indisputably true that the breed does influence the color of the milk fat; but vary the ration and there will be a corresponding variation in the color of the milk fat in each breed.

In cows of the Jersey and Guernsey breeds the body fat is frequently of such a deep yellow color that some butchers and consumers look with disfavor upon beef from these breeds. For this prejudice there is absolutely no justfication. The yellowness of the fat springs from the same cause as the yellowness of the milk fat, and there is na reason for objecting in one case to the very thing that is prized in the other.—Weekly News Leter, U S. Dept. of Agriculture.

Salt for the Dairy Cow.

Few men realize just how badly the dairy cow needs common salt. It is a shame how some of the best animals are treated. Salt is an essential needed by every herbivorous animal, but by the dairy animal most of all. Yet, how is she supplied?Ofttimes she receives salt but once a month. However, the wise dairyman is careful to feed salt at least once a week. Few really know (says a writer in Hoard's Dairyman) what would happen if we did really withhold this chemical from the dairy cow. We do know that ever so often the cow indicates, by licking her mates or otherwise, her desire for salt. She is given some of the chemical and it is made to serve the purpose until she again indicates a desire for the luxury.

It is a question with many, as to the real need of salt by the cow. The purpose it serves is scarcely known to one man out of ten. The cow is fed over so often until her appetite is somewhat lessened. The average man considers that a good deed has been done and his animal treated remarkably well. Often the opposite is the case.

Purpose of the Salt.

It is interesting to note the purpose for which salt is commonly fed the dairy cow. Writers agree that the digestibility of the ration is neither increased nor decreased. It also does not increase waste of protein but serves to lessen protein decomposition.

It is thought that ordinary salt serves as an appitizer. Thus its action is much the same as a condiment or spice. The greatest effect seems to be its ability to increase the palatability of the foods consumed and as a result the appetite of the animal. The digestive system is materially aided by the introduction of salt into the system. So called digestive disturbances are in greater part lessened if not entirely prevented. The secretion of the digestive fluids is increased. This aone is one of the strongest arguments for feeding the chemical to the cow. There is no other effect produced that is almost as equally important. The circulation of the body fluids is hastened as well as increased. From a medical standpoint, salt becomes quite essential to the animal.

Harm From excessive Quantities.

If not fed rightly, there is no doubt but that harm can come from th feeding of salt in excessive quantities. It is apt to increase the amount of water excreted in the urine. Thus the protein is broken down and the water content of the body lessened through the kidneys. An excess may cause an abnormal appetite for water. Ths is true only where the animal has not had access to the chemical for a considerable length of time. An abnormal amount of water may be consumed. This is very apt to cause considerable digstive disturbances.

Breaking Down.

Babcock and Carlyle of the Wisconsin experiment station, have done considerable work along the line of salt requirements for dairy cows. They found that when an animal has been deprived of salt for two or three weeks, an abnormal appette is created for ti. The animal may do without salt without any noticeable effect for a period of from one month to one year. It is remarkable that up to this time there is no loss in live weight. The animal does not decrease in either health, condition, or milk supply. There is, however, a stage reached where the animal has a sudden breakdown and a consequent loss of vitality. This stage is marked by a loss of appetite, a general listlesness, lustreless eyes, rough coat, and a rapid decline in milk supply and live weight.

If at this stage salt is given the animal, a quick recovery results. The breakdown is most apt to occur when the animal is heavy in milk, immediately after calving.

The Quantity Required.

The pertinent question now arises, how much salt should be fed and how often? This is a stumbling block for more than one dairyman. One authority recommends that 0.75 to 1.0 ounce of salt be fed per cow and should be given at this rate once a week. Another recommendation is as follows:—Feed three-fourths ounce per day per 1,000 pounds live weight with 6-10 oz. additional for each 20 pounds milk produced. This would probably vary between one-half and three ounces, depending upon the cow.

The Best Way.

Either recommendation may be safely followed. The important thing is the fact that the animals should receive salt at least once a week. Some darymen purchase rock salt and allow the cattle to lick of it as they will. This is among the best methods of feeding salt to cattle. After a short time, if salted previously, the cow will adjust herself to the change, so that she will consume just enough salt for her needs. This plan works out much better than the one of feeding the cow salt in connection with her feed at intervals of one or two weeks. The latter is never to be recommended.

Natural Ways.

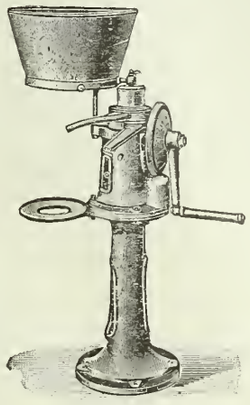
It is interesting to note that soils rich in salt supply more of this material through the herbage raised upon the land than soils low in salt content. Certain water supplies, as wells, springs, etc., vary in their percentages of salt dissolved in the water. However, there are few natural ways at the present time for the average dairyman to secure salt for his cows. It must be supplied in sufficient amounts regularly or constantly. When so applied it makes up one of the essentials so necessary to the successful care and management of the dairy herd.

Careless handling and slipshod methods can prove most disastrous in the milk and butter producing factory, for the better the cow the quicker she will be ruined by poor care, and, as a rule, the best cows in the dairy herd under poor management are the ones that are first spoiled. No animal on the farm will respond to kindness and quiet surroundings so quickly as will the dairy cow. All who work about the cow barn should be quiet, kind clean, regular in detals, energetic, and endowed with sufficient brain power to take an active interest in the work. The feeder should have the faculty of studying and learning the individual needs of the cow and sufficient energy and interest in his work to cater with regularity to each member of the herd. Success is not a matter of luck, but rather of common sense and hard work, and the application of these two to the dairy business can have only one result.—I. R. Henderson, B S. A.

The Premier Cream Separator

made throughout in the largest and best equipped separator works in the British Empire.

The highest grade of material, workmanship and finish.



All wearing parts renewable and interchangeable.

All revolving parts enclosed.

Machine-cut gearing.

Working parts easily accessible.

Bowl easily and quickly cleaned.

Simplest Construction.

Skims Cleanest.

LIVE STOCK.

Present Status of the "Dual-Purpose Cow" in Britain.

The "dual-purpose cow" is perhaps the most discussed animal in the United States at present, and many of its supporters claim that it must be retained, and in support of their argument they point to its popularity in Britain. Undoubtedly it is a fact that the English farmers for a long time bred with the object of producing an animal which would yield good beef and at the same time be a good milker. but conditions are changing rapidly and in a few years the so-called "dual-purpose" cow will be a thing of the part so far as England is concerned.

During the years 1905 to 1911 (inclusive) the bovine population of Great Britain was growing from 6,887,000 to 7,114,264. This increase was not uniform throughout all classes of stock however, while the cows and heifers in milk or in calf increased from 2,707, 392 to 2,824,509, the number of other cattle only rose from 4,279,628 to 4,-289,755, i. e., an increase of 117,117 for cows and heifers producing or ready to produce milk and an increase of 10,-127 for other cattle. These are small increases, 4 per cent. in the case of cows and heifers, and only .2 per cent. in the case of other cattle, but in considering them it must be remembered that the agriculture of Britain is much more intensive than that of the United States and other comparatively young countries and so increases in live stock will not be great. The average number of cows per square mile will give some indication of the intensity of the agriculture of a country; thus in Britain there are 44 cows and heifers in milk per square mile and in addition there are 12 cows and heifers per square mile which are in calf but not in milk, and in the United States, Iowa, Wisconsin, Vermont, and New York come first with only 24 to 31 milch cows per square mile.

The above figures show that the milch cows of Britain are increasing 20 times as fast as the other cattle. Now what are the causes of this difference in the rates of increase of the two classes of British cattle? In the first place the importations of foreign beef have increased rapidly in the last ten years and this has had a tendency to decrease the home production of beef or at least to retard its rate of increase. Then, the population of the country (especially the urban population) has been increasing and so there has been a greater demand for fresh milk. This cannot be supplied by the foreign producer and so more cows have to be kept. Again, the cost of land has gone up and also the cost of labor and the price of feeds. These three factors to a large extent determine the cost of production of both beef and milk and owing to the large increases in them the farmer has been forced to patronize the class of animals which will give the most economical returns.

It has been shown that for every 100 pounds of digestible nutrients fed, the milch cow returns six times as much edible matter as the beef animal. The cost of 100 pounds of feed is the same in each case and as six pounds of milk solids are more valuable than the one pound of edible matter produced by the beef steer, it is evident that the dairy farmer will get a much better return for the feed he supplies to his stock than will the beef producer.

At first the above factors may not seem to have any relation to the "dual-purpose" cow in England; but in fact they point to its extinction. The importations of foreign beef have an adverse effect only on the poorer classes of the home product, while the price of the better classes of beef is as high as ever it has been. The poorer quality of home-grown beef is not wanted in England, now that its place is taken by the cheaper imported article, and as it has always been produced by the "dual-purpose" animals, the beef producers have to replace them by cattle better suited for the production of the best quality of beef.

For very similar reasons the dairy farmer requires the cattle which will produce milk most economically, and these most certainly are not the dual-purpose animals. Being wanted by neither beef nor milk producers, the dual-purpose animal is rapidly disappearing in England and must ultimately become extinct.

Shorthorns were long looked on as the dual-purpose breed of England, but this idea has now been practically abandoned. Most Shorthorns are excellent beef animals but very poor milkers and so cannot be spoken of as dual-purpose animals. Then the dairy Shorthorns are excellent milk producers, but are deficient as beef animals and so must also be kept out of this intermediate class.

In Cheshire and other of the midland counties of England, the dairy Shorthorn has been bred pure for a long time and is now a typical dairy animal in both form and performance though it is perhaps not just so near perfection as the Holstein and other dairy animals which have been bred for milk production for a much longer period. The pastures in this locality are amongst the best in the world and as there are also excellent markets for milk and milk products this district is the greatest milk producing one in England. Milk recording is still in its infancy in England but undoubtedly as it develops it will do much for the production of a good race of dairy cattle.

In Scotland little mention is ever made of the "dual-purpose" animal; here they have the Ayrshire for dairy purposes and the Aberdeen Angus, Galloway, Shorthorn, and Highland breeds for beef production, and as they know that it is impossible to combine the two functions of milk and beef production, they make no attempt at evolving a "dual-purpose" breed. The average butterfat yield of the dairy cow of Scotland, though not as high as Danish yields. compares very favorably with the results obtained in other countries and the annual production is rapidly increasing under the influence of the milk testing associations.

Some of the authorities of the British Agricultural Colleges still recommend the "dual-purpose" cow though their reasons for doing so are not of the best—afraid of offending the dairy farmers they will not recommend the pure beef animal, even for beef production, and similarly they must not recommend the dairy animal lest the feelings of the beef producers be hurt. Consequently, they please very few and do much harm to the agriculture of the country.

The best animals of the so-called "dual-purpose" breeds yield beef of fair quality and a medium quantity of milk but they do not produce these as economically as do the animals which have been bred especially for the production of beef alone or milk alone and so in these days of keen competition the British farmer has no use for them. In most cases, however the beef from these half-way cattle is poor and their milk yield is small and consequently they should be termed not "dual-purpose" but rather semi-purpose animals.

The extinction of the "dual-purpose" type has been going on rapidly in Brittain but it would be much more effectual if sufficient good animals of the beef or dairy breeds could be obtained at reasonable prices. Owing to the foreign demand prices have never been higher than during the last few years and so the "dual-purpose" man, not having made much money, with his cattle, can only buy a few good animals to start with, but by breeding from these he will eventually get rid of the inefficient animals which he still has

The agriculture of Britain is much more intensive than that of the United States as a whole and so it is evident that Britain would be the first to feel the harm done by the "dual-purpose" cow. Many United States teachers and farmers already recognize the folly of breeding animals other than special purpose ones and without a doubt the "dual-purpose" animal will soon be as scarce in the United States as it is in Britain. This is an age of specialists and the cow that is a "Jack-of-all trades" and not a specialist cannot survive long.—Andrew C. McCandlish, Iowa.

(The above article by Mr McCandlish corroborates the statements made by several persons of late regarding the dual-purpose cow in Britain, Mr. McCandlish, a graduate in agriculture of the University of Glasgow, Scotland, has had a life-long experience in dairy farming in Britain, and has a good understanding of the breeding operations of that country. Several Americans who have visited England reently have come away with the same impression of the breeding operations in England as is reported by Mr. McCandlish.

From the photographs we have received of the so-called dual-purpose cow, more commonly termed the dairy Shorthorn, we are glad to believe that the form of this animal is dairy in conformation, and in the article published some months ago we called attention to this fact. Our judgment has been corroborated by Mr. Chandlish.—Hoard's Dairyman.

Foul-in-the-Foot in Cattle.

When "foul-in-the-foot" is due to what may be called common causes, it is practically the same disease, or in most respects similar, to the non-contagious form of foot-rot in sheep. Among the more common causes are acumulations of mud between the claws, giving rise to irritation and inflammation of the interdigital skin, and injuries from foreign bodies, such as thorns, nails, or metalic rubbish, often distributed about the pasture when dung is spread.

Causes of Foul.

These wounds of the foot may cause a condition akin to quitor in the foot of the horse, and , like it, most difficult to cure. Exposure to dirty, wet litter in yards, or in wet, low-lying pastures, such as give rise to the non-contagious foot-rot of sheep, also cause "foul" by keeping the horn constantly macerated, and by favoring growth without compensating wear. Cases of simple inflammation of the horn-secreting structure and adjacent skin, the result of direct irritation, may, if neglected, involve the joints and lead to disease of the bones, of the burrowing of pus and the formation of sinuses may completely disorganize the foot. Therefore, when a bullock is found to be even slightly lame, it should at once receive atention, as this may save much subsequent trouble and loss.

Symptoms of Foul.

When a typical case of "foul-in-the-foot" ocurs there is generally great lameness—lameness out of all proportion to visible disease—a peculiar separation of the digits that points at once to the seat of pain, and a swelling in the heel. Lameness is very marked, no weight can be borne on the foot, the animal lies continuously, and there is fever and loss of appetite. In the cow milk supply fails, and the flesh melts away like butter in the sun. There is scarcely any disease in which the flesh is so rapidly lost as where extreme pain exists in the feet, and to this pain the animal sometimes succumbs.

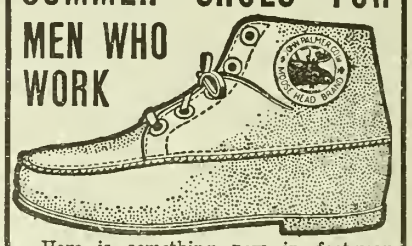
Improper Methods of Treatment.

Treatment should comence with the prompt removal of the animal from wet or dirty suroundings to a dry shed or loose box. It is of no use to apply some powerful caustic agent, such as is still too often used in the treatment of "foul" and foot-rot, and leave the animal in a wet field or dirty yard. Bleeding at the coronet, or stabbing the claws with a penknife, often none too clean, is a favorite device in some districts, particularly with cases occurring at grass in wet weather, but rarely does any benefit result, while many cases are complicated by it. Under these conditions the essentials of giving free vent to pus, the removal of all decayed, under-run, or over-grown horn, and of dry lying and cleanliness are lacking. It is a common thing, not so much, perhaps, as formerly, for a dealer or grazier to visit his bullocks in the marsh, and finding one lame to stab it between the claws with his pocket-knife, and leave it without further attention. It is difficult under such circumstances to give proper treatment, where bullocks are half wild, and there is only one "looker" in charge of scores of cattle, but it is generally a measure of economy to do at once what has to be done eventually, and so avoid such suffering the unfortunate animal, and loss to the owner.

The Right Treatment for Foul.

After removing the animal to a dry, clean place, the next step should be to cleanse the foot thoroughly, make a careful examination to ascertain the nature and extent of the mischief, and to remove anything in the shape of a foreign body. After washing in hot water, it is generally advisable to apply a poultice, the warmth and moisture of which tend to relieve pain. The bovine, lacking the training of the horse accustomed to be shod, and to have its feet picked out and washed daily, is not easily handled about the extremities at any time, and when the part is excessively tender to touch, is still less willing to submit to examination. Poulticing also softens the horn, and after removing all excess of growth, and loose and decayed horn under which pus may have burrowed, and giving it free vent, it is generally advisable to continue the poulticing for another day. With reference to paring, some discretion must be exercised. The cowman, like the shepherd in the case of foot-rot in sheep, is generally a deal too free with the paring knife, but while it is essential to remove all that is loose and decayed, and to let out pus, care should be taken to touch nothing that is sound, since denuding the foot of its horn favors profuse granulations from its sensitive parts, which are difficult to repress.

SUMMER SHOES FOR MEN WHO WORK



Here is something new in footwear specially suitable for farmers, woodsmen, millmen, trackmen, laborers—all those needing strong yet light, cool, easy shoes. These are made on good-fitting right and left lasts from our famous oil-tanned Skowhegan waterproof leather with waterproofed sole leather outsoles and solid insoles.

Palmer's "Moose Head Brand"
"SUMMER PACKS" and "HARVEST SHOES"

are light weight, comfortable, durable working shoes for spring, summer and fall wear. Sold by leading dealers everywhere. If your merchant does not carry them write us, giving his name and address, and we will see that they are placed within your reach. Made 4, 6 and 9 inches high. 19

G. J. SCHMIDT,
for information.

Bran, linseed meal, boiled mashed cargood plan is to twist a piece of tow into a light rope, saturate it with carbolised oil of a strength of 1 part of pure carbolic acid to 19 parts of olive oil, draw it between the claws, wind the free ends round the heel, and then confine the whole with a light bandage, and put the foot in a bag of sacking. Where the case has made some progress, and there are fungoid granulations between the claws, or at the heel. or where horn has been removed to let out pus, a useful dressing is a mixture of equal parts of butyr of antimony and tincture of myrrh applied with a feather or an ointment of sulphate of copper may be employed. There is never any need for strong acids or powerful escharotics, which do harm. A full dose of Epsom salts is always useful during the febrile stage.—Paisley Bridge

Potatos as a Food for Pigs.

I do not believe that the potato is sufficiently recognized as one of the most valuable of foods for the pigs. The average individual probably supposes that while it is an agreeable addition to the dinner-table, it is quite out of the question to assume that it is sufficiently nutritive to maintain life. But this is not so; the potato, cooked in its jacket and buttered, is amply sufficient to maintain man in healthy and muscular condition, the fat being added partly as a relish and partly to reduce the quantity consumed. I have reliable records of facts in proof of this remark. When fed to pigs the potato should form part of a mixed diet, which therefore assist in making the animal fat enough for sale at an earlier date. It is, however, the economical character of the tuber which enables it to obtain so high a position as a stock food. No form of grain will produce so much feeding matter to the acre. The potato contains in round figures an average of 22 per cent. of nutritious food, or 492 lb. to the ton; a crop of 10 tons therefore provides 4,920 lb. A crop of wheat of 60 lb. to the bushel, and reaching the average of the country, contains only 1,386 lb. of feeding matter with out the straw. As, however, ten tons of potatoes is much above the average yield, we may, in order to be fair, remark that the feeding value of 40 bushels of wheat, which contains 1,848 lb. of digestible food, still leaves the potato crop of 10 tons nearly three times as great. I have referred on more than one occasion to crops of 18 to 21 tons of potatoes to the acre which have been grown by farmers in my own neighborhood, and which in consequence still further emphasise the fact that this plant will produce much more pig food than grain, whether wheat, barley, or oats.

Uncooked Potatoes not Desirable.

There is, however, one point of importance to which attention should be drawn. Raw potatoes are not desirable food, containing as they do a poisonous matter known as solanine, which it has been shown vitiates the water in which they are boiled. Cooking, however, watever the form, renders them perfectly healthy; but the one form of cooking which it is well to avoid is boiling, owing to the fact that it causes a serious loss of the feeding matter, which consists chiefly of starch. The protein, or albuminous constituents, and the minerals which are available as food are chiefly found in the skin and the layer precisely beneath it, and it is these materials which it is so important to preserve, owing to the small percentage of the former which the potato contains and to the great value of the latter. For this reason potatoes should never be peeled, the double process of peeilng and boiling reducing the value of the tuber enormously. Steaming or baking in the skins should be invariably practised. It has been frequently shown that 4 lb. of grain will produce 1 lb. of grain in live weight during the first feeding period of a well-bed young pig. If we, therefore, take the most

rots, or turnips, or scalded hops, may be used for poulticing, and the material should be frequently renewed, or the whole warmed up by dipping the foot in a bucket of hot water. In the case of what "Eight Years' Reader" calls "stinking foul," it is a good plan to sprinkle the poultice material freely with powdered charcoal, which is an excellent and powerful deodorant.

It is not advisable to continue the poulticing too long as it favors profuse granulations, and an antiseptic dressing should be applied, and the foot kept as clean and dry as possible. A common food of the pig—barley—and compare it with the potato, we find that as 4 lb. of the cereal contains 2.6 lb. of feeding matter, 12 lb. of potatoes would be required to provide the same quantity. As, however, small pigs would not consume so much, it becomes necessary to reduce it and to add barley or some other meal. Barley meal, as it is sold, is not so rich in feeding matter as barley, and for this reason more is required. When pigs have reached greater size, they are able to consume a much larger quantity of feed, and it would be well if at some time a careful experiment could be made in feeding them solely on potatoes. It is well known that store pigs can be maintained on grass, clover, lucerne, and other forage crops, without any meal whatever, but the potato is much richer than these. As mangels and beet have been improved by selection and now contain larger quantities of sugar, there is no reason why the potato should not be improved in a similar way, and to contain 25 per cent. of nutritious matter, or still more in the course of time.—Jas. Long.

THE HORSE.

Training Young Horses.

A writer in the "Maine Farmer" offers a few points on the training of young horses. He says:—"When I was a boy, we thought it great sportto break the colts. The usual way was to let the colt run without even putting a halter on it until three or four years old then get it into some corner of the stable and put on a halter, and often the same day put on a biting harness. This was simply an arrangement for pulling the colt's head up and its nose in higher than it was ever expected to be kept when at work or being driven. Then turn the poor thing loose in the yard and let it run for several hours.

"We did not even think this was a cruelty to the colt; that was really inhuman, not to say wicked, because a 'merciful man is merciful to his beast.' There was no mercy in this, consequently, it was wicked. If the colt is properly handled, there is no need of its being 'broken.'

"The first thing is to secure the confidence of the colt; let it understand that you are its best friend. A ump of sugar now and then will be highly prized by the colt. Nothing loves sweets more than the horse, and a lump now and then to the colt will soon have it following you about, teasing for more. Accustom it, when only a few days old to wearing a halter by putting on a light one for a day or two at a time and leading it around. When only a few weeks old, put on a light collar and back band to which the collar can be fastened, so as not to slip off when the colt puts its head down, and let it wear these for a few hours at a time. Before it is weaned, it should have a light harness put on and be driven by the side of its mother until fully accustomed to the lines. Its feet should be taken up and handled and pounded upon with some light thing until it is accustomed to have them handled in any way desired.

"When a year old it should be harnessed by the side of a genttler horse, preferably its mother, and hitched to some light vehicle without a load, and driven until fully accustomed to the use of the reins. Accustom it to robes and blankets, so that no matter where it sees them, or how they may be thrown against body or heels, it will not be frightened. Never atempt to teach the colt more than one thing at a time, and the first and most important thing to teach the colt is the word whoa. Let it understand that 'whoa' means stop, at all times and under all circumstances. Never couple any other word with it. 'Gee' and 'haw' and 'back' are important words and should be taught, but 'whoa' is by far the most important, and if thoroughly taught will save many a catastrophe.

"But in training the colt, whatever else you do or don't do, never lose your temper, nor speak harshly, or unkindly, or in an excited manner,psotnaeser ly, or in an excited manner. If you get excited and lose your head, you must not blame your horse for doing the same."

The Renewal of Hair On Broken Knee.

A question that generally exercises the mind of the owner of the horse that has been "down" and cut his knees, when he finds on healing that the cicatrix is bald, is what will make the hair grow? It is one that can rarely be answered satisfactorily, and more rarely still is the desire of the owner for a quick reproduction and a perfect covering realized.

The amount of blemish left after healing is complete depends on the amount of damage done to the true skin. Where true skin has been cut away, or has subsequently sloughed and the hair follicles have been destroyed, there is no agent that can reproduce growth. True skin is never renewed, and this is why in operations, and in wound surgery, so much care is taken to preserve every particle. Hair cannot be made to grow under these circumstances, and it is as idle to expect that it will as to produce a new crop of bristles on a worn-out water brush by applying a hair "restorer", but there are agents that have a stimulating effect on the hair follicles if they are intact, though damaged. Even in slight wounds of the front of the knee the hair often grows the wrong way, and leaves a roughness that a careful examination will detect. Under such circumstances, it is a common practice to shave both knees, and apply a m ld blister—preferably a cantharidine one.

This is, perhaps, the best method known of preventing the detection of a slight injury. There is always a fear, or feelng, of uncertainty about buying a horse that has been "down," be the blemish ever so slight, but how far this is justified, depends, of course, on the circumstances under which the accident occurred, or the cause that gave rise to it. Some blister a badly broken knee as soon as it is healed, for the double purpose of exciting the absorption of superflous material brought to the spot by Nature in effecting repair, and of stimulating the growth of hair, which is one effect of the application of vesicating agents where the hair follicles are intact. Sometimes the hair over a contused knee wil grow white owing to the absence of pigmentary matter. Here there is no remedy except to dye it, or, if the white hairs are few, pull them out with a pair of fine forceps. Diluted mercurial ointment, popularly "trooper's ointment" or "blue unction" stimulate the growth of hair, and if a mixture of one part of mercurial ointment and three parts of lard is stained with a little lamp black, or with lamp black and a touch of Venetian red or American bole, in the case of chestnuts, to match the "points," it serves a double purpose—stimulates the growth of hair, and at the same time hides the blemish.—Pateley Bridge.

Dealing With Kickers.

Kicking is a problem with which breeders and owners of horses will always have to contend. In attempting to deal successfully with the habit some horses have of kicking at persons or other animals in the stable, the disposition of the offender must be carefully considered. It will not do to adopt the same plan of procedure, for all cases, as a plan which may be perfectly successful in some cases would be worse than useless in others.

Some horses are not naturally of a vicious or sulky disposition, but have learned to kick solely as a result of bad treatment. This is the most general cause of bad tempered horses, and in order to overcome the habit the proper thing to do is to try to reestablish the confidence of the animal and to make him forget his hostility by consistently kind treatment, combined with frequent atentions, when the horse is in the stable. If the habit is not of too long standing and has not become completely ingrained in the horse it may be eradicated by these means.

Horses which are vicious by nature or inclined to be so, someimes get into the habit of kicking at persons without any real provecation and simply as a result of either excessive high spirits or of sheer vice. This is particularly liable to occur with the young horses, and with those which are underworked and kept standing idle in the stable a great deal while at the same time being highly fed. The fact of a horse being "restive" owing to too little work and too much grain, is very apt to bring outt any vicious tendencies which may be latent in his nature.

In those cases in which a natural propensity toward viciousness, or the high spirits and unruliness which are often found in young horses, give rise to the habit of kicking, drastic measures must be taken in dealing with them, if the habit is to be overcome. The offending animal must be treated with great firmness and rquires to be kept in complete subjecttion. Whenever he kicks, or offers to do so, he should be sharply called to order, and the offence must never be allowed to pass unnoticed, as to do that merely encourages the horse to repeat it. Unless the animal, n such cases, is kept well under control and is firmly treated, he is most apt to take increased liberties, the habit gradually growing worse, and it may finally become so ingrained that eradication is impossible.

Punishing Kickers.

As to punishing horses in these cases when they kick, this depends entirely upon circumstances, and due discretion must be observed. In many cases actual punishment would certainly make matters worse and serve to aggravate the habit instead of counteracting it. To hit horse s in the stable with a whip is very often a sure way of making them kick, and a horse can be turned into a pronounced kicker in this manner. In some cases, however, the infliction of punishment on an incipient kicker by means of a cut with a whip whenever the animal kicks is attended by satisfactory results and helps

THE ST JOHN Business COLLEGE. S. KERR Principal

to stop the habit. It depends upon the disposition of the horse whether it is advisable or the reverse to inflict punishment in the stable in dealing with vice or youthful unruliness. In any case great discretion must be exercised in regard to this question, and in the majority of cases punishment will be out of place and harmful. With many horses which are unruly in the stable, and evince their unruliness by kicking, plenty of hard and regular work is all that is needed to render them more amenable and better behaved and to stop the undesirabe habit (says a writer in "Indiana Farmer") In breaking a horse of any vice it is necssary always to take advantage of the limitation in his mind that makes him reason almost wholly from experience, and to convince him that after all your will is superior to his and that he has no alternative but to obey you and to do gently and quietly. Show him that it is in your power not only to handle him as if he were a toy, but handle him very roughly, if you desire.

Heat Resistance in Horses.

It is a well-known fact that there is a great difference in horses in regard to their ability to stand heat. On almost any farm there are some horses which never appear to be affected in this way, while others puff and pant when worked anyway hard on an oppressive day. Then again, some farmers have much more trouble with this than others even though they do more work with their horses. It is a common beief that a gray horse resists heat better than any other color, but frequently black horses are found that seem to notice the heat less than gray ones they are working with. Two factors seem to determine this heat resistance; these are inborn vitality and the vigor resuting from good care. If the former is present, the latter can easily be supplied by a careful farmer, and there is very little excuse for so much trouble in this regard.

Inborn vitality is best represented by quality, and though this is usually taken as an indication of greater durability of legs and feet, it indicates equally well such things as general fineness, not only on the outside of the body but in the inside. This means greater power of digestion and greater assimilation of the food; more life and greater power of resistance, to not ony heat but any other stran that the horse may be subjected to. Consistent high selection will go further to remedy this side of the complaint than anything els.

Bones of Light and Heavy Horses.

Definite information concerning differences between the bones of light and heavy horses has been obtained by B. Hardt, of Jena University, Germany.

Upon chemical analysis of many specimens of metacarpus or front cannon bones of draught horss contain more organic matter and less mineral matter than those of light horses. There are also some minor differences in composition, but he concluded that there are greater differences in form and strength than in chemical composition of the bones of the two types. This supports the common statement of the horsemen, that the bones of light horses are generally harder than those of draught horses, for the hardness of bone and its strngth are known to increase with additional percentages of mineral matter.

Since there is a general co-ordination of structure throughout the body, the texture of the skin and hair furnishes an index to the character of the bones. Smooth skin and fine hair are generaly possessed by light horses, and particularly by those retaining sound legs to old age. When the same quality of hide and hair is found on the cannons of a draft horse, it is a fair assumption that there is a corresponding density of bone. The reputation of such horses for soundness or underpining supports that concusion.

POULTRY

Poultry Diseases.

Egg Eating

Causes. Usually an insufficient supply of lime, or material to make egg shels. Seeing another hen with the habit and following her example.

Treatment. Go to a restaurant or hotel and have a pail of egg shells saved up for you. Dump these in the yard in front of the chickens; tramp on some of the shells and leave the others as they are. This one dose should cure the egg eaters; if it does not, get another pail of shells, and keep a constant supply of them on hand. This is a positive cure for egg eating. Do not give the hens an egg shell doped with mustard, or similar so-called cures. There is nothing to them.

Feather Eating.

Symptoms. The birds stand and pick the feathers from one another. Usually the hens pick feathers from the male's hackle first.

Causes. Insufficient exercise. Feeding too much grain and heat-forming foods. Lack of green food and mineral matter.

Treatment. If only one pen is affected drop a piece of sulphur the size of a cherry into the throat of each bird. Repeat the dose the third day. Boil oats until soft and plump, and into a pail of this mixture stir a good pinch of salt and a quart of beef scraps. If youhave not the beef scraps, boil a nickel's worth of cow's liver and cut it up fine. Feed the oats and meat every morning. Cover the floor with deep litter (preferably cut clover or clover chaff) and keep the fowls busy scratching the whole grain during the day. Give sour skimmilk to drink if you have it. Watch the feather eaters, and if they continue the practice under the new system of feeding, remove them from the pen. We have cured feather eating by giving food to cool the blood, and making the fowls take more exercise. We had quite an experience with this disease when milk-feeding chickens in small crates for market.

Gapes

Symptoms. The chick continually opens its mouth, or coughs without making much noise. It ends each cough with a twist of the neck in trying to throw up the worms in the windpipe.

Causes. The presence of small red gape worms in the windpipe. The male worm is smaller than the female which becomes filled with eggs, and when these are mature the worm dies and the eggs are thrown out on the ground in a spell of coughing. The eggs are eaten by other chickens and the young worms find their way to the windpipe of the new host.

Treatment. A gape-worm extractor, a feather stripped of al the web except at the tip or several horse hairs tied together, can be dipped in turpentine and inserted in the windpipe. By twisting the extractor around and removing it, usually from one to three worms will be found.

Probably the simplest way to cure this disease is to place an ounce of carbolic acid in a saucer and heat it over a lamp. Dense white fumes will arise in which the chicken's head is held until it is almost suffocated. The idea is to kill the worms, without quite killing the chicken. Another remedy is to puff a mixture of one ounce powdered chalk and one-half ounce finely ground camphor into the chicken's face and down its throat. Another is to nsert a few drops of oil or eucalyptus with a medicine dropper directly into the mouth of the windpipe. I have never tried this treatment, but it is well recommended and sounds reasonable. In addition to killing the worms in the windpipe it is necessary to spade up the ground, and disinfect the pramises by scattering lime around. The eggs and embyro gape worms live in damp ground, edges of pools and in and around drinking vessels. The eggs hatch in a week to a month, according to conditions.

Limberneck

The following is compiled from instructive articles on this disease which appeared in recent issues of The Standard by Mr. Cavanaugh and Mr. Young.

Symptoms. Limberneck comes on gradually and often takes several days to kill the fowl. The first sign of the disease is the swinging of the bird's head and neck; then the head hangs down and the muscles of the neck seem to have lost all power to hold up the head. At the first symptoms, the fowl may be easily cured, but at the last stages, the case is almost hopeless.

Causes. Many breeders believe that limberneck is caused by fowls eating maggots, on account of the throat containing maggots, but this is a mistaken idea. Poultry is not injured, as a rule, by eating maggots, but by eating decayed flesh and rotten vegetables. In running at large the fowls discover some dead animal being devoured by maggots, and in picking up the maggots the fowls eat sufficient decayed matter to stop digestion. It is a well known fact proven by years of observation, that when a fowl swallows unfit food, this food is retained in the crop and not allowed to pass down into the gizzard.

Other animals often have the power and to vomit unfit food, but the chicken either can't throw up or has not the sense to do so. When poison, decayed food, or other injurious substance is swallowed, the fowl will retain it in its crop, an dthe poison and the good food will remain in the crop until the fowl starves to death, or the offensive stuff is removed.

Treatment. The method we have used to cure this disease is simiar to teh one we use in curing fermented crop, cropbound, or pendulous crop. We have a fountain syringe, and catching teh diseased fowl we wrap a cloth about its bobdy, wings and legs, allowing only the breast, crop, head and neck free. After filling the syringe with luke warm water to which we have added a few drops of Zenoleum, Carbo-Negus, or carbolic acid, we insert the rubber hose of the syringe well into the crop, through the mouth and neck. We allow sufficient water to flow in so that the crop is puffed out quite large, after which we remove the hose and holding the fowl's mouth open with the forefinger and thumb on the left hand, at the same time stretching the neck out straight with the head down, we squeeze the crop with the right hand, after the fashion of a rubber ball and allow all the contents to run out. This stunt is repeated several times, or until we are certain the crop is free from the injurious matter and clean and empty. A little milk is given the fowl along with a few pieces of clean, fresh charcoal. This is a simple and almost certain method of curing limbercnek.

The above is Mr. Cavanaugh's method. Mr. Young had fifteen or more birds affected with imberneck and cured all by the following treatment. He gave each a piece of gum camphor the size of a wheat kernel, and washed it down with a teaspoonful of kerosene. This dose he repeated the same evening or in about eight hours. At noon the next day the kerosene alone was given. Mr. Young not only saved every bird, but generally cured them the first day.

Other readers have tried Mr. Young's remedy and found it a satisfactory cure in every case.

Mr. Forest has another. One tablespoonful peroxide of hydrogen in three tablespoons of water. A small syringe was used to inject the mixture down the throat and prevent waste. The pullet was in a bad way with limberneck. Mr. Forest reasoned that peroxide must disinfect the crop and remove the trouble. It did. In ten hours the pullet was singing happily.

Pip.

Symptoms. A hard tip forms on the end of the tongue, and the latter bends around in circular shape, as shown in the illustration.

Treatment. We do not know the cause, (it is said to be breathing through the mouth), but have had three cases. The first we cut off the hard tip of the tongue, as was recommended. The bird died. The other two cases, we simply softened the tongue with vaseline and fed the birds on nourishing foods. After about two weeks the tongue resumed its natural shape and the birds were as well as ever.

Roup.

Symptoms. Eye inflamed and closed and filled with offensive matter. Nostrils closed in the same way. Face swollen. Offensive smell.

Causes. Practically the same as under "canker."

Treatment. Follow the first paragraph of the treatment recommended for "canker." To treat the sick birds, take a quart dipperful of warm water, and color it purple with permanganate of potash; add a half teaspoonful of Zenoleum or Carbo-Negus to the mixture. Souce the head of every roupy bird in this mixture, so that it reaches all the passages in the nostroils and eyes. Keep the little finger of the left hand between the bird's bill and keep its mouth open. Place the sick away from the others in well ventilated coops. Give nourishing food, seasoned with ginger. Conkey's Roup tonic and hroup tablets are well spoken of by our friends for use in getting rid of the after affects of this disease. They are convenient to use.

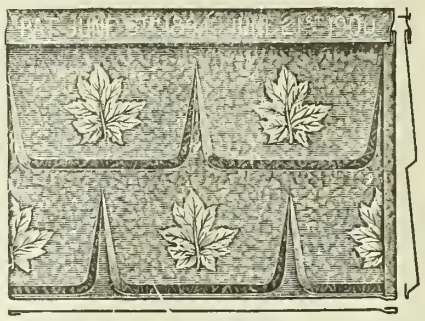
Scaly Legs.

Symptoms. The shanks and feet are covered with light yellow, powdery looking growth that spreads all over

WILSON'S FLY PAD. POISON

Every ten cent packet will kill more flies than $8.00 worth of any sticky fly killer. **Refuse substitutes, which are most unsatisfactory.**

Lightning Proof Your Farm



When you figure on the next roofing material for your house or barn be sure that you get good value for your money.

To get good value for your money you should purchase metal shingles. And when you buy metal shingles you want to get good metal shingles—a shingle with a guarantee.

"Were all medicines as meritorious as Chamberlain's Colic, Cholera and Diarrhoea Remedy the world would be much better off and the percentage of suffering greatly decreased." Writes Lindsay Scott, of Temple, Ind. For sale by all druggists.

them. From time to time particles of the growth drop and the legs present an unsightly appearance.

Causes. The disease is caused by a mite burrowing into the scales of the shanks. One fowl can transmit the disease to an entire flock.

Treatment. First take a tooth brush, soap and warm water and thoroughly wash the legs, removing all the crusts that are loose. Smear over the legs carbolated vaseline, or whiskey and sweet oil (3 ker. to 1 oil), Zenoleum and sweet oil (3 ker. to 1 oil), enoleum and oil, etc. The legs should be well cleansed with warm water and soap two or three days after the treatment. If the disease is not eradicated, repeat the remedy.

Sorehead or Chicken Pox.

Symptoms. Light colored specks, about the size of a pin head, appear on the comb or face. These specks grow rapidly into warts from one-eighth to one-quarter of an inch in diameter, and dark brawn in color. There are two varieties of pox—the dry and the moist. The dry has been described; the moist affects the eye and fills it with a frothy white substance.

Causes. The disease is caused by a fungus "aspergillus fumigatus," the spores of which are always present in the atmosphere. This is the common white mold of bread, but it works serious havoc when it attacks any living organism. The disease is prevalent in damp, cold weather. It is exceedingly contagious, but when it appears in a flock there is no necessity for isolating the afflicted bird The entire bunch is affected at once, and the birds that do not fall to the disease at once are not likely to take it later.

Treatment. Color the drinking water pink with permanganate of potash. The birds that have warts should be caught and the crust of each wart removed. The underneath tisue will bleed. Dip a clean feather in a bottle of pure Zenoleum or Carbo-Negus and touch the raw tissue of each wart with the liquid. The next morning the treated wart has a black scab over it. which dries up and falls off in two or three days. At that time the underneath flesh has healed and in a week one cannot detce where the wart had been. A white scurf appears on the comb and face. When the bird is recovering, the scurf should be rubbed off with a cloth moistened with vaseline. Remember it is absolntely necessary to remove the crust of the wart and apply the remedy to the raw tissue underneath the crust; otherwise, the raw remedy cannot get at the root of the trouble and kill the fungus.

Where the head is a mass of sores, the treatment consists in painting the entire head with pure Zenoleum three times a day. Do not try to remove the sores, but let them dry up and drop off of their own accord. This treatment will cure sorehead, even when the entire top of the head and both sides of the face are affected. We have personally proven it.

Dropsy of Wattles.

Symptoms. Wattles become enlarged and filled with fluid, either as the result of an injury, cold weather or disease.

Treatment. With a clean penknife open the wattle at the lowest point. Squeeze out the fluid, and isinfect the interior by putting the wattle in a cup of warm water with a little Zenoleum in it, and pressing the wattle. By keeping it in the water and squeezing several times, the interior can be cleansed.

White Diarrhoea

Symptoms. This is the common name of a disease or condition that afflicts little chicks under ten days old. This term is applied to this condition on account of the white discharge that passes from them, and in many cases becomes attached to the rear fluff. The chicken is then said to be "pasted up behind." It stands with wings dropping, does not move around much, and from time to time utters distressed chirps.

Causes. Numerous. The most common is a chill during the first three days. The use of decomposing food, such as wet mashes which have been left to sour within reach of the chicks. Covering the floor of the brooder with musty straw or litter. Feeding musty grain. Over-feeding. Poorly ventilated brooder house or brooders.

Treatment. Kill the chicks that are in trouble as they will die anyway. Study the conditions under which your chicks are kept with great care and try and ascertain the cause of the disease. Then overcome it. Nine times out of ten the remaining chicks can be brought beyond the danger age if the litter is removed, the brooder cleaned out and washed with a solution of Zenoleum in water. Then cover the floor of the brooder and run with 2 inches of freshly-dug black garden soil, and over the soil scatter a 1-inch layer of clean clover chaff, or clean short litter of some kind.

We spoke to a man in Kansas City who lost hundreds of chicks with white diarrhoea, because he used baled straw which was musty. As soon as he learned that musty straw was one of the causes of this disease, he tried covering the brooder floor with cut clover instead, and the white diarrhoea disappeared like magic.

Get your tinner to make a shallow trough 2 ft. long and 1½ in ch across the opening, that can be tacked to the wall of the chick pen with the upper edge about three inches above the ground. In this trough keep a mixture of equal parts of dry rolled oats and bran Let the chicks eat all they want of this food. Scatter small grains among chicks kept indoors in close in the litter above the earth to keep them busy exercising their limbs, and quarters. Fresh air is a good remedy. if you maintain the heat of the hover compartment of the brooder at 90 degrees from the first to the tenth day, you will not have any trouble with white diarrhoea. This disease does not affect chickens over ten days old, or adult stock. It is more prevalent

EVERY FARMER SHOULD KNOW

how to make the most money out of hi- land. If your Fall Wheat crops have been diseased and poor, there is a seed dressing that will ensure you a better field at trifling cost.

CORVUSINE D.C.

prevents ground rot, assists germination and is an excellent smut dressing. Corvusine is NOT poisonous, birds and animals will not touch it, and it has none of the dangerous features of bluestone and other obnoxious chemicals. 1

"SUCCESS" :: *By J. Lee Flewelling*

(Continued from last issue.)

"Yes, I remember it very well, and I knew by the look in your eye that day, that you meant it, too. What do you say Mr. Ruddock, will you accept the position?" After a few moments of thought, Charlie said, "of course sir, I accept, and am very grateful to you for the preferment, and will try to so conduct myself, and the business, that you will not have cause for regret. What will the men say?"

"You won their esteem, I judge when you trounced their champion and displayed such modesty afterwards, and I think you will have little trouble with them. Perhaps I had better announce the matter to them myself in the morning.

There is a large shipment of goods by the boat tomorrow, for Northrup & Co. of Newburg. I will give you the memorandum now, you can put them to work on that first thing, I will probably not be down before 9 as usual."

Then rising and shaking hands "I congratulate you most heartily Mr. Ruddock. If you are at liberty tomorrow evening I will be glad to have you dine with us at 7.30, and accompany my daughter and myself to the theatre, afterwards. Mina has been teasing me to take her as it is Ada Rihan's last appearance this season."

"Thank you very much Mr. Pieno, both for your invitation which I gladly accept, and for my appointment to this honorable and responsible position."

Our young manager went home in the highest of spirits. When he told his friend the German, of the great change made in his affairs, for he had found a firm friend in the latter, that worthy (aid. "I be mooch glad for yours sake Charlie, you pe vat we say, grit to the back bone. I guess the Captain wont have to pay some of his monies for your word now. Ha, Ha."

"I think," said Charlie, "Captain Jarrows will be glad to hear the good news."

The next morning Charlie took his place in the stern, and when the time arrived, put nearly all of them on the Newburg Shipment. He had taken charge several ti es during Mr. Brown's temporary absence, at the request of the latter, so no comment was made. Some one asked concerning Mr. Brown, and the reply was, he could not be here this morning."

When Mr. Pineo came in at 9, Charlie was able to announce that the Newburg order was nearly ready for shipment. "Well done, boys," said Mr. Pineo, "I guess you have beaten the record this time."

Now men, I have an announcement to make to you. At this, all work ceased, and all faces turned eo him expectantly. Mr. Brown, our late manager has been offered a more lucrative position with another house, and with my consent, he has accepted, and will not be here any more.

I have chosen a very young man, as his successor, but one who has shown himself to be in all ways worthy of the position. I could not call any young man to so responsible a post, without having most carefully examined into his fitness for the same. I am thoroughly satisfied.

It will be necessary, that you for your parts, should give prompt obedience, and willing compliance with his orders, and I will have no use, of course, for men who will not do this.

Now let men introduce to you, my new manager, Mr. Ruddock," and Mr. Pineo bowed, and walked in towards the office, ere he reached it, the warehouse rang with the cheers of the men, led off by Mike.

The men crowded round to shake hands with their new Boss, and to congratulate him.

"Sure Mr. Ruddock, said Mike, who was the first to grasp the hand of our hero, you've made a better man of me since the day you gave me the licking, and its because you took me to "Temple of Honor" and helped me back again when I broke the pledge, and stayed my friend always, that I'm a temperate man this day. The little woman at home has taught the children to pray for you each night, and God knows their innocent prayers have done you no harm any how. It's no more Charlie, its Mr. Ruddock now me boys and the fellow that don't jump when he gives the word, must settle with Mike Daley."

"Well my men" said our young friend, "this was a great surprise to me, last night as it is to you now. I never had a thought of it when Mr. Pineo called me to the office," and with a smile, "I didn't get my discharge this time. Let us all do our duties cheerfully, in our different situations, and you will have no occasion for complaint.

Now boys let us get this Newburg order completed and Saturday night we will have the oysters at my expense."

With another cheer they all set to work with a will and the large warehouse was again a busy hive of industry.

That evening our hero put on his dress suit, and presented himself at the residence of Mr. Pineo on Fi.th avenue. He was most hospitably received by his employer, and introduced to his daughter Mina, whom Charlie found a most charming young woman, and as at dinner Mr. Pineo, knowing his cleverness, took pains to draw him out. Miss Pineo was agreeably surprised to find that she enjoyed the dinner, and the stay at the opera house, afterwards, much better than usual.

The next Sunday, as they were returning from their morning service, they met young Ruddock, who lifted his hat smilingly, in answer to her recognition.

"Papa when you spoke of bringing that young man to the house, I dreaded the encounter, I thought to find him a diamond in the rough; I knew him to be clever in business from what you had said of him, but thought he was unfitted for society; but now I think he is one of the finest gentlemen I have met.

"Yes," said her father, "Mr. Ruddock is a gentleman, and you will never have occasion to blush for him."

"Why papa, he is much better educated, I judge, than I am, on whom you have spent so much money. His conversation is most interesting and instructive too, so different from that of the ordinary young men I meet and how handsome he is too. Do you know, as I looked around the opera house last night, I thought that the handsomest old gentleman, and the handsomest young gentleman were both in our box."

"Oh! You little blarney," said her father, "I believe you are fishing for a compliment, and those who go fishing on Sunday don't deserve to catch anything, so I'll not tell you what I thought. He is a gentlemanly and clean young fellow as I took pains to ascertain before introducing him to our home and I will never feel uneasy about you when he is with you."

"Do you wish to have him with us often, papa? Your words seem to imply that."

"Yes, it will be an advantage to the young man, and it will be for the benefit of the business, too; we often need to talk over matters more fully and freely than we can at the office. I am getting along in years, and will soon be too old to have the full charge of the business, and I am greatly surprised if that young man does not prove the one I need to lighten the load for me."

The next time Charlie called, Miss Pineo chanced to have some young friends with her to whom he was introduced and the evening passed so pleasantly that he was glad to repeat his visit some time later. She introduced him to all her friends with some pride, and he was by them invited to their homes, with the result, that very soon all the best houses were open to him, and he might have become a brilliant member of society; as he said to Mr. Pineo, he did not care to go far in this direction, for late hours had a tendency to make the brain flabby and less suited for the demands upon it. Still he went now and then to some parey, that he might escort Miss P neo home, when her father did not care to remain to a late hour.

One evening as they were sauntering home from a whist party which they had attended, and whence both felt they had rather walk, as it was a lovely moon-light night, than to have the carriage which Mr. Pineo offered to send round for them, she told him something of her past life; how her mother had died when she was only ten years old, and how it had seemed to her that her father had in a large measure, taken her place so kind and affectionate had he always been.

On her return from the Seminary at Wellsley, some six months previously, she had taken the reins in her own hands and assumed the control of his household. Charlie in return told her of his past life, and the fact that he had lost both parents, at the same age at which she lost her dear mother seemed to form a bond of sympathy between them.

This passed away another year and during this time Mr. Pineo never had cause to regret that he had made choice of our young friend manager.

The work went promptly and without a hitch, and the men seemed to grow more fond of, as they termed him, 'our Mr. Ruddock.'

One afternoon Charlie came to the office, just as Mr. Pineo was about leaving, and said, "Can I have a few words with you sir if you are not in to great a hurry?"

"Certainly Mr. Ruddock, you have such a long face,—I hope noehing serious has gone wrong. Sit down opposite me and I guess we will be able to straighten matters out, if not it will be the first time we have failed to do so."

"I hardly know," said our hero, "how to begin."

"There is no difficulty with the business. It is a private matter. You introduced me to your home about a year ago and you and your charming daughter have made it so pleasant place for me that I have been their quite frequently, and especially of late, and I have thought it right to tell you that I cannot go there in this way any longer.

"It would ,scarcely be right, for me, with my prospects, to aspire to the hands of your daughter, and I have come to love her so dearly, that I fear to trust myself with her, lest

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write today. Address: Mrs. M. Summers, Box 309, Windsor, Ont.

TWO WOMEN SAVED FROM OPERATIONS

By Lydia E. Pinkham's Vegetable Compound—Their Own Stories Here Told.

Edmonton, Alberta, Can. — "I think it is no more than right for me to thank you for what your kind advice and Lydia E. Pinkham's Vegetable Compound have done for me.

"When I wrote to you some time ago I was a very sick woman suffering from female troubles. I had organic inflammation and could not stand or walk any distance. At last I was confined to my bed, and the doctor said I would have to go through an operation, but this I refused to do. A friend advised Lydia E. Pinkham's Vegetable Compound, and now, after using three bottles of it, I feel like a new woman. I most heartily recommend your medicine to all women who suffer with female troubles. I have also taken Lydia E. Pinkham's Liver Pills, and think they are fine. I will never be without the medicine in the house."—Mrs. FRANK EMSLEY, 903 Columbia Avenue, Edmonton, Alberta.

The Other Case.

Beatrice, Neb.—"Just after my marriage my left side began to pain me and the pain got so severe at times that I suffered terribly with it. I visited three doctors and each one wanted to operate on me but I would not consent to an operation. I heard of the good Lydia E. Pinkham's Vegetable Compound was doing for others and I used several bottles of it with the result that I haven't been bothered with my side since then. I am in good health and I have two little girls."—Mrs. R. B. CHILD, Beatrice, Neb.

I betray your confidence and let her see how dear she is to me."

"What's the matter with your prospects, young man?" asked Mr. Pineo. "Here you are manager in a large business, you have a good social standing, and you seem to be steadily growing in popularity with the men of the ward:— I know something of the work you've been doing among them, and if you sought Civic honors you could climb to almost any position you might wish. Besides all this, as I am beginning to feel my age, and the cares of the business, I have been thinking of offering you a partnership to commence with the new year. Talk of your prospects, how does that one suit you? And more than that, if you have won Mina's affections let me tell you man, I don't know a young fellow in this city that I would rather give her to. You had better come round to night and settle matters. If I can read the signs aright you need not have any great fears concerning the result." Charlie with tears in his eyes gripped the hand of Mr. Pineo until he made that gentleman wince.

"You are too good to me," he said, "I cannot properly express my gratitude, but if I have won Mina's heart (and I cannot help hoping) it shall be the greatest effort of my life to make myself worthy of your confidence."

When he presented himself at Mr. Pineo's residence that evening, and when he saw the glad light in Mina's eyes, and the conscious blush, he felt that her father must have given her an inkling of what was coming. As he was no laggard in love he took advantage of their being alone, and told her in manly terms, and in burning words that she long remembered how dear she had become to him and pleaded for the priceless boon of her hand. If you can trust yourself to me dear, he said in conclusion, you will gladden my whole life, and I will devote that life to you. Can you, Mina?

"Yes Charlie," she said, for I have learned to love you dearly." The next moment she was in his strong arms and their lips met in the sweet and loving kiss of betrothal.

When Mr. Pineo entered the room, Charlie led Mina up to him, and said "this dear girl has promised to be mine and we crave your blessing."

"You have it my children. May God bless and keep you and may you both be very happy.

And now Charlie, the business requires that one of us should be in Paris by the end of next month. I do not believe in long engagements. What do you say Mina; can you be ready to go with him? While I dread the journey it will be a nice bridal journey for you two, and the business will not require that Charlie will have to leave your side much, and besides it will give you a chance to know if Madam Toussian has learned you the proper French accent, or not. You Charlie, I know speak French fluently. I cannot consent, my boy, to lose my only child, I would much rather have two instead. This house is large enough for us all, and when you return, I will see that it is ready for you,and let us henceforth live together.

To this our hero readily assented, and all came out as Mr. Pineo had planned.

They were married on Christmas Eve, and started New Year's Day on their bridal tour, which was to combine business and pleasure.

They spent three weeks at the French capital and one week in London, and then embarked for home. They had a pleasant time across and enjoyed the trip, even at that time of the year. A pleasant surprise awaited them as the carriage which had met them at the pier turned in at their own gateway.

A superb arch, ten feet high, of most elaborate design, done in Fir, Spruce and other pines, circled from one massive gate post to the other and had the motto

Welcome
To the working man's friend
And his Bride.

This was the work of the firm's employes, and of other members of the labor union.

Ever since his first coming to New York, Charlie had been much interested in what might be termed the labor problem, and had in his way done what he could for the uplifting and improvement of the working men and their families, as he came in contact with them through the "laborers union" with which he had early identified himself.

This tribute, showed how much they appreciated his services, and made him resolve to continue his work along this line for the future.

He saw readily that the position to which he had attained, would give him increased facilities for doing so.

He never forgot the lessons he had learned when he was in the ranks himself.

Our hero, still continued to conduct the business of the firm, with unabated zeal, and under his able management, it expended to such an extent that in a few years ":Pineo & Ruddock" was counted one of the wealthiest, of the many wealthy firms of Pearl Street.

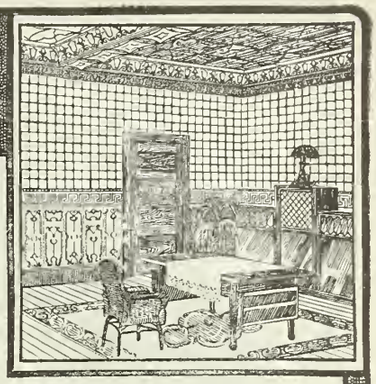
Prosperous and happy with a young family growing up around him, our hero furnishes a bright example of the fact, that poverty or humble position need be no bar to the advancement of any young man, but may rather be as it was in his case, but the incentive spur, to goad one to success.

School Improvement

The purpose of this paper is not to outline any comprehensive and original scheme for the improvement of our schools; nor to criticize, except favorably, the steps taken towards that end in the past. You will not, I assure you, hear anything you do not already know, nor is it necessry for we all know considerable about "School Improvement," although we may not have our ideas on the subject properly sorted and ordered, so as to be able, as it were, to lay our hands on the most important. With this in view, I purpose in this paper to repeat some things we all know and believe but which nevertheless cannot be repeated too often,— for we are all prone to forget. By constant repetition these truths may saturate us completely and then find expression in our daily lives.

It is important that districts should improve the appearance of their schools or should they disregard the surroundings and devote all their attention to the purely intellectual side of school life? I certainly think that the surroundings should receive even more attention than they do at present. We judge a man, and justly so, by the appearance of his property. If his property is neat, clean and tidy we may be sure that the owner has those same virtues in himself, anh we instinctively associate him with honesty and uprightness of character. If, on the other hand, his property has a dismal, slovenly or tumbledown appearance, most likely the character of the owner will be found to correspond to the appearance of his property. Can we not then without any injustice judge a district by the appearance of the School, which is their common property? I believe we can, and this is one reason why I think the surroundings of many schools suffer fram the lack of attention. I remember to have read somewhere that if one wished to visit the Schools of Prince Edward Island, one need never make any inquiries as to their location, but simply pick out the most dismal looking building in the settlement. This, of course, is an exaggeration, things are not nearly so bad as that, but the school should be the neatest, cleanest, freshest and most cheerful building in the district. Besides this, from the purely educational standpoint the surroundings of schools should be improved. We all know how impressionable children are; how they see and hear so much more than their elders. And we know too, how the ideals that will govern them throughout life are formed in childhood. If boys and girls are brought up in an atmosphere of neatness, cleanliness and tidiness, these qualities will soon become second nature to them and when they become men and women they will show forth their early training. Will not the surroundings of the school in which a boy spends almost one-third of his waking hours have a great influence on him? And will not beautiful surroundings be a great object lesson to him? Besides this, it cannot fail to be a great incentive to him to take

Sanitary, Fire-Proof Walls For Your Home



Let us show you how you can make your house more attractive, fire-proof and sanitary by using

"Metallic" Ceilings and Walls

This steel interior decoration is very inexpensive. We make it in innumerable beautiful designs that will be sure to please you. Easy to put on over old plaster without muss or fuss. Will out-last any building. Settle your wall and ceiling question for all time by erecting "Metallic" ceilings and walls. Write for complete information.

Big Money Inside The Fence

Yes! There's big money behind the wire netting of a Black Fox Farm. That's why so many owners of ranches for fur-bearing animals buy MARITIME NETTING. They want to feel positive security about the valuable animals inside the fence.

MARITIME Wire Netting is galvanized after weaving—no little places missed or unprotected crevices that will corrode and form a weak spot later on. Fur ranchers can't afford to take any such chances—therefore they buy MARITIME NETTING.

Always a good stock on hand ready for shipment and every foot of it **guaranteed.** Buy MARITIME NETTING for your poultry farm—there's none better at any price, none more strongly guaranteed. 14

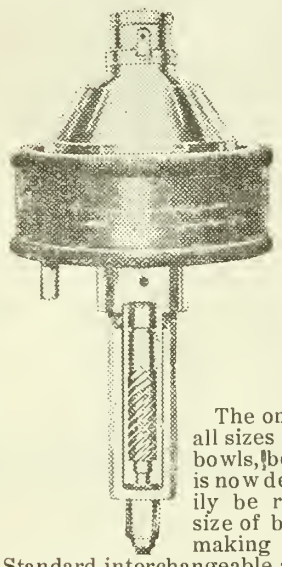
MARITIME FOX, MINK, & POULTRY NETTING

See the New 1915 Model At The Fall Fairs



FOR more than three years our factory experts and mechanical designers have been working on and testing the new features on this new Model Standard. One of the new features—the interchangeable bowl—is the most important improvement in cream separation construction in many years.

Standard

The one frame now does for all sizes of Standard Separator bowls, because the bowl casing is now detachable. It can readily be removed and another size of bowl substituted, thus making the capacity of the Standard interchangeable at will. If you require a larger capacity than you first thought necessary you will not need to buy an entire new machine—just a new bowl and fittings.

The change of capacity, please note, is not accomplished by changing the skimmers in the bowl, but by a complete change in the size of bowls, so that each bowl is constructed to do the work required of it. The interchangeable capacity thus does not interfere in any way with the Standard's famous skimming qualities. It still skims down to .01 per cent. and often less.

As a result of perfecting this detachable bowl casing, an improvement has also been accomplished in the alignment of the neck and bottom Spindle bearings, which puts the 1915 Model in a new class so far as easy running is concerned. A comparison with any other cream separator will easily prove this.

The nickel-plated cap screws which cap the bushings on the side of the casing are another new feature. They make the casing completely oil-tight and dust-proof and at the same time add to its appearance.

There is a new neat sight oil gauge too (not a clumsy oil cup or glass lubricator) which shows the amount of oil in the separator at a glance. Also a new reversible float which is without a stem to break off.

Altogether the new 1915 Model has twenty-two main features. These are explained fully in the latest edition of our Standard separator catalog, just off the press. Send for a copy. Also look for our Standard exhibit at the Fairs listed on right. At the smaller fairs the 1915 Model will be exhibited by our local agents.

pride in the beautifying of his own home. Then again, many of the pupils who are privileged to attend these schools will in their turn become teachers and in this way the enthusiasm will spread and the standard and tone of the schools will be raised. This, I suppose, will seem very far-fetched, but although we cannot see the gradual and snail-like movement, still I firmly believe that these are some of the results which will naturally follow the improvement of schools.

If, then, it is so important that school grounds should be beautiful, what a district must find out is, how best to improve their own. This will depend largely on local conditions, such as situation, extent of the ground at their disposal, and so forth. It is a question too, about which there can be much difference of opinion; but by comparing opinions good results should be obtained. It is my opinion that school grounds should consist of three chief parts; first, the play ground; second, the school garden, and third, the school lawn. If the grounds are large and the pupils numerous the play ground should be divided into two parts by a neat fence. Indeed, unless all the fences about the school property be neat and in good repair, they will detract very greatly from the beauty of the grounds. A great deal of the work put upon school property will be lost so far as appearances go if the fences are not creditable.

Each part of the school grounds mentioned above should have a goodly number of trees. I do not believe they should all be of the same variety, as is the case in most schools where trees have been planted, but I think districts that plant the trees should have in mind the educational, as well as the esthetic value of tree-planting. With this in view would it not be better to plant some of each of the varieties that grow in this country? In this way the pupils will have a chance not only to learn to distinguish one variety from another, but will also under the guidance of their teacher, learn the habit and characteristics of each. With the tree, instead of a text book before they, they will deem this not work but play. I do not mean, of course, to plant just one tree of each variety, but rather to have a preponderance of the more suitable varieties.

The play ground, should, of course, be in the rear of the building, while the garden and lawn should occupy the ground in front. The location of the garden will depend on the shape of the ground left after the play ground is marked off. In some cases it is best to have both the lawn and the garden run from the road or the street back to the building, but the lawn would, of course, have much more frontage than the garden. It is surprising the small number of schools that can boast of a garden. One would suppose that at the present day, when one hears so much about the teaching of Botany and Agriculture in the schools that gardens would be common. One thing is sure that to each either of these subjects successfully, a school gazden is a necessity. It is easy to see whether it is better to simply tell a boy that a certain flower has five petals or to give him the flower and let him pluck off and count the petals for himself. The first method is telling the boy something; the second method is teaching him something.

Nothing will give the school a more home-like appearance or set it off to better advantage than a well-kept lawn and clean walks. Of course, unless it is well-kept and not used as a play ground, the lawn will soon become rather unsightly and add very little to the beauty of the property.

I think it is unnecessary to mention anything about the building itself, as there can be no difference of opinion as to how it should be kept. It is superfluous to say that it should be kept scruplously clean, bright, cheerful and homelike. There are, however, just two more points I wish to mention; one is ventilation, the other, health.

Fresh air is just as necessary for health as food; for indeed air is food. Every breath we take we deprive the air of some oxygen, which is the essential part and supply in its place carbonic acid gas, which is a poison. Thus in an ill-ventilaeed school the air very soon becomes poisoned and the children listless and sleepy. Every district should see to it that there is an adequate means of carrying off the poisoned air, as well as a way of admitting a sufficient supply of pure air.

I think a very important improvement that should be made in our present system is the medical examination of children, say once or twice a year. Many a one who is now wearing glasses would never have had to bother with that expensive nuisance had their eyes been attended to in time. It is an established custom in many American schools and it appears to be a good thing. By correcting some abuse in the windows or black-board a visit to the school from a doctor might save lots of trouble. It would not cost a great deal but I believe it would be money well spent, for from such a visit, the parents could learn a good deal about the health of their children and the conditions under which they are living in school.

Paper read by Mrs. T. P. Cass, before the East Wiltshire, P. E. Island Women's Institute.

The Art that first made Britain Famous.

The earliest records of English history point to the manufacture of lace by the ladies of rank, more particularly in that portion of England now known as the counties of Devon and Buckinghamshire. In the latter, however, the industry became more and more the work of the people, and two hundred years ago the housewives of the district supplied the Bobbin for the cross of France and Spain as well as England.

During the last century the industry fell upon evil days until during the last decade the Organization known as the Buckingham Cottage Workers Association was formed, with the result that to-day hundreds of cottage workers are producing that celebrated lace that made England famous.

Below is shown a portrait of a cottage worker at the age of 81 who is one of

Just Starting Her Fifth Score Years.

those producing the very finest and highest quality of lace. Any lady reader interested in this art may obtain an interesting booklet and full particulars free upon application to Mrs. Laura Armstrong, Olney, Bucks, England.

* * * Running side by side with the English Lace industry was that of the sister workers in Ireland, in fact to many of the Overseas Dominions the Irish lace was better known than that of England, but unfortunately the knowledge is usually limited to the Boat merchants of Queenstown or the roadside workers of Killarney, and little is known of the unique productions of the Middle and West of Ireland. In order to assist the Irish Lace Makers in the development of the Irish Lace industry the Buckingham Cottage Workers Agency have offered to co-operate and assist, with the result that lady readers, interested in the Irish lace can obtain Catalogues and full information by addressing, as above, Mrs. LauraArmstrong Armstrong, Olney, Bucks, England

Rats Need not be Tolerated.

There isn't a single farmer in the entire country that hasn't been both ered with the rat at some time or other. It is one of the worst pests that the farmer has to deal with and the losses from its depredations amount to millions of dollars annually. In addition to its destructive habits the rat is known to be an active agent in the carrying of disease which makes it doubly important that it should be destroyed.

Too many farmers neglect the piles of boards and rails that accumulate around the barns. This makes an excellent rat harbor and they will be found in a place like this for they can rear their young without being molested. Clean up the barn yard and burn the piles of trash. Pile the boards and rails on a support about help to prevent the rats from making a foot from the ground and this will a home in them. Have some extra help and a good rat dog when destroying rat harbors. Kill the rodents and don't let them escape to some other place where they will multiply and be thicker than ever. They are noted for their great fecundity and their ability to adapt themselves to all sorts of conditions. They breed three, four, or even more times a year and produce from six to seventeen young in a litter. Females breed when only four or five months old. It is plain to see how many rats you will have around the place if no precautions are taken.

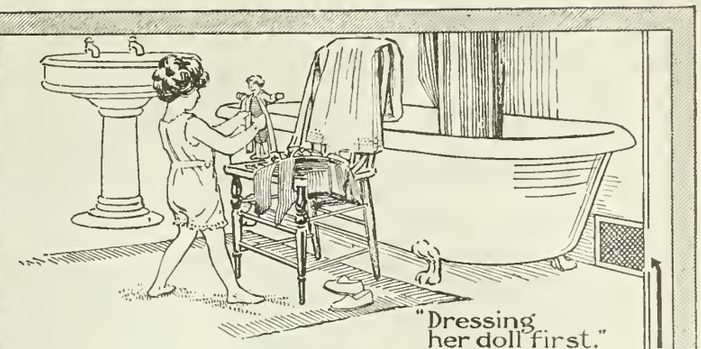
Rats have developed so much intelligence and such extraordinary caution that attemps to exterminate them have often failed. Make concrete floors and foundations and the rats won't have any place to live. Board floors in the barns, grainaries and sheds are just the place for the rats. They get under the floors and work up the dirt, making a fine place for a harbor. The farmer that has all of his buildings equipped with concrete foundations will have little trouble unless he has too many outside places where they can hide.

When a granary is built, choose a well-drained spot, and sink the walls about 20 inches in the ground, making them of concrete. Have the space within the walls thoroughly grouted with cement broken stone, finished with a rich concrete floor. Rats will have a hard time living in a place of this kind. Of course, we know that there are cheaper ways of excluding rats from either new or old corn cribs. They may be effectually kept out by the use of either an inner or an outer covering of galvanized wire netting of half-inch mesh and heavy enough to resist the teeth of the rats.

Poisons, traps and cats can render valuable service in killing off the rats that are living in a place that we cannot reach ourselves. A cat is better than a trap every time for they can easily get a rat when he gets a little to far from his nest. Cats are good for destroying the young ones in the nest and this gets them before they are large enough to run around and do damage to the grain that is stored in the barns. Every farmer can well afford to keep a few cats around the farm, for they are worth there weight in gold when it comes to the rat proposition. It is hard to catch rats in a trap for they are just a little bit to smart. About the best success can be obtained by using the wire cage trap. Place a fish head in the trap and you will catch more rats than you know what to do with at one time. We were bother with rats a few years ago and as we had purchased some fish we dicided to place a head in the wire trap and see what kind of results we would have. We placed the trap near a granary one night and to our surprise we found 24 rats in the trap the next morning. The next night we sat the trap again and caught 16. Pretty good work for one fish head. Before setting the trap again give it a thorough scalding, for the rats are very sensitive about coming around a place where they smell the blood of their own kind.

Be careful about putting out poisons for they may do more damage than good. The farm dog or some of the cats may get hold of the poison and die. Spread the poison in the runways of the rats where any animals or chickens can't get hold of it and the rodents will be poisoned without any danger. Don't let up on the rat killing until the entire place has been cleaned out. Get your neighbor to do likewise and then you won't get any of the rats after yours are all gone.—O. V. J.

Mr. W. S. Gunsalus, a farmer living near Fleming, Pa., says he has used Chamberlain's Colic Cholera and Diarrhoea Remedy in his family for fourteen years, and that he has found it to be an excellent remedy, and takes pleasure in recommending it. For sale by all druggists.



"Dressing her doll first."

Keep Children Healthy

CHILDREN'S ills usually begin with a cold—and nothing causes colds more surely than impure air and uneven temperatures in the home.

Fresh air, drawn in from out-of-doors, warmed to just the right temperature, and distributed so that every part of the house is equally comfortable, is the best safeguard against ill-health for both children and "grown-ups" The

ENTERPRISE Hot Air Blazer Furnace

draws in the fresh, pure air from out-of-doors, and sends it, warmed, but just as pure as ever, to every room in the house. That is why homes that are Blazer-warmed are more HEALTHFUL as well as more COMFORTABLE.

Yet Blazer Furnaces cost less to install than hot-water systems, are very economical in coal consumption, convenient to operate, and made to last a life-time. So all arguments—comfort, health, convenience and economy—are in favor of the "Blazer".

Most good dealers handles the "Blazer". Drop us a postcard and we will give you the name of the one nearest you also sending you a copy of this interesting booklet about the "Blazer".

Had a Bad Attack of Diarrhoea and Vomiting

Had the Doctor Eleven Times

BUT DR. FOWLER'S EXTRACT OF WILD STRAWBERRY FINALLY CURED

Mrs. Wesley Pringle, Roblin, Ont., writes:—"It is with great pleasure that I can recommend Dr. Fowler's Extract of Wild Strawberry. When our little boy was three years old, he had the worst attack of diarrhoea and vomiting I ever saw. We called in our doctor, and he came eleven times from Tuesday morning until Saturday night, but still no change. We expected each moment to be the last of his suffering, as the doctor said he could do nothing more. Mr. Pringle was going up town on Saturday night, and was advised to try your great and wonderful medicine. He got a bottle and about 9 o'clock the first dose was given, and was kept up, as directed, and when the doctor came on Sunday, he said, 'What a wonderful change; why! your little boy is going to get better.' Then I told him what we had been giving him, and he said, 'Keep right on, he is doing well.' 'I often think as I look at my boy, growing to be a man, what great thanks I owe to Dr. Fowler's Extract of Wild Strawberry."

"Dr. Fowler's" has been on the market for close on to seventy years, and has been known from one end of Canada to the other as a certain cure for all bowel complaints.

When you ask for "Dr. Fowler's" be sure you get it, as any substitute is liable to be dangerous to your health.

The genuine preparation is manufactured by The T. Milburn Co., Limited, Toronto, Ont.

Price. 35 cents.

SYNOPSIS OF CANADIAN NORTH-WEST LAND REGULATIONS.

THE sole head of a family, or any male over 18 years old, may homestead a quarter-section of available Dominion Land in Manitoba, Saskatchewan or Alberta. Applicant must appear in person at the Dominion Lands Agency or Sub-Agency for the District. Entry by proxy may be made at any Dominion Lands Agency (but not Sub-Agency), on certain conditions.

Duties—Six months residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres, on certain conditions. A habitable house is required except where residence is performed in the vicinity.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead. Price $3.00 per acre.

Duties—Six months residence in each of three years after earning homestead patent; also 50 acres extra cultivation. Pre-emption patent may be obtained as soon as homestead patent on certain conditions.

A settler who has exhausted his homestead right may take a purchased homestead in certain districts. Price $3 00 per acre. Duties—Must reside six months in each of three years, cultivate 50 acres and erect a house worth $300.

The area of cultivation is subject to reduction in case of rough, scrubby or stoney land. Live stock may be substituted for cultivation under certain conditions.

The Hessian Fly.

The Hessian fly is probably the most destructive insect of wheat, rye and barley with which the farmer has to contend. It seems to prefer wheat, but it is not uncommon, during seasons when the fly is abundant, for a large per cent. of tne rye and barley crops to be destroyed. Oats are seldom if ever attacked by this fly.

As is well known, the fly usually goes in cycles of three or four years. This is due, partially at least, to the parasites which attack them, so that we usually have about two years of abundance of flies, when the parasites become numerous enough to kill them off, and then there are several seasons when there are comparative few, and the injury is so slight that it is scarcely noticed. During these years the parasites, finding very little upon which to feed, naturally die off and this gives the few remaining flies an opportunity to breed and increase in numbers without molestation until they finally become numerous again.

For the past few years they have not done very serious damage in this state, but it is evident from the large number of letters which have come to this office during the past few months, that the pendulum is now swinging back towards the flies, and while the injury may not have been serious this season, the signs all point towards a maximum crop of flies for next year. It is for this reason that this warning is sent out at this time so that farmers may use every known precaution to protect themselves against its attacks.

Wheat is grown in every county in the State. The number of bushels raised in 1911 ranged from 23,000 bushels in Benton, which is a corn county, to 1,031,000 bushels in Posey county; the whole state yielding 34,596,320 bushels. In 1910 the yield was 36,152,022 bushels, or an average of 35,000,000 bushels in round numbers. It is estimated that an average of 10 per cent. of the crop is lost annually from the ravages of the fly; this would amount to 3,500,000 bushels which at 75 cents per bushel would make $2,625,000 as the annual loss to Indiana farmers from this source. It will be more than that this year. It is safe to say that a large part of this loss could be prevented if farmers would give more attention to a better system of farming. Some of the special crop insects, the onion thrips for example, may be held down by spraying, even wnere 75 or 100 acres are involved, but the Hessian fly is a different proposition and must be outwitted by changing the usual system of raising wheat.

Three things are necessary in raising a successful warfare against the fly, viz:—thorough preparation of the soil, so as to form the best possible conditions for germination; heavy fertilizing, if the soil is not already in good condition, so as to insure a quick and rapid growth; and late sowing, so as to compel the flies to go elswhere in order to deposit their eggs. I am aware that a number of farmers have said that late sowing has not worked this year; that fields that were sowed as late as October 15 and 18, were badly infested this season, but, we must remember that last fall was exceptional, so far as weather conditions were concerned. There were no killing frosts here at LaFayette until October 21. Farmers were plowing until the first of February; in other words the conditions were very favorable for tne late development of the fly. It is safe to say that the great majority of the adult flies are out before September 15, in most parts of Indiana. It takes about two days for the female

to lay her eggs, so that wheat sown after the 20th, in the central and first of October in the southern counties, would be very likely to escape the fall brood, especially if there is much volunteer wheat in the wheat field of the previous season. The spring brood does not usually migrate to other fields in order to find places to deposit eggs, as there are plenty of wheat plants close at hand, but a hard wind storm at the time they are laying their eggs might, and often does blow them considerable distances and might land them in fields that have been hitherto uninfested. This fact may account, in part at least for the late sowed fields being infested this season.

DESCRIPTION OF THE FLY.

It has been said that not one per cent. of the farmers of Indiana can recognize the adult fly, and that is probably true, because unless one takes the trouble to breed them out in cages, they are seldom seen. A miniature mosquito is a good, short description of the adult fly, which is only about one tenth of an inch long, dark color, slender legs and with only one pair of wings. At the present time they are in the "flax seed" stage in the wheat stubble, and if the field was not seeded to grass or clover last spring, they may be destroyed by burning the stubble. If this is not advisable then the late sowing, as stated before, is recommended.—J. Troop, Entomologist, Purdue University.

Whitewash for Various Uses.

There is nothing which will add to the interior appearance of farm buildings, especially dairy barns, make them more wholesome and attractive and furnish a bigger inducement for the owner to keep the barns clean and neat than an occasional coating of whitewash. In fact it is the cheapest substitute for paint that can be had and considering its added disinfecting properties, which may easily be greatly increased as we shall see with but little extra expense and no danger to the animal occupants of the buildings, it may well be considered of considerable importance. Slacked lime is therefore doubly valuable since it can be used to make the interior of the buihings more attractive while at the same time it is one of the most active disinfects for stable use, having the added advanage over some in one's being able to see where it has been applied.

The use of whitewashes need not end with that of interior work either. as various ingredients have been added to the ordinary lime wash enabling it to meet many and varied uses and needs. Fences and gates, milk houses and even the larger outbuildings may be treated wieh these comparatively inexpensive paint substitutes with equally good resdlts.

There are many receipts for whitewashes of various kinds and for various purposes, some of the most common and most satisfactory being included in the list to follow. The United States Bureau of Animal Industry recommends the following as a very efficient and antiseptic whitewash. Slake 7½ pounds of lime, mixing it to a creamy consistency with water. Add 15 fluid ounces of 95 per cent pure liquid carbolic acid and make the mixture up to five gallons. Stir thoroughly and strain through a wire sieve if it is to be applied with a spray.

The government whitewash recipe which is always a popular one, is as follows: Slake ½ bushel of lime with boiling water, keeping it covered during the process. Strain it and add 1 peck of salt dissolved in warm water, 3 pounds of ground rice put in boiling water and boiled to a thin paste, ½ pound of powdered Spanish whiting, 1 pound clear glue dissolved in hot water. Mix all these well together, add 5 gallons of hot water, stir and allow to stand a few days. This is to be put on while it is as hot as it is convenient to handle it with paint brushes or whitewash brushes.

For indoor work the following recipe is to be recommended: Slake lime with water and add sufficient skim-milk to make it the consistency of thin cream. To each gallon add 1 ounce of salt and 2 ounces of brown sugar dissolved in water. Stir thoroughly. If it is desired to increase the disinfecting propeeties of this wash it may be done by adding one third ounce of Calcium chloride to each gallon of the wash.

For outside work, such as fences and gates, a good whitewash is made as follows: Slake 20 pounds of lime and make it the consistency of thin cream. Add 3 pounds common salt and ½ pound of alum. To increase the disinfectant properties of this wash add ½ pint carbolic acid to each pailful. This is another government recipe.

For a whitewash which it is claimed will not rub off, the foflowing is recommended: Dissolve 2 pounds of ordinary glue in 3½ quarts of water and when it is dissolved add 6 ounces of bichromate of potassium dissolved in 1 pint of hot water. Stir the mixture and then add enough whiting to make it up to the usual consistency and apply with a brush in the usual manner, as quickly as possible. This dries in a very short time, and becomes a perfectly insoluble waterproof coating which will not wash off even with hot water and at the same time is mold proof which is not always the case with other kinds.

Were it is especially desirable to make a particular whitewash so that it will not rub off easily, one of the following methods may be employed: (1) For every gallon of the color wash stir in a pint of glue that has been dissolved in water until it becomes the consistency of mucilage. (2) To every gallon of color wash stir in a pint of well-boiled starch or flour paste, being sure that there are no lumps in it. (3) For every gallon of color wash stir in a quart of boiled sweet skim-milk. (4) Boil a pound of rice in 2 gallons of water until a smooth paste is formed, strain through a cloth and use the water the same as any other sizing. —Kimball's Dairy Farmer.

One of the most common ailments that hard working people are afflicted with is lame back. Apply Chamberlain's Liniment twice a day and massage the parts thoroughly at each application and you wil get quick relief. For sale by all druggists.

A decided economy in fuel consumption is effected by using nickelled steel in

Something New for Men

Restore Your Own Strength--No Drugs

The free illustrated pock et compendium of private advice for all men, whether young orl elderly, single or married, whether well or ailing (explained be ow), not only contains a great fund of necessary information upon certain avoided private subjects, telling you what to avoid, what to do and what not to do, but also fully describes a new small mechanical appliance called a VITALIZER which generates a natural force and which is now being worn by men all over the world who seek new manly vigor. You, yourself, no matter where you live, may easily have one of these little VITALIZERS to try out in your own case. Therefore, please use the coupon below and get this free pocket compendium by return mail. SANDEN. AUTHOR.

How would YOU, reader, like to be strong, vigorous, vital and manly once more, without an ache, pain or weakness? If you really seek and want this new vigor, this rugged manly strength, then please call at my office or write today and get my free book that you may know the whole wonderful story of this great, drugless, self-treatment, this marvellous little VITALIZER of my invention, which you wear comfortably on your body, and which sends its steady gentle, silent supply of FORCE into your nerves, blood and organism while you sleep.

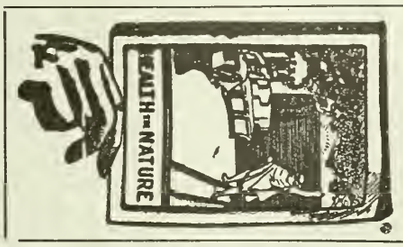
Manly Men Fascinate the Whole World

Real manhood witha perfect manly strength is not only nature's own gift, but, according to my belief, may easily be within the reach of practically any man. Of course, we all know that it is the husky, vigorous, vital fellow who attracts both women and men to him, and it is he, also, who is ever sought out and who achieves the really big things of life. Sturdy, vital manhood is, without doubt, the one great, silent universal power which fascinates us all, no matter how we may argue to the contrary. Therefore, reader, I care not what may be your age, nationality or creed, whether you are married or single, whether you are a bank president or work on the farm or in the shop,nor do I care how unstrung or nervous you may feel, or what past acts may have left you debilitated and enervated, I say to you in all seriousness, if I can show you an easy, drugless way by which you may treat yourself with the object of bring ing back full vigor to your organism, then I will show you the road to new hope and new manhood. A man may be small in stature, yet as strong and attractive as a giant, or he may be big in stature, yet unstrung, nervous and unmanly. It is all a question of your own vigorous strength. Therefore, let me suggest that you call or write at once, then, after reading my book, if you decide you want to try out my little vitalizer in your own case, and will write to me sayingso, I will reply to your letter and guarantee to make an easy proposition which should enable you to have one of the vitalizers at once. At all events, you need the knowledge that my little book contains, whether you ever get a vitalizer or not, so please call or fill in and send the coupon.

NOTE—With special attachments my VITALIZER is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, nervousness and general ill health.

Free Self-Help Book For Men

I publish a little illustrated pocket compendium in booklet form, as mentioned above, which is meant to guide both single and married men along the road of Vigorous Health and Moral Rectitude, so they may be as vigorous and strong as the best, and may live to a ripe, healthy old age. There is a lot in this little compendium which every young or elderly man should know and can refer to from time to time with great profit to his own physical health. The booklet in one part fully describes my new VITALIZER, the great drugless self-treatment. If it is not convenient or if you are too far away to call, please write for this booklet today. It will come to you in plain, sealed envelope by return mail. Please use coupon. Office hours, 9 to 6.



Dr. M. F. SANDEN, CO.,
140 Yonge St., Toronto; Ont.

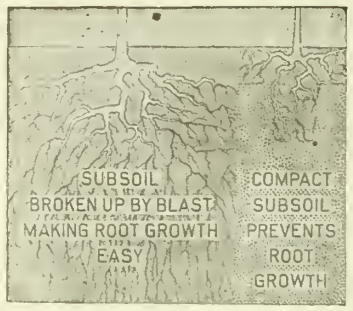
Dear Sirs—Please forward me your book, as advertised, free, sealed.

NAME.....

Address.....

Valuable Manure

Hen manure of all the farm manures is the most valuable for garden purposes. It contains a large percentage of potash and phosphoric acid, and is especially rich in nitrogen. It has long been regarded the best fertilizer for onions, as well as for all nther garden crops requiring large amounts of nitrogen. The fine texture, when an absorbene has been used in sufficient quantities, makes it highly desirable for intensive system of cropping.



The above cut clearly demonstrates the advantages to be gained by planting trees in holes exploded with C. X. L STUMPING POWDER. The ground is so pulverized that the roots can immediately expand in search of nourishment.

Also used for clearing land of stumps and boulders, ditching and subsoiling.

Institutes in Nova Scotia

While there has been nothing in these columns for some weeks about the Women's Institutes of Nova Scotia, it must not be taken for granted that nothing has been accamplished. It has been because this summer has been a particularly busy one that it has been difficult to find time to sit down and tell just what has been on foot. "On foot" is a happy phrase and altogether adequate to the occasion, although used at first, without an ulterior motive. Two people have been most constantly "on foot" since the first of June, and one of them has been the Superintendent of Institutes for Nova Scotia and the other, Miss Grace Dutcher, teacher of Domestic Science in Prince of Wales College, Charlottetown. Miss Dutcher has been very greatly interested in Institute work in P. E. Island., and it is greatly due to her efforts and those of the clever and capable first Supt. of Women's Institutes in P. E. I., Miss Katherine James, that the work has grown to its present extent on that busy Island.

The first field work in Nova Scotia this summer was carried on in the southern and western counties, throughout June and the first of July. Distr cts in Kings, Annapolis, Digby, Yarmouth, Queens and Lunenburg, were visited and altogether twenty meetings were held. In nearly every case these were well attended, and the principal thing desired, that of stirring up an interest in the Institute movement, was well evidenced. The addresses on the growth and development of the Institute by the Superintendent and on the subject of "Foods and Their Value to the Body," by Miss Dutcher, were well received and outside of the fact that new work was well established, it was felt that the trip was altogether worth while.

Eleven new isstitutes were added to the list and judging from the reports received since from the secretaries of these Institutes, the idea has, as the boy on the street would say, "caught on." Before leaving Lunenburg County, Miss Dutcher gave a demonstration in Canning Fruit and Vegetables, before the Bridgewater Institute, which has been enjoying a healthy existence since the first of the year. It was easily perceivable, from the questions asked and the discussions between audience and demon strator, that a pantry well stocked with bottles of fruit and vegetables, scientifically canned was something to make the heart of a housewife rejoice.

A week later Antigonish County was invaded, six splendid meetings held and five Institutes were organized. It is too early yet to say much of these Institutes, but the opinion can be given that what the women of the Western Counties can do, the women of the Eastern Counties can duplicate. The next two counties to be visited are Guysboro and Halifax and when these have been visited the mainland of Nova Scotia will have been fairly well covered. It has been thought wiser to have a few Institutes in each county, at first, that the interest may spread from those and already the wisdom of this course is apparent. Thirty institutes to date, is not a bad record for an organization that only found a foothold in Nova Scotia one year ago The list of newly organized institutes is as follows:—

Canning, Kings Co.— Hon. Pres. Lady Borden; Pres., Mrs. Schafheitlein; Vice-Pres., Mrs. Avery; Secy.-Treas., Miss Belle Patriquin; Directors, Mrs. Harry Rand, Mrs. Peck, Mrs. Strong, Mrs. Payzant.

Lakeville, Kings Co.—Pres., Mrs.

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvellous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvellous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it towards the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyne, whether new or renewal subscription. When sending in money state which size you want. Send today.

We guarantee these burners to do as represented or money refunded. Extra burners 35c. each.

The Maritime Farmer

SUSSEX, N. B.

Notes from Nova Scotia

Miss Miriam J. Cox, teacher of Domestic Science in the Truro School and in the Provincial Normal School, Truro, has been secured by the Department of Agriculture to give a series of demonstrations before the Institutes. Mise Cox commences her work on Wednesday, Aug. 5th, with the Institute at Martock and Windsor Forks, Hants Co. Her demonstrations include such important subjects as Invalid Cookery, Cooking of Starch, Salads, and their place in the Diet; Cooking of Tough and Tender Meats; Preparation, Cooking and Serving of Vegetables, etc.

The Department being anxious to help the Institutes to secure the benefit of a library, has decided to put them in touch with the Travelling Libraries of McGill University, and are offering to pay the expenses of the first library to each Institute in the Province. The matter has been placed before each Institute and is under consideration. It is expected that many of the Institutes will avail themselves of this offer.

The Institute at Port Williams Kings County, is very busy erecting a hall, which is to be devoted to the interests of the citizens of that busy little spot. Rooms for library, reading room and gymnasium are in the place, as well as a room for the use of the Iostitute. This Institute entertained the Canning Institute in June and an enjoyable and interesting afternoon was the result. This is a good idea for the older Institutes to follow.

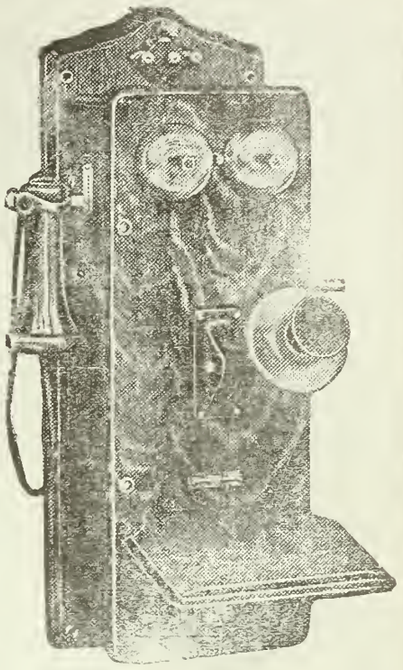
Grade Pre Institute, Kings 'Co., held a very enjoyable picnic during the first week in July, at the Experimental Farm, at Kentville, through the kindness of Prof. Sandy Blair, Director of the Farm.

Another Institute to hold a picnic in July was East Leicester, Cumberland Co. The members were invited by Mrs. Wilbur Logan, Stanley, Cumberland Co., to come and enjoy the afternoon in a beautiful grove on the Logan farm. That the members did enjoy the afternoon and the kind thought of Mrs. Lagan requires no telling. This Institute has arranged a program for the remaining months of the year. The meetings should prove interesting as the subjects are well and wisely chosen.

The Wallace Bay, Cumberland Co. Institute has decided to impose a slight fine on those of its members who fail to provide the items in the monthly program assigned to them. Just a gentle hint that the program of this Institute are to be taken seriously. They are also considering ways and means of establishing a permanent library.

The Secretaries of the new Institutes report interesting and well attended first meetings and what is better, interested members. Many of these first meetings resolved themselves into a discussion of plans far the future and the Superintendent is anticipating that the reports of the future months will make very gratifying reading. Some of these new Institutes have already planned work for themselves that will prove a benefit to their district also. Round Hill, Annapolis Co., decideh to supply the schools in their district with sanitary drinking fountains. West Northfield, Lunenburg Co., is discussing ways and means of securing a suitable hall for their meetings and one of the "ways" proposed is the holding of a garden party. Canning Kings Co., is taking up the subject of beautifying their village and Lady Borden has very kindly offered her house as a meeting place for the summer months, an offer gladly accepted by the President and members.

Put the Latest Style Telephones On Your Lines!



Increase the efficiency of your Telephone system by installing the latest style Telephones. Canadian Independent Telephones are the highest grade made. We guarantee them to be superior in style, workmanship, and material to any others on the market. You can prove this true by trying them out on your own lines, side by side with other phones. This you can do without risking a cent. Just ask us about our Free Trial Offer.

Get Our Advice If your locality does not enjoy the social and business advantages afforded by an up-to-date telephone service it is time you got into communication with us. We are the largest Independent Telephone Manufacturers in Canada, and have been instrumental in seeing that the majority of the indpendent local and municipal companies have started into telephone business along lines that ensure success. We can help you get a telephone line for your locality. Write us and we will tell you how.

Had Pain Around Her Heart for Three Years

Was Not Safe to Leave Her Alone

Day after day one reads or hears of many sudden deaths through heart failure, and many people are kept in a state of morbid fear of death, become weak, worn and miserable, and are unable to attend to either their social or business duties, through this unnatural action of the heart.

To all such sufferers Milburn's Heart and Nerve Pills will give prompt and permanent relief.

Mrs. Norman H. Esan, Ship Harbor, N.S., writes:—"For three years I have been troubled with a pain around my heart. I took medicine from my doctor until I found it was of no use, as it only seemed to help me while I was taking it. I got so bad at last that it was not safe for me to be left alone, so having heard of Milburn's Heart and Nerve Pills, I took five boxes of them, and I can say they helped me so much that I feel like myself again."

Milburn's Heart and Nerve Pills are 50 cents per box, or 3 boxes for $1.25. For sale at all druggist and general stores, or will be mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto. Ont.

A vast amount of ill health is due to impaired digestion. When the stomach fails to perform its functions properly the whole system becomes deranged. A few doses of Chamberlain's Tablets is all you need. They will strengthen your digestion, invigorate your liver and regulate your bowels, entirely doing away with that miserable feeling due to faulty digestion Try it. Many others have been permanently cured—why not you. For sale by all druggists.

It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information

Blacksmith Tools on the Farm

The constantly increasing use of machinery on the farms has made it necessary for all progressive farmers to have repair shops equipped with some blacksmith tools.

Farm machinery and equipment in general are subject to wear and breakage, and constant attention to repair is necessary, since the original cost of farm implements makes the frequent exchanging af old for new prohibitive. The profit realized from a machine consists of the work it does economically over and above paying for itself. The amount of service to be obtained from any article depends largely upon the care it receives. In the case of a machine, a mower for instance, the care has reference to shelter, lubrication, nuts tight, bearings free from play, sickle sharp and breakages repaired.

The extent to which the forge work should be done on the farm depends upon the ingenuity of the farmer and also upon local conditions. If there is a reliable shop nearby where repairs can be made without loss of time, it may be best to take some of the more difficult work tnere. However, this is seldom the case and breakdowns are most frequent during the busy season. The amount of time lost in making a few trips to town when the farmer is mose anxious to get his ground prepared, seed sown or harvest completed would be sufficient to convince a farmer that the shop is an important adjunct to his equipment. It is not advisable for a farmer without considerable experience to sharpen his own plows or shoe his own horses, as they require skill, practice and additional equipment.

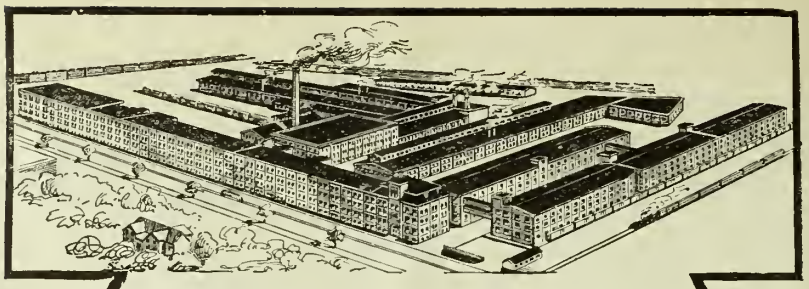
A small, well selected outfit, used to the best advantage and kept in good condition is much more satisfactory than a large miscellaneous set of tools, many of which are seldom used. In nearly all localities tools may be purchased of the local dealers. In addition, manufacturers of tools offer outfits in such combinations as makes it possible to obtain most any set desired. A small outfit of good tools to begin with and then added to as the demand increases, would be advisable. The tools needed first would be as follows Forge, anvil and hardie bracksmith hammer, blacksmith tongs, cold chisels, punches and drill bits.

A forge of the portable type with a fan blower may be obtained for $15 to $20. Anvils are divided into two classes, steel and cast iron. The steel anvils are the best and cost approximately 11 cents per lb. Howeveri a cast iron anvil, purchased for about one-half the sum, would be very serviceable. A 100-pound anvil would be most satisfactory.

An anvil hardie is used for cutting both cold and hot iron. It has a square shank that fits into ehe socket of the anvil, thus holding it securely in pos tion. It is a very handy tool around the shop and can be purchased for about 50 cents. A stationary bench vise with jaws about four inches wide, is best for ordinary work. It weighs about thirty eight pounds and costs approximately $6. A two pound blacksmith hammer which will serve for general work, costs about $1.25. Three cold chisels, ½ inch, ¾ nch and 1 inch, made of tool steel, may be obtained for about 20 cents, 40 cents and 75 cents respectively. Cast steel chisels cost less. Three punches— one-fourth inch, three-sixteenths inch and one-thitd inch at the point—cost about 15 cents each.

Two pairs of blacksmith tongs are needed: one pair of common tongs for flat pieces of iron and one pair of bolt tongs for handling round iron, cost about 20 cents per pound. Drill bits—that fit an ordinary carpenter's brace—may be secured. These are adapted for boring either wood or metal. The cost of these drills is from 10 cents upwards, according to size and quality.

There are an unlimited number of articles which can be added to the shop equipment, but those needed most would be as follows: Post drill, set of one-half dozen drills, set of taps and dies—ranging from ¼ to ¾ inch—sledge (5 pounds), riveting hammer, heavy hammer, additional tongs ,fullers, facers and swages pipe wrenches and a babbitt ladle.



Ask the Men Who Specify It!

The extensive Massey-Harris establishment shown above is only another instance where careful, foresighted business men insisted upon Brantford Roofing for their valuable plant. These immense premises represent a heavy investment. To protect their investment, the Company's officers specified the tried and tested

Brantford Roofing

Many of Canada's largest industrial plants are roofed with Brantford Roofing. The number of firms who choose Brantford Roofing in preference to all others is so large that it means more than mere coincidence. Ask yourself why the great plants of the Dominion are roofed with Brantford Roofing!

Can you do better than follow the example of Canada's shrewdest business men? Use Brantford Roofing and you can rest easy that your roof is proof against fire, heat, frost, rain, lightning, acids—in fact all the enemies of roofing. Brantford Roofing costs you no more than ordinary roofing material. Send a post card for big FREE book on roofing, and samples.

Our new patented appliance for laying Brantford Roofing is worth investigation. Positively prevents buckling or expansion.

The Cost of Pasteurizing Milk

With a properly designed and properly operated plant the average cost of pasteurizing milk is $0.00313 a gallon, and of cream $0.00634 a gallon, according to tests recently conducted by the United States Department of Agriculture and reported in Bulletin 85. These tests also show that the "flash" process, by whizh milk is raised to 165 degrees F. and kept there for a moment only, is more expensive than the "holder" process, in which milk is maintained for 30 minutes at a temperature of 135 degrees to 145 degrees. The "holder" process requires 17 p. c. less heat than the other and, in addition, there is a saving on the expense of cooling. For hygenic reasons, also, the department recommends the "holder" process.

Many milk plants and creameries, it was found, do not attempt to make any use of the latent heat in the exhaust steam from their engines and steam-driven auxiliaries. This heat would be sufficient in many cases for all the pasteurizing done in the plants if it were properly utilized instead of being permitted to go to waste. When exhaust steam is used, it is calculated that for every 400 pounds of milk pasteurized per hour with it, one horsepower is taken from the boiler load, with a consequent saving in fuel cost.

Another common source of waste was found to be the faulty arrangement of apparatus and leaky piping. The loss from these causes may run as high as 30 per cent of all the heat required, a loss that can be reduced to negligible proportions by proper arrangement. The use of the regenerator, in particular, by which a large portion of the heat in the pasteurized milk is transferred to the raw product, is also an important factor in securing maximum economy

In considering the cost of pasteurizing, the investigators estimated the life of the necessary apparatus at 4 years, and the annual depreciation, in consequence, was figured at 25 per cent. This is due to the fact that the whole dairy apparatus must be taken apart after each operation in order to give it a thorough cleaning. This necessarily results in rough usage. The mechanical equipment, such

as the engine, boiler, shafting, etc., has, on the other hand, been considered as depreciating at the rate of only 10 per cent per annum.

Concrete Fence Posts

A circular or square mold twelve inches in diameter is large enough for end, corner or gate posts. To make a post that will stand forever, dig a hole for the base four or five inches in diameter. In this hole put a few inches of concrete, then the reinforceing irons, which much reach up to within a few inches of the top of the post. We commonly use second-hand pipe of about two-inch diameter, old buggy axles or sometimes four steel rods of half-inch diameter. One big reinforcing iron in the middle of the post will be sufficient but if small ones are used they should be placed at the corners.

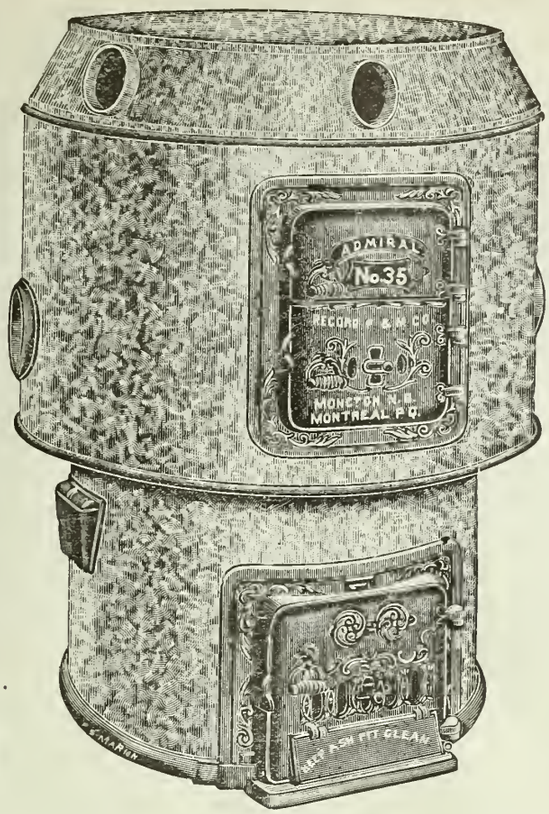
With the reinforcing in place fill the hole to the surface of the ground with good rich concrete, made wet but not sloppy; then set over the mold and complete the filling. One mold has steel hoops and is in two together with small bolts. It can be set up on each side of a wire fence and thus the fence wires can be imparts, each a half circle. It is held With a form of galvanized corrugated bedded in the midst of the post. This is a favorite practice of ours. steel lubricated with crude oil a very smooth post is made. We find it easy to put in hinges after the post is complete, making holes for them with hammer and cold chisel, and setting them with pure cement, using the kind of hinges that screw in.

We find all that is needed for braces is to place at the surface of the ground, or g little below it a cross of concrete about six feet long and eight inches in diameter each way. This is accomplished by simply excavating two little trenches across the line of the post, cleaning them out carefully, placing in them about two inches of concrete, then on that good reinforcing, say of inch pipe or rods, then filling up the trencnes to the level of the ground with good concrete. This makes the post in effect like a tree with roots and it is our experience that it will endure any stress that may be placed upon it, the essentials being that the post have depth in the earth, reinforcement throughout its length and good material.

Last spring we did a daring thing. Needing an iron for reinforcing a corner post we cut a small wild cherry tree, about six inches in diameter, stripped ir of its green bark, cut notches in its end and drove therein a lot of big spikes, placed three inches of rich concrete in the bottom of the hole and set our wooden stick for reinforcement. As it does not at any point come nearer than two inches to the outer air we see no reason why it may not endure in its place for a century or more and being perfectly green it could not swell and burst the concrete posts. We read that wood, to some extent, is being used in like manner in England.

Quality in Horses

This is a term rather loosely applied and has reference to hair, skin, tendons, muscles and bone. Good quality is shown by fine, bright, silky hair; soft, pliable skin; clean, well-defined tendons; smooth, well-developed muscles, and strong and smooth bones. Freedom from coarseness in the hair, skin, tendons, muscles and bones, emphasises soundness and guarantees durability. The best way to determine quality is to run the hand down the legs, over the knees, hocks and cannon bones. The hair and skin should feel soft and pliable to the touch, and the bones firm and smooth. The fingers should almost seem to tounch each other as they pass between the tendons and the bones, especially in the light type, where the tendons are well detatched. Soundness also indicates quality.



Good For Wood and Hard or Soft Coal

This is the furnace you require for all round heating purposes and now is the time to instal it.

Flues do not clog up with soot. Large double feed doors specially adapted for wood.

Record Admiral Furnace

The ADMIRAL is a leader in hot air furnaces, designed to give the greatest amount of heat out of fuel with the least amount of labor or attention.

The Slandering Know-It-All.

"There is no greater nuisance in the whole horse business than the maniac who insists that prizes go by favor in the show ring—that the judges "tie the ribbons on the men, not the horses." Who of us, even of the younger generation has not heard this batlant nuisance declare that the premiums are allotted beforehand and that such and such ownesr are bound to win, hap what may? Sometime, however, this chap is more than a nuisance. Occasionally he becomes a damage, and by pouring his mendacious trash into the ear of some novice in the breeding game prevents him from taking really meritorious stock to the shows.

"Not so long ago the writer received a letter from a small breeder in Iowa saying that he had never shown his horses at a state fair, but had decided to make a beginning this season Unfortunately, the letter continued, he did not think it would prove profitable to do so, because he had been informed by a man, who claimed to know, that the location of the premiums at the show in question was always "fixed up in a room in a hotel the night before,' and that it didn't matter how good any one else's horses were they could not win if they did not belong to the chosen few—and considerably more to the same effect. Believing that he should get the straight of it in reply, this Iowa breeder sought information.

"There are men who make a business of declaring that judging, like kissing, goes by favor and it may be that there are some few who are so meanly constituted themselves that they actually believe it. No one, though, ever heard an exhibitor with any class to him, or a breeder who had achieved any degree of success, making any such assertons. There is another pest, too, that infests the show ring and its purviews, to wit, the man who never showed a beast in his life and yet year after year loudly insists that he has at home animals far better than those to which the best premiums have been awarded. This chap, of course, is of the same family that chops its wood in the summer and pitches its hay in mid-winter, but at that his very blatancy of delivery and insistency of assertion may carry conviction to the mind of the tyro.

"Naturally the man who has crawled slowly upward from a small foundaton and has finally produced one or two animals that he thinks good enough to show, is a little rearful, first, that his own judgment may not be the very best and, second, that even if his animals are good enough to win they will be sacrificed for the advancement of interests more powerful than his own. This is fertile soil for the sowing of the seeds of distrust, but there never is the slightest occasion to waste a moment paying attention to such self-evident untruth.

"There may have been a time in the show ring when money talked with sufficient force to sway the opinions of the men chosen to make the awards, but if there was, it has passed long, long ago. The most diligent research in the personnel of the various professions and lines of mercantile endeavor would fail to discover a more high-minded, intelligent, upright, practical and honest delegation than those who are annually appointed to judge in the American show ring To begin with, it is their natural bent and inclination to do right for right's sake. Their reputations are at stake. They could not afford to do wrong, even if they wanted to, because the moment a judge's selections are seriously questioned, his usefulness is destroyed. Putting it on the lowest possible ground, no judge could afford deliberately to make a fraudulent award with four or five thousand people watching him and several hundred in and about the ring quite as capable as he of ranking the animals correctly.

"It passes belief how any man can deliberately say that a judge in the ring will not do his duty, is not doing it or has not done it. To cook up a yarn with artictic verisimilitude that is no use for some small breeder to try to win at this or that show, because the prices are all alotted the night before in some hotel bedroom, is not only an offence against common decency, but an actual crime on conviction of which the penitentiary would yawn for the offender, against whom such a statement was proved. Usually it is some self elected village oracle, some bombastic know-it-all, who undertakes, from his superior knowledge, to post his less experienced neighbors and acquaintances.

"Nvertheless, despite the magnificence of this oracular individual's station in his own estimation, the moment he shoots off his mouth in this wise, he may be set down as a malicious ignoramous who is utterly unacquainted with the most elementary principles of show yard business. Whenever you hear him start his slanderous mouthings, call him and call him good. Dare him to name an instance of the sort he mentions and you'll find that some one else told him so—that it happened some where else—and most likely his authority will be dead or in jail.

"Some people may contend that the untruth of all such statements is so obvious that it is hardly worth while making such a fuss about it. Perhaps that is true, but then again there are too many men who unthinkingly charge a judge with wrong-doing, merely to make themselves big in the esteem of the credulous fools who listn to and believe them. Sometimes men of this ill-begotten brood will leer and wink when this, that or the other award in the show yard is discussed, as much as to say that if they would, they could a tale unfold that would show how that award had been reached by a very devious course. Too mean and cowardly to come right out and charge the judge with dishonesty, they are nevertheless quite willing to absorb credit for amazing cleverness in having discovered the crookedness, but without actually saying so. If anything this breed of tomcat is more dispicable than the other.

"Fortunately, perhaps, much of this unwarranted criticism comes from an ignorance of the true state of affairs. It is not hard to see how a young chap, horsey, let us say, in his tendencies, and who, during his youth has sat at the feet of the village stud horse Gamaliel, may come unthinkingly to hand on the slanders he has heard pronounced. He does not sense that his oracle may know far less than nothing about the business or ethics of the show yard. He has been accustomed to count as gospel all that the old scoundrel may have said, but he should draw the line at repeating statements that are slanderous.

"As to the pest who has at home stock a whole lot better than the winners at even the biggest and best of the shows, he is his own worst enemy so enshrouded in self-conceit or ignorance that while he is a nuisance he is hardly worth bothering with. No one believes him. If he had better stock than wins at the big shows, some one would have heard of it before—some one would have brought it, shown it and won with it. Not infrequntly he is a good-natured sort of a chap who counts not the cost of what he says and little recks that the bystandrs are merely egging him on to have him blow his horn a trifle louder and make himself more ridiculous. There are a few hopeless cases in this category. Let us hope their tribe may not increase."—Live Stock World.

REMINGTON UMC

REPEATING RIFLES

High Power

Solid Breech Hammerless Safe

THE things that distinguish Remington-UMC Big Game Rifles from all others of their class are certain fundamental refinements invented and used exclusively by the Remington Arms-Union Metallic Cartridge Company.

The famous Remington-UMC *Slide Action* features; Six Shot; Hammerless; 22 inch Ordnance Steel Barrel; patented quick-adjustable Straight Bar Rear Sight and new design Copper Bead Front Sight. Chambered for .25 Rem., .30 Rem. and .32 Rem. cartridges.

Look for the dealer who displays the *Red Ball Mark of Remington-UMC*. He has these Remington-UMC Rifles in stock now, or he can get them for you.

To keep your gun cleaned and lubricated *right*, use Rem Oil the new powder solvent, rust preventative, and gun lubricant.

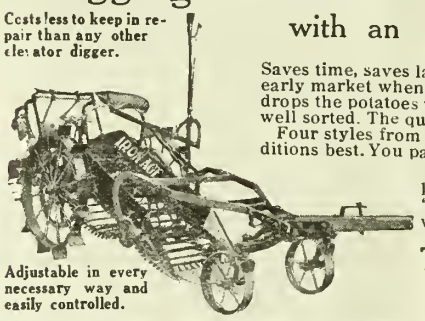
REMINGTON ARMS-UNION METALLIC CARTRIDGE CO., Windsor, Ontario

Smut Disease of Crops.

A buletin .No. 73) of the Department of Agriculture, Ottawa, Canada, gives a summary by Dr. Gussow, the Dominion botanist, of what is known of the cause and control of the smut diseases of cultivated plants. The bulletin shows that the spores of the smut fungi are distributed by wind and such farm instruments as threshing machines, and recommends the disinfection of the latter by means of formalin. The results of recent experiments demonstrate that though. generally, the spores are killed by passing through the body of an animal, this is not always the case; nor can it be stated with certainty that when diseased grain is fed to stock the animals run no risk of disease. As is now generally accepted, different smuts have different methods of infecting the host plants. In stinking smut of wheat covered smut of barley, naked and loose smut of oats, for example, spores distributed from diseased ears reach and lodge upon the grains, are sown with the seed, germinate in the ground, and produce secondary spores which infect the seedling. In other smuts, such as the loose smuts of wheat and barley, the spores, which are ripe at flowering time, are carried to the stigma of the wheat or barley flower, germinate like pollen grains thereon, and, sending down a germ tube in to the ovary, provide for the infection of the grain which is being produced in the ovary. Evidently a knowledge of these facts must determinate practice. Whereas dressing seed with copper sulphate or formalin, or treating it with hot water, is productive of good results in the former class, it is without effect when applied to those smuts in which floral infection occurs. Early sowing of autumn wheat has been shown by Dr. Mugserati to result in a considerable reduction in the

Digging Potatoes with an IRON AGE

Costs less to keep in repair than any other elevator digger.



Adjustable in every necessary way and easily controlled.

Saves time, saves labor, gets all of the potatoes, helps you get to an early market when the price is right. Digs, separates thoroughly, drops the potatoes where you want them, and in most cases fairly well sorted. The question is: Can you afford to be without a digger? Four styles from which to choose the one that suits your conditions best. You pay for and your horses draw only what you need

We have been making Diggers 10 years and know what to build for this work. Our booklet "D" tells the whole story in an understandable way. May we send it ?

SUMMERSIDE, Prince Edward Island.

amount of disease. Thus wheat sown in France on October 11 gave rise to only 1 per cent. of diseased plants, whereas in similar wheat sown on November 22 infection took place in 90 per cent. of the plants. From these and other experiments it may be laid down that the later in autumn and the earlier in spring wheat is sown the more the crop is likely to be affected. The gravity of smut diseases may be judged by the estimate that oat smut alone causes a loss of eight per cent. of the total crop—that is, a financial loss of uwards of £3,000,000 per annum.

Potato Culture and Potato Drying in Germany.

The German Association of potato dryers held their annual meeting in Berlin lately. The report showed that the large crop of potatoes in 1913 (54 million tons) diminished the price of dried potatoes to 66-70 cents per 100 lbs. But the same cause has long augmented the quantity of potatoes dried very considerably.

On account of the low prices that prevail and the great waste entailed by keeping potatoes over, many farmers have had their surplus stock dried at the factories. The expense of drying amounts to 4 or 5 cents per 100 lbs. of potatoes.

There were over 200,000 tons of dried potatoes prepared by the 500 potato drying factories during the year. The 733 existing machines are capable of dealing with about 1,000 tons per hour or about 1,200,000 tons in 100 days.

An interesting table was submitted showing the cost of fabrication and the financial return for the different ways of utilizing the potato industrially. In each case 100 lbs. of raw potatoes are dealt with.

Cost of Fabrication per 100 lbs.	Value of Product
cents	cents
Distillers 16	33 as potato spirit of alcohol.
Starch making 4	18 as starch.
Dried potatoes 4-5	20 as dried potatoes.

The analysis of the potatoes pulped and dried is as follows: Water, 13 per cent.; cellulose, 2.2 per cent.; protein, 1 per cent.; starch, 67.5 per cent.; mineral matter, 4.5 per cent.

The dried potatoes are liable to deteriorate if they contain more than 14 or 15 per cent. moisture.

The reduction of the raw potatoes in the process of manufacture varies according to the percentage of dry matter or solids they contain. From 300 to 400 lbs. of raw potatoes are necessary in order to produce 100 lbs. of dried pulp.

During the year some cases of fraudulent adulteration were detected. The adulteration consisted in mixing the potato starch or potato spirit offal with the dried potato pulp which they closely resemble.

The chief nutrient element in the potatoes is the starch; they cannot therefore be used as a substitute for oil cakes, oil meal, meals made from cereals, and other forms of concentrated feed rich in protein and fats that are generally used in order to balance the home-grown ration. Dried potato pulp produces a good flow of milk and may also be fed to beef cattle with advantage as it contributes to the good health of the stock.

For countries like Germany, where potatoes are extensively grown, the potato drying industry possesses the advantage of enabling potato growers to preserve their surplus stock in the years of abundance and therefore contributes to the popularization of potato culture.

The addition of 15 to 20 per cent. potato flour to rye flour renedrs the resulting bread more appetizing and improves its keeping quality.

Great importance is attached to the potato drying industry in Germany as it is capable of creating large food reserves that would fill many months in the event of war or famine.

¶ Four years ago we began to pay transportation charges on all our mail order business. Since then this business has increased five-fold.

¶ In emulation of this success, the whole mail order business of Canada is gradually measuring up to our prepayment methods.

But Our Clean-cut Policy

of paying all charges on everything in catalogue

is Still Unapproached

¶ In this last six months we have installed a complete new plant for handling our mail order business. It occupies four times the floor space of our former one and is one of the most complete and most modern equipments on this continent. This has enabled us to give all our Mail Order customers a one-day service, that is,

We Now Ship Your Order Within One Day Of Its Arrival

¶ This new speed service is now inaugurated because we are determined to deserve still greater business from our customers. It will give them a far more efficient service than has been possible in the past.

¶ Our new Fall and Winter catalogue, the most beautiful catalogue we have ever published, full of fine colored prints that show the actual appearance of the goods, is now ready. When you get your copy peruse it carefully. If you have not received a copy, your name and address on a post card will bring one by return mail.

Remembering These Four Points!

1. Every article in a Simpson catalogue is prepaid to your post-office or nearest express office.
2. Every order for goods from a Simpson catalogue is despatched within one day of the time we receive it.
3. Every customer gets the benefit of Toronto styles and prices just as if the Simpson store was in your home town.
4. Every order goes to our customers by fast train. We no longer make any freight shipments.

FARMER ADS. BRING RESULTS

Before Sickness Comes.

It is easier and pleasanter to keep sickness out of the home than to get rid of it once it has gained a foothold, and with this end view one should strive diligently at all times to see that cleanliness reigns supreme.

Do away with dark corners and musty-smelling drawers and chests. Let light and sun and air have full sway. Moderation, cheerfulness and a simple, nutritious diet, in combination with deep breathing of fresh air spell health. Women especially do not half use their lungs.

Self-control also must come into play, for fits of anger, ungoverned jealousy, moroseness, or "blues," are most detrimental to health. You alone are responsible for keeping your individual plot of life sweet and free from weeds. Do not allow yourself, therefore, to get stirred into rebellion over another's wrongdoing, even though it seems aimed directly at you. The only way in which another can really harm you is by allowing yourself to be shaken out of the calm which is your birthright. Let their part go, but keep your own stable and sweet, and contentment and peace will ultimately be yours.

Remember that cleanliness, not only of the house, but of the body, is essential. The daily bath, either cold or tepid, is a habit which, once formed, one will never drop.

A few minutes of full, deep breathing at an open window, a vigorous rub with flesh brush or rough towel, until every inch of the body is in a glow, following a quick bath, will put one in trim for the day better than any amount of medicine. And, listen: Do not forget a few steady, true-hearted resolve about the affairs of the day before you leave your room. Get into harmony with life and the day will swing smooth and free, for this is the wonderful tnread on which a complete and happy life is strung.

Bear in mind also that the body requires a liberal supply of water inside as well as out. A glassful, hot, about half an hour before meals is a great aid to digestion, and one should for the habit of drinking at least six or eight glasses of cold water during the day.

Personally, I believe the more raw foods, such as fruits, cabbage, lettuce, celery, etc., one can work into the diet the better, and it is well to know that bran is a great regulator of the bowels if they become sluggish or irregular—the usual daily amount being from one to four tablespoonfuls, but one should regulate the quantity by individual need.

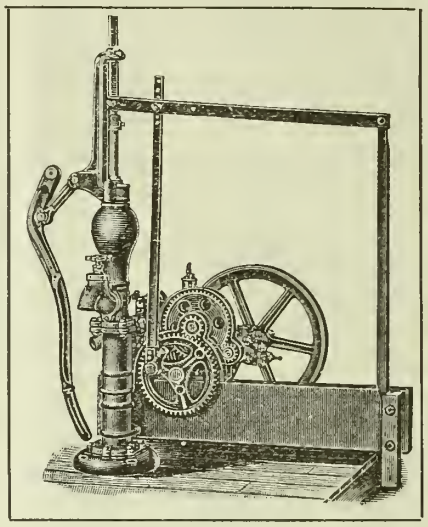
It may be taken either cooked or raw, the simplest way being to mix one or two tablespoonfuls into a glass of cold water. If faithfully persisted in, it will cure bowel trouble of many years standing.—L. D. Stearns.

To Prevent Paint Blistering

The chief cause of paint blistering is moisture in the substance painted. Wood especially, even when apparently dry, may contain a considerable amount of moisture, and if painted when in this condition it is prevented from escaping until a warm sun, converting it into vapor, raises the paint and causes the unsightly blisters. Moisture between two coats of paint has the same effect. It therefore follows that every care should be taken to see that the substance to be operated upon is perfectly dry.

THIS LITTLE ENGINE

is designed to take the place of the man at the pump and anyone who watches this outfit pump water for ten minutes will never again be willing to work the pumphandle. The operating cost is very small and a splendid feature is that this engine can be easily connected to "any old pump." The ladies often start it to pump a single pail of water. They rest while it works.



The Outfit Complete as shown sells for $70.00. The engine alone $55.00. Immediate shipment from stock.

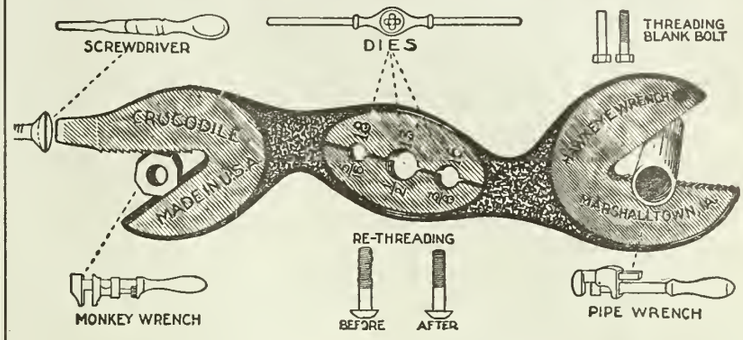
The Crocodile Wrench

An All Around Handy Tool for the Home, Farm and Shop



Six Handy Farm Tools in One

The Crocodile Wrench is drop forged from the finest tool steel and scientifically tempered. Every wrench guaranteed against breakage. It is 8 1-2 inches long and weighs ten ounces.

A pipe wrench, a nut wrench, a screw driver and three dies 5-16, 3-8 and 1-2 inch for cleaning up and re-threading rusted and battered threads, also for cutting new threads on blank bolts. Dies will fit all bolts used on standard farm machinery.

Teeth and dies are case-hardened in bone-black, making them hard and keen.

The dies on this wrench alone would cost $1.50, and would be worth more than that to every farmer, as they would often save valuable time, besides an extra trip to town for repairs.

Sold everwhere for 75 cents cash.

How to Procure a Crocodile Wrench

On receipt of $1.00 we will send you the Maritime Farmer for one year and also one of these Crocodile Wrenches. New subscriptions will date from time of receipt, renewals from date of expiration of present subscriptions. Send us two new cash in advance subscribers to the Maritime Farmer at 80 cents each and we will send you a wrench for your trouble. Or for 75 cents cash we will send you a wrench.

The Maritime Farmer, Sussex, N. B.

DR. JOHN STANDISH DEAD.

Dr. John Standish, veterinarian at the Nova Scotia Agricultural College, died suddenly at his home in Georgetown, Ontario, on Saturday, August 15th. He was ill only two days, the cause of his death being blood poisoning, which it is thought he contracted in making a post mortem of a cow that had died a few days previously. Dr. Standish has been connected with the Agricurtural College for the past seven years. He was well known all over the Maritime Provinces, and genuine regret will be felt by his many friends at his untimely decease.

New Brunswick Agricultural Societies United.

(Continued from page 782)

this organization is not to increase the use of commercial fertilizer, but rather to furnish to those farmers to whom commercial fertilizer is necessary a first class article at as low a price as possible. We wish to get in touch with all Agricultural Societies throughout the Province and it is the object of the Central Organization to issue, a little later, a pamphlet to all societies giving full instructions regarding financing of purchase, home-mixing and use of chemical fertilizers. Through the pamphlet mentioned instructions will be furnished to every Society in New runswick regarding the ingredients required to make up different mixtures.

The Annual meeting of the "New Brunswick Agricultural Societies United" will be held on the fourth Thursday in November. At this annual meeting the delegates from the Agricultural Societies, as provided for in the bill, will meet to arange business for the coming year. It will be necessary for all Societies, wishing to purchase fertilizers through the Central Organization, to hold either three annual meetings or a special meeting before the annual meeting of that organization and to be in a position to place their orders, through their delegates, at any time. It is necessary that all orders for fertilizer be in by December 1st.

REMARKABLE OFFER TO SUBSCRIBERS

The Maritime Farmer has secured a limited number of Mauser rifles, weight noly 7½ pounds. sighted for 1,100 yards, which it offers with the Maritime Farmer for one year for only FIVE DOLLARS. These rifles are models for hunters. They are sold elsewhere for a much higher figure and are easily worth from three to four times as much as we are asking for them. The first to call will get the choice.6The rifles will be sent express to your nearest express office, collect. Money must accompany all orders and rifles will only be supplied to new subscribers, or those who pay strictly in advance. They are the best lot of rifles of the kind on the market. We can also supply ammunition for the rifles in lots of 100 rounds at most reasonable prices.

An Old Adage.

Among strawberry men it is said, and it may be correct or wrong, that lime and strawberries are not congenial. I won't say it is, but the strawberry men are a little careful about using lime.—Horace Roberts, Burlington County, N. J.

DEPARTMENT OF AGRICULTURE, FREDERICTON, N. B.

Honourable J. A. Murray, Minister.

Circular to Live-Stock Breeders:--

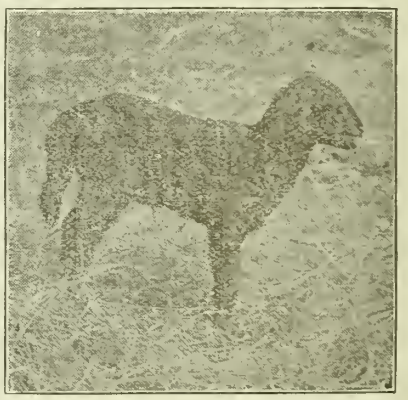
As a result of the policy of the Department of Agriculture, in aiding Agricultural Societies to purchase pure-bred stock, numerous enquiries are being received, as to where suitable breeding stock can be obtained. At the present time this Department is not in a position to give satisfactory information to these enquiries.

In order to increase the efficiency of this Department in supplying reliable information, and at the same time placing the breeder and the purchaser in closer touch with one another, it is proposed that an accurate record be kept at this office of pure-bred stock offered for sale by New Brunswick breeders.

To facilitate this work the co-operation of breeders would be greatly appreciated by this Department. by their supplying a list, together with a detailed description and the price of animals offered for sale, and by their sending a corrected list of their offerings at the first of each month. In this way we hope not only to be of service to those looking for stock but the breeders as well.

Kindly address communications to the Live-Stock Branch, Department of Agriculture, Fredericton, N. B.

Yours very truly
J B. DAGGETT,
Sec'y. for Agriculture.



Three-quarter-blood Lamb Bred on our Ranch

We handle the best strain of fur producing Karakule sheep on the Continent.

We are now booking orders for full-bloods, three-quarter bloods and half-bloods. Delivery on short notice.

Long distance connection through Sussex exchange.

THE CANADIAN KARAKULI-ARABI SHEEP AND FUR CO., LTD.,
Apohaqui, - New Brunswick.

Owing to circumstances brought about by the European war conditions, the Commissioners of the Nova Scotia Provincial Exhibition have decided to cancel the Exhibition. There will, therefore, be no Halifax Exhibition this year.

THE MARITIME FARMER

Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 19. SUSSEX, NEW BRUNSWICK, SEPTEMBER 15, 1914. Number 23.

SUSSEX DAIRY RECORD CENTRE

In the course of the visit to the Provincial Dairy School, Sussex, a few days ago we found Mr. H. N. Flewelling, who has charge of the Cow Testing Association in this section busily engaged in testing samples of milk for members of the Association. Mr. Flewelling has worked up a great deal of interest among the dairymen of Kings Couty in Cow Testing work and we believe the Sussex Record Centre is leading in point of cows under test.

Some of the pertinent questions and remarks that Mr. Flewelling asks the farmer in his jurisdiction are:—

Dairy herd improvement must be brought about by Seletion, Breeding and Feeding.

Do you keep a record of the production from each cow in your herd?

Do you keep a record of the feed given to those cows and the cost of that feed?

Do you know that all your cows are making a profit or are some being fed at a loss?

Do you use a good pure bred sire from a producing strain for the purpose of improving your herd?

Following is a record of general results in the Sussex Dairy Record Centre in 1913:

Complete records from 34 herds	448 cows
Average production of milk	4748 lbs.
Average production of Butterfat	193.6
Average cost of feed per cow	$46.38
Average value of production (Butterfat 29 cts. lb.)	$54.14
Average profit per cow	9.76
Average cost per cwt. milk	97¾c.
Average cost per lb. Butterfat	24c.

Highest	Comparison Average for Herds	Lowest
6834	Pounds milk	2900
271	Pounds Butterfat	104.8
$78.59	Value of production ,Butterfat at 29c. lb.-	-30.39
72.03	Cost of feed	32.10
1.43	Cost per cwt. milk	.80
.37	Cost per pound Butterfat	18½

Average cost per cow	$ 61.42

(Continued on page 824)

THE SAINT JOHN EXHIBITION

The Maritime circuit of fall fairs was opened at St. John when on Saturday, September 5th, the gates leading to the spacious exhibition grounds were swung open.

The official opening of the exhibition was held in the Amusement Hall on the evening of the 5th when in the presence of a large and enthusiastic audience His Honor Lieutenant-Governor Wood formally declared the exhibition open to the public. Short addresses were delivered by His Worship Mayor Frink, Acting-Premier, Geo. J. Clark, Hon. J. A. Murray, Hon. John E. Wilson and His Honor Lieutenant-Governor Wood.

Optimism characterized the keynote of the various addresses and the patronage of the people of St. John and other parts of the provinces showed that despite the upheaval which is shaking the whole world at the present time the people of the Maritime Provinces wish to keep matters running smoothly and devoid of all pessimistic tendencies.

The weatherman dealt out a favorable brand of weather and visitors came into the city by the various avenues of transportation until at times it was difficult for one to wend his way through the throngs.

The Main Building

Every nook and corner of the Main Building was lled with the exhibits of the various industrial houses and so tastily were the various booths and exhibits displayed that the whole building presented a very attractive appearance. The only section of the main building which was not quite up to the notch in point of exhibits was the machinery hall. The Humphrey Shoe Co. of St. John, had a process exhibit where shoes were manufactured and during the hours of demonstration the process was watched with much interest by a large number of the sight seers.

The Agricultural Hall

contained a very creditable display of products of orchard, garden, field and aipiary.

"Notwithstanding the early date the show of fruit was very creditable," was the verdict of the veteran judge, Mr. S. L. Peters. In the section for county collections the awards were: —

Albert County—1, W. A. Colpitts; Kings County— 1, A. R. Gorham; 2, F. E. & H. G. Smyth. St. John County— 1, W. R. McFate. Queens County—1, W. P. & F. L. Fox; 2, S L. Peters' Sons. Sunbury County—St. John Valley Farm & Fruit Co.; 2, Isaac W. Stephenson. Victoria County—1, Donald Innis. The best County collection was shown by A. R. Gorham of Kings County, who also had the best collection of tender fruits in natural condition. H. E. Bent, of Nova Scotia, and W. R. McFate of St. John County figured in second and third collections.

H. E. Bent had the best collection of hardy fruits with Gorham and Colpitts in second and third positions. Gorham also had the best collection of small fruits in glass. Bent and McFate carried off the second and third prizes.

The prize winners in the apples and pears sections were as folows:—

Export Barrels ready for shipment— 1, H. E. Bent; 2, A. R. Gorham.

Export boxes ready for shipment—1, John N. Chute; 2, W. P. and W. L. Fox; 3, A. R. Gorham.

Domestic barrels ready for shipment —1, H. E. Bent; 2, A. R. Gorham.

Domestic boxes ready for shipment —1, St John Valley Farm and Fruit Co.; 2, W. P. and W. L. Fox; 3, A. R. Gorham.

Domestic baskets ready for shipment —1, A. R. Gorham; 2, S. L. Peters & Sons.

Desert Varieties—

Any three varieties—1, H. E. Bent; 2, A. R. Gorham.

Any Seedling—1, S L. Peters' Sons; 2, A R. Gorham.

Decoration Exhibits—

For dining table—2, H E. Bent.

For show table and shop window—2, H. E. Bent.

Industrial Varieties—

Alexander—1, S. L. Peters' Sons; 2, John N. Chute; 3, A. R. Gorham.

Duchess—1, W. P. and W. L. Fox; 2, St. John Valley Farm & Fruit Co.; 3, A. G. Sangster.

Gravenstein—1, H. E. Bent; 2, M. E. Armstrong; 3, A. G. Sangster.

Crimson Beauty—1, I. W. Stephenson; 2, J. N. Chute.

Maiden's Blush—1, A. G. Sangster.

Red Astrachan—1, M. E. Armstrong; 2, F E. and H. G. Smyth; 3, A. G. Sangter.

Ribston Pippin—1, H E. Bent; 2, A. G. Sangster; 3, J. N. Chute.

Fameuse—1, Mrs. E. W. Darcus; 2, St. John Valley Farm and Fruit Co.; 3, A. G. Sangster.

St. Lawrence—1, I. W. Stephenson; 2, St. John Valley Fruit Co.; 3, A. R. Gorham.

Baxter—I. W. Stephenson; 2, St. John Valley Fruit Co.; 3, A. G. Sangster.

Wolf River—1, St. John Valley Fruit Co.; 2, M E. Armstrong; 3, I. W. Stephenson.

McIntosh Red—1, A. R. Gorham; 2, W. P. and F. L. Fox; 3, Mrs. E. W. Darcus.

Wealthy—1, W. P. and W. L. Fox; 2, St. John Valley Fruit Co.; 3, A. G. Sangster.

Best six fallf-1 p-Mdnua etaoinu

Blenheim Pippin—1, H. E. Bent; 2, A. G. Sangster; 3, J N. Chute.

Any other Seasonable variety—1, H. E. Bent; 2, A. G. Sangster; 3, St. John Valley Fruit Co.

Best display crab apples—1, A. G. Sangster.

Best 5 varieties Pears—1, H. E. Bent; 2, J. N. Chute; 3, A. G. Sangster.

Best six fall Pears—1, A. G. Sangster; 2, H. E. Bent; 3, S. L. Peters' Sons.

H. E. Bent won three first prizes and one second prize on plums, peaches and grapes and John N. Chute won one first and one second prize in the same class.

The Demonstration in the Handling of Bees

Perhaps no practical demonstration attracted more of the visitors at the exhibition than that conducted by H. B. Durost, Prov. Apiarist. The idea of the demonstration was to show that when properly handled, bees are as gentle and submissive as any of the farm livestock. Too many of those who are mortally afraid of bees (and most people are) it was a great surprise to see Mr. Durost, with coat off, sleeves rolled up, and with no covering whatever on face or hands, working with the bees. Many were the exclamations of wonder when he was seen to grasp the live bees up by the handful and pour them from hand to hand.

Besides handling the bees, Mr. Durost showed, and explained the use of all the various apparatus used by an up-to-date bee-keeper.

There was a nice display of apiarian products and awards were:—

Bees

Best Colony Black Bees—1, W G. Asbell.

Exhibit of Live Queen—1, W. G. Asbell.

Comb Honey—1, Miss Elda T. Smith;; 2, W. G. Asbell; 3, G. S. Peabody.

Best Liquid Extra. terd Honey, Light —1, W. G. Asbell: 2, G. S. Peabody.

Best Liquid Extracted Honey, Dark —1. W. C. Asbell.

Best Granulated Honey—1, W. G. Asbell.

Best Display of Honey—1, W. G. Asbell; 2, G. S. Peabody,

Best Comb Honey Super—1, G. S. Peabody; 2, W. G. Asbell.

Largest display articles of diet into which honey is a component part—1, G. S. Peabody; 2, Mrs. Jos McKay; 3, Mrs. Geo. McKay.

Best Beeswax—1, G. S. Peabody; 2, W. G. Asbell.

Best Apiarian supplies collection—1, W. G. Asbell.

Largest and neatest display of Apiarian Products and supplies—1, W G. Asbell; 2, G. S. Peabody.

Best general exhibit—1, W. G. Asbell.

Best general display beeswax—1,W. G. Asbell.

Harve yMitcehd .R; & M,eklv2.

Harvey Mitchell of the Dominion Dairy Division placed the awards in the Dairy Products Sections. Following are the awards with score made by each exhibitor.

Cheese

Cheese, 2 cheddar, colored—1, William Clark, 96½; 2, Adrian McInnis, 96; 3, Archie Cousins, 95½

Cheese, 2 cheddar, white—1, L. Bibeau, 96½; 2, Archie Cousins, 96; 3, Adrian McInnis, 95.

Cheese, 3 flats, colored—1, William Cousins.E—.Sec.o .SVt etoinashrdlup Clark 97; 2, Adrian McInnis. 96½; 3, Archie Cousins, 95.

Cheese, home made dairy—1, Isaac W. Stephenson: 2, Miss Clementine Drake.

Butter

Box for export 28 or 56 lbs.—1, J .P. Simmons, 96¼; 2, Farmers Dairy and Produce Co.. 95¼; 3, W. C. Lewis, 95; 4, Sussex Cheese and Butter Co., 94.

Prints, 20 lbs.—1, J. P. Simmons, 95¾; 2, W. C. Lewis, 95½; 3, Farmers Dairy and Produce Co., 95¼; 4, Sussex Cheese & Butter Co, 94.

Crock or tub, 10 lbs., private dairy— 1, Bertrand Goodspeed, 94; 2, McFarlane Bros., 93½; 3, Harvey Weade, 93, 4, J. W. Foster, 92½.

Prints, 10 lbs. private dairy—1, McFarlane Bros., 94; 2, Bertrand Goodspeed, 93½; 3, Geo. M. Holmes, 92½; 4, J. W. Foster, 92.

There was a good display of field roots and grains and garden vegetabes. The awards were placed by S. J. Moore Maritime Seed Inspector.

The awards in field grains and roots were as follows:—

Best Assortment of Potatoes—1, Bertrand oBodspeed, Penniac, N. B.; 2, John N. Chute, Berwick, N. S.; 3, Hugh A. Dickson, Truro, N. S.

Best collection of Field Roots—4 entries— 1, Hugh A. Dickson; 2, Bertrand Goodspeed; 3, John N. Chute.

Field Grains

Best collection of grain grown in New Brunswick—Donald Innis.

Field Grains—Bertrand Goodspeed, A R. Gorham, M. B. Harrison, Donald Innis, McFarlane Bros., J. A. Johnston, H. E. Bent, Geo. M. Holmes, H. S. Secord & Sons.

Sheaf Grain—D. Innis, M. B. Harrison, B. Goodspeed, McFarlane Bros., Geo. M. Holmes, A. R. Gorham, H. S. Secord & Sons.

Best collection Sheaf Grain—D. Innis M. B. Harrison.

In the garden vegetable section, Mrs. Annie Freeman had the best collection of tomatoes and Hugh A. Dickson, F. B. Waters and Bertrand Goodspeed carried of the first, second and third awards in their respective order for sweepstakes collection of produce.

The Dominion Experimental Farm had a splendid display of the various products of the Station at Fredericton. The exhibit proved very instructive and attendants in charge were kept busily engaged answering questions. An egg candling station was in opration under the direction of Mr. Hare of the Ottawa Station who clearly set forth the advantages accruing from the organization of egg circles in farming localities.

Highfields Farm, Hampton, N B. had a table in the Agricultural hall on which were displayed their various products. A casual glance at this table revealed the fact that the management of this farm is alive to the possibilities of catering to a good class of customers. There were samples of butter, Devonshire clotted cream, Coulommier cheese, Pont L'Eveque cheese, Gervais cheese, bottled fruits and vegetables and other articles. We would judge by the exhibit that the aim of the proprietress of Hampton Stock Farm is to make everything count by putting the products and by-products of the farm on the market as attractive and as appetizing as possible.

The Natural History, Economic Minerals of Canada, Fine Arts and Woman's Work Departments were well filled and much nterest centered on the exhibits in the various sections.

The Child's Welfare Association had a display in one of the galleries which proved most attractive and which showed what kind and willing hands can do for the health and happiness of the little tots.

The attractions before the grand stand and in the amusement hall were clean and sprightly and between them and the noisy pike the sight seers found ample opportunity to forget dull care.

The Live Stock

There is no part of an exhibition on which so much interest centres as on the live stock section and this was particularly true at St. John. The various encosures were thronged with visitors, who admired the magnificent horses, the beautiful dairy cattle, the fat beef cattle, the sheep, the swine and the noisy poultry. Each and every section had its admirers. The judging was rushed through as quickly as was consistent with thoughtful work so that the management was able to pay all prizes from twenty-four to thirty-six hours before the close of the show.

Horses

There was a fair showing of horses in point of numbers and good in point of quality. E. Watson, Manager Mount Victoria Stock Yards, Hudson Heights, Que., placed the awards on the lighter breeds and John Vipond, Whitby, Ont., dispensed the prizes in the heavy horse classes.

THOROUGHBREDS were shown by Geo. Carvell, St. John, Geo. M. Holmes, Amherst, E. L. Woods, East St. John, Jas. Watters, Marsh Bridge, and R. J. Armstrong, St. John. Carvell's Melsino by Meltonian shown in the aged class carried off the male championship.

Nancy Brown shown by E. L. Woods was the best mare, 4 years old or over and best with her C. R. W. Foal by her side and champion.

STANDARD BREDS—Four aged stallions wheeled around the track in the Standard Bred class. H. C. Jewett's Canadian Prince led the way and captured the stallion championship. W. J. Alexander was second with Dan Gilbert and W. Brickley's Golden Result, a brother to Bingen, was third, while C. R. W. stood in the fourth place.

Jas. B. Stentiord, of St. John, showed Dodd's Princess, by King Dodds, the only two-year-old filly. She was good enough to capture the female champion.

HACKNEYS were shown by R. A. Snowball, McFarlane Bros., W. H. Burnett and W. M. Johnson.

Model Performer, Sedgewick Enterprise and Stampede were placed in their respective order with the former carrying off the championship diploma and Canadian Hackney Horse Society Medal.

W M Johnson's Ardimersay May Queen was first in the aged mare cass and champion and also first with her Model Performer foal. Her only competition for these honors being Snowball's Chatham Lily with her foal by Cock o' the North.

CLYDESDALES—McFarlane Bros. and R. A. Snowball were the largest exhibitors of Clydes.

n the aged Stallion Class McFarlane Bros.' Baron Squire, H. C. Jewett's Day Dream and G. C. Cossar's Dunure Crag were the prize winners in the order named.

Snowball's Baron's Own had no competition in the three-year-old class as was the case with McFarlane Bros.' imported Boreland Crest by Baron's Crest in the two-year-old class. Boreland Crest carried off the male championship diploma and the Canadian Clyde Association prize. Jewett's Day Dream carried off the Association prize for best Canadian bred stallion.

Snowball's aged mare, May Lothian was champion female and his Miss May was best Canadian bred mare. McFarlane Bros. also showed the nice two-year-old imported filly, Ballmangan Belle. Snowball's May Lothian foal by Baron Balgreddan was first in this class.

John Sharp's Clydesdale Baron Balgreddan was first with six of his get, all breeds competing.

Shires—There was only one shire horse on the grounds.

PERCHERONS were few in numbers D. P. Cayton's Indican and Jewett's Gresham were awarded first and second prizes in their class while a third stallion shown in the ring was awarded the goose egg unless the judge changed his mind later and placed the award.

Samuel Jones and G. W. A. Chamberlain showed one three stallion and one two-year-old. stallion. respectiely. W. S. Allison and Geo. Chamberlain showed all the females in the class.

SUFFOLKS—Two three-year-old Suffolk Punch stallions Belmont Royal George and Belmont Sovereign were shown by G. F. Stephenson and Samuel Jones of St. John, and prizes were awarded in the order named.

Beef Cattle

Shorthorns were shown by R. A. Snowball, C. A. Archibald, Isaac Chipman & Son, A. N. Griffin and G C. Cossar—a strong competition. Archiebald's herd was out in good shape although their owner claims that they were loaded direct from the pasture abroad cars without any special fitting. Snowball's Gay Archer led the way in the aged bull class with Archibaid's Prince Imperial, Chipman's Victor and Cossar's May Dawn in second, third and fourth places.

Griffin's two-year-old Proud Monarch by Stately Monarch had no competition in his class but was good enough to capture the male championship. There was an excellent showing of young bulls. The strongest competition in females was in the senior calf class in which nine beauties appeared before the judge.

Snowball's Roan Mina, the first prize two-year-old heifer carried off the female championship. Griffin's Proud Monarch was first with three of his get. Snowball's Chatham Bell was first with two of her offspring and Archibad's Rosabella captured the special award in this section which was donated by the Dominion Shorthorn Breeders' Association. The biggest honor in the class, the breeders' young herd prizes were won by R. A. Snowball and Chas. A. Archibald and in both cases Mr. Archibald's faorite expression obtains "We breed our winners and sell them too."

HEREFORDS—Wm. O'Brien & Sons and Jas. E O'Brien were over from Windsor Forks, N S. with a nice string of well-fitted white faces but met no competition worthy of ther steel.

ABERDEEN ANGUS—A nice, well-fitted herd of doddies was shown by J. M. Laird & Son, Kelvin Grove, P. E. I. and they too had no competitors.

Dairy Cattle

Ayrshires—Clifford Creighton, McIntyre Bros., A. McRae & Sons, Geo. Retson, C. A Archibald and P. Blanchard were exhibitors in the ever popular Ayrshire class. Jas. Bowden, Danville, Que., placed the awards. Creighton sprung a surprise on his competitors by being again back in the ring in battle array. Mr. Samuel Creighton, his father, was one of the old timers in the Ayrshire show ring but he dispersed his herd some years ago. At the time of his sale he withdrew a young heifer from the sale when not more than $60.00 was bid for her. This young heifer was a daughter of J. Frank Roache's famous White Heather and from the offspring of this cow Creighton has again buit up a herd that is second to none and has clearly demonstrated what a farmer can do, by persistent breeding, in a few short years.

In the aged bull class, Creighton's Cherry Bank Cicero by Netherall Milkman led the way with McIntyre Bros. Grange Kelly and McRae's Hobsland's Trumphies Heir in second and third places.

Cherry Bank Ccero carried off the male Championship and was first with three of his get and sire of Association Specia prize for get of sire. Creighton's White Heather, of Siler Falls, the first prize cow in the aged calss, was champion femae and first with her offspring and the dam of the pair that captured the Ayrshire Association Special for progeny of cow. Creighton, McaRe & Sons and McIntyre Bros. had the best aged herds in their respective order while McRae & Sons led the way with young herd closely followed in second and third places by two splendid herds shown by McIntyre Bros. Blanchard's Miss Peter Pan was first in the dry 4-year-old-cow class.

JERSEYS were shown by Clifford Creighton, H. S. Pipes & Son and E. J. Young. Mr. Young was formerly of the firm of Josslyn & Young. The Pipes herd was at St. John fresh from their victories at the Quebec exhibition where they had won the choicest prizes there offered. R. R. Robertson placed the awards.

Pipes' senior yearling Purple Blue, succeeded in landing the male championship and J. E. Young's Fox's Kathleen, shown in the four-year-old class walked off with the female championship.

Creighton, Pipes and Young won pri es in their respective order on aged herds and Pipes won first and second on breeders' young herd with J. E. Young in third pace. Fox's Katheen was first with two of her offspring and Creighton's Brampton Phra was first with three of his get.

GUERNSEYS—Hugh A. Dickson, Truro, N. S. and Roper Bros. had every thing their own way in the Guernsey cass. Dickson's Conqueror of Willow was the champion male and was first with three of his get. Roper Bros.' Rosalind was the champion female. Dickson led the way in the senior herd, bull and three of his get and cow and two of her offspring casses. Roper Bros. showed the best young herd.

HOLSTEINS—Lea & Cark, J. S. Gibbon and W. S. Harding were the only exhibitors of Holsteins. The Lea & Clark herd was out in particularly good fit. Harding made no especial preparation although his herd was in good working form. Lea & Cark's aged bull Ida Rooker's II Vale was the champion male and their three-year-old cow Ida Rooker's Johanna was champion female. The reserve female was Lea & Cark's Aggie Nig De Kol.

DAIRY GRADES—There was a good showing of dairy grades and prizes were awarded as will be found on other pages of this issue.

Sheep

There was a nice display of well-fitted sheep. C. E. Bain, Taunton, Ontarrio placed the awards.

Geo. Retson, Brookside Farm, Truro, N. S., captured the siver cup donated for the best judging of sheep by an amateur.

COTSWOLDS—Geo. Retson had the most prize winners in the Cotswold class. Geo. Thompson captured a third prize on aged ewes, a second prize on shearling ewe and second pen of lambs.

LEICESTERS brought out some stiff competition between two Boswall flocks, the Cossar farm flock and Retson's flock. The Boswall flocks carried off the biggest share of the money.

LINCOLNS were shown by Albert Boswall and C. D. Pugsley. The Boswall flock carried off all first prizes and Pugsley came in for a good share of the seconds and thirds.

OXFORD DOWNS—J E. Baker & Sons and J. M. Laird & Son were the only exhibitors of Oxfords. They were all out in show shape and every inch of the way to the prizes was contested.

SHROPSHIRES—Two Boswall flocks and a few representatives from Cephas Nunn's flock were in the ring. The aged ram shown by Geo. L. Boswall was imported recently from Fred Nock, a noted English breeder.

The Bronze Medal for

SOUTHDOWNS—The Bronze medal for the grand champion ram of the show, all breeds competing, was won by Cephas Nunn, with a two year old ram of his own breeding which argues well for Mr. Nunn's qualifications as shepherd and breeder. The honors in the Southdown cass were contested for by Messrs Cephas Nunn and J. E. Baker & Sons with fairly even results.

DORSETS were exhibited by Geo. L. Boswall and M. K. Boswall.

HAMPSHIRES—Cephas Nunn and Almon Boswall were the only exhibitors of Hampshires.

CHEVIOTS—Nunn and Symes divided the honors in the Cheviot class.

SUFFOLKS—The Boswalls had the only Suffolks at the fair.

FAT SHEEP—J. E. Baker & Sons, Geo. L. Boswall, L. Bibeau, Cephas Nunn, C. D. Pugsley and Almon Boswall carried off all the awards in the fat sheep class.

Swine

One of our contemporaries in reporting the Dominion Exhibition at St. John a few days ago reported "the swine were all judged in five minutes and that the judge had time to talk between classes." Were it not for Geo. Callbeck of Summerside, who was over with a fine string of Yorks the same report might have been applicable to this year's Swine show. Thos. Barrett, of East St. John also showed some nice Yorkshires and J. E. Josselyn showed a few Chesters. Callbeck's typical, well-grown, well-fitted. clean looking pigs were the subject of much favorable comment. Callbeck captured the Boar Grand Championship Bank of Commerce Bronze Medal as well as the silver cup for the best judging of swine by an amateur. James Bowden, Danville, Que., placed the awards.

Poultry

The poultry classes were judged by Seth Jones, Poultry Superintendent for the New Brunswick Dep. of Agriculture. There was a good showing of turkeys, ducks and geese but in the other classes the competition was not so keen. At this early date, few, if any of the birds were in good feather.

THE PRIZE WINNERS

HORSES

Thoroughbreds.

Stallion, 3 years old and upwards—1, Geo. Carvell, St. John, N. B.; 2, Geo. M. Holmes, Amherst. N. S.

Stallion, 1 year old—1, Jas. Watters, Marsh Bridge, N. B.

Mare, 3 years old and upwards—1, E. L. Woods, East St. John; 2, R. J. Armstrong, St. John; 3, Geo. M. Holmes.

Filly, 2 years old—1, Jas. Waters.

Filly, 1 year old—1 and 2, Geo. M. Holmes.; 3, Jas. Watters.

Foal of 1914—Geo. M. Holmes

Brood Mare with Foal by her side—1, E. L. Woods; 2, Geo. M. Holmes.

Stallion, any age, Diploma—Geo. Carvell.

Female, any age, Diploma—E. L. Woods.

Standard Bred

Stallion, 3 years old and upwards—1, H. C. Jewett, Fredericton, N. B.; 2, Wm. J. Alexander; 3, Wm. Brickley; 4, E. L. Jewett.

Mare, 3 years old and upwards—1, Filly, 2 years old—1, Jos. B. Stentiford. Geo. M. Holmes; 2, Hugh Yearwood.

Foal of 1914—1, Geo. M. Holmes; 2, Hugh Yearwood.

Brood Mare with Foal by her side—1, Geo. M. Holmes; 2, Hugh Yearwood.

Stallion, any age, Diploma—H. C. Jewett.

Female, any age, Diploma—Jos B. Stentiford.

Hackney

Stallion, 3 years old and upwards—1, Snowball, Chatham, N. B.; 2, McFarlane Bros., Fox Harbor Pt., N. S.; 3, W. H. Burnett.

Mare, 3 years old and upwards—1, W. M. Johnson, Chatham; 2, R. A. Snowball.

Filly, 1 year old—1, R. A. Snowball; 2, W. M. Johnson.

Foal of 1914—1, W. M. Johnson; 2, R. A. Snowball.

Brood Mare with Foal by her side—1, W. M. Johnson; 2, R. A. Snowball.

Stallion, any age, Diploma and Canadian Hackney Horse Society Silver Medal—R. A. Snowball.

Female, any age, Diploma and Canadian Hackney Horse Society Silver Medal—W. M. Johnson.

CLYDESDALE

Stallion, 4 years old and upwards—1, McFarlane Bros.; 2, H. C. Jewett; 3 G. C. Cossar.

Stallion, 3 years old—1, R. A. Snowball.

Stallion, 2 years old—1, McFarlane Bros.

Stallion, 1 year old—1, R. A. Snowball.

Mare, 3 years old and upwards—1 and , R. A. Snowball; 2, McFarlane Bros.

Foal of 1914—1, R. A. Snowball; 2, McFarlane Bros.

Brood Mare with foal by her side—1, R. A. Snowball; 2, McFarlane Bros.

Stallion, any age, Diploma—McFarlane Bros.

Mare, any age, Diploma—R A. Snowball.

Special Prizes Offered by the Clydesdale Asociation of Canada.

Best imported Clydesdale Stallion, $40.00—McFarlane Bros.

Best Canadian bred Clydesdale Stallion, $40.00—H. C. Jewett.

Best imported Clydesdale Mare, $35.00—R. A. Snowball.

Best Canadian-bred Clydesdale Mare—R. A. Snowball.

Percheron

Stallion, 4 years old and upwards—1, D. P. Clayton, Fredericton; 2, H. C. Jewett.

Stallion, 3 years old—1, Samuel Jones.

Stallion, 2 years old—1, Geo. M. Chamberlain.

Mare, 3 years old and upwards—1 and 2. Wm. S. Allison, St. John.

Filly, 2 years old—1. Geo. A. Chamberlain.

Filly, 1 year old—1, W. S. Allison.

Suffolk Punch

Stallion, 3 years old—1, G. F. Stephenson, Golden Grove; 2, Samuel Jones, Marsh Bridge.

Roadsters

Stallion, 3 years old and upwards—1, J. F. Kelly; 2, Geo. M. Lawson; 3, Wm. Brickley.

Colt of Filly, 2 years old—1, Jos. B. Stentiford; 2, Colin Taylor; 3, John B. Wood.

Matched Pair, any age—1, Geo. M. Holmes; 2, P. H. Nugent.

Carriage Horses

Single Horse, Gelding or Mare—1, W. M. Johnson; 2, Geo. M. Lawson; 3, H. C. Greene.

Heavy Draught Horses

Mare or Celding, 3 years old and upwards—1 and 2, R. A. Snowball; 3, McFarlane Bros.

Colt or Filly, 2 years old—1, McFarlane Bros.; 2, R. A. Snowball.

Team, Mare or Gelding—1 and 2, R. A Snowball; 3, Manchester, Robertson & Allison.

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

October 13-27

A CLERGYMAN'S EXAMPLE

We glean the following from one of our Prince Edward Island exchanges. We trust every clergyman in the Maritime Provinces will read it and having read see what they can do to follow the example that is set by Rev, Dr. Gauthier.

"Prof. Ross, who has returned to Charlottetown from Western Prince, where last week he had been judging the fields of standing grain, reports excellent crops of all kinds. Not for many years has the hay crop been so heavy, he says, and most of it has been gathered in excellent condition. A good many of the grain fields are patchy on account of the cold, wet spring, but the crop will likely be a heavy one. The show thistle and the hawkweed are however abundant. The former is now general all over the Island and is becoming a serious menace to our grain crops. The turnip and potato crops give evedince of being very heavy. The latter is this year blooming very prolific, much more so than ordinarily. Even within the short space of one year Prof. Ross notices very considerable improvements. Rev. Dr. Gauthier is continuing his experiments and demonstrations. In one field he has sown three varieties of Oats, Old Island Black, 50 lbs., black and Ligowo. The first named is much the best, the Ligowo comes second and the 50 lbs. third. Besides, the 50 pounds is quite rusty, and this strip of oats, running through the whole of a large field, can easily be noticed as one drives along the road, and the Rev. doctor is kept busy explaining that it is a different variety and seems to be more susceptible to rust. Dr. Gauthier's other demonstrations of rotations and clovers, etc., have been very successful and with the exception of one field which is now in process of treatment, the parochial farm is intensively cultivated and can challenge the Island in crop production. The kind of crop grown, too, makes for the improvement of the parish. They are fed to live stock on the place, and his excellent herd of Holsteins is the pride of the commuuity. Not only is the reverened doctor directing the spiritual welfare of his parishioners, but he is testing for them the latest agricultural practices, demonstrating the best methods and leading the way to better and more remunerative agriculture.

OUR DUTY TO ONE ANOTHER.

"The following from the New Glasgow Enterprise is very timely:

"Now that war is on let us consider our duty towards our neighbor. At no time is it more incumbent upon us to do so. Henceforth till peace return there is no longer Tory or Liberal, capitalist or workman. There is only an old nation proud in arms facing as one a conflict which is not of its seeking. Our brothers by the hundreds of thousands must face death. What can we who from age or other reason are out of the fighting line do to prove ourselves worthy of them and to help.

"Let us wring the last drop of selfishness from our hearts. Let us each and all resolve that no action of ours shall add to the perplexities in an unwonted situation. If food is rising in price, let not those who are well to do and can afford to pay the high price seek to lay in stores, for by so doing they will make things harder for the poor people who have to buy by the little. We must help to make their cents go as far as possible.

"If you have bank accounts do not let us embarrass our bankers by panic stricken drawing, in order that we may have cash in the stocking. If our credit is good, we shall be able to get the things necessary to our existance and the need of ready money will be lessened, if we are content to remain quietly at home. Again if any be in our debt let us not choose this moment to press him for the settlement of his debt. It is easy to break a man by pressing him in a moment of difficulty, while forbearance may enable him to weather the storm, and in the long run prove os profit to creditor, who io his legal rights, adds the security of an honorable obligation.

FOR BUMPER 1915 CROPS.

In the last issue of The Maritime Farmer, under the Caption of "If England Dies You Die;" we drew the attention of our readers to the pressing need for extensive preparations this fall in the line of getting every possible acre of soil in readiness for the sowing and planting of farm crops next spring so that, other conditions being favorable, harvests will be reaped in the Maritime Province in the fall of 1915 such as was never before known in our history.

Since the article in question was published we have received many flattering Commendations of the policy we have outlined.

Anent this subject we glean the following cable and references thereto, from a recent issue of one of our exchanges:—

"Ottawa, Aug. 30 (Via Gazette leased wire)—That the farmers of Canada can do the Empire a good turn, with profit to themselves, by largely increasing their wheat acreage for next season's crop, is the belief expressed in a cablegram just received from a number of members of the Liverpool Corn Exchange. It is pointed out in this message that the area likely to be sown to wheat in Europe will be seriously reduced, owing to the mobilization of nearly twenty million men. The Dominion government is strongly impressed with the desirability of increasing the wheat acreage in Canada.

"In discussing the Liverpool cable Hon. Martin Burrell, minister of agriculture says:

"Apart from the practical certainty that wheat next year will yield a large financial return to the grower, there is the great fact that the Canadian Farmers, who by extra effort, enlarge their wheat acreage, are doing the best thing possible to strengthen the Empire in its day of trial."

While wheat is the only crop referred to in the above article, the term may truthfully be extended to include all farm and garden crops.

COMMUNITY MARKETING.

"A. D. Wilson, Director of Agricultural Extension and Farmers' Institutes, University Farm, St. Paul, says:—

"Co-operation in marketing and in buying is, we believe, essential to the economical distribution of products. Large quantities of uniformly good products can be sold much more advantageously than can smaller quantities of products, each sample of which may be good in itself but which when brought together are not uniform. When every farm was manufacturing its own butter, and each of the hundred or more farmers in the community was trying to sell butter of a different quality, the price of butter was comparatively low. Where butter is manufactured in one plant, the manager of the creamery has at his disposal large quantities of a uniform product and can sell at the best possible price

"If the products of a community, such as grain, potatoes and live stock, can be made uniform by co-operation among the members of the community in production, and then these larger quantities of uniform products can be sold by one man, the same advantages that come to the large farmer, can be secured in other enterprises on the farm.

THE N. S., A. C. WORK CARRIED ON AS USUAL.

Despite the fact that wars and ruinous of wars are disturbing business interests throughout the whole world, the Nova Scotia Agricultural College, Truro, will as usual carry on its good work. The 1914--15 classes will find the college doors open on November 3rd., and on January 5th., the Farmers and Farmers' wives and daughters of the Short and Domestic Science Courses will be received. Present indications we are told point to a large attendance and should it be that subsequent developments should lead to a reduced attendance, the smaller number of students will have extra advantage of the attention which they will receive from the members of the faculty. It makes no difference what profession a boy intends to follow he will be a broader-minded and better citizen in after years if he takes advantage of the excellent training afforded by spending a year or two at the N. S., A. C.

Present Status of the Dual-Purpose Cow in Britain.

In the last issue of the Maritime Farmer we published an article under the above caption credited to Hoard's Dairyman.

In this issue we are publishing an article which was written by Prof. Thomas Shaw, who has been in England purchasing milking Shorthorns for the United States. The article in question under the caption of "Sacrificing Good Cows" was prepared for the Live Stock Journal and relates to a condition of affairs all too common in the Maritime Provinces as elsewhere.

Commenting on Prof. Shaw's article the Farmers' Advocate, and we agree with the sentiments, says:

"Too many good stock and milk cows are turned off to the butcher at the very prime of their lives, simply because their lactation period is at an end and their owner, who is a city milk producer, does not want to wait for the beginning of another."

Here is what Prof. Shaw says:

"While there is very much to be admired in the practices followed by the breeders of live stock in Britain, one that I have noticed in regard to the same is, I think, peculiarly unfortunate. The reference is to frequent sales of valuable cows that are made to dairymen who supply milk to the large cities, and who find no other use for a cow than to sell her for slaughter when her lactation period is over. This evil is present in the United States as well as in Britain, but relatively in a less degree. The cows thus sold are quite mongrel in their breeding, and therefore are less valuable than the beautiful grade milking Shorthorns that prevail to so great an extent in England.

"This drain, I am told, is continuous, and it goes on through all the year. An intelligent farmer at Penrith stated only a few days ago that the sales of these cows, or at least the shipping of these from Penrith, would average not fewer than fifty a week. It would be interesting to know the aggregate of these sales in a year; without a doubt the record would be startling. The loss to the country, could it be stated in figures, would be appalling.

"Why should the loss be stated thus? Because of what it really represents. The buyers of cows for the uses named prefer young cows, and for the reason that they sell for a good figure when the lactation period is completed. They may, and do, buy some old cows, but they are much more anxious to get them when they are young. Suppose a cow is bought at six years old; she is milked one season by the city dairyman, after which she must die; she is cut off in the zenith of her youthfulness. The milk which such a cow would produce subsequently for several years, if she were spared, is not forthcoming, of course. But, what is more to be regretted, the calves which she would produce to perpetuate her kind remain unborn. While the business is perfectly legitimate, it does seem unfortunate that it exists. Milk could be supplied from the farms without the slaughter of cows n their prime.

"Do the breeders of England know that the demand for non-pedigreed milking Shorthorn cattle is going to be brisk in the near future? The bars are down, insomuch that non-pedigreed cattle can be taken over now. American farmers will want them because of the fact that the practice in England has been to milk them for past generations. This is a guarantee of their good milking qualities, and they are all so capable of producing animals that will be good producers of beef. It is animals such as these that the American arable farmer now wants, and it is animals such as these that he does not now have.

"Why are cattle of the dual class so few in America to-day? Because of the fact, first, that many of the teachers in the agricultural colleges persisted in teaching that dual-purpose cattle cvannot be bred; because many who were interested in dairying proclaimed the same truths, and because the dairy press aided in the dissemination of such erroneous teaching. The success of this unfortunate crusade—for it was a crusade—was aided by the low prices of meat in America, and the high prices relatively of dairy products. Meats have become very dear—nearly, or quite, as dear as in Britain. The farmers cannot supply the demand. The dairy cattle whih prevail so extensively can only supply but a small portion of it. The supply from Western ranges is sensibly decreasing, because of the breaking up of much of the Western ranges into arable farms. The population is increasing at the rate of 2,000,000 people each year. Where is the extra supply of meat to come from but the arable farm? What class of cattle must furnish it mainly? It must come from dual cows, for such cows will bring more money to the owner than can be obtained from straight beef cows kept under arable farm conditions.

"Will the growers of dual-purpose cattle in Britain, whether of the pedigreed or non-pedigreed sorts, make due preparation for the market that is thus opening up to them for non-pedigreed cattle? The chief fear is that the demand may exceed the supply. Those cows that are being thus sold in numbers so largely to city dairymen would serve a much better purpose by reproducing their kind in America. The time is nigh when they will want these cows. Can nothing be done to prevent them being thus sacrificed?"

The Canadian Seed Growers Association in New Brunswick.

Editor Maritime Farmer:—

At the annual meeting of the Canadian Seed Growers' Association held in Ottawa it was decided to ask the several Provinces to undertake the work of field inspection and extension. Hitherto this part of the work had been done by the Field Officers of the Dominion Seed Branch. Recent addition to the staff of most of the provincial departments of Agriculture, and the increased duties of the Seed Branch Officers have justified the step.

The New Brunswick Department of Agriculture has agreed to undertake the work in this province and has placed in charge, Mr B. T. Reed, who is prepared to visit or communicate with farmers who may be considering membership or who are interested in the production of seed grain. New Brunswick is naturally well adapted to the production of seed of good quality, particularly of oats and potatoes, and it is felt that the membership of the Association should be extended. In 1911-12 there were only four operating members, although a number had signified their intention of joining.

Prince Edward Island, which has made a name for its oats in the Upper Provinces had at the same time twelve operating members; of these, nine are selecting the "Banner" oats.

Another instance of success attained by following the methods of the C. S. G. H. is that of the corn growers of western Ontario. Some ten years ago, very little seed corn, and almost none of good quality, was produced in Canada. Since that time, very largely the influence of the Seed Growers' Association, the industry has developed so that now practically all of our seed corn is produced in that district. The result has been beneficial both to the growers and to the users of seed corn in Canada.

A word with regard to the objects and methods of the Canadian Seed Growers' Association may not be out of place. The movement was begun in 1904, as an outgrowth of the Macdonald-Robertson Seed Grain Competition. Membership is confined t o farmers who make the growing of see d a special branch of their farming operations, and who wish to have their seed registered in the records of the Association at Ottawa in order that they may reap a fuller reward for their labours should they have a quantity of such seed to sell.

The system of seed growing followed by the members is, briefly, as follows:

The member is advised as to the variety to use and is enabled to obtain through the Association enough registered seed to give him a start if it is thought advisable for him not to begin on his own seed which he already possesses. His work consists in keeping pure and in multiplying the sort under the inspection and direction of the Association. This is accomplished by giving each year a special "seed plot" from which is selected a sufficient quantity of typical plants to give enough seed to sow another plot the following year. This "hand-selected" seed is then threshed by hand, every precaution being taken to keep it pure. The remainder of the plot is harvested and threshed separately and used for sowing a special field the next year.

Seed which is grown and handled by members in accordance with the regulations of the Association may be registered in the records of the Association as "Registered Seed," and certificates for registration may be issued for such quantities as may be offered for sale.

Farmers who are interested should communicate with the Secretary, Canadian Seed Growers' Association, Canadian Building, Ottawa, or with B. T. Reed, Agricultural School, Woodstock, N. B.

Club Root of Turnips.

A Sackville, N. B. farmer writes:—I have a one-half acre plot of land on my farm on which all roots grown are usually badly affected with club-root. What does this land require to eliminate this trouble or can it be eradicated? The soil is very rich and gives abundant yields when occupied by other crops but turnips, cabbage and other roots are only masses of club-roots. Potatoes grown on it are fine and clean as can be.

Ans.—Club-rootof thet urnip, cabbage, cauliflower and related plants is a fungous disease which is also known under the name of Club-foot and Finger-and-Toe disease. As its name indicates this disease causes distinct and marked swellings or "clubs" at certain portions of the root system of the cabbage and related plants; when the attack is severe, the roots are apparently all united into one large swelling wholly distinct from the normal growth of the plant. The fungus causing the disease may remain active in the soil for several years, and the young plants are frequently very seriously attacked even before they are set in their permanent quarters. Affected plants appear weak and sickly, they grow slowly or not at all and are disinclined to form heads. Where land becomes seriously infested with Club-root, like the plot in question, it is best to discontinue for three years or more the growing of the crops on which it lives. This ordinarily is cheaper and quicker than to endeavor to destroy the pest by direct means. For instance, the disease may be lessened somewhat by thoroughly dressing the land with an air slaked lime, at the rate of 75 bushels per acre; but it is usually cheaper and always more effective, to cease the growing of turnips, cabbage, etc., for three or more years and grow other kinds of crops in the land and thus starve it out of the soil. All material which is capable of encouraging the growth of the fungus should be destroyed and the spread of the disease should be checked whenever opportunity offers.

Experimenters find that manure from cows fed on affected roots will, if applied to a clean plot of land, convey the disease germs so that it may become badly infested. Implements used in cultivating the plot in question might also convey the germs to plots formerly clean and subsequently cultivated with the same machines unless such machines were thoroughly cleaned before using.

In 1894, soil from a cabbage field which was seriously infected with club-root, was sown in the hills of a cabbage field at Cornell University. The soil was clay. The plants were ruined by the disease.

In 1895, cabbages and turnips were grown on the area. Five-sixths of the cabbages were ruined. About 10 per cent. of thet urnips were affected, but not seriously. In 1896 the area was fallow, with good tillage until late summer, when turnips were sown. Again the turnips showed a little disease. In 1897 and 1898 the area was occupied by general vegetable crops, other than cabbages, cauliflower and turnips. In 1899 cabbages and cauliflower were again grown on the area and they were free from the disease. The region from which the soil was imported still suffers from Club-root; but here it was starved out in two or three years.

While talking with one of the most observing farmers in this vicinity a few days ago we were informed that he had had some difficulty with Club-root. In fact he was obliged to discontinue turnip growing for a few seasons and grow corn instead for his cattle. He and several other gentlemen were accustomed to purchase their turnip seed together in bulk. Although the farmer in question was so seriously troubled with club-root the other farmers grew clean crops which goes to prove that the trouble was not caused by the seed sown.

We understand the New Brunswick Department of Agriculture is going to probe the Club-root question and issue information for the benefit of the farmers of the Province.

The Six-O'clock Man.

Did you ever notice that the man who sits on the fence for ten minutes waiting for the hands of his watch to get around to seven o'clock before he starts the day's work on the farm, and the man who would unhitch his horses at the far end of the field when the bell or whistle announced the hour of six p. m., are usually the poorest men in the field between the hours of seven and twelve and one and six? No man who is taking the interest he should in his farmer employer's work is so particular to a few minutes morning or evening. Do not think for one moment we are advocating long days. Not at all. As a general practice they are a detriment to progress; but at this season of the year conditions may arise which make it necessary for the best interests of the farmer and his men in getting the crop harvested to work a few days a little early or an hour late. Only a few such days may or should arise on a well managed farm. It is not often necessary to draw in longer than ten hours, and reaping is a short work on most Eastern farms, but it may be that a certain field is in fine condition to go in the barn, and in fact may all be harvested but a load or two at six o'clock. The wind may be blowing damp from the southeast with an overcast sky threatening a heavy rainfall. The six-o'clock-under-all-conditions man lays down his fork and quits. Unless other willing workers are plentiful the remaining two loads gets soaked, possibly partially spoiled. Here is where a good system which should show in some cases a little more elasticity is overstretched. On the other hand no one can blame men for not wanting to work from daylight until dark. Just be reasonable. Quit at six as a general rule, but do not object to an hour or two later if conditions demand it.—Farmers' Advocate.

Cattle with Cracked Heels

Farmer.—Keep the cows from wading through filth or grit. Cleanse the parts, then ' poultice for 3 nays with hot flax-seed meal and then cleanse again. Afterwards paint the sores freely once a day with balsam of Perd.

HORTICULTURE.

Parasites on Army Worms and Tent Caterpillars.

From many sections of the Maritime Provinces came reports this season of the ravages of the army worm. The worm was a so prevalent in many other setions of Canada. The following letter from Prof. L. Caesar, of the A. O. C., Guelph, is a recent issue of the Farmers' Advocate, will be of interest to our readers:—

"Seeing that none of us were thinking of thearmy worm last year, but had our intention centered on other insect pests, no denite data was acquired beforehand as to the cause of the present outbreak; so anything that I can say is solely conjecture, baed on what I know goes on in the case of such insects as the tent caterpillars.

"I may say in the first place that last Monday, when I was examining the army worms that were still feeding on the corn, I was surprised at the large number of parasites of various kinds that were attacking them. These consisted of Tachina flies Ichneumon flies. Braconid flies, and a disease either of a fungous or bacterial nature. I have not determined which. This disease is at present the least important control factor, though in moist lands, such as a swamp down at Whitby, which I visited, it had done considerable good.

"Of the insect parasites mentioned above the Tachina flies are evidently the most valuable, as they are also the most conspicuous. They are of the size and general appearance of the house-fly, but have a bristly abdomen. These are most persistent creatures, and will wait for an hour, as we could see, to lay their eggs on the neck or back of the caterpillar. Anyone who gets a chance should watch this interesting operation. The fly faces the side of the caterpillar, and sends its very long ovipositor right through between its legs and past its head until it reaches the back of the caterpillar and drops the egg in place. I counted several caterpillars with as many as 23 eggs on them, and on opening one side of one of these caterpillars counted 8 magots alive inside and feeding on its juices.

"The Ichneumons and Braconids are less conspicuous, the latter being very small, not more than half the size of a mosquito. There are apparently three species of Braconids and two of Ichneumons attacking the caterpillar. The Braconids increase very rapidly, and, as they have had plenty of material to feed upon, I have no doubt that there will be great numbers of them ready to attack the new brood of army worms which will begin to appear in September. The eggs of both Braconids and Ichneumons are laid inside the body of the caterpillars, and therefore are not visible.

"I think it is probable that the very dry weather last year and this has been the favoring cause in the increase of the army worms, because moisture appears to favor diseases. There is, in my mind, no doubt that for several years these insects have been gradually increasing in the low marshy lands. The moths can be seen in considerable numbers almost any year. About four years ago there were so many of them that I should not have been astonished if the outbreak had come sooner. I did not happen to be collecting any last year or the year before, so cannot say from actual experience how many there were, but as I said, I think there must have been very many.

"The parasites meantime were not numerous enough to control them in their native feedingplaces. This is the reason why tent caterpillars have been so bad for several years but from some study I have made of these I feel satisfied that in at least Eastern Ontario, where the study was made, the tent caterpillars have been almost destroyed by the parasites. Nine out of every ten examined were parasitized or diseased. There will be a few next year, but scarcely one the next is my prediction. So it is in the case of the army worm, but as there are two broods of this in a year the parasites are able to increase much more rapidly than on the tent caterpillars with only one brood. After the army worms nearly all perish, the parasites will perish too, or all but a very few of each."

The Largest Apple.

The largest and heaviest apple ever grown in the world, says an English paper, has been raised this season in England. t is a Gloria Mundi, and was produced by the same grower who a few seasons ago raised the famous gant apple of the same variety, which measured 26 inches in circumference and weighed 27 oz. Sent for sale in Covent Garden on October 19, 1909, it realized the astonishing price of £14 ($70) by public auction, breaking all previous record. The new record breaker weighs no les than 32½ oz. This wonderful apple was grown in an 11 in. flower pot, the tree producing six mammoth fruits at the same time. It was this very tree which bore the giant of 1909.

Inspector Vroom Making Collections of Nova Scotia Fruit Forgrimsby Conference.

"Come for an auto ride to Berwick." With this invitation on Wednesday morning from Capt. G. H. Vroom it was not difficult to leave our office for a few hours. G. F. Freeman and Prof. Raymond Barss were fellow passengers.

With perfect weather, charming scenery, a fine car skilfully handled and agreeable company what more enjoyable than a morning trip in the Annapolis Valley.

From Middleton to Aylesford the road is very bad being sandy. From Aylesford to Berwick the roadway is fine but the bridges poor. With good bridges this would be an elegant stretch of roadway.

The fruit crop appears light on the Post road from Middleton to within a couple of miles of .erwick. But at Berwick the crop is heavy.

Arrived at the orchard of S. B. Chute the object of Inspector Vroom's trip becomes apparent, Insp. Alcorn is already on hand and they together proceeded to select a couple of barrels of the best fruit in Mr. Chute's big plantation and Mr. Vroom evidently knew where to find the good fruit for Mr. Chute has a fine crop of clean apples.

The varieties chosen were the early Williams, Duchess, Crimson Beauty and Astrachan. Insp. Vroom explained that he purposed taking these apples to the Dominion Fruit Conference to be held at Grimsby, Ont. Sept. 2nd, 3rd and 4th.

This conference will be made up perhaps of fifty representatives from all parts of Canada four of them being from Nova Scotia. The Hon. Martin Burrill who called the conference desired a collection of apples from each fruit district of Canada.

Mr. Vroom is also taking a couple of Nova Scotia barrels, a few apple boxes and the various sizes in plum and berry boxes all of standard make. The adoption of uniform standard packages for the fruit of Canada is one of the subjects the Minister of Agriculture wishes considered at the Grimsby conference.—Middleton Outlook.

The Potato Trade in Cuba.

Mr. Ralph N. Clark left on Monday last for Havana, Cuba. His mission is a part of the forward movement of the United Fruit Companies of Nova Scotia and is designed to advance the success of our great co-operative movement.

For nearly fifty years, or ever since the Reciprocity Treaty was denounced in 1866, the West Indies have been the chief market for Nova Scotian potatoes Fortunes have been made out of that potato trade, but, like the fortunes made out of the apple shipping business under the old regime—before the days of co-operation—the producer has not benefited.—Potatoes have been purchased in the Valley at a price agreed upon by those who had the monopoly of the trade and sold at a price which was "all the market would bear," but of the size of that price, or the profit involved, the producer knew nothing. In the words of the politician, "It is time for a change," and to effect the change the United Fruit Companies have decided to place a representative in the West Indian field.

Mr. Clark has no easy task before him, but he goes with the full support and confidence of the Co-operative organizations of Nova Scotia and in a positon to guarantee to purchasers the good quality and proper handling of the goods he offers. As in the export apple trade, time will doubtless be required to effect the desired changes in [illegible] of marketing potatoes in the West Indies but those changes are bound to come and when they come the farmers of the valley will be able to realize more fully the advantages of producing more and better potatoes.—The Register.

Running up and down stairs, sweeping and bending over making beds will not make a woman healthy or beautiful. She must get out of doors walk a mile or two every day and take Chamberlain's Tablets to improve her digestion and regulate her bowels. For sale by all dealers.

In the fore going tables there is much food for thought. Compare the records of the various individuals in the herds and see to it that you so keep records of your herds in order that you may by a system of selection, feeding and breeding build up a herd to a high standard of profit producing efficiency.

Milk record forms and feed record forms may be obtained free of cost by applying to the Dairy Commissioner, Ottawa.

Anent this subject of record keeping under the caption of "The Hole in the Bottom" the following coliloquy appeared in a recent issue of Hoard's Dairyman.

"How much does it cost you to produce a quart of milk?"

"Oh! I don't know. More than I get for it."

"How do you know that?"

"Feed and everything is so high and cows cost so much. We don't get enough for our milk."

"Would you mind letting me look over your books?"

"Your record books where you keep track of the cost of feed and labor and the amount of milk produced by each cow, your crop records and other records you may have."

"Oh! We haven't time to fool with such things. We have to work to make a living on this farm. If our milk checks come to more than enough to pay our feed bills and our hired man we are ahead of the game. If they come to less we are running behind. That's all the books we need."

"But how can you tell where your loss is if you don't keep records of your work. How do you know but that you might make money if you could locate the loss?"

"Look here, mister, you may be a shark with figgers but I can tell you we used to make money with these same old cows. When we could get a hired man for $18 or $20 a month and feed cost us about $20 a ton the farmers around here made money, but now we have to pay $35 for a man and feed is about $35 a ton. Cows cost us a hundred dollars now that used to cost $65. We only get a little more for our milk now than we used to get. If we can't reduce the price of labor, feed and cows, we will have to get more for our milk, that's all there is to it and it don't take no bookkeeping to find that out."

The argument at firstt glance looked good and we backed off. Later when we had a place where we could do a little figurng we tried to find the hole in it. We didn't believe he was right and yet the more we figured the harder it seemed to disprove his statement. Going back to his original statement of profit we started agin. "If the milk check comes to more than enough to pay our feed bills and our hired man we are ahead of the game." In other words, if the milk would pay for the purchased feed and the hired man, what was left over would be the pay for the feed grown on the farm and the time of the farmer and his family.

It seemed that there must be some factors left out in this man's calculations. He had been in the dairy business for a good many years. He once made money but was now losing money. We know of dairymen who are making money today, and this fact did not accord with this man's conclusions. The next day we went back to see him again.

"You claim that you cannot make anything under present conditions. How do you account for Mr. Blank's success over in the next town?"

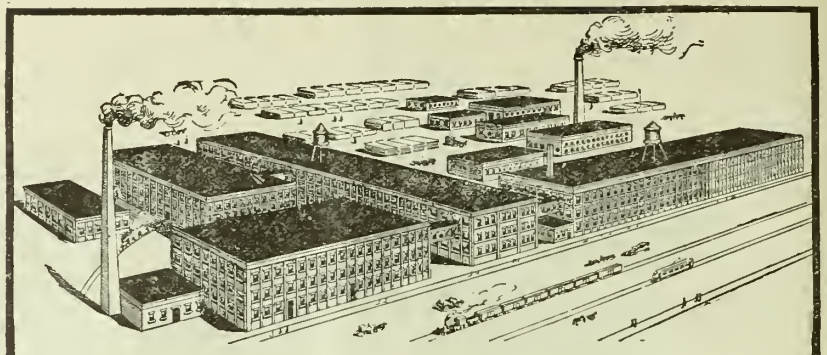
"What do you mean, books? What books?"

"He gets 20 cents a hundred more for milk than I do. He has a special price that our company will not pay."

"If you got 20 cents more how would you come out?"

"Let me see, I sold 9,000 lbs. of milk last month from my 20 cows; 20 cents more would make $18. That would have just paid the amount I was short and $2.50 more. I wouldn't get rich at that rate very fast, would I? I'll tell you I don't believe that. Blank isn't getting rich out of the milk business. It must be something else."

"Supposing we go over and see him and hear what he has to say about it."



Ordered Where the Best is Wanted

When the officials of a Company are arranging for the erection of a new plant, and want the best material regardless of expense, *Brantford Roofing* is specified oftener than any other ready roofing made.

This great plant of The McLaughlin Carriage Co., Limited, Oshawa, Ont., was roofed entirely with *Brantford Roofing.* The Company, having in mind what a heavy investment their new plant represented, wanted a roof that would be fireproof first of all; but also proof against frost, rain, heat, chemical fumes and other unfavorable conditions. They chose

Brantford Roofing

in preference to all others, because it met their demands on every point mentioned. Furthermore, it has a reputation for durability that common roofings cannot earn.

When you roof—whether it's a shed or barn or a great industrial establishment, follow the lead of Canada's foremost business men and have it done with *Brantford Roofing.* It costs no more! To-day—write for free book on roofing and samples.

Our new patented appliance for laying Brantford Roofing is worth investigating. Positively prevents buckling or expansion.

MONEY IN POTATOES

Don't lose any any of it by wasting it for expensive hand labor to harvest your crops.

O.K. CANADIAN POTATO DIGGER

will save its cost in no time by its saving of labor. The purchase of such a machine is one of the best investments the farmer can make. It will repay him dividends of larger profits for years.

The O.K. Canadian Potato Digger is exceedingly simple in construction and operation. It is designed to avoid undue strain on any one part and built throughout of steel and malleable iron. It digs *all* the potatoes without damaging them and lays them in a row ready to be gathered.

Investigate the O.K. Canadian Digger and you will see that you cannot afford to be without it. 26

"All right."

On the way over my farmer friend didn't have much to say, that 20 cents a hundred had been a disappointment to him for it did not show any quick way to wealth. As we drove into the yard Mr. Blank came out of his office and greeted us "Good morning, gentlemen," and to my friend, "I hear you fellows are going to organize to boost the price of milk over in your neighborhood. How about it?"

"Well there is some talk of it. I was in for it, but I don't know. some way it don't seem to reach the right spot. We came over to see you and to find out how it is you seem to be so prosperous. I can't see how 20 cents a hundred makes the difference."

"How many cows are you milking?"

"Twenty."

"How much milk did you sell last month?"

"Nine thousand pounds."

"What did you get a hundred?"

"Dollar fifteen."

"How much feed did you have to buy?"

"Ninety-four dollars."

"And you paid $35 for a hired man?"

"Yes."

"Your milk came to $103.50. You were short about $15.50 for the month?"

"Yes."

"Come into the office, I want to show you something. I am milking 60 cows at present on a farm just the same size as yours and my feed bill at the store for the 60 don't cost as much as your 20. I have here an itemzed statement of the cost of producing 100 lbs. of milk from my herd. Inorder to make it easy to compare with yours I will give you the figures on 20 cows. These twenty produced 16,000 lbs. of milk where yours produced 9,000 lbs. The milk sold for $1.35 per hundred bringing $216.00 where yours brought $103.-50. My feed bill at the store was $30; yours was $94.00. I notice that you figure on the hired man's time, on the principal, no doubt, that your chief increase is from milk and the hired man's work is indirectly all for the benefit of the herd. In order to make our comparison fair I will put in one hired man at $40.00. This makes the charges for feed purchased and labor, $70.00; yours is 129.0. Ihave a profit of $146.00 and you have a loss of $15.50. My farm of 200 acres produced a profit when figured on this basis of $438 for the month, yours showed a loss of $15.-50 for the same sized farm."

"How do you cut your feed bill down so much?"

"I grow alfalfa, corn silage, corn and barley, and have to buy very little feed. If I couldn't grow alfalfa I would grow cowpeas, soy beans, vetch, sweet clover, red clover, or some legume. I wouldn't think of running a dairy unless I could grow a legume successfully. Silage is one of the best feeds to go with legumes. With alfalfa and silage you need very little grain."

"You say you got an average of 16,-00 lbs., or 26 lbs. of milk per day per ow? How in the world do you do this?"

"I raise my heifers from selected cows and use only the best bull I can find. It took me a little while to get the average up to this point but now it is easy to maintain. The profits in dairying come from the inside, not from the outside. You fellows over there can win some dollars to be sure, in boosting the price but your chance to make money is to breed and feed better. It is a fact that I am making dollars where you are making dimes and it can't be acounted for in the difference in price."

My friend was again silent as we rode back to his place, but when we reached the gate, he said, "We have been a lot of muddle headed fools. I am going to get into this thing right. I am much obliged to you for taking me over to Mr. Blank's. It has taught me a leson. Watch my dairy farm grow."

The hole in his first argument showed up big enough now. The trouble with a lot of fellows is that they are still farming as they did 25 or 30 years ago. Conditions have changed and they have stood still. The old methods don't work now. When milk was the product of summer pasture, little or no grain was fed; labor was cheap and there was some profit in the business apparently, no matter what kind of cows were kept. Today the same farmer is buying grain, feeding and milking in winter, and the same old cows turn a loss instead of a profit. The hole is big enough and the profits all run through. There are a lot of dairy farmers who need to plug this hole up before they will see a profit again.

Milking and the Milker.

There is a great difference in the effect that a change of milkers will have upon different cows. Some cows will allow themselves to be milked by almost anyone who approaches them, but no cow will milk equally well with all persons. Some cows will dislike, or fear, or kick with three out of five persons who try to milk them. They will often refuse to yield their milk to any other than the milker to whom they are accustomed. Owners of dairies cannot afford to overlook the preference that cows have for certain milkers. It is a preference that is based on nerves, and neither the cow nor the milker can control it. The cow in perfect accord with the attendant will show her feelings by her actions. When one whom she does not like approaches her she shows her dislike by standing perfectly still, or by turning her head away, or by moving away. The dairyman should discover the likes and dislikes of his cows as early in their careers as possible. The milk and butter-fat they will produce will depend largely upon the milkers he provides to draw their milk. The point is that the cow is a highly sensitive and nervous machine. She can do her best work only when her nerves are in their normal condition. The milker whose presence, touch or voice throws her into a state of fear or excitement will never be able to produce milk in the largest quantity or of the best quality.

The Massey-Harris Separator Gives Satisfaction

Satisfaction follows the use of this Separator

These are the Reasons Why

It saves more of the cream at all temperatures than any others.

It is easy to fill—easy to turn—easy to clean.

It is built to last.

It is a neat, symmetrical, nicely finished machine—one you will take pride in having and using.

LIVE STOCK.

Smaller Herds, Better Cattle.
(Western Experience)

Let's have less trust busting and more regulation based on the actual production cost.

We may say with certainty that the day of the old-style range and ranch is past. That beef-production must be carried on in small inclosures, approximating more and more to general eastern farm conditions. The element of cheap land for grazing is steadily decreasing as an important factor. If land in the semi-arid states is at $15.50 per acre and it takes twenty acres to graze one cow per year, the land upon which that cow must pay interest is to be booked at $300.00 and as the interest rates in those short-grass districts are high the interest cost of the grazing land will aproximate at least $25.00 per annum. (Between legal interest and side premiums anywhere between eight and fifteen per cent. actual cost. We are giving an inside minimum. It wil be some time before the short-grass country will more than hay feed in winter and it will cost two tons of hay or other fodder to economically winter a cow and the cost of that hay will seldom be less than five dollars per ton. Wherever the cost, in favored or distant-from-market places is a dollar less per ton, or four dollars as is true of a limited number of places that may be pointed out, ten places where it will be from one to five dollars per ton higher can be pointed to with readiness. To these basic charges must be added the interest on the cost of the cow, and personal taxes, labor, salt, etc., to say nothing of the cost of improvements.

The production of beef on the old ranch and range plains cut up into grazing farms cannot by any process of fair bookkeeping be less than as follows:

Interest on cow per land per annum	$25.00
Two tons of hay per cow per annum	10.00
Interest on cow's value ($75), per annum	7.00
Labor and salt, say, per annum	5.00
Actual cost of calf weighing 400 lbs	$47.00
or $11.75 per cwt	

Nothing for the loss of a per cent. of the calf crop, by abortion, by failure to get promptly in calf, or by the death of the cow. In olden times a large per cent. of the cows, left to shift for themselves without shelter or feed, died, and that was costly. But with the old times big herd feed and shelter was an impossibility. Likewise, 400 lb. calves were an impossibility, on the average, less than ten per cent. of the crop approximated this. But under the smaller-herd-and-better-cattle conditions possibly today this weight of calves for fall delivery can be increased from 100 to 200 lbs. per calf but that entails additional care and feed. For the cow must be bred to calve in shelter in February or March and summer crops produced, to which the calf has access and the cow excluded. Two quarts of corn per day, (or its equivalent in kaffir, cotton cake or the like) for 166 days will take ten bushels of the golden grain worth, delivered on the ranch, at least 75 cents per bushel.

Counting then that the cow regularly produces a calf in March and that she was well cared for with feed and shelter till grass would support her flow of milk, and then the calf had an intelligent herasman, (for economy preferably the proprietor) who placed regularly its grain allowance, we will find:

Keep of cow as per above tabulation	$47.00
Grain for the calf 10 bu. @ 75c.	7.50
Additional labor	2.50
Actual cost of calf weighing 600 lbs.	$57.00
or $9.05 per cwt.	

With a good grade of Hereford cows and a good Hereford bull these weights and grains are within the reach of any careful cattleman. But as a matter of fact that calf will go some. Counting it to have weighed 100 lbs. at birth, it must from its birth say, March first, gain approximately 2½ lbs. per day to weigh its 600 on October 1st. If he were weaned and well fed and cared for his November and even December keep would be costlier but the feeder might play even. At 600 lbs. no beef the equal of this Hereford ever entered the mouth of man. To ship this calf long distances to market and again after fasts and to the finishing barns of another feeder incurs a heavy shrinkage and although the increased weight that might result would add to the quantity at some expense of quality, if the original breeder got cost, the subsequent feeder's probable profit or loss would be purely speculative.

With the 600-lb. perfect young beef, journeys on foot should be limited to the very shortest possible. Its traveling should be on the hooks in refrigerator cars, not that it needs refrigeration or ripening, for it will be ripe as soon as it is free from animal heat. But that its perfection may be retained. A piece of the neck of this carcass is better than the tenderloin of mature beef of the dairy interests. There will be insignificant waste.

Now the producer of this perfect human food is entitled to a profit and a dollar a hundred is little enough. Six dollars per cow. True, he has had, according to our table, interest on all investment and payment for labor. But nothing for insurance, upkeep, or various other expenses that are inseparable from his plant and business. If he can make somthing by producing a part of all his manufacturing needs, well and good. We have not forgotten the manure. It is as silly to compel him to take this for his profit as it would be to force the storekeeper to make his profit from the pins in the sweepings added to the waste paper, old packing boxes, etc. These have a value but they are perquisites.

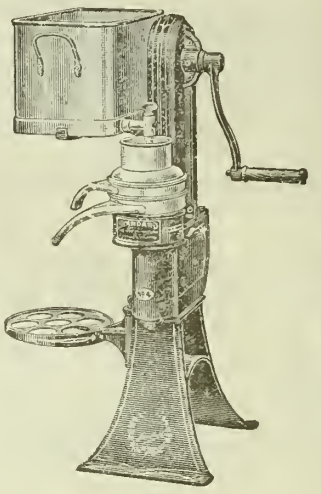
With first-class packing plants at most central cities capable of utilization of this wasteless beef and to accept them as a sufficient profit for slaughtering, there is diminishing need for long journeys of beef on the hoof and with a much needed fraternity between the producer and the packer, the future of early ripened meats is the one great boon that beckons the best gray-matter farmyard. It is the packers place to encourage the production of this wasteless beef and to solve the method of its uniform distribution throughout the entire year. It is the governments place to see that the packer and the producer interests are carefully guarded along cost of production, and preservation routes, that the consumer be righteously treated and yet taught to understand that he has no rights to a product, no matter what it cost him, that has been produced or handled at a loss somewhere along the line it took to reach him. A producer, somewhere between the calving and the slaughtering,has hitherto suffered an actual loss in beef production. Where profits to one element have occurred they were offset by other been only fits and starts, booms and boomerangs. The meat maker's hope is in the settled conditions that a population of over 100 millions overtaking and passing production of steadily decreasing herds and flocks, and of the stationary agricultural acreage.

The past has been one in which a surplus of meats requiring export encouraged speculation. The future looks exceedingly bright for fair trade with profits that will encourage production. We will not only see two blades of grass grow where one grew before, but the growth of grass will support fourfold the meat-making animals that the hap-hazard ways of the past have permitted. While world-readers are studying the soundness of the figures submitted above the writer hopes they will adapt them to the con-

My! How Easy It Runs!

THAT'S the sort of exclamations we hear from people who turn the 1915 Model Standard for the first time. It runs so easily that it seems as if a hidden motor must be doing most of the turning. That a cream separator should run so remarkably easy is considered to be a wonderful thing. But it is only one of the new features of the 1915 Model

Standard



Cream Separator. There is the interchangeable capacity feature, too. The one frame of the 1915 Model Standard accommodates all sizes of bowls, the frame and gearing being sufficiently heavy to drive our largest capacity bowl. Think of the wide margin of extra strength and durability this means for the smaller bowls.

If after buying the 1915 Model Standard you should increase your herd you will not need to buy an entirely new machine of larger size. Just get a larger size bowl and fittings. An allowance will be made for the used bowl and fittings. This is the most important improvement in cream separator construction in years, and it is fully covered by our latest patents.

The other new features are explained fully in the new edition of our catalog, just off the press. The results of the tests of the Standard at Government Dairy Schools and Creameries are also shown.

ditions that obtain upon the higher priced lands of the rain belt. In a later Hereford edition of the Live Stock World the writer hopes to present some suggestions as to the cost of profect beef in Cornland—T. F. B. Sotham in Live Stock World.

Stomach Worms in Sheep.

August and September are the months when stomach worms do most damage to sheep and lambs. and the time when flockmasters should be continually on the lookout for these animal parasites.

Frank Kleinheinz of the Agricultural Experiment Station, University of Wisconsin, has found that lambs are the greatest suffers from stomach worms. Occasionally, however, older sheep will also be attacked by the deadly little pests.

The presence of worms in a sheep is shown by thinness of flesh. a dull look, a tendency to drag behind the rest of the flock, harsh, dry wool, and the eating of an unusual amount of dirt. When any of these symptoms are noticed, the flockmaster should catch the animal and turn back one of the eyelids. If the inside of the lid is very pale or colorless, it is an almost sure sign that worms are sucking out the life blood of the sheep or lamb, and unless treated immediately the animal can live but a short time.

This treatment for stomach worms is recommended by Mr. Kleinheinz: Take the affected animal away form the flock in the evening and keep it over night where it can get neither food nor water. In the morning, give it a drench made up of five to six ounces of cow's milk, one tablespoonful of gasoline for a lamb or one and one-half tablespoonfuls for am ature sheep, and one tablespoonful of raw linseed oil. Shake this mixture thoroughly and give it to the lamb from a long, narrow necked bottle (a pint catsup bottle is very satisfactory.)

This treatment must be repeated for three successive mornings, when the lamb should be cured. After its drench in the morning, the animal may be turned out on pasture with the rest of the flock during the day.

Lice on Live Stock.

Farm animals, especially those housed in stables more or less infested with insects and vermin, are commonly troubled with lice. Animals in good health resist the insects, but those already in a non-thrifty condition do not fare so well. Lice cause a good deal of annoyance to farm stock, inasmuch as they bite the skin, suck the blood, and thus cause considerable irritation. Lice can be seen with the naked eye. Infestation, as a rule, takes place in filthy quarters, and the best means of disinfecting such places is by the use of a spray or kerosene. One of the best means of applying this to hogs consists in rubbing posts, which are constanty smeared with kerosene. In this way the hogs are induced to treat themseles. Infested hogs may also be treated by pouring kerosene directly over the infested parts, like the neck, shoulder and back. Dipping tanks, made of cement or wood, are frequently located in the run yards in which is placed some disinfectant fluid. Hogs use these small tanks as wallows, and in this way they disinfect themseles.

For horses and cattle a good remedy is made as follows: Boil for an hour 8 tablespoonfuls of arsenic, 8 tablespoonfuls of soft soap in two gallons of water. After being prepared by boiling, add enough water to make two gallons. When cool, wet the animal all over with a little of it, using a brush or curry comb to get it into the skin. Another good remedy is made of boiling staves-acre seeds, 1 part to 20 parts of water, for an hour, and let it simmer for another hour; then add water to make it up to the original bulk. This applied to the affected parts brings quick relief. It is advisable to repeat the application in a week or ten days, so as to catch any new lice from any eggs that were not caught by the first application. A very common treatment is secured by mixing a pint of linseed oil, 8 tablespoonfuls of oil of tar, and 8 tablespoonfuls of sulphur. This is then rubbed on the affected parts once a day for two days and allowed to remain for a few days, after which it is washed off with soap and water. In serious cases the application should be repeated within a week or so.—Exchange.

The One Perfect Flour!

WHOLESOME — NUTRITIOUS — PURE — CLEAN

Strictly Highest Grade!

After once using Regal Flour you will agree it has unusual quality and merit as well as purity and wholesomeness so much desired. Try it and be convinced.

There is no time like the present to try Regal Flour. Your success with your baking will be a delight to every member of your family. It never disappoints.

THE HORSE.

Curb and Curby Hocks.

Briefly, curb is an unsoundness and common cause of lameness arising out of injury to certain ligamentous structures connected with the movement of the hock joint. The exact structure involved is a matter on which difference of opinion exists. It is really very difficult to decide, but what is of most importance to the horseman is the appearances presented externally, and the means of recognising the existence of a curb. Curb is a proturberance some 4 in. below the point of the hock on its posterior aspect, a slight convexity rising from the back of the bone, and it is best detected by looking at the joint in profile—that is, by standing exactly at right angles to the line of the back of the leg, when any marked deviation from the perpendicular is apparent. Standing behind the animal the deviation from the straight line may escape notice, while if a stand is taken further to the front prominence of one of the bones may be mistaken for curb.

Valuations.

Curbs vary a good deal in size, and also in the degree of hardness of the swelling. Hardness is generally an indication of the length of standing of the case. In recent cases there is usually heat and tenderness to touch, with more or less lameness, and a tendency to knuckle forward at the fetlock. Unless the hock is "sprung" there is rarely any severe or continued lameness in mature horses, but curb in young animals is often a most tedious business, and prevents them being put to work for a long time after they are expected to be earning their living. Unbroken colts will often "spring a curb" as a result of galloping or jumping when at pasture. The conformation of the hock joint largely governs the liability to curb. Over-bent or sickle-shaped hocks, small hocks, and those with long calces are most liable. There are "curby" hocks that are congenital. They cannot, of course, be looked upon as disease, but they undoubtedly constitute a deformity conferring a liability of disease.

"Unsoundness" for Breeding Purposes.

By many authorities curb is included among hereditary unsoundness, but this means that there is an inherited tendency for injury to result, when strain is placed on the part, that would be less apparent in an animal with clean, straight, thin hocks, and not that curbs are necessarily congenital. Horses are, of course, often foaled with the defective hocks of their progenitors; and, therefore, animals that present the defective shape of hock-joint which judges of horses recognize as "curby" should not be used for breeding purposes.

Treatment.

The treatment of curb necessarily varies with the individual case, and the age of the animal and the duration of the lameness are points of importance in deciding what measures to adopt. An aged animal to which antiphologistic treatment is applied may be fit for work in two or three weeks after having "sprung a curb,'- while a young one may be lame and defy all sorts of treatment for a year, especially if when it seems a little better it is rushed into work. Even when there is no lameness it is not advisable to work a young horse. Rest is most essential, and Nature must be given time to strengthen the structures which the occurrence of a sprain like curb have shown to be unequal to what has been required of them. In recent cases rest, and a high-heeled shoe to relieve the strain on the parts involved, and throw them more completely into a state of rest, are the first indications. We have known aged horses, treated for a day or two by cold-water irrigation or the application of a cooling lotion and then painted once in two days with a dressing of 10 grains of perchloride of mercury dissolved in 1 oz. fluid of rectified spirit, to be at work again in three weeks, apparently little the worse for the accident. On the other hand, we have known colts that derived no benefit at all from exactly the same treatment, or for the matter of that, from any other, including blistering and firing, until time had resulted in consolidation and repair. For the removal of the thickening, iodine is useful, and the ointment is, perhaps, the best form in which to apply it. A small piece should be rubbed into the curb twice a week, stopping the treatment when the skin becomes scurfy and tender, and resuming it agin when the part has hardened. Iodine is slow in its action, and it is idle to expect immediate results from its employment, or that a few applications will remove all evidence of a curb at once. The perchloride of mercury should be used in the same way as the iodine—that is, the hair should be closely clipped from over the enlargement, and the dressing confined to it alone. The object is not to blister, but to excite absorption. Too frequent stimulation may cause sloughing of the skin, destruction of the hair follicles, and a permanent blemish. When lameness persists, and blistering is determined upon, a combined ointment of cantharides and biniodide of mercury is recommended. One drachm of biniodide of mercury and half a drachm of powdered cantharides to 1 oz. of lard is a useful strength The usual precautions should be taken to prevent the animal interfering with the blisterd surface.

Firing.

If firing is resorted to, owing to persistent lameness, the thermo-cautery gives the best results, and leaves the least blemish. Sometimes both hocks are fired when only one has a curb. This is commonly done to deceive a possible purchaser at any time the horse may come into the market. At one time it was quite a common thing to fire the hocks of young horses to strengthen them and prevent curb and spavin. The idea that the burning of the skin where the iron was drawn through caused the integument to shrink and form a natural bandage or elastic stocking seems to have been at bottom of the practice. The notion is exploded now, but in some parts of the country, and notably in Ireland, this firing to strengthen the hocks is still resorted to. Thus the marks of the cautery do not necessarily indicate existing or previous unsoundness, especially in horses of the hunter class, hocks should always be viewed with suspicion, and carefully examined as to their shape and action. Everyone condemns firing to strengthen hocks that may never become the seat of disease as cruel and unnecessary; but the firing of both hocks when only one is diseased, the object being to make them both alike and to deceive the unwary, is worse. Some little judgment is needed in buying a horse with a curb. Hard, cool curbs, being merely the remains of previous disease, may not prove detrimental to the animal's working powers, but careful attention should always be paid to the shape of the hocks and their action. Sometimes horses are capable of light work in special shoes when they would be lame from curb or ordinary shoes. Raising the heels to the extent of 1½ in. will often cause a lame animal to do fairly well. Galloping and jumping are, of course, likely to cause curb, and the repair should be quite complete before any such strain is placed on the joint as these exercises entail.—Veteran.

Some Diseases of the Nervous System.

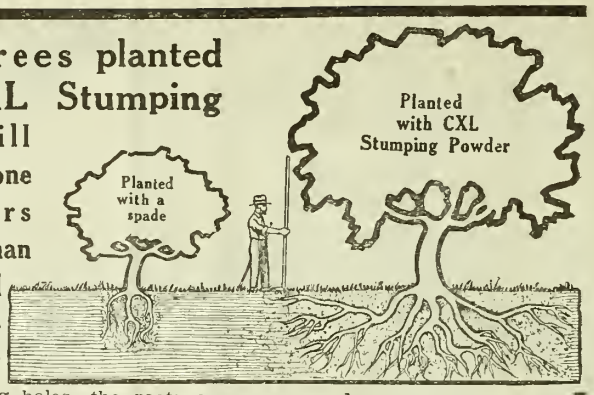
Paralysis in the horse, in the great majority of cases, arises not in the brain, but in some portions of the spinal cord. For example, when a horse hurts its back by an accident, the spinal cord is not infrequently so damaged as to be divided in halves, and then paralysis and insensibility follow. Whenever paralysis results from an injury or disease, it shows itself posterior to the lesion. For instance, if in the lumbar region the hind legs are paralysed; if high up in the neck, as in pithing, death results immediately from paralysis of the muscles of inspiration, diaphragm, etc.

Hemiplegia, when only half of the body longitudinally is paralysed, is rather a rare disease in domestic animals. The symptoms are distinct and obvious, usually occurring suddenly. The most manifest is the want of command over the limbs of the side, which remain immovable. At the same time the limbs are perfectly flexible to external impulse, to which they offer no resistance. Hemiplegia is always due to disease of the brain, and, remember, in whichever side of the brain the cause exists, paralysis always occurs on the opposite side.

In the case of a valuable animal, perhaps one might place it under good nursing, which would include, possibly, slinging, etc., in the hope that the cause is ephemeral—e. g., rupture of a blood vessel, bursting of an abscess, etc., but in most cases it is quite hopeless.

Paraplegia—i. e., when one-half of the body is paralysed transversely—usually arises from injury to the spinal cord, and comes on suddenly. This is the most common form. It usually af-

Fruit trees planted with CXL Stumping Powder will yield from one to two years earlier than those planted in the old-fashioned way



In spade dug holes, the roots are compressed within narrow limits by the hard-packed soil.

CXL Stumping Powder shatters and loosens the earth for yards around; thus the roots can reach out easily for nourishment, the soil will absorb moisture more quickly and retain it for a longer time.

Besides—the planting is done in less time and with less labor. There's a CXL Explosive for every blasting purpose.

When You Suffer From Your Back

YOUR KIDNEYS MUST BE WRONG

Many women work day after day with an excruciating pain in the back, and really do not know that the kidneys are the source of this pain. When the back starts to ache you may be sure that the kidneys are not working properly, and the only way possible to make a complete cure is to take "time by the forelock" and get rid of all these aches and pains by using that old and thoroughly tried remedy

DOAN'S KIDNEY PILLS

Mrs. John Power, Peake Station, P.E.I., writes:—"I suffered from backache for three years, and I tried all kinds of medicine but got no relief. I was so bad at times I would not be able to walk. A friend told me to try your Doan's Kidney Pills, so I got five boxes, and before I had three boxes used I was nearly well. I used the other two, and I can say your Doan's Kidney Pills cured me. Had it not been for them I would be suffering yet."

Doan's Kidney Pills are 50 cents per box or 3 for $1.25 at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct specify "Doan's."

fects the hind limbs, the animal being unable to rise. The loss of power and sensation is sometimes apparent at once. These cases are incurable. Paralysis may occur to old animals from hardship, cold damp. Cows suffer from partial paralysis during the later days of gestation. This disappears after calving. It is seen, also, in parturient apoplexy. Reflex paraplegia may arise from blood poisoning, as for instance, in azoturia, or from eating poisonous seeds or grasses, such as darnel, flax, ryegrass, vetches ergotised seeds, etc., or from lead or its salts; constipation, or from uterine irritation during the period of oestrum; or, in the dog, from indulgence in rich food and insufficient exercise, presence of worms, teething. In considering the number of causes one is often unable hastily to advance an opinion about treatment or its results. All cases of reflex palsy are hopeful. The first object is to find out the eccentric cause, and effect its removal if possible; for this purpose purgatives are usually employed—aloes or linseed oil in the horse, Epsom salts or other salines in the cow; belladonna or aconite if inflammatory trouble is suspected; fomentations with hot water to the loins; a light, sloppy diet, good nursing, the use of patient to massage, warmth to extremities by bandages, and later on, if persistent, a course of iodide of potassium. In the above cases it is probably due to the action of the sympathic or vaso-motor nerves narrowing the calibre of the blood-vessels supplying the spinal cord with nourishment.

Various Forms.

Spinitis (the affix "itis" is always employed to signify inflammation) may be acute or chronic, and is due to inflammation of the substance of the cord, or its membranes, and shows itself in paralysis if acute fever is present; but this is not easy to differentiate from the relax form.

The chronic form is, in its early stages, very difficu[illegible] recognie. The animal turns with apparent pain, and it may easily be confounded with rheumatism. Later on, as the disease advances, there is knuckling over at the fetlocks, a fear of lying down, and a difficulty of rising. These cases gradually get worse, and death ensues from the disease if not mercifully hastened by the poleaxe.

Slight Paralysis.

Paresis is the name given to a slight incomplete paralysis affecting motion, but not sensation. This form occurs as dropped lips; one or both hang flaccid and powerless And as the horse depends upon his lips largely to gather his food (unlike the ruminants who depend more upon their tongues), he has great difficulty in feeding and drinking. This is due to injury to one or both of one pair of cranial nerves. Here treatment is generally successful, although patience may be required. Feed with sloppy food out of a pail, remove all pressure from the head stall, etc., apply friction along cheek, stimulants to sides of head and later on perhaps mild blistering. Paresis occurs also in the tongue, sometimes caused by brain disease, sometimes by injury to the member itself in giving medicines or even by malicious intent. In this case first return tongue to its place between the teeth, and plug a bandage around the muzzle loosely, but sufficient to keep in place. The animal's strength must be maintained with eggs and milk.

In finishing, let me point out a pitfall that even a veterinary surgeon with much experience amongst hunters and racehorses may fall into—that is, a sprain of the psoœ muscles, the name given to the two inside muscles of the loins. This sprain much resembles paralysis or broken back, and many horses have been unnecessarily destroyed when treatment and patience would have permanently cured them

The action of these muscles is to draw the body from the last ribs to th thigh, and when from injury or severe [illegible] on these muscular fibres are broken or stretched, and they are unable to contract, you have "roached back." But not the difference between spinal trouble and muscular injury. Although the animal has a difficulty in getting up when down, it can still flex or extend its limbs, showing that motor and sentient power are still intact. In this case slinging—if the animal can or will stand in them—is indicated, otherwise lying down in a loose box with plenty of short straw; blistering, patience, good nursing, and „ later on, a run at grass will complete the cure.

General Treatment.

In all cases a good aperient dose of linseed oil of Epsom salts should be given, followed up by ½ oz. doses three times daily of bromide of potash, to which in a few days 30 grains of iodide of potash should be added. After about a fortnight of treatment as above nerve tonics should be tried, and ½-oz. doses of tincture nux vomica given twice or three times daily, to which, later on, 1-oz. doses of Parrish's food may be added.—Southern vet.

POULTRY

Mineral Elements in Poultry Feeding.

The majority of people who raise chickens have the idea that grit and oyster or cam shell is necessary, and most of them believe that the oyster or clam shell supplies lime, from which the hen makes the egg shell. True, the egg shell is largely composed of calcium compounds, but there are other mineral compounds found in all parts of the body and hence, we appreciate the need of fowls for mineral elements.

Notwithstanding the last fact, but little attention has been given to the matter, beyond providing a sufficient quantity of mineral matter, regardless of its composition.

The supply of mineral elements, however, is very important and it has a very direct bearing upon the growth and development of the chick. Food builds and maintains the structure of the body, and defincies in the amount and kinds of nutrient available may affect, not only the size, but also the character of the growth of birds. The animal body is constructed from fourteen elements contained in foods, but all foods do not contain the fourteen elements in amounts sufficient to sustain growth. Many foods, such as the grains, do not contain nearly enough of the mineral elements; wheat bran and linseed meal, on the other hand, are rich in mineral elements. The mineral substances entering into the composition of animals constitute the ash and the importance of the mineral salts in the vital processes of the animal cell lies almost entirely in their physical properties. These substances must be in solution and when we consider that the mineral elements in the body are most of them strongly acid or basic, we know that their compounds have a tendency to become exceedingly actively active when in dilute solution. Thus through their peculiar attributes the mineral elements maintain a very important relation to practically all the vital processes and they enter into the composition of every tissue and fluid of the body.

Calcium, phosphorus, sulphur and iron are used in the formation of the essential structures in the body. Iron also, through its affinity for oxygen, becomes a carrier of gaseous products and functions in the liberation of energy. Sulphur and phorphorus give rise to sulphuric and phosphoric acids, and these acids are neutralized through the equilibrium existing in the blood between the alkali carbonates and the phosphates. Again, mineral salts establish certain degrees of acidity or alkalinity which affect the activity of the enzymes, which function in building up and tearing down the animal body. The proportion of calcium, magnesium, sodium, and potassium salts acting upon the voluntary and involuntary muscles, accomplishes their control. Among other functions, the mineral salts serve in the movement of liquids throughout the body and its tissues, they facilitate vital processes involving the proteids and they keep in solution certain nitrogenous constituents in the ilquids of the body.

Cacium in the blood is esential to its coagulation.

Concerning the variety of functions the mineral elements serve in nutrition, it is also interesting to note that animals can live but a few days on food that is practically free from mineral matter; in fact, animals will live longer if given no food at all.

Not only must fowls be given a sufficient quantity of mineral food, but it must be of the proper composition, for it is the composition and not the amount of ash constituents that is important in bone formation. Bran, for instance, is rich in ash and it has been advocated as an excellent ash food. It contains about 3.3 per cent. phosphorus pentoxide and only about 0.3 per cent. lime, and is, therefore, quite unsuitable for bone formation.

Seeds of all kinds contain slightly more phosphoric acid than lime, though the bones of animals contain about 50 per cent. more lime than phosphoric acid. It is quite evident then that the grains do not contain the mineral elements in the proper composition for best results in growth, flesh or egg production.

Other inorganic elements are required by the animal body in the building up of its tissues. The digestive secretions also demand inorganic elements; the gastric juice contains chlorine, potash is present in saliva and the blood, iron is present in the blood and its presence is most important, and flourine is present in the teeth and bones.

All these mineral elements must be supplied in adequate quantities or the normal functions of life cannot be properly fulfilled.

The Weeding-Out Process.

It has become a custom of late years amongst poultry-breeders to discard all fowls in their poultry-yard which reach the age of two years. This weeding-out process takes place according to the time the pullets are able to take place of the two-year-old hens. If the egg basket is to be increased, all birds in their third year must be dispensed with, excepting such hens as have shown special merit as layers, and these are only needed for reproduction. None but promising pullets should be kept—that is, birds which from their sprightly appearance, build, and comb, give promise to be good layers. Then, for show purposes, the seleceted birds, must have white skins, and carry plenty of breast meat, with the least amount of offal and bone. Much might be said against discarding as useless the 2-year-old hens; their eggs are larger and heavier, the chickens strong and healthy, and are raised at a minimum of cost and labor. Although the cost of feeding an increased stock may have to be considered, and the vigor of the chickens raised. Besides, a hen that averages 150 eggs the first year, and 100 the second, besides raising two or three broods of chickens, may well be said to have earned her own worth, and been a lucrative source of income to her owner. As it is, however, under ordinary conditions, adult birds do not require so much food as younger growing stock, and if given their iberty will forage for their own keep, and for their offspring.

Only the Best Strains.

On many farms where from 50 to 100 birds are kept all the year round for various purposes, they receive no more attention than one ration of grain in the morning and are left to find their own living for the rest of the day. Under such haphazard conditions disease is unknown in the farmer's poultry yard, nor do losses often occur, except by sudden and violent depradations of rats or cats. Therefore, it may be held with justice that if only the best strains are kept in any poultry yard, these hens may be kept,, even to the third year, and if mated with vigorous, young, pure-bred cockerels, results will be equally satisfactory. Exhibition birds noted for show or utility purposes are not infrequently known to breed true up till the fourth year, and their stock show strength, vigor, and immunity from disease. But this applies only to stock carefully selected from the best strains of breeds noted for their laying qualities or table properties, and kept for stock-raising either as pure-breeds or profitable first crosses. Then, again, there is a good deal rests on results when the birds are "acclimatized." Birds raised on the same

Amatite
ROOFING
It needs no painting
Put Amatite on your farm buildings and you need never worry, for you have a good roof.
It is a comfort also to know that you won't have to paint these roofs, for frequent painting costs almost as much as a new roof.
Amatite is waterproofed with Coal Tar Pitch, the best waterproofing material known, and it has a real mineral surface.

premises for several years become, as it were, accustomed to their surroundings, which vary considerably in soil and temperature, according to climate and district. The introduction of new blood in such cases has been found to strengthen good and vigorous qualities already gained. How interesting and advantageous it would be if a breeder of poultry should know right off what fowls are best suited to his own particular district and clime, in regard to their laying and other properties!

Adaptation to surroundings goes a long way in poultry-rearing (says a writer in the "Scottish Farmer"), and it would save no end of time, labor, and even expense to their owners, in their choice of breeds, were the breeds best adapted to certain known surroundings so far reliably ascertained and fixed. The various properties of certain breeds of fowls necessarily differ under certain conditions, and from unacowner in discovering his mistake in the quaintance with these cases the dipappointment that too often accrues to the choice of breed he has made. The road to successful poultry-farming is not reached by leaps and bounds, but by patient observation and practice, and by following natures lines as closely as possible, by skill, knowledge, wisdom, and patience, the art is brought to perfection.

From these remarks, one can gather how important the 2-year-old fowl may be, and after she has won honors in supplying the table with eggs and chickens beyond the two-year limit, she may be made profitable when fattened for the home larder or the wholesale poulterer.

Buy Good Cockerels.

Something must be said in regard to the males kept for breeding. Here change of blood is esential and desirable, especially if the hens are of a mongrel type. The shortcomings of the male bird are nearly always reproduced in the offspring, and therefore it is false economy to go in for cheap or impure male birds. New blood to remedy defects must be infused in the poultry yard, as well as in the stable, the sheep cot, or the byre. In buying stock for the poultry yard the breeder has to use caution in case of disease being imported by strange birds. This has been infrequently led to many a prize breed being entirely extirpated, to the disgust and disouragement of the breeder. The golden rule in buying stock can't be too emphatically repeated—"Buy good cockerels, and mate them with the survival of the fittest only"—and the money and the time so devoted will not prove ill-spent.

Poultry Keeping for the Beginner.

Selecting Stock Birds

Discard the wasters.—To afford young stock the opportunity for development the first point is rigidly to weed out the wasters. I have already mentioned the importance of doing so in previous articles, but I should like to emphasisc the necessity of weeding out where the selection of future breeders is concerned, thus leaving plenty of space for the most promising chickens. To hamper or retard their growth by allowing them to breathe impure air or to run on contaminated ground, will spoil the characteristics that are so essential to success in those from which it is intended to breed. Very frequently mis-shapen, badly colored, or otherwise faulty birds are allowed to exist to the detriment of the remainder. It is, however, perfectly true that when ve reached the age of ten or twelve weeks the temptation to keep them to killing age is very great, but the initial mistake was in keeping them so long. They should have been disposed of before this age.

The most promising chickens are not necessarily those that are the most attractive in appearance. For instance those which at a very early age have grown their adult plumage, and look trim and neat, almost perfect in their premature "finish", seldom reach the standard size of the variety to which belong; nor do they prove of much service when selected for the breeding pen. It is better to keep for stock purposes those that big-boned, angular, and somewhat ungainly in appearance, and seem to be growing right away from their feathers. These birds are developing their frame quickly and their internal organs more slowly, and the more gradual development takes place in the latter, the better. It is not always the very early laying pullets that are the most suitable for spring breeding. Therefore, the growth of the pullets in the early stages should be observed, and it will be invariably be found that those which mature slowly when this stage is reached are the more perfect.

Delay in making selection.—There are many poultry-keepers who make the mistake of leaving the selection of the breeders until almost the actual time of breeding has arrived, with the result that it is done so hurriedly that due consideration cannot be given to the necessary characteristics essential in breeding stock. Of course, I do not mean to imply that future breeders should be selected when they are chickens, but an eye should be kept on those that show signs of future value, and it will frequently be found that these birds figure very prominently when the time arrives for the final seletion.

Type in utility stock.—When selecting birds for breeding purposes it is absolutely necessary that the type of the particular variety should be strictly observed. The utility man is very often tempted to ignore the standards, and regard them as purely matters for the fancier. This, however, is a mistake, and one that very often leads to failure, since many of these so called arbitrary points have economic value, and when the standards—that is external points—are neglected it will invariably be found that the birds will not breed true to their economic characteristics.—By "Practical Poultry-farmer," in Feathered Life.

Experience in Poultry Keeping.

While it would be in vain to attempt to enumerate all the many causes of failure in poultry-keeping, it is well to emphasise from time to time common mistakes, several of which generally mean, if not actual failure, at any rate, considerably less profit than might reasonably be expected. That poultry keeping may be conducted with profit requires no verification here. Everyone, no matter what the station in life is, may secure a wonderfully good return in proportion to the extent of his operations—a return that is unequalled by any other individual branch of farming.

But to make the utmost out of this or any other occupation, it is absolutely necessary that every detail in the management may be turned to advantage. Perhaps more failures are attributable to want of experience than to anything else. I do not mean to insinuate (says a writer in an exchange) that unless one has had a thorough training in poultry culture, one should not keep fowls, or, if one does, that failure is the inevitable end. It is only when a start s made on a very large scale, without knowledge or experience, that failure is almost sure to follow. The man who starts with a few fowls and undertakes the work himself, gains experience day by day, and when his establishment develops, he is well able to face any emergency that may arise, and to overcome difficulties that would entirely overwhelm the man who had started on a large scale with little or no experience.

Separate the Flock.

The best results are secured if the pullets and cockerels are separated when eight or ten weeks old. The pullets must be kept growing and developed for early laying to bring the most profit. Early hatched pullets should begin laying when five or six months old. Unless the cockerels are of exceptionally fine stock they may be forced and sold as broilers or roasters and will often bring more per head in early summer and they would if kept until Autumn. The chicks should be kept growing and developing from birth to sale or maturity to give satisfactory returns —N. E. Chapman, University of Minn.

$120,000 SAVED BY CANADIAN FAMILIES LAST YEAR

Twelve hundred Sherlock-Manning instruments went into Canadian homes last year, each representing a saving to the purchaser of fully one hundred dollars

In the last eighteen months the output of Sherlock-Manning 20th Century Pianos has increased 150 percent—surely an indication of the esteem in which they are held by the public generally. We build each Sherlock-Manning Piano to last—construct it so the owner is going to be a booster for us. Many of our sales today are made through the recommendations of people who bought from us years ago, proving that time does not cause a Sherlock-Manning owner to think less of his purchase. There are solid, common sense reasons for calling the

Louis XV. Style 105.

Sherlock - Manning 20th Century Piano
"CANADA'S BIGGEST PIANO VALUE."

It has every modern piano improvement and every standard quality feature, such as Otto Higel Double Repeating Action, Weickert Felt Hammers, Poehlmann Wire Strings, etc. These standard parts are found only in high-grade instruments, and since we rank the Sherlock-Manning second to none, we incorporate them in every piano we make. With skilled workmen and the best materials that money can buy, there is no doubt of our ability to give you a piano equal to the best made. When we can, at the same time, save you a hundred dollars on any instrument you may buy you should, in justice to yourself, look into our offer. Write Dept. 6 for full particulars of this money-saving opportunity; also ask for a copy of our handsome art catalogue.

CPAHE	RCYREH	YCRAPRSRE	ERPA

Can you arrange the above sets of jumbled letters into the names of eight well known fruits. If so, YOU CAN SHARE IN THE DISTRIBUTION OF THE ABOVE PRIZE. It is no easy task. But by patience and perseverence you can probably make out 5 or 6 of them. To the person who can make out the largest number we will give the sum of One Hundred Dollars. To the person making out the second largest number the sum of Fifty Dollars, To the person making the third largest number the sum of Thirty Dollars. To the person making the fourth largest number the sum of Twenty Dollars, Should two persons send answers equally correct, the first two prizes will be divided between them, (each receiving $75.00) Should three send in equally correct answers, the first three prizes will have to be divided, (each receiving $60.00). Should four persons send equally correct answers, the whole sum of $200,00 will be equally divided (each receiving $50.00), and so on in like proportions, provided they comply with a simple condition about which we will write as soon as answers are received. WE DO NOT WANT A CENT OF YOUR MONEY WHEN YOU ANSWER THIS ADVERTISEMENT. If you can make out anything like a complete list, write us at once enclosing 2-cent stamp for our reply, DO NOT DELAY. WRITE AT ONCE. Address, CANADIAN MEDICINE CO., Dept. 96, MONTREAL, QUE.

A Matter 'O Business.

I.—A Strange Request.

"He is made that wey, an' he canna help it," remarked Roderick Macpherson to his neighbour, Donald McTavish, as they stood at the latter's farm gate, where the high road takes a sharp dip down into the glen.

He referred to Wattie McNab, who had just passed, and to his character, more than his ill-shapen dwarfed figure.

They had both said "Good-morning," cheerfully, and Wattie had grunted in reply, "Ay, tae some folks."

"He's a queer cratur, is Wattie," replied McTavish, "an' has a tongue like a razor."

"Maybe, but he has a guid deart a' the same. There's no muckle wrang wi' that part o' him, or his heid, either." Macpherson responded.

"I grant ye that; but a' the same I dinna care tae hae muckle dealin' wi' the cratur. I feel somehow as if I never can get tae the depths o' him.

At that moment a young lady drove past in a trap and the farmers lifted their hats.

"I wunner what the Laird means lettin' his dochter drive that pair o' greys alane. They hae tae muckle bluid for a young girl tae manage," exclaimed Macpherson critically, as he scrutinised the fiery pair.

"I'm thinkin' the dochter takes the bit intil her ain mouth, an' its a mair difficult handfu' for the Laird than his horses. Young wummen nowadays are no easy managed," was the answer.

The words were scarely out of his mouth when suddenly, to their horror, they saw the horses shy at an empty potato-bag which had been blown against the dyke and was flapping in the wind. The girl by a quick tug at one of the reins just saved the trap from being upset against the opposite wall; but in doing so she let the other rein slack, and one of the horses caught it under its tail. Then they bolted down the hill. The road had several turns in it, and the two farmers ran across a field to a point from which they had a clear view of the highway, which for nearly a quarter of a mile descended in a straight line, and then turned at right angles along the steep bank of the river.

"They'll gang straight intil the dyke at the foot, an' she'll be pitched richt over intil the water," panted Macpherson to his friend.

Then they held their breath in amazement.

Right in the path of the runaways stood Wattie McNab, one hand outstretched as if he meant action.

"What can the cratur do?" exclaimed McTavish, "he'll be killed."

"I'm no sae sure," replied the other. "What he lacks in legs he mak's up wi' arms. Did ye never notice what an uncanny length they are, an' as strong as iron? He is meanin' tae dae somethin' wi' them noo."

In another instant the horses were on top of the dwarf, and with a shudder the onlookers saw him go down beifore them like a shot, and they looked to see his mangled body on the road behind. But there was nothing there except a flying cloud of dust.

"Where has the mon got tae?" asked McTavish in amazement.

"Losh, juist look at him noo!" exclaimed Macpherson.

Wattie had gripped part of the harness of one of the horses, and by the strength of his arms had drawn himself up until he flung his leg over its back. Then he gripped the reins of both horses and pulled with all the might of his iron muscle. His strength and purchase power were so great that he almost brought the creatures on to their haunches. They recognized the master touch. With a jerk the speed stopped, and the trap brought to a standstill. The horses stood trembling but the strength of Wattie's arms had calmed them with a new confidence.

"Mon, that was bravely done!" Macpherson said in his admiration. "Ye canna say onything against Wattie noo."

The two farmers hurried to the spot, and found that the Laird himself, who was shooting in a neighbouring field had been witness of the scene.

He was profuse in his expressions of gratitude, as also his daughter, who had received a great shock.

"I don't know how we can ever repay you for this," he said as he wrung the rescuer's hands.

"I'll drive ye baith hame, an' we can think o' that then," was Wattie's matter-of-fact reply.

He had been brought up among horses, and he had no fear of them, if indeed this strange little man feared anything. If his body was small his heart was big, and he loved all animals. The princely greys seemed to understand him as he reached up and stroked their noses and they allowed him to handle them as he liked.

During the drive home the Laird was puzzling himself how he should reward this gallant deed. Many suggestions passed through his mind but as he looked at Wattie, somehow he felt that any of them might be deemed an insult. Wattie owned a small croft which he had inherited from his uncle, and possibly the fact that he was his own master as well as the twist in his character gave him that singular air of independence which was evident in his acts as his words.

When they reached the castle and the horses were handed over to the care of the groom, the Laird invited Wattie into the library.

"Now, Wattie, I must say again," he remarked, as he offered him a seat, that I do not know how to thank you for saving my daughter's life to-day. If the horses had not been stopped, they would most certainly have dashed into the stone wall at the foot of the brae, and she would have been pitched over the precipice into the river. I know you are the kind of man not to think of yourself in the matter of a reward, and that makes it all the more difficult for me to think of what to offer."

"I'm feer'd Laird, ye dinna ken me," was Wattie's unexpectd interruption.

"I am very glad to hear that," responded the Laird, smothering his astonishment, "for after all I would like to give you something personal. It will make it very much easier."

"I'm no sae sure o' that," was the enigmatical retort.

"Well, Wattie, I am glad to hear you speak in that way, for I wish to reward you very handsomely for to-day's work, and if I could put it into —er—er a money form the cheque would be a large one. In fact, Wattie, I shall leave the matter in your hands. Mention what you consider a reasonable amount, or say what you want, and it shall be given unto you."

"Unto the half of my kingdom," Wattie rejoined, as a slight smile broke over his wizened face. "Ye manna forget Herod an' mak' his mistak'; but I'll tak' ye at yer word, Laird, an' I ken ye wullna gae back upon it. Noo, I nae nae hesitation in tellin' ye what ye wish, since ye are sae guid as tae promise that ye'll dae it for me. It will no cost ye a single ha'penny. In fact, it will pit twenty poonds a year intil yer ain pocket."

"That will be a queer kind of reward," interposed the Laird with a smile. "But what will it do for you?

"I'm no much carin' aboot that," said Wattie. "After a' I hae naethin' I need, but I dinna think ye hae the richt tae refuse a twenty-poon note tae yoursel' every year, foreby keepin' up the value o' the estate, an' what I'm goin' tae ask, ye'll admit wull dae that an' mair."

"Well, Wattie, you are the right kind of person to offer a reward to. I hope you will not prove another Herodias. Let us hear the demand."

"Weel, I've been thinkin'." Wattie began in a deliberate tone, "that the farm o' Lochbend cud be made a great deal mair o' if ye wad tak' it intil the hame fairm. That wud gie ye anither hundred an' fifty guid acres, an' it wud hardly mean ony mair expense, for ye hae mair horses the noo than ye need for the hame fairm. Am I no richt in sayin' that ye cud mak' twenty pounds mair if ye took it intil ye ain hands?"

"You are quite right, Wattie. I believe it would be worth that to me over and above its present rent."

"Then as the lease is oot at the May term the reward I ask for what I hae done the day is that ye tak' it intil yer ain haunds, an' I'll keep ye tae yer promise."

The smile died away on the Laird's face and he gave his moustache a twist of annoyance.

"I'm afraid that will be a difficult thing to do, Wattie. You see Mrs. McLeod is tenant of it at present. Ever since her husband died I have kept her in the farm, and I had no intention of disturbing her, even though as you say it would be an advantage to myself. It has been in the hands of McLeods now for two generations: besides, what could the poor widow do, if in this way I took her livlihood from her?"

"She's got a son oot in Canada, an' cud gang oot tae him a' richt."

"But at her age, think what it would mean to break up all the ties of home."

"She's nae older than mysel', fifty-sax, an' mony a one gangs at a greater age. She'll dae fine oot there. But onyhow, a laird maun think o' his estate."

"That's a strange doctrine from your lips, Wattie," said his host essaying a laugh to try and humor his strange guest.

Wattie's features, however, did not relax. His mouth was firmly set.

"Ye canna brak' yer word, Laird, an' I'll no tak' onything else," he said with determination.

"It looks as if you had something against the woman."

"I hae nothin' agin her. She's been a guid, God-fearin' wumman a' her days an' has tried tae dae her best. I wish there were mair like her i' the parish."

"And yet you want to turn her out of house and home. It seems very strange," remarked the Laird.

"I dinna care hoo it looks. The Creator saved me from makin' that mistak' when he gave me this ill-shapen body. I've learned never tae care hoo a thing looks, or tae judge by appearances. But if ye are no a mon o' yer word, Laird, ye had nae richt tae ask me in here."

Wattie rose with an action of indignation from his seat.

Meantime the Laird scrutinized him very closely. There was no relenting about the face, but Wattie had one vulnerable spot, his eyes. They were true peep-holes into his soul, and could not wear screens. Something the Laird saw there brought a look of relief into his face, and he responded in a kindly tone.

"Your wish will be carried out. I will take Lochbend into the home farm."

II.—Its Reason.

Some days later Wattie sauntered into the joiner's shop in the little village. He chose the hour when the apprentices were away for their dinner, and Big Rory, as he was locally known, was busy finishing some extra work. Rory McCallum was a hard-working man, and skilled in his trade. He was reputed to have made lots of money, and no wonder, for he toiled incessantlyq, allowing himself but half time for meals.

His home was guarded by two sisters. Both were tall. bony and masculine. When Rory left his workshop and passed into the house he became their prisoner and did not reappear from custody until daylight called him to his task. On Sunday they walked one on each side of him to church, and he sat between them in the pew. Many pitied him, some blamed him, but all agreed that now he had not the spirit

BETTER THAN SPANKING.

Spanking does not cure children of bed wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W, 209, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

SUFFERED EVERYTHING

For Years, Restored To Health by Lydia E. Pinkham's Vegetable Compound.

Canadian women are continually writing us such letters as the two following, which are heartfelt expressions of gratitude for restored health:

Glanford Station, Ont.—"I have taken Lydia E. Pinkham's Vegetable Compound and never found any medicine to compare with it. I had ulcers and falling of womb and doctors did me no good. I suffered dreadfully for years until I began taking your medicine. I also recommend it for nervousness and indigestion." — Mrs. HENRY CLARK, Glanford Station. Ont.

Chesterville, Ont. — "I heard your medicines highly praised, and a year ago I began taking them for falling of womb and ovarian trouble.

"My left side pained me all the time and just before my periods which were irregular and painful it would be worse. To sit down caused me pain and suffering and I would be so nervous sometimes that I could not bear to see any one or hear any one speak. Little specks would float before my eyes and I was always constipated.

"I cannot say too much for Lydia E. Pinkham's Vegetable Compound and Liver Pills, for there are no medicines like them. I have taken them and I recommend them to all women. You may publish this testimonial." — Mrs. STEPHEN J. MARTIN, Chesterville, Ontario, Canada.

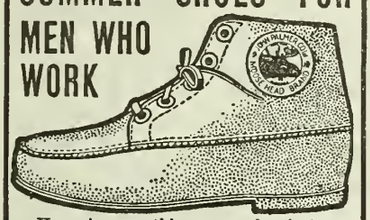
WAS BOTHERED WITH BILIOUSNESS AND SOUR STOMACH FOR 20 YEARS

Sour Stomach and Biliousness are caused by a sluggish Liver, for when it is not working properly, it holds back the bile, which is so essential to promote the movement of the bowels, and the bile gets into the blood instead of passing through the usual channel, thus causing many stomach and bowel troubles.

Mr. Charles Pettit, 256½ Richmond Street, London, Ont., writes:—"I feel it my duty to write you a few lines in regard to your Milburn's Laxa-Liver Pills. I have been bothered with Biliousness and Sour Stomach for twenty years until a year ago I started to use Laxa-Liver Pills, and I have not been bothered since. I wish to let it be known to all those who suffer as I did."

Milburn's Laxa-Liver Pills are 25 cents per vial or 5 vials for $1.00. For sale at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

SUMMER SHOES FOR MEN WHO WORK



Here is something new in footwear specially suitable for farmers, woodsmen, millmen, trackmen, laborers—all those needing strong yet light, cool, easy shoes. These are made on good-fitting right and left lasts from our famous oil-tanned Skowhegan waterproof leather with waterproofed sole leather outsoles and solid insoles.

Palmer's "Moose Head Brand"
"SUMMER PACKS" and "HARVEST SHOES"

are light weight, comfortable, durable working shoes for spring, summer and fall wear. Sold by leading dealers everywhere. If your merchant does not carry them write us, giving his name and address, and we will see that they are placed within your reach. Made 4, 6 and 9 inches high. 19

to break his bondage.

"That's gey sad news aboot Mistress MceLod," said Wattie, seating himself on a pile of boards. "The Laird is pittin' her oot at the term."

The big joiner took a firmer grip of his saw and drove it with more fierceness than skill through the wood he was cutting.

"If the Laird does that he'll repent o' it," was the surly answer.

"Weel, that wull no dae Mrs. McLeod muckle guid. She'll be o'er the seas lang afore then."

"What for shud she leave the parish?" asked Rory, looking round with anger on his visitor.

"You're forgettin' her son Airchie oot i' Alberta," responded Wattie, as he began to whittle a piece of stick with a knife.

"An' what kind o' hame wull that be for his mither?"

"A shack wi' verra lettle comforts for ony wumman, forby ane that has been brocht up like Mistress McLeod," was Wattie's reply. Then he continued, as he casually turned the stick over in his hands,, "It's a gey cauld place i' the winter. Just think o' saxty degrees o' frost. Mon, Rory, she'll no staund it at her age."

"She's no sae auld as ye're makin' ott," interrupted the joiner with some irritation in his voice.

"Maybe, but onyway I'll no gie her lang o' that climate. The fact is atween oorselves, Rory, it wull be the death o' her."

The joiner by this time had laid down his tool. He was no longer fit for work. Besides, his big, clumsy brain was beginning to think.

"Ay, it's murder," he said slowly, "an I'll tell the Laird sae mysel'."

"Ye'll dae no guid but only anger him. His mind is made up. He's gaein' tae tak' Lochbend intil the hame fairm, an' I hae no doubt, if he's let alane, he'll gie the mistress fair compensation. Noo what you an' I hae got tae do is tae try an' be o' some kind o' practical help tae her; an' that reminds me o' what brocht me here. I hae made up my mind tae gie her the chests she'll be needin' for takin' oot her things, an' I'm gaein' tae gie ye the order for the makin' o' them. Mind ye, they are tae be o' the verra best material, an' ye'll hae tae do it reasonable."

"What size o' boxes wull be wantin'?" asked Rory in a half-absentminded sort of way.

"That's just it. I canna tell ye mysel'; but ye'll gang up the nicht tae Lochbend an' see the mistress, an' tak measurements. She's tae get a' she wants, and ye maun be quick about it, or ye'll no get your siller."

"Ay, I'll gang the nicvht," said Rory in a voice that sounded far distant from his thoughts.

When Wattie was gone the joiner went mechanically on with his work, and forgot all about his dinner, until the strident voice of Sarah, his sister, startled him from the doorway.

"What are ye standin' glowerin' at when the dinner has been ready these ten meenités. Come awa' this instant an' no keep Betsy an' me waitin'."

Big Rory followed meekly; but the meal was a silent one, and the sisters little guessed the resolution that was forming in the stolid head of their brother.

All the afternoon he was in the same mood, and the apprentices began to take liberties, until to their astonishment he told them to go home an hour be fore the usual time.

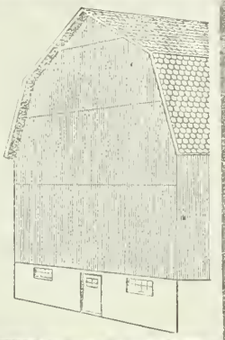
"Is the supper no ready yet?" Rory asked impatiently of his sisters, as he entered the house before even a cloth was laid on the table.

"What's a' the hurry the nicht?" noon daein' nothin' but starin' oot o' the workshop seems tae hae gi'en ye a greater appetite than workin'. Weel, it wull just be a' the sharper for anither half an hour's waitin'."

(Continued on page 836)

"Metallic" Corrugated Iron Barns are Lightning, Fire, and Weather-Proof

Lumber and labor are too expensive to be used in farm buildings; besides, wood buildings are easily destroyed by fire and lightning. "Metallic" Corrugated Iron makes buildings that last a life-time; that are warm and dry; and proof against fire, lightning and weather.



Costs Less Than Lumber

You save money on labor and lumber when you use "Metallic" Corrugated Iron. Write for complete information before you buy any building material. We can save you money. Our corrugated iron is made in galvanized or painted sheets, straight or curved. 7

THE MARITIME FARMER
SUSSEX, N. B.

An article that has real merit should in time become popular. That such is the case with Chamberlain's Cough Remedy has been attested by many dealers. Here is one of them. H. W. Hendrickson, Ohio Falls, Ind., writes "Chamberlain's Cough Remedy is the best for coughs, colds and croup and is my best seller." For sale by all dealers.

Farm House Food.

The two following receipes are sent out by the Royal Horticultural Society:

Preserving of Beans.—Secure earthen jars with wide mouth and clean thoroughly with boiling water. Pick the beans when dry or dry them before the fire, wipe them with a cloth, tear away the strings and slice them as for cooking. Sprinkle layer of clean kitchen salt at bottom of jar, put in a layer of beans, then more salt, and so on until the jar is full and heaped up. Cover jaw with clean plate on which a weight is placed. Next day remove any dirt on top of jar, add more beans and salt till jar is full. Once or twice in the next ten days uncover and remove any scum. Finally, cover with bladder tied down To prepare for eating, take out the beans and soak thoroughly in several changes of water until free from salt. Boil for rather a shorter time than for fresh beans. To increase the food value strain off the water when the beans have boiled soft, add a piece of dripping or butter to the pot stir for five or ten minutes, and dish out.

Fruit Bottling.—Choose wide-mouthed bottles and clean them thoroughly. Pick just ripe fruit clean and dry. Place in bottles. Apples and pears should be sliced in quarters, plums and damsons put in whole. Fill the bottles with clean water. Stand them up to their necks in water in a fish kettle or open boiler. The bottles must be open. Slowly raise the water to the boil and let it boil for twenty minutes or half an hour. Take out the bottles singly, and without the smallest delay tie the mouths with clean bladder whilst the water in the bottles is at boiling heat. If corks are used instead of bladders, scald them first. Insert them and seal the tops with sealing or bottle wax. Remember to boil the water gradually. Store the bottles in any cool place. Blackberries can be preserved with a smaller quantity of sugar than other fruit.

Garden Steward (Girton) writes to the Times:—"Fruit may be preserved without sugar by the following methods: (1) In special glass jars with screw tops. These should be filled with fruit and water, almost to the top. The lid and screw should then be loosely put on, and the jars placed in cold water up to the neck. The water should be slowly heated to 180 deg. Fahr., and the bottles then removed, placed on a wooden table or board, and the lids screwed up firmly. It is an additional safeguard to the sterilization and an aid to the subsequent removal of the lid, if a little grease, such as lard, be run inside the screw. (2) In ordinary glass jars, which also should be filled almost completely with fruit and water. Then a piece of soft wet blader whould be tied on the top and the bottles submerged in water heated to 180 deg. F. Fruit thus preserved may be stewed, or made into puddings, with a small quantity of the cheap sugar which is unsuitable for the making of jam.

Srewed Mutton With Carrots and Rice.—Take one pound of the neck of mutton, two large carrots, half a pound of rice, one pint and a half of hot water, pepper and salt. Cut the mutton into neat pieces and put them into the saucepan over the fire with the hot water and let it boil; add salt to throw up the scum; skim thoroughly, and add the carrots scraped, washed and cut into slices, cover with a lid and let all simmer for one hour;then skim again. Have the rice very well washed, add it to the contents of the saucepan and cook again for half an hour without a lid upon the pan; by this time the rice will be quite soft and have absorbed all the moisture. Dish up the mutton on to a hot dish, smother with rice and garnish with the carrots.

Tomato rice.—Set 1 oz. of butter in a frying pan and cook in it slowly a tablesuoonful of chopped onion till it smells strongly. Then add a teacupful of washed and dried rice and stir constantly till slightly browned. Take nearly a pint of mashed and strained cooked tomatoes, and mix with nearly the same quantity of stock. Add this to the rice, etc., in a clean stew-pan, season highly with pepper and salt, and cook slowly till the rice is perfectly tender and the broth quite absorbed. Just before serving stir in a tablespoonful of butter and season to taste. Arrange the rice in a flat mould, with the boiled mutton in a circle on it, and round the mould pour a little thick, rich gravy.

Equal Partners.

I firmly believe that the only right way to run the farm is on a co-operative plan, where husband and wife are equal partners, working and planning together, and both sharing the profits after expenses are paid.

Every true farmer's wife should take an interest in the out-of-doors side of the farm, and help her husband all that she can. The husband, also, should take as much interest in his home and the rearing of his children as he does in his barns and thoroughbred stock.

However, it is a fact that there are farmers' wives who do not know or care anything about the farm management or their husbands' part of the work. There are also husbands whose homes mean nothing to them except a place to eat and sleep; and I doubt if some of them know their own children, they pay so little attention to them.

I can truly say that my husband and I are trying to run our home and farm on the co-operative plan. We both have faults and both make mistakes but we try to not make the same mistake twice.

We are trying to pay for our farm and we haven't found our path all "sunshine and roses," either. We both know what hard work and economy mean, but we try to make the best of what we have, and are looking forward to better things..

My husband is progressive in his methods of farming and likewise I try to be progressive in my methods of housekeeping. He improves farm conditions and buys labor-saving ma-

If you knew of the real value of Chamberlain's Liniment for lame back, soreness of the muscles, sprains and rheumatic pains, you would never wish to be without it. For sale by all dealers.

chinery as fast as we can afford it, and I try to improve the house and get articles to save myself all the unnecessary labor I can.

? can't understand the philosophy which doesn't teach that a farmer's wife should have a cozy sanitary home with modern labor-saving conveniences, just as much as her husband should have a sanitary, up-to-date barn and all modern machinery.

My husband is just as proud as I am when, after careful saving, I am able to install some new comfort or convenience in our home. I think he is the "best ever," and I don't intend, not does he want me to drudge myself to death so that some "Miss Spinner" may take possession, as as outlined in the story "The Lord Giveth."

The Ill-Matched.

Some time ago I noticed in one of my home papers a pathetic appeal from a sister whose husband mentally her inferior, was uncongenial and unsympathetic. She was bound to life upon a farm, instead of town life, which she preferred. The care of several little ones excluded all social pleasures, and she found herself very unhappy, longing for the liberty and privileges she, as a teacher, enjoyed before her marriage.

It was with the deepest interest I read the several replies which appeared in a later issue, every one of which contained censure and blame without stint, but hardly a word of that sisterly comfort and advice for which she asked. She asked for bread and received a stone.

Foolish, indeed, she had been to form an alliance with one whom she must have known to be her inferior; wicked, perhaps, in her rebellion at the results of such an ill-advised step nevertheless, a sister in dire distress, and as such entitled to the best that could be offered her. Unfortunately her case is not an unusual one. All over the land exist indifferent husbands, discontented wives, unwelcome little ones, irksome home duties. Their name, alas, is legion!

In this particular case the wife complained that her husband cared nothing for reading, while she possessed a decided literary taste. Having been a teacher, she can, no doubt read well aloud, and this should prove an important factor in creating a better literary atmosphere in the home. Very likely her husband, in common with all men, has a hobby, and I would suggest that in looking over their home papers, she mark such articles as might be of interest to him, and draw his attention to them, or read them to him, particularly if they coincide with the opinions he may chance to hold upon the subject.

I do not consider it a sin for any woman, especially one isolated upon a hill farm, to long for the society of her kind, or to crave the pleasures of an occasional concert or lecture; and I know by experience what it is to miss the church and social privileges to which, from childhood, I had been accustomed in town. Not all women are so constituted that they find the highest pleasures and ideals in life in flocks of chickens and turkeys as one sister suggested in connection with this case. I never did, and I have looked upon many a goodly flock of my own raising, with justifiable pride.

THE BLESSED LITTLE ONES.

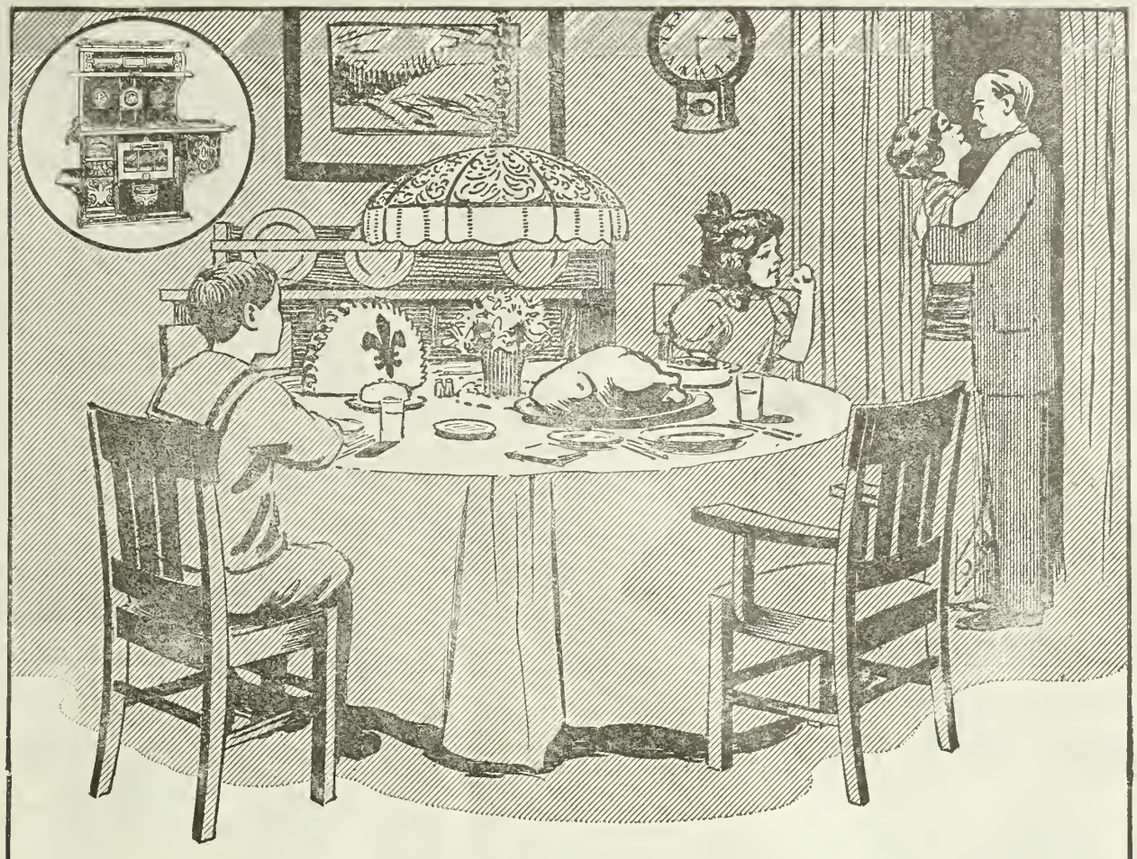
But when it comes to the little ones then and there must all rebellion and discontent be crushed out of our lives for their dear sakes. All that is sweetest and best in a mother's life is their lawful heritage and nothing short of that can satisfy their just claim.

So let me suggest to this dear sister (and others similarly situated) that in setting about to better her domestic conditions she begin first with her own heart.

Look upward with an abiding faith and trust in God's overruling power and wisdom and see if you cannot discern in these trials a corrective influence for many a fault in your own character. Open your heart and let in the sunlight of God's wondrous love, and see how quickly it disperses the gloom of rebellion and discontent. Then will you look out upon your life with a quickened vision, and old things will become new.

The fact that he is the father of your children will clothe that uncouth husband with at least respect in your eyes and see if he does not respond to the sweet, womanly, helpfulness you extend to him by an effort to better measure up to your ideals and standards. No man ever yet failed to be proud of his wife's superiority, secretly perhaps, but that chord exists in every man's heart and will vibrate if touched by the finger of wifely love and sympathy. Then, too, will the care of the little ones be no longer a burdensome task, but a sacred trust, and all these other othside things, good and proper in themselves, will be no longer essential to your happiness.

Perhaps, the future years may hold in their grasp some of the privileges you crave. Then accept them as God's good gifts, not as your rightful due. This is no theory I am advancing but a knowledge born of personal experience. Believe me, 'tis the only way. Try it and be convinced.—Helper, New York.



The whole family appreciates a Monarch

Every member of the family notices and appreciates greater promptness in meal-time, better cooking, and a happier Mother when there's an

ENTERPRISE
Steel
Monarch Range

in the kitchen. By robbing cooking of all its inconvenience, and much of its labor, the Monarch does a great deal toward preserving a happy home. Just how it does this is too long to be told here. We have published a booklet, however, describing the Monarch fully—from its oven thermometer, heat economizer, anti-scorch cover, removable reservoir, controller-damper, and removable towel-rod to the polished steel plate of its body and its generously big, inter-changeable firebox. You will find this booklet very interesting. It tells about the many ways in which the Monarch makes cooking easier.

GOLD WATCH FREE.

A straightforward generous offer from an established firm. We are giving away Watches to thousands of people all over the world as a huge advertisement. Now is your chance to obtain one. **Write now**, enclosing 25 cents for one of our fashionable Ladies' Long Guards, or Gents' Alberts, sent carriage paid to wear with the watch, which will be given Free (these watches are guaranteed five years), should you take advantage of our marvelous offer. We expect you to tell your friends about us and show them the beautiful watch. Don't think this offer too good to be true, but send **25 cents** to-day and gain a Free Watch. You will be amazed.—WILLIAMS & LLOYD, Wholesale Jewellers (Dept. 59), 89, Cornwallis Road, London, N., England.

SYNOPSIS OF CANADIAN NORTH-WEST LAND REGULATIONS.

THE sole head of a family, or any male over 18 years old, may homestead a quarter-section of available Dominion Land in Manitoba, Saskatchewan or Alberta. Applicant must appear in person at the Dominion Lands Agency or Sub-Agency for the District. Entry by proxy may be made at any Dominion Lands Agency (but not Sub-Agency), on certain conditions.

Duties—Six months residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres, on certain conditions. A habitable house is required except where residence is performed in the vicinity.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead Price $3.00 per acre.

Duties—Six months residence in each of three years after earning homestead patent; also 50 acres extra cultivation. Pre-emption patent may be obtained as soon as homestead patent on certain conditions.

A settler who has exhausted his homestead right may take a purchased homestead in certain districts. Price $3 00 per acre. Duties—Must reside six months in each of three years, cultivate 50 acres and erect a house worth $300.

The area of cultivation is subject to reduction in case of rough, scrubby or stoney land. Live stock may be substituted for cultivation under certain conditions.

A Matter 'O Business.

(Continued from page 833)

When the meal came it was another silent one, and Rory seemed as anxious to have it over as he was to get it. When they rose from the table Betsy said:

"See here, Rory, I want ye tae hold this keino ' wool for me while I roll it into a ball."

"Ye'll hae tae wait a wee, as I'm gaein' upstairs the noo."

It was the first note of rebellion on the part of the younger brother, and his sister looked after him in amazement as he left the room.

"What can he be after the nicht?" remarked Sarah to Betsy ten minutes later. Rory's bed-room was over the dining-room, and as the house was old, they could hear every footfall above.

"He'ss pullin' oot drawers as if he were dressin' himsel'," was the answer in tones of suspicion.

Could they have looked through the ceiling they would have been dumbfounded at the actions of their brother. He was standing before a mirror, and on his table lay a selection of neckties, which he had long been forbidden by his sisters to wear on the Sunday because of their bright colour. He had chosen now, the flashiest of the lot, and with bold determination was tying it into a neck-knot.

When at last he was dressed to his satisfaction he very quietly opened his door and began to creep stealthily down the stairs. But it was impossible to keep the boards from creaking under fourteen stones' weight. He had almost got to the bottom and was within reach of the front-door, safety, and liberty, when his sisters emerged from the dining-room and confronted him with their stern faces of disapprovel.

"What on-goin is this?" asked Sarah sharply, as if her brother had committed an unpardonable sin.

"My word, he's got his Sawbbath claithes on," Betsy joined in.

"I'm gaen oot," said Rory, boldly, although his courage was beginning to sink.

"Is there a Kirk meetin' or coffin' the nicht?" Sarah demanded, for these were the only occasions that justified his "blacks" at such an hour.

"No, it's a matter o' business," rejoined the brother sturdily.

"It's a queer time for a matter o' business," was Betsy's exclamation.

"Wattie McNab has gi'en me an order, an' I'm gaein' for measurements."

"No' in yer 'bests' anyhoo," commanded Sarah in tones of authority. "Ye're no tae spoil yer Sawbbath suit wi' warkin' in it. If ye hae tae gang tae Wattie's for measurements pit on yer auld things."

"No I'm gaen' as I am," replied Rory, taking the law into his hands for the first time, and feeling the exhilaration of it.

The sisters listened as he went down the garden path, and turned on to the high road.

"He's no gaen' tae the village or Wattie's. He's awa' up the hill towards Lochbend." was Betsy's comment.

"It's the first time I ever heard Rory tell a lee. What wud oor puir mither say?" Sarah exclaimed, with tragedy in her voice.

Meanwhile Rory was striding along with no conscience to prick him, for he had said nothing but the truth. When he reached the entrance to Lochbend farm he again felt a tremor at his heart, but to turn back now and face his sisters was much worse than to go on.

"Wattie has sent me tae tak' measurements for packin' cases," was how he introduced himself, as he held out his hand to the widow. I'm grieved tae hear ye're thinkin' o' leavin' us."

They were standing alone in the little parlor of the farm-house, where everything from the carefully dusted ornaments to the neatly arranged papers on the table seemed to Rory a part of the woman before him.

Hall Manufacturing Co., Limited,

SUMMERSIDE, Prince Edward Island.

"Yes, I cannot understand what the Laird means by putting me out; for he has always proved himself a kind friend, and it will break my heart to leave the parish where I have lived all my days." As Mrs. McLeod spoke tears welled into her eyes, and it was the sight of them that broke the last barrier of reserve in Big Rory's heart.

"Mary" he stammered, "there's nae need for ye tae leave the parish. If ye'll let me, I'll build ye a better hoose than ye've ever had, an' among yer ain folk who a' respect ye. Only ye maun tak' me wi' the hoose Mary. I'm tired livin' at hame wi'—wi' my sisters, an' if ye dinna help me there's no anither who wull. Ye ken hoo fond we were o' each ither when we were boy an' girl. See, dae ye remember the rose ye ainee gave me. Here it is" and the joiner took from a flap in his pocket-book a piece of paper with a crumpled rose stem. "I havena changed, Mary, except on the ootside," he added awkwardly.

She let him lead her to the sofa and they sat down hand in hand, forgetting how many years had flown since the childish days when they had been inseparable companions.

"There'll be no need for measurements the nicht," said Rory with a smile, as at a late hour he left Lochbend, "an' Sarah wull get the surprise o' her life when she hears o' the matter o' business I've had in hand."

But Rory had no fear as he stepped briskly down the hill, for he knew that now he had the support of another woman who to him was the best in all the world.

The only one who was not surprised at the news was Wattie. The Laird laughed when he met him a few days later.

"You have been making a pawn of me, Wattie," he said.

"Ay, a king's pawn; for unless you had moved, Big Rory wudna hae captured his queen."

Burnt Lime vs. Limestone.

I have purchased a farm. They are not growing clover with success on it. I have a circular issued by the New York Agricultural Department, and it seems to favor putting lime on the land in the form of burnt limestone or quick lime as being cheaper and more economical to handle.

Some papers always talk ground limestone. Please explain whether both give good results. Is there danger of hurting the land with the quick lime? I want to try to raise clover and alfalfa.

What is the difference between limestone and rock phosphate?—Hoards.

We have emphasized the use of the ground limestone or marl for agricultural purposes, rather than burnt lime, because of the caustic properties of quick lime. Burnt limestone is a very effective agent in correcting the acidity of the soil. Fifty-six pounds of burnt limestone is equivalent to one hundred pounds of ground limestone. In the burning of limestone to make quick lime, 44 pounds of carbon dioxide is thrown off, this makes less bulk to handle;, but the caustic properties of burnt lime destroy a considerable percentage of the organic matter, which is very important to our soils. It is for this reason that we have urged the use of ground limestone rather than burnt limestone.

Limestone is a compound which is chemically known as calcium carbonate (Ca Co3) and when applied to the soil the acids will take up the calcium which form compounds that are not acid.

Rock phosphate is tricalcium phosphate (Ca3 (Po4)2) and is used to supply phosphorous to the soil, an important element of plant food. It would be too expensive to use this material to supply calcium.

You Can't Make
BEAVER FLOUR
Bread
with a western
wheat Flour,

YOU can't get the delicious, nutty, homemade flavor, with western wheat flour, that you get with "Beaver" Flour.

You can't get the lightness—the snowy whiteness—the fine texture—the uniform, dependable quality and strength—with western wheat flour that you get with "Beaver" Flour.

The Agricultural Colleges have proved—by experiments — that a true blended flour like "Beaver" Flour, is the only one suitable for both Bread and Pastry.

The bakers, in the big cities like Toronto, have proved that it pays to use a blended flour like "Beaver", because all their customers want "that delicious Bread with the tasty, homemade flavor".

Try "Beaver" Flour yourself. Test it for Bread and for Pastry—and you'll see that it IS BEST for both. Your grocer has it.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my free ten days' trial of a home treatment suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men cannot understand women's sufferings; what we women know from experience, we know better than any doctor; and thousands have proved there is hope even for the hopeless in my method of home treatment; if you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, failing or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you are cured, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old. To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Then accept my generous offer, write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

HYSLOP BROTHERS, Limited
Dept. R TORONTO, Canada

The Cow and the Sheep.

There is always more or less discussion as to which is the more profitable the cow or the sheep. This, like all other live stock and agricultural comparisons, depends more on the handler than on the stock. A sheepman will succeed best with the cow, because the conditions and requirements necessary for the successful development of each will be contributed, and the animals will do their best.

All kinds of farm animals will succeed and become profitable when properly handled. This we see on all sides; it has been proven. The question nowadays is, will the owner or handler of live stock make a success out of the business of handling stock? The business itself is a success, but the handler often does not know anything about the business of handling stock, and therefore fails in obtaining the best results or even moderate results.

The sheep is a profitable animal on the farm and has made a very profitable animal on the range when systematically handled. The cow is a profitable animal on the farm when used as a dairy feature, and the farmer who has an aptitude for dairy management and dairy work will make a success with the cow in this line of industry.

The relative cost of keeping the cow and the sheep cannot be figured accurately, owing to the variation in the size and feeding capacity of these animals. The experiences of those who have thought they observed tests closely are widely different in their estimates, ranging all the way from five to ten sheep, as an equivalent to a cow in matter of feed consumed and expense of keeping. All sheep and all cows are not on an equal basis in consumption of feed. It is fair, however, to presume that on an average of six sheep can be kept on the feed required for a 1,000-pound cow.

The keeping of a few sheep on the farm where there are pastures fenced to hold them is a safe proportion of any farmer. Even the dairy farmer may find it profitable to keep a few sheep, as they are good weed destroyers, and in wool and mutton will return a good profit for feed consumed. They are not injurious to cow pastures, as many believe, espeially where but few are kept. The keeping of cattle and sheep on the same pastures at the same time is not recommended; yet all over the eastern sheep-raising districts the cow pastures were usually the run of a few sheep of extra quality, those being given a little extra care for show or breeding purposes. The keeping of a few sheep is the best way to solve the question of profit, also of the matter of whether you would like to engage in sheepraising as a business.

The Cow's Udder

It is quite customery to relieve the cow's udder to some extent immediately after freshening, although it is not considered a wise policy to attempt to remove all the milk at this time. Some of the most prolific milkers require milking before freshening, but this is not a good practice unless the condition of the udder is such as to make it advisable; that is to prevent over-distention of the udder, which is apt to be more or less injurious. When the udder is entirely relieved at the freshening period, milk fever is more likely to develop. Often and frequent milking and massaging the udder are considered advisable at this time.

EVERY FARMER SHOULD KNOW

how to make the most money out of his land. If your Fall Wheat crops have been diseased and poor, there is a seed dressing that will ensure you a better field at trifling cost.

CORVUSINE D.G

prevents ground rot, assists germination and is an excellent smut dressing. Corvusine is NOT poisonous, birds and animals will not touch it, and it has none of the dangerous features of bluestone and other obnoxious chemicals. 1

SPECIAL ADVICE FOR MEN Strength Restored By New Method

The little book described below (which I gladly send free, sealed, by mail, to any young or elderly man anywhere) contains in its 85 beautifully illustrated pages everything a man need know with regard to certain strictly personal subjects, and as a guide through his entire life, from the delicate period of youth, when wholesome advice is most needed, on through early manhood to a ripe, vigorous, healthy old age. Over a million of these books have been thus distributed by me all over the world. Therefore, please use coupon below and get YOUR free copy by return mail. SANDEN CO., DISTRIBUTORS.

MANLY MEN ARE THE WORLD'S POWER TO-DAY

Do you know, my friend, that there is a wonderful new way to apply a certain, great, natural FORCE to your body, and by which you may, without effort, trouble or inconvenience, treat your own self in the privacy of your home for debility and lost vitality, without using a single drug or medicine? This great FORCE, as a restorer of vitality and as a means to overceme those weaknesses which result from indiscretion and unnatural practices, is to-day being used all over the civilized world, and I give it as my honest opinion, based upon a vast observation and study, that any man anywhere, who leads a decent, manly life and who applies this marvellous FORCE in a scientific and rational way, can, without employing a single drug, be restored again to a state of perfect, rugged health and vigor, without a remaining ache, pain or weakness.

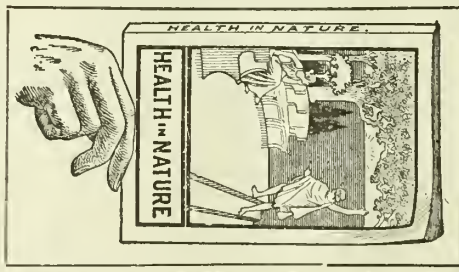
As we all know, these debiliating weaknesses handicap a man in every condition of life, while, on the other hand, a perfect speimen of vigorous, robust, lusty manhood is ever admired by both women and men alike, while, of course, it is certainly only such a man who can attain the really great success of life. Therefore, I say to you, no matter what your size, whether you are small or large, no matter what your occupation, no matter whether you are a college graduate or workng on the farm or in the factory, no matter whether you are young or elderly, it is all a question of your vigor and your vitality, and if I can give you a good, abundant supply of this same great power of VITAL FORCE, then it is easy to believe that I can completely restore your vigorous health, can overcome the evil of past indiscretions so you will be exactly the same in your influence over people, exactly the same in your manly bearing as other manly, strong-nerved, warm-blood ed fellows of your acquaintance.

With an idea of attaining this all for you, I recommend you to investigate a simple little VITALIZING APPLIANCE of my invention, which I am now sending out in great numbers for use by men everywhere who need new manly strength. This little VITALIZER is very light, weighing only several ounces, and can be worn without any one suspecting that you are wearing it. You buckle it on your body upon going to bed and take it off mornings. Thus while you sleep it sends its wonderful power which I call VITALITY or VITAL FORCE, into your blood, nerves and organs. Users say it takes pain and weakness out of the back from one application, and further say 60 to 90 days' time is sufficient to restore a state of health, strength and vigor. I am not offering this VITALIZER here for sale, but want you first to send for my book, that you may learn all about the whole wonderful subject, and why I get such quantities of testimonials from users everywhere telling of results after drugs completely and utterly fail.

NOTE— With special attachments VITALIZER is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, nervousness and general ill health. Please write for book to-day, or, if near by, I should like you to call. Hours—9 to 6.

Use Coupon; Get Free Book

Remember, the little illustrated book which I send free, sealed, by mail, as per coupon below not only fully describes my VITALIZER, telling of a special offer by which you may get one on special terms for use in your own case, but contains a great fund of private advice for men, some good, wholesome cautions, and a lot of general information that might be of value to you to the end of your days. Therefore, please write or call.



DR. M. F. SANDEN CO.,
140 Yonge St., Toronto, Ont.

Dear Sirs:—Please forward me your book, as advertised, free, sealed.

Method of Salting Cattle.

I was much interested in the article on "Salt for the Dairy Cow." Perhaps the plan of salting cattle which we have been using may be of interest. A box about 8 by 18 inches and 6 inches deep is securely fastened to a post in the barnyard or pasture where the cattle may have daily access to it. A slanting cover to keep out the rain is fastened over the box by means of leather hinges. Keep the box filled with salt and the cattle soon learn to lift the cover and take what they want.—C. G. Bridgman in Hoard's Dairyman.

Explains Black Yolk.

Just how many black rots are found in current New York receipt of eggs. The occurrence of black rots has caused a good deal of discussion and everyone has his own view as to the cause of the dark yolk and few opinions are alike. The general impression is that blackness is caused by grass or certain kinds of feed. In addition to the black yolk which is in excessive evidence during June, July and August, there is the grass yolk. Few know just what causes a grass yolk although all acknowledge that there is such a thing.

To learn the cause of the black yolk a New York paper asked Dr. M. E. Pennington, at Philadelphia, chief of the Food Research Laboratory of the United States Department of Agriculture, Bureau of Chemistry. Her reply follows:

"You ask what causes dark yolks in eggs. It is generally supposed that the color of the yolk is due more to the food of the hen than to any other factor. Hens which are fed a clean ration, containing plenty of grain and green food, are more apt to lay eggs with golden yellow yolks

"An egg with a dark yolk frequently arises when the hen is fed a diet rich in meat or bugs. Some people have gone so far as to call dark yolk eggs 'dung hill eggs', implying that the hens have foraged for a living. I am not prepared to endorse the truth of all these statements, but, undoubtedly, there is close relation between diet and color.

"The term 'grass egg' is frequently applied to those eggs whose whites have a greenish tinge. These eggs are very common in damp weather where the nests do not have proper attenteion. The green color s produced by bacteria, which are enabled to penetrate the shell when moist, but cannot enter if the shell is kept dry. The eggs with a greenish tinge to the whites always contain a very large number of bacteria and are considered entirely unsuitable for food purposes."

Testing the Age of Eggs.

There are various ways of testing the age of eggs. An old-time method which was often adopted when a "stolen" nest was found, was to put the eggs in a vessel of cold water. On the principal that weight decreased as age increased, it was held that eggs which had been laid several days would float, while any of recent date would go below the surface. All that promptly sank to the bottom were supposed to be good for food. This was an easy method, but unfortunately as a good many people who had faith in it discovered after they had made a few experiments, it was not always reliable. Just why its results were not uniform has never been satisfactorily explained. It often worked out correctly but sometimes eggs that were very far from good sank in the water. When these eggs were broken the one who was to cook them had not an altogether pleasant surprise.

A prominent poultry journal has just reprinted from a French paper, and without comment, a description of a somewhat similar method of learning the approximate age of eggs which may work out satisfactorily. This involves the use of salt water, and the eggs to be tested are placed in this solution. A strictly fresg egg is supposed to sink to the bottom and an egg only one day old should go nearly there. If an egg swims it has probably been laid at least three days and one that floats has reached a greater but entirely problematical age.—A. E. Vandervort.

We invite you

To visit our Mail Order Building during the second week of Exhibition, Sept. 6-12th. We promise you an interesting and profitable experience.

"Free for the asking"

IF YOU

EATON'S

"The House of Best Values and Assured Satisfaction, supplying most all your needs with a generous

Free Delivery Offer"

We Pay the Shipping Charges on all orders for any amount large or small on

Men's, Women's and Children's Outer Garments

This means that you can buy any one of the known EATON quality garments delivered to your nearest railway station or post office for the price we quote, without any additional cost for shipping charges.

$10 This is in addition to our FREE DELIVERY $10 of all orders amounting to $10 or over of all goods catalogued, and heavy goods quoted prepaid

56-611. CHEVIOT CLOTH COAT 5.00

Do not fail to look these values up in your catalogue. The descriptions fully explain the big saving in store for you.

56-533. ALL-WOOL SERGE 3.95

Want to Increase the Buying Power of your Money--Then you'll need this book of big values

We refer to our Fall and Winter Catalogue for 1914-15 just issued. It's the best all-round book of big merchandise values we have ever issued. From cover to cover its pages are fairly brimming over with buying opportunities that will greatly interest you. If you have received a copy you should not fail to study each page carefully and order early and often so that you may receive the fullest benefit. There are buying possibilities in store for you such as you've never known—and the more you spend the greater the saving. **Send us your name and address if you have not received a catalogue.**

IT LISTS MERCHANDISE OF ALL KINDS

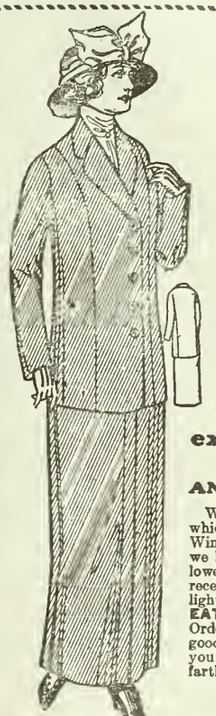
It is not merely a book of fashion—almost every known household commodity is offered in wondrous variety throughout the three hundred odd pages of this book. This is what makes it of so much value to one and all. An **EATON** Catalogue in your home is indeed a treasure store of untold worth.

WE SHIP YOUR ORDER QUICKLY

EATON Service is unequalled. The quick, careful way in which all orders are handled and shipped out has long since gained for us an enviable position. The proof of all this is best appreciated by sending us an order. You take absolutely no risk, because should we fail to please you in any particular you have this positive assurance:

THE EATON GUARANTEE

Goods Satisfactory or Money Refunded, including Shipping Charges



These are notable examples of EATON Low Pricing

AND THERE ARE LOTS MORE

We reproduce three of the many splendid values which are to be found in your **EATON** Fall and Winter Catalogue. These examples of low pricing we believe fully bear out our claim "Best value at lowest possible price." We know that once you receive your purchase you will be more than delighted. Style, fit and finish are all up to the **EATON** standard, price alone has been lowered. Order these from your catalogue, and allow the goods to convince you. The price quoted is all you pay. Values like these make your money go farther.

DO NOT FORGET

That when your order amounts to $10.00 or over of any goods in the Catalogue, including Men's, Women's and Children's Outer Garments or heavy goods, we pay the shipping charges to your nearest station or post office. It gives you the opportunity of getting practically all your needs at our low prices delivered free if you make your order to this amount.

THE T. EATON Co LIMITED TORONTO - CANADA

56-439. CHEVIOT SERGE SUIT 5.95

Lost Certificate.

Farmer, N. B., Please inform me about the following:

Some years ago I bought a registered cow. I have lost the certificate I know the cow's name and year registered. I now want to register a calf of her's. Where can I find out about this cow's number and registeration ?

Farmer has not mentioned the breed of the cow for which he wishes to get a duplicate certificate, and whose progeny he wishes to register.

Write the Secretary of the breed Association, giving cow's name, year registered and name of owner at that date. Also give color markings and any other particulars for identification, and we have no doubt he will be able to make a search of his records and get you the desired information. There will be a small fee for new certificate. You may also be required to testify to the correctness of your assertions re the cow in question as being the cow for which the original certificate was held.

Value of Cows Going Up.

Estimates made January 1, 1914 by the U. S. Department of Agriculture indicate that the number of milch cows on farms in the United States is now 20,737,000, an increase of about one-half of one per cent. over the census figures of 1910. Meanwhile the average farm price of milch cows has increased rom $35.79 in 1910 to $53.94 or an increase of 50.7 per cent On this basis the farm value of the milch cows now in the United States is estimated at $1,118,487,080 as compared with an estimated value in the census year of $738,184,000 an increase of $380,303,000 or an average annual increase for four years of $95,075,000.

A FARMER'S GARDEN

Helps his wife to plan her table in busy times. Saves work and worry, saves buying so much meat, gives better satisfaction to the help. A good garden will be almost impossible in your busy life without proper tools. They cost little and save much hard work.

IRON AGE WHEEL HOES AND DRILLS

will sow, cultivate, ridge, furrow, etc., better than you can with old-fashioned tools and ten times quicker. A woman, boy or girl can do it. Can plant closer and work these hand tools while the horses rest. 38 combinations from which to choose at $3.00 to $14. One combined tool will do all of the work. Ask your dealer to show them and write us for booklet, "Gardening With Modern Tools" and "Iron Age Farm and Garden News" both free.

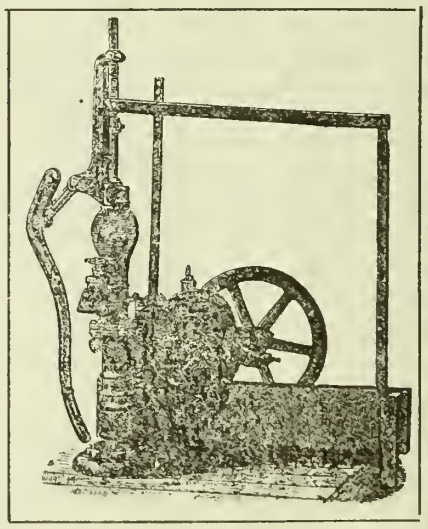
THIS LITTLE ENGINE

is designed to take the place of the man at the pump and anyone who watches this outfit pump water for ten minutes will never again be willing to work the pump handle. The operating cost is very small and a splendid feature is that this engine can be easily connected to "any old pump." The ladies often start it to pump a single pail of water. They rest while it works.



The Outfit Complete as shown sells for $70.00. The engine alone $55.00. Immediate shipment from stock.

Minard's Liniment Co., Limited.

Gentlemen,—I have frequently used MINARD'S LINIMENT and also prescribe it for my patients always with the most gratifying results, and I consider it the best all-round Liniment extant,

Yours truly,
DR. JOS. AUG. SIROIS.

Few, if any, medicines, have met with the uniform success that has attended the use of Chamberlain's Colic, Cholera, and Diarrhoea Remedy. The remarkable cures of colic and diarrhoea which it has effected in almost every neighborhood have given it a wide reputation. For sale by all druggists.

High Quality Builds Big Telephone Business

THIS business was organized to manufacture telephone equipment for independent local and municipal systems. Right from the start our equipment made records for efficiency. It did not take long for our goods to acquire a reputation for quality and reliability. As a result our business has grown by leaps and bounds.

It is a well-known fact that we have been securing over 80 per cent of the new telephone business in Ontario. The business, too, has been secured with less effort than business secured by competitors. The satisfaction our telephones and equipment have given under all conditions has paved the way for easy business getting.

To judge how fast our business is growing, you'll remember we stated in a previous announcement that our business last year doubled that of the year before. Well, this year the first two months' sales total more than twice the 1912 sales for the same period. More and more is it being recognized by those in the local telephone business that we are the legitimate people todeal with. There are those in the telephone business who are interested in depreciating the success of the independent telephone movement and the development of munibipal systems. On the other hand, our business lies wholly and directly with the independent telephone systems and it is to our own best interests to look after those systems well, as on their success depends the growth of our business.

If you would like a list of the large independent telephone systems built in Ontario during the last twelve months, just drop us a line. We would be glad to send you a list of the systems, with the make of the telephones they are using. In fact, if you'll name over the large independent systems built during the last year in Western, Northern and Eastern Ontario you'll find that nine out of every ten are using our telephone and equipment.

You are absolutely safe in equipping your system with our telephones. We guarantee them as regards material and workmanship. In fact we guarantee all our equipment and materials. And in addition, we offer to send your telephones for FREE TRIAL, so you can test and compare them with others right on your own lines before risking a dollar.

Ask for our No. 3 Bulletin—containing the latest information about building telephone lines—Also No. 4. describing our magnetic telephones, is free on request,

Send for a copy.

REMARKABLE OFFER TO SUBSCRIBERS

The Maritime Farmer has secured a limited number of Mauser rifles, weight only 7½ pounds, sighted for 1,100 yards, which it offers with the Maritime Farmer for one year for only FIVE DOLLARS. These rifles are models for hunters. They are sold elsewhere for a much higher figure and are easily worth from three to four times as much as we are asking for them. The first to call will get the choice. The rifles will be sent express to your nearest express office, collect. Money must accompany all orders and rifles will only be supplied to new subscribers, or those who pay strictly in advance. They are the best lot of rifles of the kind on the market. We can also supply ammunition for the rifles in lots of 100 rounds at most reasonable prices.

A Gift From Brandram-Henderson Limited.

News comes from Ottawa, that on August 10th Mr. J. R. Henderson telegraphed Sir Robert Borden as follows:

I have learned through my son that the Naval Service Department require forty five thousand pounds White Lead and have wired the Deputy Minister as follows—With further reference Brandram-Henderson, Limited, quotation just called my attention thirty-thousand pounds Pure White Lead required by the Naval Service at Halifax, fifteen thousand pounds, Esquimalt, have pleasure in cancelling same and in offering material as a gift to the country and empire in this time of need.

(Sgd.) Jos. R. Henderson.

To this Sir Robert Borden sent the following reply:

My colleagues and I most warmly appreciate your generous and patriotic offer and send our sincere thanks.

(Sgd.) R. L. Borden.

The Hon J. D. Hazen also expressed the thanks of the government as follows:

Ottawa, August 11th, 1914.

Dear Mr. Henderson,—

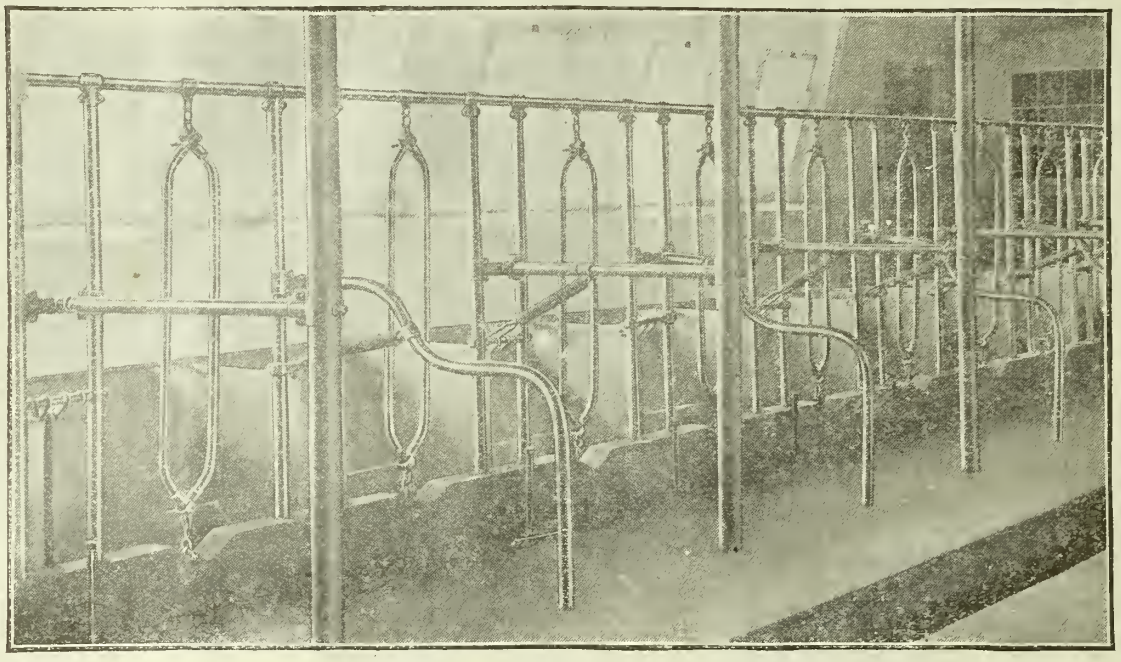
Mr. Desbarats, Deputy Minister of the Naval Service has informed me of your generous and timely offer to supply free of charge all our requirements of white lead for the Ships of the Naval Service in the present emergency.

As Minister of the Naval Service I desire to express to you on behalf of the Dominion Government their appreciation of your generous and patriotic offer. The Government accepts this timely gift as being doubly valuable in these anxious days. Actions such as these strengthen our hands and encourage us in the work of safeguarding the interests and honor of Canada and the Empire.

I have the honor to remain, Sir,
Your obedient servant,
J. D. Hazen,
Minister of the Naval Service.

LOUDEN

Sanitary Steel Stable Equipment



What it means to you

MODERN, Sanitary Stables, at a reasonable outlay of time and money.

Convenience in looking after your cows, and a saving of time and labour in tieing, feeding and cleaning them.

Increased milk production, no waste feed, and increased profits.

What it means to your Cows

COMFORT, cleanliness, and almost as much freedom as when in pasture.

More sunlight and fresh air, the great germ destroyers.

Our catalogue is FREE. Write for it to-day.
It tells all about the complete LOUDEN line.

Special War Notice.

We have received a cable from Mr. W. C. Catesby, of Catesbuys Limited Tottenham Court Road, London, England—the well-known firm of English Mail Order Tailors— whose advertisement appears regularly in our columns, which reads as follows.

Please assure your readers who have sent orders to us that they will get their suits delivered without delay. We anticipate parcel post shipments to Canada will not be delayed long. In the meantime, please instruct your readers who are about to send orders, to mail them, together with their money orders, made payable to Catesbys Limited, 119 West Wellington Street, Toronto. All monies will be held in Toronto and duplicate measurements forms made up and sent by Specially Registered Mail to us. So that in the unlikely event of anything going astray we will have an absolute ecord and duplicate of the order, and guarantee each customer against any loss what soever.

Please thank your readers for us for their continued patronage during these strenuous times. Assure them we very heartily appreciate their goodwill. Tell them they can get our New Style Book and patterns for the fall season free by addressing Catesbys Limited, 119 West Wellington Street, Toronto, and that our regular advertising will be resumed at a very early date.

The St. John Business College.

What a gathering it would be could the thousands, who, during the past 47 years, have been students at the St. John Business College be brought together? It would include Bank Managers, Members of the Houses of Assembly, the Bar, the Press, the Pulpit, etc., but especially those prominent in business circles.

To these men and women the St. John Business College is indebted for the reputation and standing it now enjoys. They have made good in their respective callings in life, and each and every one of them is ready to testify that they owe their successes to the business principles and training received at the College.

We have just received the 1914-15 prospectus of this institution. It is replete with testimonials from many men and women in various walks of life who at some time in their career have attended this excellent school. What the school has done for ex-students it is ready and willing to do for all those who may patronize it in future. The principal and staff have a reputation to maintain and do it they will.

It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information.

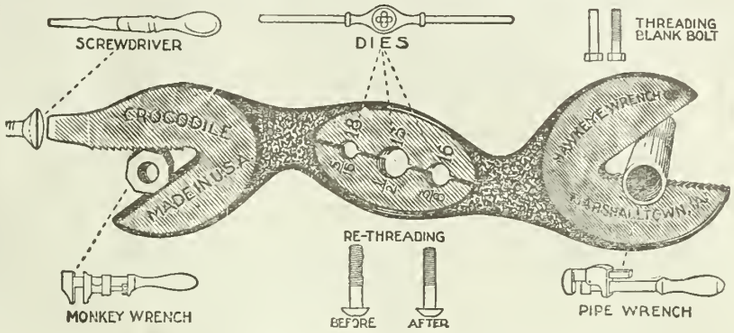
The Crocodile Wrench

An All Around Handy Tool for the Home, Farm and Shop



Six Handy Farm Tools in One

The Crocodile Wrench is drop forged from the finest tool steel and scientifically tempered. Every wrench guaranteed against breakage. It is 8 1-2 inches long and weighs ten ounces.

A pipe wrench, a nut wrench, a screw driver and three dies 5-16, 3-8 and 1-2 inch for cleaning up and re-threading rusted and battered threads, also for cutting new threads on blank bolts. Dies will fit all bolts used on standard farm machinery.

Teeth and dies are case-hardened in bone-black, making them hard and keen.

The dies on this wrench alone would cost $1.50, and would be worth more than that to every farmer, as they would often save valuable time, besides an extra trip to town for repairs.

Sold everwhere for 75 cents cash.

How to Procure a Crocodile Wrench

On receipt of $1.00 we will send you the Maritime Farmer for one year and also one of these Crocodile Wrenches. New subscriptions will date from time of receipt, renewals from date of expiration of present subscriptions. Send us two new cash in advance subscribers to the Maritime Farmer at 80 cents each and we will send you a wrench for your trouble. Or for 75 cents cash we will send you a wrench.

The Maritime Farmer, Sussex, N. B.

John McDonald & Son
Shubenacadie, N. B. - Bloomfield Farm

It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information

The Dominion School of Taxidermy, St. John, N. B.

We take pleasure in calling the attention of our readers to the fact that a Correspondence School, for the purpose of teaching the interesting subject of Taxidermy, has been started in St. John, N. B. There has long been felt the need of a school of this kind in Canada, especially in the Maritime Provinces whese game is so plentiful, and where specimens worthy of preservation are so often obtained.

Mr. Miles D. Emack, the founder of the school, is a prartical taxidermist of many years experience and well qualified to give instruction in every branch of the work.

This school presents the opportunity of learning how to mount birds, animals, game heads, etc. The course is composed of a complete set of lessons, clearly and concisely written, with illustrations and drawiugs adapted to aid the beginner in his work. This is the chance for those who wish to know how to preserve their own trophies and thus save money, or to do this work for others and by this means add to their incomes in leisure hours. It also presents a means to those parents who would solve the problem "How to Keep the Boy at Home?" This is a course which combines business, pleasure and decorative ingenuity and and the work is fascinatingly absorbing once it is understood.

The school has issued an illustrated catalogue in which the prospective student will find full information concerning the particulars of the course, the methods used, cost of tuition, etc. This catalogue may be secured by writing to address given above, enclosing two cent stamp for mailing.

Additions to Plant of the Enterprise Foundry Co., Sackville, N. B.

In spite of the comparatively quiet times throughout Canada this year, there is one firm at least whose buisness has increased so much that it necessitated large additions to their plant—This is The Enterprise Foundry Co., Sackville, N. B., makers of stoves and furnaces and advertisers in this paper.

One of the additions is an extension to the warehouse of ninety (90) feet. This was necessary in order that they might carry a larger stock and thus insure immediate shipment of all orders which they receive.

Another improvement is a thoroughly up-to-date absolutely fireproof pattern storage, size 50x60 ft. In this are kept all the different patterns for the many stoves and furnaces they make.

They have also recently made a large addition to their plating department and have installed an automatic polishing machine—one of the first to be used in Canada.

All these improvements and additions have been caused by the rapidly growing demand for Enterprise products which have secured such a high reputation for excellence throughout the Dominion.

It must be very gratifying indeed to the owners of this business to have such success attending their efforts, and it shows that there s throughout Canada a rapidly growing demand for goods of the very highest character and people are beginning to realize more than ever before the necessity of buying high class goods.

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"
"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvellous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvellous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it towards the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new "**GREAT WHITE LIGHT**" is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyne, whether new or renewal subscription. When sending in money state which size you want. Send today.

We guarantee these burners to do as represented or money refunded. Extra burners 35c. each.

CONCRETE MANURE PITS

THE following description is taken from Farmer's Bullentin, 481, "Concrete on the Live Stock Farm," United States Department of Agricul ture. The portion in back type is by the editor.

For maintaining or restoring the fertility of the fields, there is nothing better than barnyard manure. By the ordinary methods of piling manure on the ground or storing it in wooden pens or boxes, 30 to 50 per cent. of its fertility is lost. This loss is brought about in two ways: First, by leaching or washing due to heavy rains; second, by fermentation or heating caused by lack of sufficient moisture. Since concrete pits are waterproof, manure can be kept in them as moist as may be necessary and such an enormous waste in the fertiity of the manure may thus be entirely prevented. One load of manure from a concrete pit is worth 1½ to 2 loads of manure as usually stored. Moreover, with concrete pits the supply of manure is increased by all the liquid manure, the richest part, from the barn guttters and feeding floors.

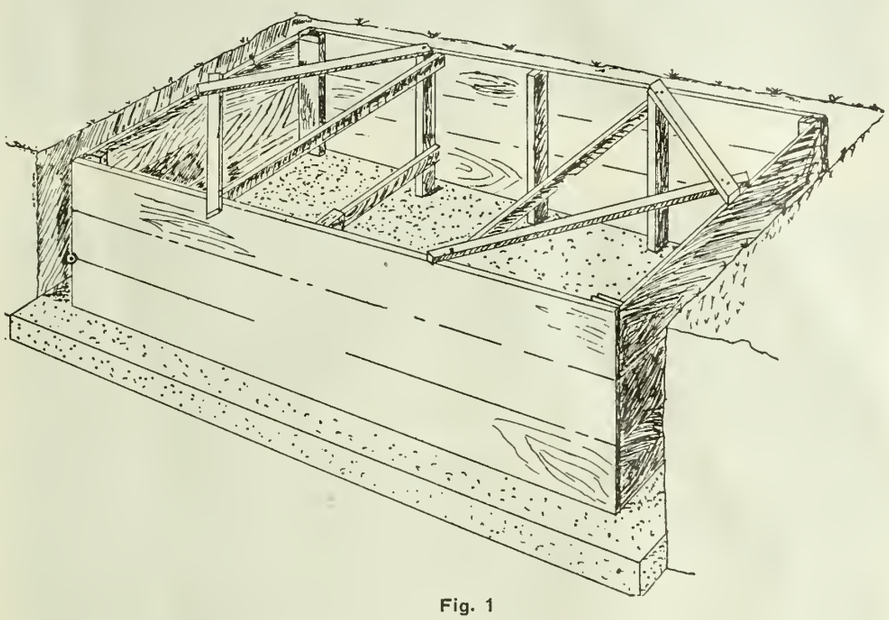

Fig. 1

Shallow Manure Pits.

Shallow manure pits do very well where the manure can be frequently hauled to the fields. In Figs. 1, 2 and 5 are shown plans for such a pit adjoining a feeding floor. The walls and floor are five inches thick. The clear dimensions of the pit are: depth, 3 feet; width, 6 feet; length, 12 feet. Dig the trench 3 feet 5 inches by 6 feet 10 inches by 12 feet 10 inches. By keeping the sides vertical, only an inside form will be needed. Frame the sides and ends separately. For the sides, cut the 1 inch siding 12 feet long and nail it to four 2 by 4 inch uprights 3 feet long and equally spaced. The end uprights for the sides are 2 by 4 inch pieces nailed flat to the siding; the others are also 2 by 4, but are nailed on edge. It is not necessary to cut these uprights to exact lengths; they may be allowed to extend above the siding. Make the siding for the end section of the form 5 feet 2 inches long and at the ends nail it to the edge of two 2 by 4 inch uprights. Palce a single 2 by 4 upright between each end pair. Cut four cross braces 5 to 10 inches long, from 2 to 4 inch timbers. Have enough sections of woven wire fencing, 7½ feet long, to cover the bottom of the pit.

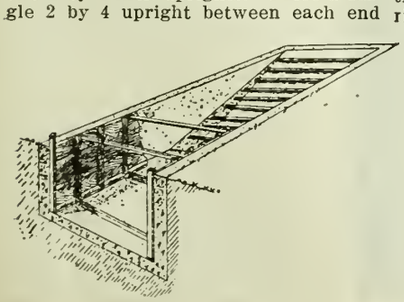

Fig. 2

Mix the concrete in the proportions of 1 part cement, 2 parts sand and 4 parts broken stone or coarse gravel according to the directions given in our book "WHAT THE FARMER CAN DO WITH CONCRETE," on page 148. Tramp in a section of concrete (not too wet) 2 inches thick and a little wider than the strip of woven-wire fencing used as reinforcing. Lay the wire with an even division of the extra length, so that it may project upward into the side walls. Tamp in the remaining 3 inches of concrete. Work rapidly and complete the floor. No facing mortar is needed.

Immediately set up the forms on the finished floor so as to allow a 5-inch wall on all sides. Join them by nailing together the 2 by 4's at the corners of the sides and ends. Do not drive the nails home. Cross brace with 2 by 4's and with 1 inch boards from each central end upright to the second side upright.

Quicky begin filling the forms with concrete almost wet enough to pour, and keep it practically the same height on all sides. Puddle the concrete by running a long paddle up and down next to the form. Do not puch the earthen wall. Dirt in the concrete may make a poor wall. If the top of the earthen wall tends to crumble, hold it back with 1 inch boards placed against the forms. To keep out flood water, pit may be extended 6 inches above the ground by using the ower half of a 1 foot board to hold back the dirt, by alowing the remainder to project above the ground level, and by adding 6 inches to the height of the inside form. Remove the forms after the concrete has set four days, by first drawing the nails in the corner 2 by 4's. The pit may be used after ten days.

Manure Basins

Where manure must be stored for a considerable length of time, larger pits or basins are required. Such pits are seldom made over 5 feet deep (in the clear at the deeper end) and are wide enough that the manure may be loaded on a spreader in the pit and drawn up a roughened concrete incline or run. The slope for such a run must not be steeper than 1 foot up to four feet out.

In building such a basin as planned in Fig. 3 use a team with a plow and scraper to make an earthen pit in which to build a concrete basin of the clear dimensions shown. In laying out the earthen pit, bear in mind that the concrete walls and floor are 8 inches thick and make due allowance for the same. With a spade trim the sides and the deep end vertical.

In order to form a sump hole from which the liquid manure ca nbe pumped, in one corner at the deep end of the pit dig a hole 18 inches deep by 2½ feet in diameter. To protect the concrete floor at the upper end of the driveway excavate a trench 18 inches wide and 2 feet deep for a concrete foundation apron. Extend it around the corners and slope it upward to meet the driveway incline.

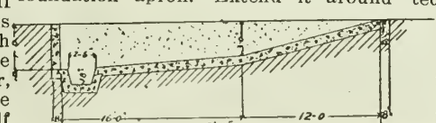

Fig. 3

In general, the framing of the form is similar to that of shallow pits. If the earthen walls stand firm, only an inside form will be needed. Otherwise, build an outer form. For the forms use 1 inch siding on 2 by 4 inch studding spaced 2 feet 8 inches. These uprights need not be cut to exact length. Save lumber by allowing them to extend above the siding. Stiffen each section of the form by nailing a 2 by 4 inch scantling to the uprights at top and bottom of the forms.

Erect the forms in the pit. Set them on 8 inch concrete blocks or bricks, so that the floor may be built under them. To prevent bulging, cross-brace the forms with 2 by 4 inch timbers. Begin filling with concrete, as for "Shallow Manure Pits," and do not stop until the job is completed.

Lay the floor for the bottom and the incline the same as for shallow pist. To give teams a sure footing on the incline, embed in the concrete the turned-up ends or iron cleats bent at right angles similar to a capital U. Old wagon tires, cut in lengths not greater than 20 inches and turned up 4 inches at each end, will do. Leave 1 inch clearance between the cleats and the concrete, and set them so as not to obstruct the wheelway. Space the cleats 14 to 16 inches. Roughen or corrugate the bottom crosswise every 6 inches by using a 5 foot length of 2 by 4 inch scantling beveled lengthwise to the shape of a carpenter's chisel. To make the corrugations, set the timber with the beveled face toward the incline. Strike the 2 by 4 with a heavy hammer, so as to indent the concrete to the depth of 1 inch.

SEPTIC TANKS

The problem of the sanitary disposal of sewage on the farm is becoming one of the most important questions. The old form of out house and the later cess-pool are gradually passing away as farmers are learning that they are nothing more than disease spreaders, a large percentage of all sickness being traced directly to them. The liquids from them seep into the ground and in time find their way into the best well or spring. Even though located down hill from the well, the rock formation is sometimes such as to lead the liquid directly into the well.

These methods are no longer tolerated in cities. Large sums of money have been spent for the installation and maintenance of sewage disposal plants. This large outlay, however, is not necessary on the farm. Where some system of water supply has been installed—such as a cistern and pump, elevated tank or hydraulic

ram—the house may be fitted with running water, giving all the conveniences of toilet, bath and kitchen. With this amount of water, there should be some method of disposing of the sewage, and this is best obtained by the use of an inexpensive eptic tank, which eliminates all danger of sickness from such a source.

The results will depend to a certain extent upon the kind of plumbing which is installed in the house. Each figure should have a separate trap and the soil pipe should be extended through the roof—see Fig. 1. A.

Septic tanks are nothing but long underground, water-tight cisterns through which the sewage passes very slowly and evenly. Being underground, they are warm and dark—ideal conditions for the development of bacteria or germs which live in the sewage and, by their growth, liquify the sewage and render it harmless in much the same way as another kind act on cider and cause it to ferment.

When the sewage enters the tank the solid matter or "sludge" rises to the top and it is in this "sludge" that the bacteria find their food, living upon it and gradually turning it into a clear liquid. To prevent this from being disturbed the current of the inflowing sewage should be broken up. This is done by placing cross walls—called "Baffle-boards"—in the tank and also by having the sewage enter and leave through vertical pipes. The latter condition is obtained by building the pipes with an elbow.

Location

In deciding on the location of the tank, choose a place where it can be placed with the side walls entirely underground and with the top flush with the surface. It should not be too near the house and should be entirely out of danger of flood water.

For a family of six to eight the tank should be 5 feet deep, 3 feet wide and 8 feet 4 inches long. The walls should be 8 inches thick. If the soil is stiff enough to stand alone, dig the hole 9 feet 8 inches by 4 feet 4 inches and 6 feet deep. This allows for using the soil as the outside "form." If the soil will not stand without supports then the size must be increased to provide for outside "forms."

Forms

The tank shown in Fig. 2a is divided into two compartments by the partition wall. By this method the inside forms are nothing more than two hollow boxes without any top or bottom. Build two hollow boxes, 3 feet by 4 feet and 5 feet deep, and place them so that they are 8 inches from the sides of the hole and 4 inches apart. This makes 8-inch side walls and a 4-inch partition wall. They should rest on 6-inch concrete blocks—previously moulded—which are laid on the bottom of the hole. As the partition wall is only 4 feet high nail two boards across the tops of this opening extending one foot from the top to make the side walls continuous.

Placing Concrete

Before starting to place the concrete, have all the drain pipes and the bolts to which the baffle boards are connected in place. This can be done by cutting holes in the forms," through which they are passed.

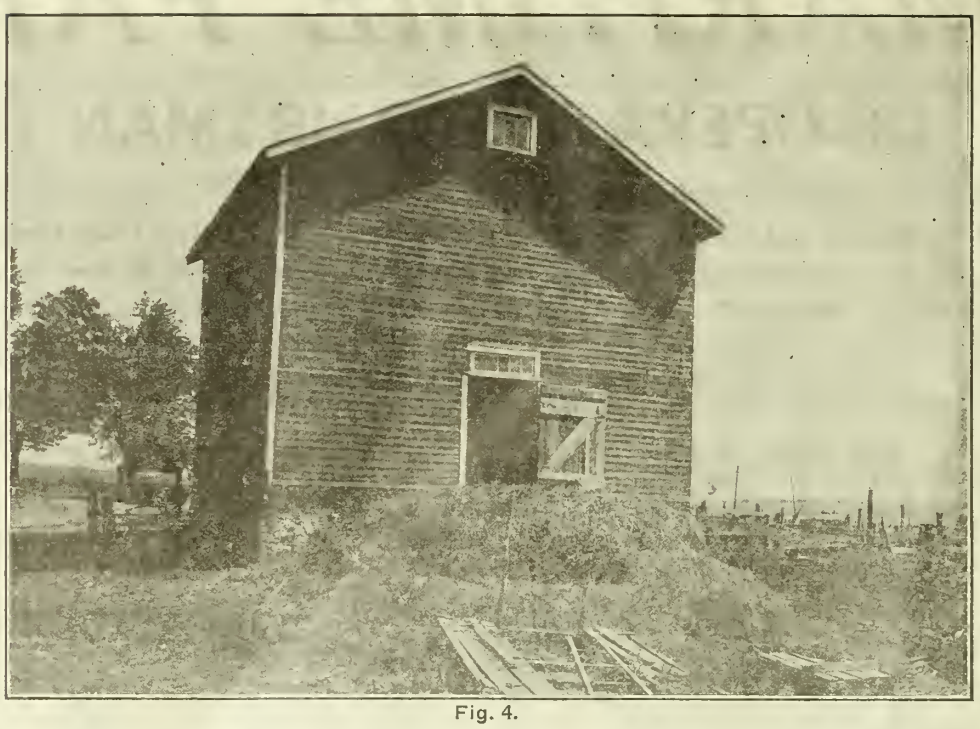

Fig. 4.

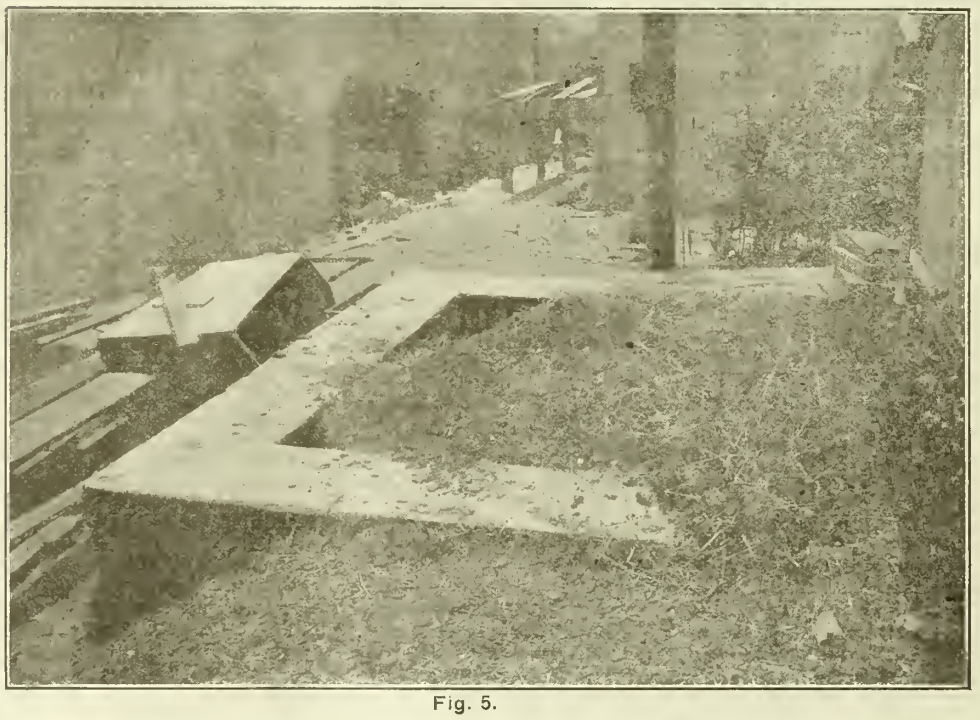

Fig. 5.

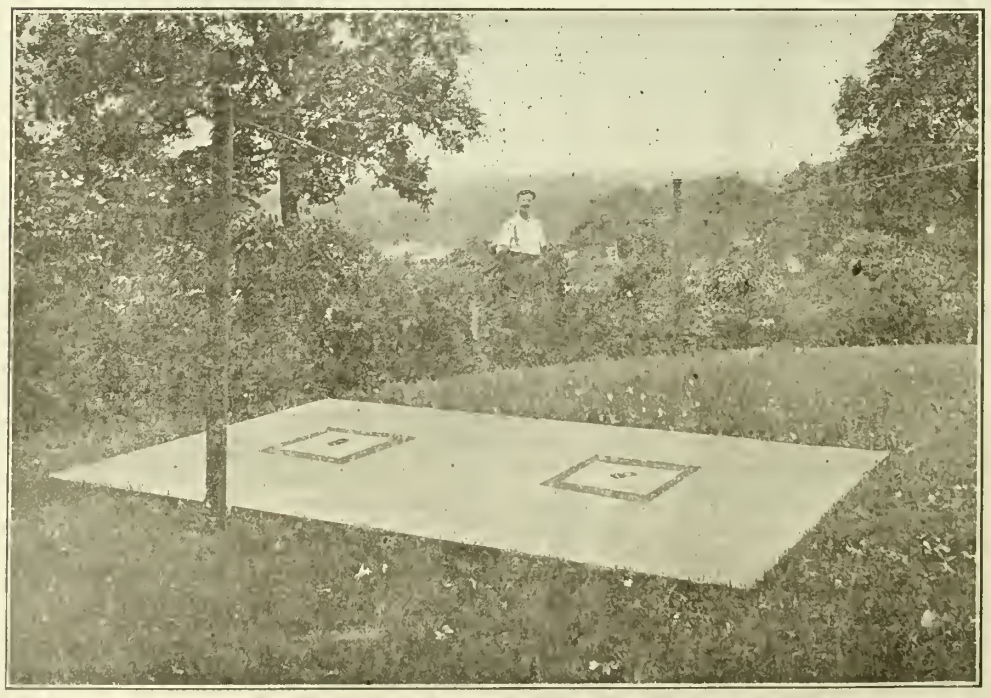

Top of Concrete Septic Tank

As the walls are to be water-tight the concrete should be mixed in the proportion of 1 bag of cement, 2 cubic feet of sand and 4 cubic feet of stone. It should be made muchy wet. Fill the wall forms first, 6 inches at a time, until the top of the form is reached—the partition wall stops at four feet. Immediately start laying the floor before the concrete in the walls has "set." In placing the concrete in the walls, some will spread out through the opening but this is all right. As the concrete is wet, it can be "puddled" as each layer is placed, by an iron rod or a 2x4. The surface next to the "forms" by working a garden spade up and down and to and fro between the concrete and the "form." This pushes the large stones away from the "face" and leaves a smooth surface without any hollow spots.

Roof

A Manhole is centered over each compartment for cleaning. The manholes are made with beveled sides and are two feet square. Before filling the manhole "forms," four one inch gas pipes are put in place vertically to serve as ventilators. As the concrete reaches the top bent pieces of iron can be inserted as handles for lifting them. The bevel edges insure a tight fit and the weight prevents children from opening them. The "forms" for the roof are supported by 4x4 struts which rest on wedges so that they can be easily removed.

In laying the concrete for the roof, first put in place a two inch layer of concrete and on top of this place steel rods 3-16 of an inch in diameter and 6 inches apart. The rods are placed across the shorter direction and are bent in the form of right angles at the ends to anchor them. Around the manholes the rods are placed as shown in Fig. 3a. After the rods are all in place, put on a layer 4 inches thick. This should be done before the first layer has become hard.

The inlet pipe is connected to the house plumbing and the outlet can discharge into the regular farm drain tile as it is nothing more than clear water.

If this liquid cannot be discharged into a stream, lay the tile with open joints, allowing it to filter into the soil.

Only a rich man can afford to keep poor cows. Sometimes it is said, that a man, unless he is well off, cannot afford to own good cows. This is wrong. If he can afford to own any, he can afford to own good ones. The man who refuses to spend the money necessary to purchase a good cow, and finds enough to get hold of a second ate one, must work double time to get any profit, and wait years before he can breed up to a higher standard. The fact should be realized at the beginning that it is better to put all the money in half a dozen good cows than in a dozen inferior ones.

The Control of Cabbage Maggot on Early Cabbage

Cabbage Maggot Injuries Serious

Any pest which attacks the roots of plants mustbe considered a dangerous enemy. The injury involves the parts most essential to tbe life of plants; and the pest itself is liable to be so hidden from view that its presence will become known only when the effects of its work appear, which is frequently too late for effective control. The concealment in the soil, also, and the protective influence of this cover make repressive measures very difficult and uncertain. For these reasons, control of the cabbage maggot has long been a problem for entomologists. In the growing of late cabbage, however, the insect is not to be feared in the field, since its ravages for the season are over before the plants are set; and the practice of screening seed beds makes it possible to secure, at only slight expense, healthy, uninjured, vigorous plants to set.

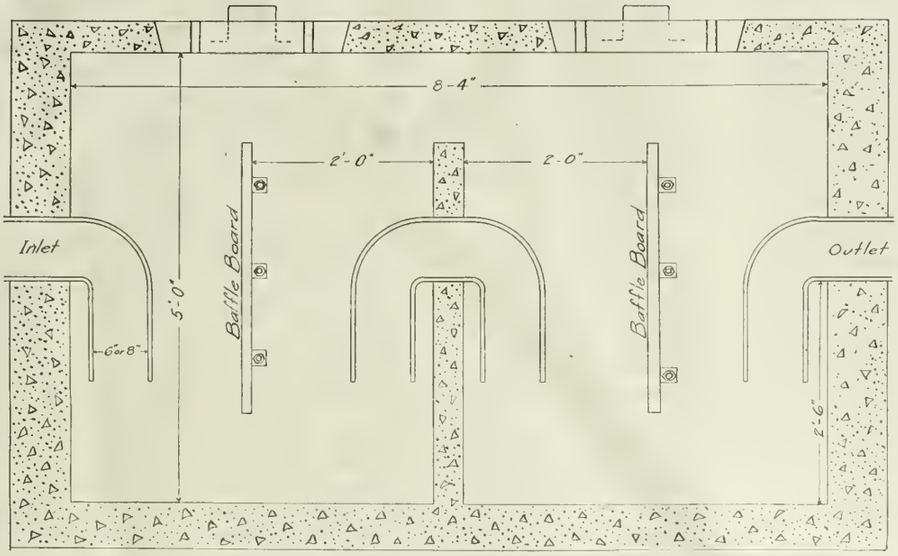

Fig. 2a.

Work on Early Cabbage.

Upon early cabbage, on the contrary, the cabbage maggot is a field pest; and its injuries are sometimes so scvere as to destroy all hope of profit from the crop. In order to secure the best prices for early cabbage, the heads should be ready for market in July; and this means that the plants must be set in the field—from greenhouses or cold frames—in late April or early May. Shortly after this time the cabbage maggot flies appear and are busy laying their eggs. From these the larvae hatch in a few days so that when the young plants should be making their best growth the maggots are most abundant and most busily at work. In consequenc, entire plantings of early cabbage are absolutely ruined.

Use of Insecticides.

Against this pest, only two methods of control are practicable—the young maggots may be killed by injecting into the soil some conttact insecticide, or the flies may be prevented from laying their eggs about the plants. Many materials have been tested for the purpose of destroying these larvae, but, in the main, with out thoroughly satisfactory results. If strong enough to kill the maggots the materials employed have also been strong enough to injure the delicate roots of the plants and to so stunt them that the crops have been little better than they would if the insects had been allowed to work undisturbed.

The experiments made by other entomologists, some of them dating back thirty years, and preliminary tests made at the station seemed to indicate that carbolic acid emulsion was most promising of all the insecticides suggested, and it was decided to make a series of thorough tests with it in both laboratory and field.

Tests of Carbolic Acid Emulsion

In the laboratory, direct immersion of eggs of the maggot flies in the emulsion, even when as strong as 11-3 per cent. of carbolic acid, did not affect them; but when the eggs were covered with soil and treated with emulsion, so that the exposure was more prolonged, as it would be in the field, few of the eggs hatched and the larvae that did hatch died near the eggs. This was true even when the emulsion contained only one-third of one per cent. of the acid.

Field tests with the emulsion were made during two different years on cabbage seed beds near Seneca Castle, but it proved wholly ineffective, though not injurious to plants five to seven inches high. On plants one or two inches high the same emulsion was very injurious. In tests on transplanted cabbage, in two fields—one heavy clay and the other light sand—an emulsion slightly stronger than one-third of one per cent. acid caused serious injury to recently set plants. Plants longer set were not injured. As a result of all these tests with insecticides, then, even the one commonly regarded as best is a very uncertain dependence against cabbage maggot. Although it will destroy eggs and young maggots when used at a strenth of one-third of one per cent. carbolic acid, it will not kill older larvae; and it is certain to injure small or recently set plants and liable to do some harm even to older plants.

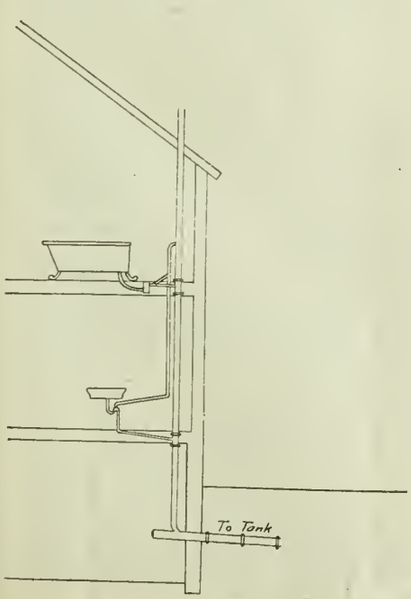

Fig. 1a.

Tar-pads.

There remains, therefore, only one resource—to prevent the flies from laying their eggs on the plants. The so-called "repellent" materials—lime, ashes, tobacco dust, tar, etc.—have proved either wholly ineffective or too expensive to use; but one mechanical obstruction to egg-laying—the "tar-pad" or hexagonal disks about 3 inches from angle to angle, slit to the center at one angle and with a short cross-cut at the center which allows the collar to fit about the stem of the plant. When placed in position it should lie close upon the ground and fit snugly about the stem, so that the flies of the cabbage maggot are mechanically prevented from reaching the stem at the point where the eggs should be laid, just at, or slightly below, the surface of the ground. These pads can be easily and rapidly cut by the use of a special tool, not patented, and easily made by any good blacksmith. The pads can be made for from 50 to 55 cents a thousand.

The idea of using such pads was first proposed about 25 years ago, and they have been used with good success in several loc. s since that time.

Tests of Tar-pads.

At the station four careful tests with these pads were made during 1912 and two during 1913, and the results justify a hearty recommendation of this method of preventing inury to early cabbage by maggots. In three tests injury from maggots was great and benefit from use of pads was marked. In the first field 400 disks were applied to 4 alternate rows of plants on May 22, and during the next month ten per cent. of the check plants were killed or badly wilted, as compared with one per cent. of those protected by the tar-pads. In addition to this notable numerical difference, the cabbages in the protected rows were slightly larger than those in the check rows. That is, maggots had worken on the unprotected plants and checked their growth even where the attack was not severe enough to result in death or distinct dwarfing. The same effect was noticed in all the other tests where maggots were abundant. This check to growth materially interferes with early heading, a most important factor in protable marketing of early cabbage. In the second test 16 per cent. of the check plants were killed or seriously injured, as compared with 5¼ per cent. of those protected. In this case the lumpy condition of the clay soil and low setting of the p ants made it impossible to place the disks so that effective protection could be secured in all cases. and a heavy shower soon after placing the disks covered many of them with earth and allowed the flies to deposit eggs on the stems above the pads.

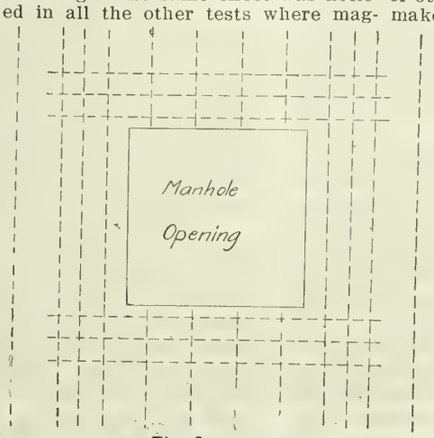

Fig. 3a.

In the third test of 1912, the injuries on checks and protected rows were eight per cent. and two-thirds of one per cent. respectively. In the most striking test in 1913 disks were placed on about 700 plants in six alternate rows, on May 3. By June 5 the alternate ro vs shawed marked dierences. It was estimated on June 9 that 93 per cent. of the protected plants and only 45 per cent. of the checks would make marketable heads.

After harvest it was found that nearly three-fourths of the plants in the protected rows had furnished suitable heads for early marketing and only one-fifth of those on the check rows.

On the basis of 1,000 plants, the results were as follows:

marketable heads yielded by 1.000 protected plants	723
Marketable heads yielded by 1,000 check plants	193
Gain due to tar-pads	530
Value of 530 heads at 8 1-3 cts per head	$44.17
Cost of protection	1.40
Net profit per 1,000 protected plants	$42.77

Maggot Injury Unevenly Distributed.

In two of the tests of the first year and in one the second year, cabbage-maggot injury was comparatively slight, even on the check rows, although other fields nearby suffered severely from the pest. This restricted distribution of maggot infestation is a factor that must be considered by each grower; for fields adjacent to those badly infested, or even certain areas in infested fields, may be comparatively free from the insects and therefore need no protection. In testing the ability of the use of the pads it will be well to apply them in alternate rows, leaving the intervening rows as checks, in order that the extent of the infestation and the effectiveness of the pads may be more readily learned. If uninfested areas of considerable size are noted, they should be kept under observation in subsequent years, as soil or other conditions there may regularly make these areas practically immune to maggot injury, so that pads need not be applied.

Conclusions.

These tests prove quite plainly and conclusively that where maggots are abundant and where conditions are such that the pads can be properly applied, these tarred-paper disks serve as efficient protectors of the cabbage plants. They not only prevent serious injury to practically all the plants, but protect all from the slighter infestation which retards growth and makes the earliest and most profitable marketing of the crop impossible. Their use has advantages over the use of carbolic-acid emulsion, aside

GIVE YOUR BOY A COURSE AT N. S. A. C.

The Nova Scotia Agricultural College will open its doors for the 1914-15 classes on November 3rd. Will your boy be one of the number who will enter the N. S. A. C. this fall to prepare himself for one of the numerous opportunites which is available to the trained agriculturist? Writing on the Subject of "Opportunites for College Graduates in a recent issue of The Breeders' Gazette says:- What opportunities are open to the graduates of "the agricultural college? This question is often asked; as if the farms of the country were not waiting and calling for all the knowledge and training available. Perhaps the question implies that the graduate ought to do something better than to farm; as if the farm did not require the best talents of any man and repay his efforts about as fully as most lines of business and with far more certainty. The question is, however, capable of analytical answer, and I will try briefly to show what the graduates of the agricultural colleges of the country are doing. I may remark by way of preface that approximately 95 per cent of them are in some form of agriculture with exceedingly few failures.

"The things such graduates may do are divisible into two classes: those he may undertake immediately upon graduation, advancing with experience, and the other class which he should not undertake without more age and experience than are possessed by the average man at graduation.

"The great opportunity for the graduates of the agricultural college is farming. That it is so regarded is shown by the fact that more than half of all the number go at once upon the farm, not to mention the difficulty in securing modern highpriced land, and the necessity which drives a good many for a time into something that will bring ready money with which to pay college debts and to make at least a payment upon an outfit for farming. Statistics prove this point and while I cannot substantiate the statement by data my opinion is that at least 90 per cent ultimately own and operate land. In any event, almost every teacher in college, or journalist, or forester of middle age, owns land somewhere.

"Whatever other calling may be open to young men from the agricultural college, and they are many, it will be a sorry day when, if ever, the colleges themselves or their students lose sight of the fact that the great business of the American agricultural college is to prepare young men for successful country life. They are colleges not for a landed gentry ; nor are they peasant schools to drill an ignorant constituency in the art of husbandry, like most of the agricultural schools of Europe. They are institutions for acquainting average intelligent citizens with the science and the economics of food production and the methods and standards of rational living in the open country,

"Responsive to their ideal, it is safe to say that, in general, every graduate heads at once for the farm, providing only he has a farm to go to, and if he has not he begins to lay plans for securing the means of getting at least a foothold on land The apparent exceptions to this are the natural teacher and student of agricultural science, though most teachers own land.

"For the present purposes the graduates are roughly divisible into two classes ; those who own or have ready access to land through relatives, and those who have no present means of obtaining a foothold. Both classes are again divisable into two groups : the country-born, acquainted with the art of farming, and the city boy, ignorant of the most common details of country life. Here then are four groups of would-be young farmers, and each has his problem.

"Fortunate is the young man who was born and brought up in the country and who has a farm in his own right awaiting his graduation. This man soon marries, establishes his home, attends strictly to his own business for a few years, and is gradually drawn into positions of influence among his neighbors. He has generally learned two things through graduating; one is to keep his mouth shut; the other is that he owes service to the community as soon as it calls upon him. The course of this man is clear and his success is limited only by his natural ability, the fortune of health and the blessed fact that farming does not lead into overwhelming wealth.

"To the country boy without land two courses are open. He may rent or he may go where it is cheap and lead the life of a pioneer. In many respects the latter course is preferable and in the end brings the largest returns, though the family has less to enjoy in the immediate prospect than if farming should be carried on upon rented land in an older country.

"The city boy with land at his command is of course in an anomalous position. He is supposed to know agriculture because he has been to college, but he has never practiced farming and he has much to learn that is not taught in college, as has every graduate. What he has learned is something of the science of agriculture that will help him in his general policies. What he has not learned is the art of daily practice of farming and the thousand and one details that go to make up the technique of one of the most complicated of all the professions.

"If this kind of student has been wise and well advised he will have spent his summer vacations upon the farm. If he has not succeeded in this before graduation the very best course is to hire as a farm hand upon some good farm for at least a full year. What ? A college graduate work as an ordinary hand with his head full of valuable knowledge ? Certainly ; why not ? Some of the best railroad presidents were once section hands, at least for a limited time. Whatever is good of his knowledge is safe from leaking out of his head while his hand becomes cunning in the only possible way. After this he is safe in beginning his own farming operations. This course is strictly advised except where the boy's possessions lie in a new country, where the operations are simple and possible of "picking up" from the neighbors.

"The fourth class of would-be farmer is the city boy without land, and his course is either to go at once to a new region to "grow up with the country," or to follow some other occupation than farming till he can accumulate money for a start, using every opportunity in the meantime to pick up a knowledge of the art to suppliment his knowledge of the science of agriculture.

"The reader would be surprised to know that a full third of all the students in most colleges of agriculture come from the town or city, with little or no actual knowledge of farming. He would also be surprised to learn that most of these men "make good," their enthusiasm and energy going far to make up the lack in not being "to the manner born." They are of course a picked lot not many generations removed from the land and born with an instinct for country life. Sharply to be distinguished from the tpyical citizen who abominates the "dullness and monotony of the country."

"There are many other avenues open to this class of young men the morning after commencement if not before. First of all they may teach.

"Our rapidly growing faculties of agriculture must be recruited largely from young graduates. Once a man is successfully settled upon the land he will scarcely be available for teaching, and if not successful he is not wanted. If the young graduate plans to teach in college or to work in the scientific staff of the experiment station he must expect to serve cheaply for a few years, then go to some good university other than the one from which he graduated for about three years of post-graduate study, though generally some portion of this study may be done in connection with minor paid positions. After a long period of preparation he may expect if successful to hold a $2,000 position, which if things go well may increase to $3,000, $4,000 and possibly to $5,000 or $6,000, though there are few of the latter because the teaching profession does not pay commercial salaries and the average salary in agriculture is not far from $2,000 in the best institutions.

"The young graduate can go at once into an agricultural department of a secondary school, normal school or small college at $1,000 to $1,500, according to his experience, and without spending more than one additional year in college he can earn $2000 and perhaps advance to a superintendcy at $2,500, but if he goes much further he will need his doctor's degree.

"Quite akin to college and school employment are the positions in the scientific staff of the Federal Department of Agriculture which employs thousands of men of almost all degrees of experience from the novice at $50 a month to the mature man at $2,000 to $3,000 a year, and in few cases more.

These two great callings, farming and teaching, with the kindred work of research, absorb the great bulk of graduates from the agricultural college.

"But there are still other avenues. By farming we mean the production of grain and forage crops, live stock, fruit, vegetables, milk and other foods characteristic of the country. Growing out of this is another line of occupation for which the college man may train himself, such as the conduct of milk depots with city delivery, creameries, cheese factories, confectioneries, condenseries, canneries and abattoirs.

"There yet remains to engage the attention but requiring specialized courses veterinary medicine, forestry, machine experting for harvester companies (a favorite vacation employment), floriculture, and the growing profession of landscape gardening. Last and most difficult of all in its requisites as to knowledge, specific training, and natural bent is journalism and authorship two growing and influential callings recruited from the ranks of agricultural college graduates.

"There are certain lines of agriculture for which the student needs a degree of maturity and an amount of experience which are not found among the average college students at graduation.

One of these is the oversight and management of large landed properties belonging to other people. In rare cases where the owner is father or other relative, with a personal interest in the young man, and especially if he himself is a practical farmer, the graduate may safely begin on the plan of "working into the business." But when the estate is owned by a man primarily interested in other things, or where he has newly heard the agricultural bee buzzing in his bonnet, or when, having made a "hatful of money," in some city business, he now desires a country place as a plaything to show his friends—in all cases of this kind the young man should pass by on the other side and the two keep as far apart as possible. Any one of these contract's is a man's job, requiring the extreme of knowledge and experience combined with a kind of balance that comes only with maturity, and a diplomatic tact found but rarely. It is foolish for young men to undertake these responsibilities and it is criminal to assist them in doing so. No self-respecting college will recommend its young graduates as candidates for failure in this difficult and hazardous line of work.

"Pretty much the same can be said of the country adviser. God save the mark! To undertake the contract of advising hundreds of farmers, rich and poor, capable and incapable, educated and ignorant, wise and foolish—this too is a man's job. No boy, however well educated, can know the problems of a man with a family on the farm, with sickness, disease and debt, beside the hazard of season and the disappointment of children gone wrong. It is the preacher's job as well as the farmer's and the agricultural adviser, like the medical missionary, must know how to apply the knowledges he posseses and to use it to advantage in a multitude of difficult if not conflicting circumstances. Here too are demanded maturity and that judgment which is born only of experience, both successful and unsuccessful, and here too it is a crime to put the young man with only twenty-two years and a college course behind him.

"Colleges of agriculture are frequently critised for not being able to furnish skilled labor for ordinary employment on the farm or for operating small farms for non-resident owners. The colleges exist not for the purpose of training men for hire for and owners but for the purpose of training farmers to engage in business for themselves. and while there are individuals who offer themselves temporarily for ordinary employment at ordinary wages it is for the experience they can get, and these men are headed for successful farms where they can learn from others, not for farms which they are expected to operate at ordinary wages for other people.

"All in all the openings are many and the opportunities are worthy the best of men, but they all demand a superior type of men with good training, seriousness of purpose, and unflagging industry. There is no place in agriculture for the lazy or the incompetent college graduate, of which, however, the numbers are few, and under present policies rapidly declining."

Disinfecting Farm Premises.

An object is said to be infected when contaminated with disease poducing germs. It is disinfected by destroying the vitality of these organisms. Disinfection deals only with destroying the vitality of these minute forms of life which cause disease. It does not mean the destruction of all lower forms of animal and vegetable life that may be in or upon an object; this is sterilization. Disinfection must necessarily be greatly in excess of the actual requirements, as we are attacking an invisible foe. For instance, a sick room might be disinfected and rendered safe by the use of a small amount of germicidal solution to a limited area. but as we are not able to see the germs it is necessary to apply disinfecting agents to every inch of surface of the room, and all its contents in order not to miss that particular spot.

Our present knowledge of disinfection favors the vapor or gaseous disinfectant. By reaching all confined spaces it has a better chance of coming in contact with all infective material. Formaldehyde comes nearer being an ideal disinfectant than any of the gases in general use. It is not poisonous and does not injure fabrics, doors, metals, or objects of value. The preparation of a room is of great importance. As a great deal of gas is lost through cracks and crevices, all such places should be closed by pasting paper over them, or by caulking with suitable material. Expose the objects in the room so that the gas may have free access to all the surfaces. Hang clothing, bedding and fabrics upon lines strung acros the room, move furniture away from the walls, and open the doors of closets, bureau drawers and lids of boxes, so that the gas may enter freely While the articles in the room must be arranged so the gas may gain access to all surfaces possible, do not disarrange the contents too much, as the same surfaces should be exposed to the gas that were exposed to the infection. The secret of successful disinfection with formaldehyde gas is to obtain a large volume of gas in a short time, a temperature above 65 degrees F. and a certain degree of moisture. A concetrated voume of formaldehyde gas will kill exposed bacteria almost instanty, but to destroy spores it requires about one hour. Penty of time shoud be given to allow the gas to permeate to all corners and dead spaces of the room.

The following formula is one of the best methods of use on account of its simplicity and the large amount of gas evolved in a short time: Use 500 c. c. of formalin and 250 grams of potassium permanganate for each 1,000 cubic foot of air space. The potassium permanganate is first paced in a pail and the formalin poured upon it. An active effervescence takes pace and considerabe heat is evolved; therefore a pail of sufficient capacity, and especially of sufficient height, should be used to prevent boiling over. The floor should be protected from heat by the use of some bricks or some suitable device. For small spaces, such as cosets, wardrobes and cabinets, the formalin may be sprayed directy upon the objects to be disinfected. In this way they enjoy the direct germicidal action of the substance in solution and further are bathed in the gas which is sowly evolved. This method is not practical for larger rooms. The room or incosure undergoing disinection should remain closed for at least eight hours; after which it should undergo a very thorough mechanical cleansing and be opened for the free entrance of air and sunshine.

The conditions met with in stables render their disinfections difficult on account of the accumulation of organic filth, and high resistance of anthrax and tetanus spores, for which stables are sometimes disinfected. It is advisible to give a stable a preliminary fumigation with sulphur in order to destroy surface infection and the vermin which always occupies these places. This is done by thoroughly moistening the surfaces and articles to be disinfected, and burning 3 pounds of sulphur for every 1,000 feet of air space. Remove all small articles that need disinfection, such as pails, currycombs, brushes and other articles that have been used around the infected animals, or have come in contact with infected material. These should be thoroughly scrubbed and allowed to remain for several hours in a 5 per cent solution of carbolic acid. All hay and grain should be removed from the racks, all bedding from the floors, and all debris from the cracks in the floor and walls. After its collection at some safe place this refuse should be saturated with petroleum and burned. All surfaces of the stable should now be thoroughly saturated with a strong antiseptic solution, such as 5 to 10 per cent carbolic acid. The floor and walls should then be scrubbed with a strong hot lye solution. After several days exposure to air and sunshine the interior of the stable should receive a fresh coat of whitewash, prepared from freshy-burnt lime.

Wells may be disinfected by the use of freshly-burnt lime; half a barrel should be put in the well, thoroughly stirred, and the walls washed down with the resulting milk of lime. The well is then pumped out, cleaned, allowed to refill and a second supply of lime added. This should be allowed to remain 24 hours after which it is thoroughly stirred, pumped out and allowed to refill. This is repeated until the water is free from lime. Chlorinated lime may be used for this purpose, sufficient being used to make approximately a 1 per cent. solution. Soil may be satisfactorily disinfected by the free use of lime.

When to Cut Corn for Silo.

Twenty years ago the Maine Agricultural Experiment Station studied the yield and composition of Maine flint corn at different stages of growth. These results, which are probably lost sight of by most Maine growers of corn, are just as valuable and as pertinent today as they were when made. They are far more valuable for Maine conditions than experiments made in States having a warmer summer and a longer growing season.

In order to obtain data on this important point, a field of Maine dent field corn was cut at five different stages of growth. The field selected for this study was very uniform. It eared out finely and was in every way suited for the experiment. There were ten tenth-acre plots, each with five rows of corn.. One row in each plot was harvested at the five differen' stages of growth. Hence, each cutting represents one-fifth acre. The first cutting was made when the ears were just beginning to form. This second cutting was made 13 days ater, when the plot contained a few roasting ears. The third cutting was made a week later, when all the ears had reached the roasting stage. The fourth cutting was made another week later, when the ears were beginning to glaze, and the last lot was cut ten days later, when all the ears were glazed.

There was a continuous increase in dry matter from 11.7 percent at the first cutting to 25.3 percent at the last. The graduations were 11.7 percent., 17.5 percent., 19.6 percent., 23.1 percent., and at the last cutting, 25.3 percent dry matter.

There was also a steady increase in protein as follows: 1.8 percent. 2.1 percent, 2.2percent, 2.3 percent, and of nitrogen free extract from 5.5 percent by the following steps: 9.7 percent, 11.7 percent, 14.5 percent to 16 percent nitrogen free extract in the corn cut when all the ears were glazed.

The mature corn is much less watery. This means that it contains more nutritive matter. During the thirty days while the crop was maturing, there was a constant increase in the percentage of dry matter. There was also a constant increase in weight of dry matter. At the first cuttng, the total crop yield was 13 tons per acre; at second cutting, 15½ tons; at third cutting, 14½ tons; and at last cutting, when the ears were all fully glazed, 14 tons. From this it might be infered that the time to cut was at the second cutting when there were only a few ears at roasting stage. The yield in dry matter, however, constantly increased as follows. At the time of first cutting, there were 3050 pounds dry matter per acre; at second cutting, 5,200 pounds; at third cutting, 6050 pounds; at fourth cutting, 6700 pounds. and at the last cutting, 7050 pounds The dry matter increased two tons per acre during the thirty-seven days, or at the rate of over 100 pounds per day. This daily increase per acre is equivalent in quantity to the daily ration for four or five cows.

Furthermore, this increase was mostly in the nitrogen free extract which is a mixture of such highly nutritious bodies as sugar, starch and gums. The proportion of starches and sugar increases from 25 percent at time of first cutting to 50 percent. at last cutting. The actual weights of starches and sugar increased as follows: First cutting contained 360 pounds per acre; second cutting, 1200 pounds; third cutting, 1550 pounds; fourth cutting, 1750 pounds; and the last cutting, when the ears were all fully glazed, 2250 pounds of starches and sugars per acre. There is as constant a growth of starches and sugars up to full maturity.

Other letters have given the results of experiments made by the Maine Station and show that the varieties of corn that will mature in Maine are the most economical for either fodded or silage. These experiments show why this is so, and also point out the fact that there is a large and continuous production of the valuable plant constiuents up to the period of full maturity. From this it follows that harvesting half-grown or immature corn is a wasteful practice. Owing to the large production of sugars and starches in the late stages of growth, a pound of the dry substance of the mature, well-eared plant possesses a higher nutritive value than at any earier stage of growth. For the most economical production of fodder and siage, it is clear that one should use a corn that will mature in Maine and that it should be allowed to stand until the ears are full glazed.—Chas. D. Woods, Director Maine Experiment Station, in Maine Farmer.

Wise Advice.

Said a wise college professor to his class:

"Do not fall into the very stupid error of thinking that no matter how highly learned you may become you do not need constant association with the unlearned classes of society. These men know many things from actual contact with life that books and schools do not convey and which you must know if ever you become truly effective.

How Sod Affected an Apple Orchard

Tillage Superior to Sod Mulch

Five years ago a bulletin of the Geneva, N. Y. Station, No. 314, announced that in the Auchter orchard, typical of the great majority of commercial apple orchards of western New York, the tillage-and-cover-crop system of soil management was, in practically every way, superior to the sod mulch system. Five additional crops have confirmed this conclusion and strengthened the belief that grass roots above apple-tree roots are detrimental to the health of the trees and a menace to good crops.

Under exceptional circumstances, as in the Hitchings orchards, discussed in Bulletin No. 375, deep soil well supplied with moisture may grow both apples and grass successfully and to the financial advantage of the orchardist; but such conditions are so uncommon in commercial orcharding in the great New York apple-belt that the only safe practice is to adopt the tillage-and-cover-crop system unless careful study of all factors has proved sod-mulch better for the particular combination of topographical, soil, labor and market conditions in individual orchards.

Auchter Orchard and its Management.

The Auchter orchard, in which the experiment here reported was located, is near Rochester, in the heart of the "apple-belt" and was chosen because it was uniform in soil and topography and quite typical of the apple orchards of western New York. The land is slightly rolling and is a fertile Dunkirk loam, about ten inches deep, underlaid by a sandy subsoil. The orchard includes nine and one-half acres, set to Baldwin apple trees, 40 feet apart each way, which were 27 years old when the experiment began in 1903. About 120 trees were included in each half of the experiment. On the sections devoted to tillage the land was plowed each spring and cultivated from four to seven times, after which a cover crop was sown, usually during the last week in July. During all but the last year in the five-year period the cover crop has been medium or mammoth red clover, but in 1913 oats were sown. On the sod-mulch plats the orchard grass and the blue grass were cut once, sometimes twice, and the crop allowed to lie where it fell. In all other respects except the application of fertilizers in certain subsections, the treatment of the plats has been alike and such as prevails in the best commercial orchards.

Experimental Conditions and Results.

During the first five years of the experiment the orchard was divided into east and west halves for the cultured operations and during the last five years into north and south halves. In this way, at the close of the ten years the northeast quarter of the orchard has been tilled ten years, the northwest quarter in sod five years and then tilled five years, the southwest quarter in sod ten years and the southeast quarter cultivated five years and then in sod five years. About one-half of the area in sod during the last half of the test—a section through the middle of the area—received annual applications of nitrate of soda in an effort to overcome the unfavorable influence of the grass.

In considering results, of course yield comes first, since orcharding is a commercial proposition and upon the amount of fruit harvested must largely depend the income; but in comparing systems where production cost differs as greatly as in sod-mulch and tillage methods of soil management, it is essential to associate these costs with the yields.

The average yield on the plat left in sod for ten years was 69.16 barrels per acre, on the plat tilled for ten years 116.8 barrels, a difference in favor of the tilled plat of 47.64 barrels per acre. These apples were sold at varying prices but averaged $2.60 for bareled stock and 72 cents for evaporator and cider stock, from which sales there was secured an average annual return of $126.04 per acre ofr the apples grown on sod and of $224.15 from those under tillage. The average acre-cost of growing the apples on sod was $51.73 and under tillage $83.48. Subtracting these figures from the gross return we have a "balance" per acre for the sodded plats of $74.31 and for the tiled plats of $140.67, an increase in favor of tillage of $66.36. For every dollar taken from the sodded trees, after deducting growing and harvesting expenses, the tilled trees gave one dollar and eighty-nine cents.

In general quality, also, the fruit from the trees under tillage was much better, being crisper, jucier and of better flavor; and it kept from two to four weeks longer than the fruit from trees in sod. In color, however, the apples grown on sod were superior to those from tilled trees, and they matured from one to three weeks earlier.

The difference in the effect of the two systems on the trees was almost as great as on the fruit. The trees in sod gained 2.4 inches in tree diameter, taking the average of the measurements, while those under tillage gained an inch and a half more than this, or 3.9 inches. This difference extended to a similar ratio to gain in height and spread of branches; and the foliage of the tilled trees was so much more abundant, and of such dark, rich, green color, that the line between the two plats could be recognized more than half a mile away.

Closer view showed more plainly the sparseness of foliage, irregularity of branches, presence of dead branches and lack of plump, healthy, bright-colored new wood on the trees grown in sod. The trees under tillage, on the other hand, were very uniform in development, with new growth and fruit well and evenly distributed, and notable for their vigor and health.

Change of Conditions

At the close of the first five years one quarter of the orchard was changed from sod to tillage and another quarter from tillage to sod. In each case the effect of the change was almost instantaneous. Before midsummer, the trees released from the influence of the sod showed plainly the benefit of the added moisture and available plant food furnished them by tillage. Both trees and foliage improved notably, and the apples on them grew as large as any in the orchard. The number setting was, however, influenced by the previous poor conditions so that the first year's crop was below normal; but the average for the entire five years was as great as that of the trees continuously under tillage. The change for the worse was quite as remarkable and as immediate in the section of the orchard turned from tillage to sod; for the average yield per tree on this section during the first yea was less than three-quarters of a barrel, while even the trees continuously in sod yielded twice this amount.

The use of nitrate of soda on the sod helped matters somewhat and was a paying investment, yet for the whole five years the trees in sod thus fertilized yielded less than half as much as the tilledt rees without any fertilizer.

Does Tillage Exhaust the Soil?

Since the trees under tillage have borne heavy crops annually for ten years, without any addition to the soil except the seed of the cover crops used, it might be supposed that the soil would show the draft. Careful analyses made at the close of the test prove that this is not the case. The mineral elements of fertility are practically alike throughout the plats. and the nitrogen and humus are much greater on the tilled plats. Though analyses were not made at the start it is not probable that material differences then existed, for the soil is apparently quite uniform, and previous treatment had been made the same for years. It is fair to conclude that the tillage and cover-crop treatment conserves nitrogen and humus better than the sod-mulch treatment, while it also gives much larger crops.

Why is Grass Harmful

Grass in an apple orchard is evidently a detriment, and it acts against the best interests of the trees in several ways. These ways have been so fully discussed in Bulletin No. 314 that it is only necessary to state them here.

(1) The growing grass lowers the water supply, since every plant uses and evaporates many score of times its own weight of water. Under rare conditions this reduction of the water content of the soil might be an advantage to the trees, butt in ordinary seasons, on soils neither very deep nor specially retentive of moisture, as in most New York orchards, the trees need all the rain that falls during the growing season, and the draft of the grass roots on the supply of water left near the surface by showers is robbery that affects both the crop of apples and the trees that bear them.

(2) With the water there goes into the grass a certain amount of plant food, which will become available to the tree roots only after a considerable time and some of it probably never. The use of fertilizers in certain portions of the Auchter orchard proved this factor of plant food of less consequence than that of water; yet the trees in sod responded promptly and profitably to applications of nitrate of soda. Trees under tillage, on the other hand, seemed to have enough and to spare of nitrogen, as well as all the other food elements they needed.

.4) The growth of grass on a soil reduces its temperature. Whether this is a serious disadvantage we cannot say, but most New York apple soils are comparatively cold; so it would seem reasonable to suppose any additional cooling influence harmful, as heat causes the food substances in the soil to dissolve more rapidly, hastens their diffusion through the soil water, aids soil ventilation, stimulates the absorptive action of the roots, and helps to form nitrates in the soil. Thermometer readings made over a considerable period showed that the tilled soil in June and July is more than a degree warmer than the sodded soil in the morning and more than two degrees warmer at night.

(5. The supply of air is less in a sodded soil than a tilled soil; and good soil ventilation is essential not only to the life of the plant itself, but also to the activity of the bacteria which make certain forms of plant food available.

(6) Sod affects deleteriously the

beneficial micro-organisms in the soil. The experiment given supplies no definite data to support this statement; but the lowering of the humus content of the soil, restriction of the air supply, cooler temperature and smaller moisture content of the soil under the sod are all factors unfavorable to the development of those bacteria whose action in the soil we know to be beneficial to plants.

(7) Sod may "poison" apple trees. This conclusion has been reached by very careful investigators in England, who assign to this factor, principally, the evil effects which they have found to follow attempts to grow apple trees in sod land. The sudden changes from good to illresults when trees in the Auchter orchard were changed from sod to tillage, lend some support to this theory that the grass roots excrete some substance harmful to apple trees: but the other factors previously mentioned, particularly the lowering of the water content of the soil, seem quite sufficient to account for the evil influence of sod without laying much stress upon its excretion of an actual "poison."

Deductions From These Tests.

It is hardly necessary to repeat again or to emphasize the main conclusion from this ten-year test, that tillage and cover crops rather than sod-mulch should be generally adopted by commercial orchardists in New York State.

But some other statements should be made regarding the application of this experiment in other directions.

In orchards on deep soils the sod-mulch method is less of a detriment than on shallow soils. In the deep soil the tree roots have some chance to escape the drought-producing influence of the grass roots. Under such conditions, as where moisture is over abundant and apple trees make too luxuriant growth, sod may occasionally be used with benefit to check growth and promote fruitfulness. There is, however, nothing in the experiment to indicate that on ordinary soils the grass roots and tree roots ever establish amicable relations; for the difference between the tilled and the sodded plats was greater at the end of ten years than during the first half of the test. That is, apples do not become adapted to grass. The injurious effects of the grass on apple trees occur, no matter what the variety or age of the tree or other cultural treatment; and are even more liable to be shown by dwarfs than by standard trees because of the shallow root systems of the trees on dwarf stocks. Pasturing orchards in sod may reduce the injury from the grass just to the extent that the pasturing reduces the growth of the grass; but it can never wholly overcome the evil. The owners of sod orchards may not realize how their trees are weakened and their crops lessened by the growth of the grass, since they have no tilled trees under the same conditions to compare with them; but a trained observer can usually detect, even from a distance, signs of poor health and diminished vitality in the light color of the foliage.

The sod-mulch system is bad enough but grass grown in the orchard, not for a mulch, is all but fatal—its makes the trees sterile and paralyzes their growth. It is the chief cause of unprofitable orchards in New York State.—Geneva Station Bulletin 383.

The Fourth Dominion Conference of Fruit Growers.

Fruit growers from all parts of Canada met at the Fourth Annual Conference, at Grimsby, Ontario, on September 2nd, 3rd and 4th. It had been generally expected that the Hon. Martin Burrell, Minister of Agriculture, would preside over the conference sessions, but owing to the extreme pressure brought to bear upon the cabinet by the conditions existing throughout the British Empire, he was unable to fulfill his presidential duties. However, the conference had the pleasure of his company at one of the sessions, when he deliveed an inspiring address realtive to the fruit-growing industry and the duties devolving upon Canadians in this trying time. Under the guidance of Dan Johnson, Dominion Fruit Commissioner many important matters pertaining to the welfare of the industry from the Atlantic to the Pacific were thoroughly discussed. The sessions of the first day were devoted to a discussion of Transportation as appied to Fruit, which was led by Geo. E. McIntosh, Traffic Expert of the Ontario Fruit Growers' Association; to an examination of the cold storage warehouse recently erected by the Dominion Government, and to a discussion of pre-cooling fruit led by J. A. Ruddick, Dairy and Cold Storage Commissioner, Department of Agriculture, Ottawa. Mr. Ruddick gave a clear and concise explanation of the Gravity Brine and Mechanical Systems of Refrigeration, pointing out the more important features of each system. In referring to the cold storage plant at Grimsby, the Commissioner pointed out that the objects in view were to illustrate the Gravity Brine system of refrigeration; to illustrate and demonstrate the value of precooling of fruit and that the Cold Storage Branch was now given the opportunity to conduct experiments in the storage, packing and shipping of fruits. The warehouse, in charge of Mr. Smith, has already handled and tested the following fruits: strawberries, cherries, gooseberries, blueberries, blackberries, early varieties of apples as well as matoes.

The second day of the conference was devoted to a motor ride through the famous Niagara fruit belt, and was one of the most pleasant, interesting and instructive features of the conference. The Inspection and Sale Act, and the standardization of packages formed the subjects of discussion on the closing day.

The following is the Report of the Committee on the Inspection and Sales Act, which was passed at the Fruit Growers' Conference:—

1. That fruit districts in the different provinces shall be divided into sections.

2. That a sufficient number of inspectors shall be appointed so that each inspector shall have a certain section under his charge, so that he may be enabled to make at least weekly visits, and when instruction is required to either impart such instruction himself or, when time does not permit, that he be authorized to employ for such purpose and such time as may be required, a competent assistant.

3. That in all cases when the pack is not consistent with the Fruit Marks Act, the offender, after receiving not more than one warning, or when it may be deemed advisable by the inspector to allow the offender to grade his fruit down, that on every occasion when the warning is not heeded the full penalty of the law be inflicted, and for every additional offence the fines be inflicted [illegible] with the law.

4. That all packers and shippers of fruit be compelled to register with the Chief Inspector of the Division in which he resides.

5. Ever since the coming into force of the Fruit Marks Act there has been a growing desire for some kind of report of the result of inspection which could be used as an assurance to the purchaser that the fruit in that shipment which had been inspected was up to the standard of the Fruit Marks Act. We recommend that so far as the plan can be worked out without injury to the work of inspection that such certificate of inspection be given to shippers requesting same; such certificate to be plainly stamped or printed in such a way as to indicate that it only applies to the packages inspected which may, if found desirable, be stamped "inspected" on such parts of package as seem likely to best serve as an intimation that such package had been inspected.

Among the resolutions passed were the following:—

That the Department of Agriculture should take the necessary steps to keep Canadian growers in closer touch with the importers of fruit, if necessary by the appointment of special commissioners in Great Britain, Europe, South America, Australia and South Africa; and that the Department should set aside a sum of money for trial shipments on a commercial scale for the development of additional markets.

That whereas, certain countries require, either by law or custom, that fruit imported be contained in packages of a fixed size, thereby preventing our exporting in packages other than those they demand.

Be it therefore resolved that we respectively ask our government to legalize exporting in such packages as meet the requirements of the countries with whom we wish to trade.

That we respectively petition our government that such legal requirements as to size or capacity of fruit packages for Canadian fruit shall apply equally and as rigidly to fruit imported into Canada.

Whereas the steamship companies carrying Canadian fruit to the English markets have greatly increased ocean freight rates, and whereas some at least of such companies are subsidized by the Federal Government and their schedule of freight rates may be controlled by the Government.

Therefore, resolved that a Committee be appointed at this Conference to

DAIRYING.

The Production of Clean Safe Milk.

Persons engaged in the production of milk and consumers interested in procuring clean, safe milk, will be interested in the factors for producing the same, as outlined by the United States Department of Agriculture in a recent Farmers' Bulletin No. 602, entitled "Production of Clean Milk." The essential factors are outlined as follows:

Clean, healthy cows kept in clean, light, well ventilated stables.

Stable so constructed as to be easily cleaned.

A clean, well-drained barnyard.

Clean utensils, thoroughly sterilized.

Clean, healthy milkers that milk with dry hands.

A small top milking pail.

Immediate cooling of the milk to 50 degrees F. or lower.

Storage of milk at a low temperature until delivered.

A separate house for handling the milk.

An abundant supply of pure water.

The new bulletin in its eighteen pages contains a number of figures and describes in detail the practical methods that should be followed in the production of clean milk.

How Milk Becomes Diseased

Bacteria, according to the bulletin, find their way into the milk from various sources. Some may come from the udder itself, where they grow in the milk cisterns and ducts. The greater number, however, come from the dust of the air, the dirt from the udder and flanks, from the milker, and from unclean utensils. Disease- producing bacteria may get into the milk from cows having such diseases as tuberculosis, or from people who handle the milk, who may themselves have contagious diseases or who have been taking care of patients afflicted with such diseases as typhoid fever, diptheria, and septic sore throat.

The consumer is sometimes responsibe for the contamination of the milk. Milk bottles should not be taken into a sick room because infectious diseases can be spread by carrying infected bottels back to the dairy farm. If bottles are left where there are contagious diseases, they should not be collected by the milkman until they have been properly disinfected by the board of health. In the case of typhoid fever or other serious diseases which may be carried in the milk, it is better for the consumer to put out a covered dish for the milk or have it delivered to some member of the household. Until official permission has been granted, no milk bottles should be removed from a home in which there is or has recently been a case of communicable disease. The consumer should not use milk bottles for holding vinegar, kerosene or liquid other than milk.

Why Clean Milk is Important

Cleanliness is not an absolute safeguard against disease, but it is the greatest factor in preventing contamination. From the health standpoint there is great danger not only from the specific disease-producing bacteria previously mentioned, but from milk that contains large numbers of miscellaneous bacteria which may cause serious digestive troubles, especially in infants and invalids whose diet consists chiefly of milk. There is also the minor consideration of the loss to the consumer from milk souring or otherwise spoiling before it can be used. The cleaner the milk, the longer it will keep good and sweet.

Clean milk not only benefits the consumer, but the milk producer who will consider this subject from an unbiased standpoint will find many ways in which he himself is benefited by producing cean milk. There are a number of items in this connection which, when considered alone, may seem unimportant, yet collectively, they are of great importance. Moreover, they are not only of immediate value, but have a cumulative value reaching far into the future. Tuberculin testing, for example, is not only a safeguard to the purity of the milk supply for the consumer, but is a means of assisting the producer to protect his herd against future ravages of tuberculosis.

Most producers of market milk have experienced the chagrin of having a shipment of milk refused or returned because it reached the market sour, tainted, or otherwise in poor condition. Although such milk may be used for feeding pigs, it usually means a complete loss to the producer, as it costs too much to transport it back to the farm and because, depending on the market as an outet for his milk, he has no means for utilizing small amounts at uncertain intervals. Another important consideration is the unpleasant effect upon the purchaser. Delivering sour or tainted milk usually results in losing the confidence of the dealer; or if it is delivered direct to the consumer, it means the loss of good customers. A reputation for clean milk means fewer complaints, a better class of patrons, and a steady market for all the products of the dairy

Safeguarding the purity of the milk is a protection to health on the farm in several ways; first, the heath of the farmer's family, who use a portion of the milk themselves; second, the health of the calves, which live largely on milk. Healthy cows to breed from and pure milk to feed upon are two important factors in rearing thrifty calves and in the development and maintenance of a healthy and profitable herd. Aside from these immediate and definite benefits there is another consideration, not immediately measurable but of vast influence, namely, the moral influence, for no one can learn to produce good and clean milk without learning good methods of care and management of the herd, and the study of these things leads to greater care and intelligence in the economic features of the business.

Dairying with Cottonseed Meal.

If used in reasonabe amounts cottonseed meal may be fed for indefinite periods of time and the animas keep in a vigorous and heathy condition. The great troube with the average feeder is his lack of acquaintance with the concentrated nature of this material and his disposition to feed it as freely as he would corn or some other feedstuff not so high in digestibel nutrients. If the farmer and dairyman will bear in mind that one pound of cottonseed meal contains about four times as much digestible protein as a pound of corn, they will have no trouble from feeding it. Four or five pounds of cottonseed meal contain the protein equivalent of from 16 to 20 pounds of cornmeal. It is seldom that this much corn meal would be fed as a dairy ration to an animal weighing 1,000 pounds, and the average feeder who is unacquainted with cottonseed meal can hardly bring himself to realize that 4 or 5 pounds is about the right amount to feed per day to a 1,000-pound cow when not giving over 2 gallons of milk.

Our exports of cottonseed meal in 1911 unfortunately amounted to about 650,000 tons. This meal did not bring the producers in the south more than about $25 a ton, yet it is known to contain fertilizing constituents of an equal value. This meal went chiefly to Denmark, German yand Great Britain and was used largely in feeding dairy cows, though of course considerable quantities were fed to beef cattle as well. For years the policy of these nations has been to secure concentrated feed materias of high nutritive quality and rich in plant food constiuents from all the outyling sections of the world and to feed them on their farms. As a result they have built up soils which were extremely poor a half century ago but are now rated as among the most productive and desirable for agricultural purposes in the world. Denmark has risen in preeminence as a dairy nation and the products of her herds top the market in the great capitals of Europe. It may be surprising to some to know that the basis of the dairy ration fed in Denmark is founded in a great majority of cases on the cottonseed meal produced in the southern part of the United States.

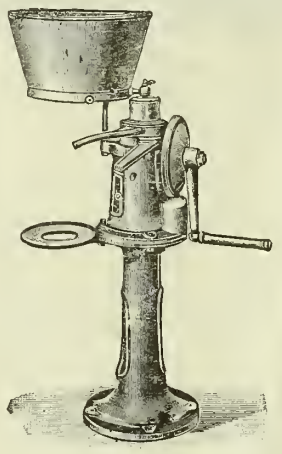
If the meal can be taken across 3,000 miles and fed with such remarkable success by the farmers of Europe, it is surprising that it should not be wholesome and desirable for use here at home. As a matter of fact, so long as the meal is allowed to be exported a drain amounting in the aggregate to millions of dollars is being made on the soils of the south to the enrichment of Europe. At the same time these Europeans are developing an industry of world-wide importance and producing for the consuming population the most wholesome and desirable of beef and dairy products.

A campaign of education is needed which will reveal to our own people the very great mistake they are making in failing to utilize these products here at home, so that our own beef and dairy industries may be advanced to the proud position which they should occupy. When this is done "starving America" will be abundantly supplied with the most wholesome and desirable

The Premier Cream Separator

made throughout in the largest and best equipped separator works in the British Empire.

The highest grade of material, workmanship and finish.



All wearing parts renewable and interchangeable.

All revolving parts enclosed.

Machine-cut gearing.

Working parts easily accessible.

Bowl easily and quickly cleaned.

Simplest Construction.

Skims Cleanest.

Lasts Longest.

dairy products at a reasonable cost.—Andrew M. Soule, Georgia College of Agriculture in Breeders' Gazette.

What Sampling Reveals.

A herd owner may ascertain from the creamery that his average is 40 pounds of fat per cow for the month and yet have a dim idea that some of his cows are better producers than others, but probaby few men are prepared for the veritable surprises encountered when they commence regular weighing and sampling. To take the case of two-year-old heifers that freshened this spring, last month one gave 30 pounds of fat, the other gave 46 pounds. One 5-year-old in the same herd of grade Jerseys gave 67 pounds of fat, and another 5-year-old gave only 36 pounds. The owner would scarcely believe that one mature cow is thus earning, with fat at 27 cents per pound, eight dollars and thirty seven cents more than her stabe mate in just one month. What will the difference be for the whole year? That is the crucial test.

Between two 3-year-olds in the same herd, that both freshened in March, there was a difference last month of 19 pounds of fat, worth over five dollars. Similar differences are to be found in many herds, illustrating very clearly that it is palpably unfair to take a general average of the herd unless they are decidedly more even in production than those cited above. Records of individual production alone can give this valuable information to the owner Milk and feed records may be obtained free on application to the dairy commissioner, Ottawa.—C. F. W.

The Ayrshire as a Butter Producer.

The Official test is proving what a valuable producer is the Ayrshire Cow. To June 1st, 1914, 454 cows and heifers have registered in the Record of performance test. This immense herd gave a yearly average of 408 lbs. of Butter, a splendid average considering 189 of them were two-year-old, and 82 three-year-old heifers.

One cow gave over 850 lbs. butter; 3 gave over 700 lbs.; 22 gave over 600 lbs.; 30 gave over 500 lbs.; 70 gave over 450 lbs.; 140 gave over 400 lbs.; a number gave from 300 to 500 lbs. and a comparative few were under 300 lbs. There is a profit in dairying when Ayrshires are kept.—W. F. Stephen, Secretary Canadian Ayrshire Breeders' Association.

A Simple Sanitary Measure.

The Hollander, when placing his cows in their stalls which they do not leave during their entire time in the stable, cares for the tails of the cows by braiding the switches and fastening a ring in each and then suspending them by coils from the ceiling.

This is, of course, to prevent the tails from getting befouled by reaching down into the gutter when the cows are lying down and subsequently employing them for the dissemination of filth and germs.

This is the more important from the fact that the tubercular cow, by swallowing her sputum, discharges large quantities of tubercular germs through the bowels.

I was much impressed at the time by the excellence of the arrangement, and have frequently since then cudgled my wits to devise some similar arrangement that would be practical in this country where cows leave their stalls for water, and have been chagrined at being unable to solve so simple a problem.

I have finally reached a conclusion, and as I always suspected, it is so simple that I feel like kicking myself for not thinking of it before.

Braid the switch and fasten a ring in the end, as the Hollander does, and then fasten it to the thigh of the cow by a strap around above the hock.

This will allow the tail all of the liberty that it needs, when there are no flies to swat, and still prevent it from getting into the gutter.—W. C. Huntington, M. D., Howell, Mich.

Sour Milk for Calves.

That in summer time calves do as well on sour milk as they do on sweet will be interesting news to many farmers who have hitherto been kept from raising calves by the expense of keeping the milk sweet in hot weather. This expense experiments carried out by the department indicate to be quite unnecessary. The calves will make as rapid gains on sour skim mik. In winter, it is true, this is not quite so satisfactory. It chills the calves and some of them drink it with great reluctance. Very young calves have even been known to refuse it altogether. On the other hand, of course, it is much easier to keep the milk sweet in winter.

In calling the attention of farmers to these facts, however, the department at the same time emphasizes an important precaution. Unless the milk is produced and kept under cleanly conditions, it may become contaminated with disease-producing bacteria. Farmers should, therefore, allow the milk to sour quicky and then feed it without delay.

In the course of these experiments sour skim milk was fed to 22 caves—Holsteins, Jerseys and Guernseys—at different seasons of the year. In no case would cause digestive disturbances, even when the change from sweet to sour milk was made abruptly when the caves were only a few days old. Moreover, no evil resutls followed the alternate use of sweet and sour. It seems, therefore, that the common idea that sour milk leads to scours is quite unfounded. The calves, it was found, did not like the sour milk as well as the sweet, but in the majority of cases soon become accustomed to it. The aversion, however, increased when the mik was fed them at a low temperature.

An Investment—Not an Expense

A MASSEY-HARRIS SPREADER on your farm will enable you to apply the manure when it will do the most good, even if help is scarce, for it is a great labor and time saver. -:- -:-

It spreads manure over more acres, because it is so thoroughly pulverized that all of it is available as plant food and need not be applied so thickly as would be necessary with hand spreading. -:- -:-

It makes possible the top dressing of field crops, which is usually the most effective method—the first rain carrying the fertilizing elements down into the soil. -:- -:- -:- -:- -:- -:-

On meadows and pasture lands it makes it possible to apply the manure so as to be of the greatest possible benefit—renewing the fertility without losing the use of the land for a time. -:- -:-

O. K. CANADIAN COW STANCHIONS.

O. K. Canadian Stanchions have sold before at $1.50. Owing to our having purchased a large quantity of steel at a very low figure and to improved processes of manufacture we are able to offer them, for the time being, at $1.00 each, f. o. b. Galt, cash with order.

We have not in any way altered or cheapened the construction of the Stanchions. They are *exactly* the same as those formerly sold at $1.50.

These O. K. Canadian Stanchions are made of the same U-Bar steel, they have the high hinge that has always been a feature of their superiority, and the simple, secure lock that is proof against the wiliest cow.

Orders for Stanchions at $1.00 can be filled only while our present supply of steel lasts, so those who wish to take advantage of this price should order quickly, either through their dealer, or direct from us.

Tell us how many cows you keep and we will quote prices on complete metal stalls.

Abortion in Sheed.

The President of the English Board of Agriculture and Fisheries appointed a Committee in April, 1905, to inquire, by means of experimental investigation and otherwise, into the pathology and etiology of Epizootic Abortion, and to consider whether any, and if so, what, preventive and remedial measures might with advantage be adopted with respect to that disease.

In 1909 the Committee submitted a Report (Cd 4742) embodying the principal results of their investigations concerning Epizootic Abortion as it occurs among bovine animals, and an Appendix by Sir J. McFadyean and Mr. (now Sir) Stewart Stockman, giving a detailed account of the experiments on which the report was based.

The inquiry was extended to include a consideration of the administrative measures which should be taken to deal with cases of this disease in cattle, and a Report (Cd. 5279) was presented by the Committee in 1910 dealing with this aspect of the question.

A third report has now been presented by the Committee, dealing entirely with abortion in sheep, and, in a separately published appendix, an account is given of the experimental work on the disease in sheep carried out for the Committee by Sir J. McFadyean and Sir Stewart Stockman.

First Prize aged herd at the 1914 St. John Exhibition. This herd includes: The champion male, Cherry Bank Cicero. Following him in line are: White Heather of Silver Falls, the champion female, first with two of her offspring and dam of best two animals progeny of one cow at St. John. The other cows in the photo are Emma of Silver Falls, Lady Viola and White Lady of Silver Falls.
Owned and exhibited by Clifford Creighton, Silver Falls, N. B.

Microbe of Abortion in Sheep.—In the Committee's first report it was stated that these investigators had never found the microbe of cattle abortion in connection with natural outbreaks of abortion among sheep, and that a totally different microbe—a vibrio—had been repeatedly isolated from outbreaks of abortion in ewes, and that it had been successfully used at the laboratory to infect pregnant ewes with abortion experimentally.

Although the Committee are not prepared to say that the vibrio is responsible for all serious outbreaks of abortion among ewes, they have not met with any other specific form of the disease in this species.

The microbe was found to occur both in the short "S" form as well as in various long spirillar forms. The individual organisms vary in length from 1.5 to 3 microns, and the breadth is from 1-4 to 1-3 of a micron at the middle part, which is broader than the extremities. The appearance of the spirillar forms is very like that of a spirochaete. The vibrio is motile.

Virulent Material and its Vehicles.—The contents of the infected uterus, viz., the exudate, the membranes and the foetus, contain the microbes and are virulent. An important point is that lambs may be born alive from an infected uterus at or about full time.

In the case of bovine abortion an infected cow is probably seldom in a position to infect others until the actual time, or shortly before the actual time of abortion, when virulent material is discharged from the uterus. This, however, is not the case with ovine abortion. It would appear from the experiments carried out for the Committee that virulent material may be spread about the pastures (a) by infected ewes although they may lamb at full time, (b) by aborting ewes, and (c) by infected ewes ong before they show outward signs of being about to abort.

In connection with the dissemination of the disease among sheep, the report calls attention to the fact that, as compared with epizootic abortion in cattle, ovine abortion is enzootic in character, that is to say, is seems to confine its operations to a comparatively small proportion of farms without showing much tendency to become widespread. On the other hand, it is pointed out that a disease does not owe its epizootiogical character to its contagiousness alone, but also to the opportunities given it for dissemination. The opportunities which operate in relation to the disease in cattel and not in sheep are as follows:—(a) Breeding goes on all the year around in the case of cattle, whereas with sheep, it is almost entirely confined to a season, and a considerable interval of rest intervenes. (b) Cows are frequently sent to the bull on other premises, where the disease may prevail, but this does not apply to ewes to any extent. (c) There is a very considerable interchange of in-calf and newly-calved cows through markets, while ewes are practically always tupped on the owners' premises and remain there throughout pregnancy.

The history of some flocks shows that the disease may prevail on the same premises at intervals over a number of years. It is difficult to explain how the virus is kept alive during the long interval between each breeding season; but bridging this interval it is comprehensible that in those outbreaks which have recurred after an interval of some few years, a few abortions not amounting to an outbreak, may have occurred in the intervening years. The circumstances surrounding some outbreaks favour the idea that the vibrio may lead a saprophytic of other existence outside the bodies of the sheep.

Methods of infection.—The ntaural channels of infection are the alimentary and genital passages, mainly the former. The Committee considered whether any part in the spread of ovine abortion is attributable to the ram; and they state that it seems most improbable that a ram could spread infection mechanically from ewe to ewe, in a flock merely from the fact of having been contaminated by an aborting ewe. because, in the great majority of cases. both rams and ewes, when the breeding season begins have been excluded from sexual intercourse for nearly a year, and the ewes must have been free from maternal duties, other than suckling, for about six months. There seems to be only the possibility that a result of abortion in ewes, inflammation of the womb is not uncommon, and this may end fatally especially when the contents of the uterid are putrid.

Distribution and Prevalence of the Disease.—Particulars indicating the distribution of the disease were obtained by the Committee by means of replies from farmers to circular letters of inquiry. The proportion of the aborting ewes taken by the Committee as indicating that something definite had operated on the ewes was 10 per cent. and over; and of the 470 farmers from whom replies were received, the proportion was 10 per cent. and over, on 70 farms (or 14.7 per cent.), these infected farms being situated in 24 counties in Engand, 4 in Wales, and 6 in Scotland. The proportion of barren ewes on the 476 farms was also ascertained, as it was thought that an unduly high proportion might be ascribable to the ewes casting foetuses unobserved. The proportion of barren ewes was 10 per cent. or over in 26 flocks out of the 476.

Preventive and Remedial Measures.—No particular breed of sheep seems to possess natural immunity to the disease, although some individual animals are apparently more resistant to infection than others; and further, the evidence obtained by the Committee as to the resistibility of ewes which had already aborted was in no way conclusive. A few experiments were carried out to ascertain whether immunity could be conferred on ewes by subcutaneous injection of living cultures of the vibrio, but no preventive effects of any value were obtained. Fairly successful results were obtained with an anti-serum, but, owing to doubt as to the constant virulence of artificial cul-

ESTABLISHED 1875

ram from infected premises may be a carrier of infection owing to the upkeep in some way of virus in its body, but of this being actually the case there is no evidence of any consequence.

Symptoms.—No particular symptoms in connection with abortion seem to have been observed in the field except just before the act, when, if the period of pregnancy is advanced, and it usually is, the ligaments are relaxed, the mammae and the vulva are swollen and a sanious mucoid discharge is seen around the latter. It is pointed out that a pregnant ewe, which before her time shows soiling of the fleece by sanious material, should be regarded with suspicion and the discharge should be examined. The evidence from the field is that many of the foetuses are putrefying when expelled, and this seems to apply more particularly to those which have died in uterus at a comparatively early stage of pregnancy. It appears that the interval between infection and abortion varies between 13 and 113 days, and the percentage of abortions on infected premises averages about 23 per cent. As the retures of the vibrio no great importance ched to these experiments. Further investigations are proceeding in relation to the possibilities of the serum and also as to drug treatment.

To prevent the spread of infection once the disease has broken out the following measures are recommended:

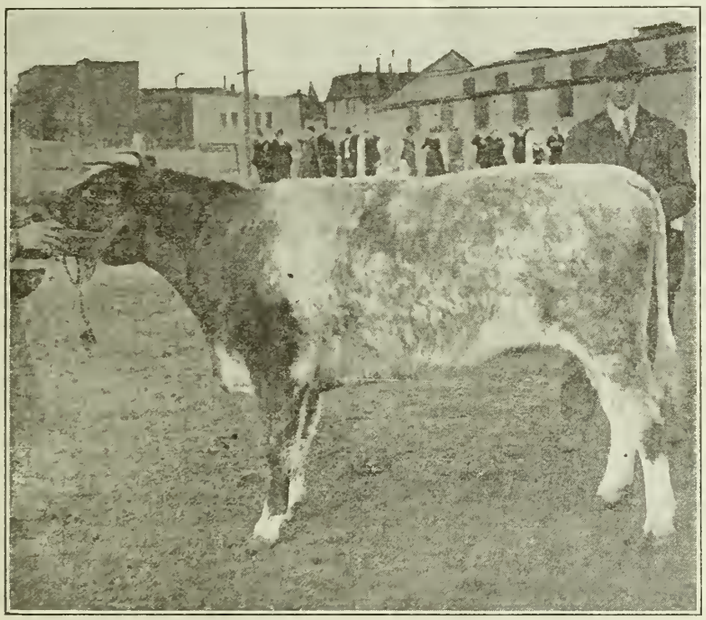
Destruction of Virulent Material and Disinfection of Everything Contaminated by it.—This is obviously important. The membranes, foetus, the discharge, and any litter soiled by the material should be removed at once and destroyed. It is even preferable to destroy their virulence on the spot by mixing the material freely with caustic lime and slaking or enveloping it in straw soaked in paraffiin and burning it. Any patches of the pen or pasture which are known to have been soiled should be disinfected with a strong disinfectant. The boots, clothing, and hands of attendants should be disinfected.

Isolation of Aborting Animals and Those Which Have Aborted.—When a ewe shows before her time a discharge from her genital organs, or should she abort, it is essential that she should be removed from contact with her fellows. The same applies to ewes which have given birth to live lambs prematurely, in which case both ewes and lambs may be excreting infectious material. It would be preferable, of course, to remove the still pregnant ewes when this is possible.

Penning or Folding of Ewes Before Lambing.—In some cases it is customary to pen ewes at night towards the end of pregnancy, and it is also not unusual to fold them by hurdles to feed on certain crops. As far as abortion is concerned, these practices may do no harm, so long as there are no infected ewes in the flock; but given out or two cases of abortion occuring in the narrow area of a pen or fold; it will be obvious how great will be the opportunity for other ewes to become infected, and it is pointed out that a ewe may abort from infection acquired only a short time before her normal time to lamb. Of the 70 farms referred to above as having experienced 10 per ceint. or more of abortion, 46 were in the habit of penning or folding their ewes some time before they were due to lamb.

It is advisable then not to adopt these practices if they can be avoided but if they are adopted the greatest vigilance should be exercised in watching for cases of abortion. Should such occur, two courses are open either to destroy all evacuated material disinfect the ground and remove the ewe or immediatey to remove the other ewes to clean ground. The second course is the more to be recommended, if it can be carried out

Disinfection of the Genital Passages of Ewes Which have Aborted.—This may be done by gently injecting an antiseptic wash (3 per cent. pure carbolic acid in water, or corrosive sublimate 1 in 2,000) by way of the external genital organs. It is advisable to carry out this treatment, because it may have the effect of destroying a certain amount of virulent material which has passed from the uterus into the vagina, and it may also help to prevent further invasion of the passages and womb by harmful microbes from with out. Ewes which have aborted should be put in improvised pens, and ereated in the same way until the discharge ceases.



Roan Mina

Two-year-old Champion Shorthorn female at the 1914 St. John Exhibition Bred and owned by R. A. Snowball, Chatham, N. B.

YOUR
Fattening
Hogs

It is not what a hog eats, but what he digests and assimilates that gives strength and rapid growth. A hog is not naturally matured until he is 2 years old, but nowadays we crowd him into market at six to eight months weighing two to three hundred pounds.

This crowding process is a terrible tax on the hog's constitution and some form of medicated tonic is necessary to enable him to stand it.

INTERNATIONAL STOCK FOOD Tonic

is a medicinal preparation (contents printed on label) which aids digestion and assimilation and purifies the blood-------- guarantees health and rapid growth. We guarantee it to enable hogs to be marketed in one or two months less time than can possibly be done without it. The cheapest tonic sold---3 feeds for 1 cent---less than a cent per day per hog.

Every claim made for International Stock Food Tonic is backed by our money-back guarantee. Sold by dealers everywhere in 50c and $1.00 packages and 25 lb. pails. 133

The Maritime Farmer has a few more Mauser Rifles which wil be given with one year's subscription to the paper for the small sum of five dollars. Ammunition supplied, 100 rounds for $3.75. The rifle is easily worth fifteen to twenty dollars. Weight only 7½ pounds. Sighted up to 1,100 yards.

THE HORSE.

Horses vs. Tractors.

Wayne Dinsmore, earnest champion of the draft horse, has prepared a comparative statement showing that even in Alberta, with fields of 500 to 2,000 acres, tractors have been proven second to the horse for farm operations.

Reasons for the general use of tractors in Saskatchewan, Aberta, and Manitoba were: 1st, large areas of prairie sod purchased at low prices, and of such character as to render feasible operation from 50 to 2,000 acres per field; 2nd, high prices of horses and refusal of horse owners to sell unless substantial cash payment were made; 3rd. wilingness of tractor companies to sell complete outfits, costing from $4,000 to $10,000, on very small initial payments, and long-time notes, most of them running for three years; 4th, knowedge that such outfits have been known to break from 20 to 30 acres of sod per day when handed by experts; 5th, lack of knowledge as to depreciation and cost of operation of such engine outfits, especially in comparison with the cost of horse operations.

The result was the purchase of thousands of tractors in the Canadian northwest. They have now been used from two to five years, and the Canadian farmers, business men and bankers have had experience enough to know their advantages and disadvantages. The net result is an overwhelming decision against such outfits for general farm work. A few have been successful with tractors, but even these cannot show returns that will indicate any advantage over horse out-

Charles Esterbrook of Alberta gives for illustration these figures:

Daily cost figures on tractor plowing, gas engine of 45 horsepower on drawbar:

Cost of engine and plows, $3990.	
Interest on same at 7 percent, $279.30 per year, or on 313 working days, per day ....$	.88
Depreciation 25 percent on total, $3990, or $997.50 per year, or $3.19 per day	3.19
Gasoilne, 45 gas. per day, 33 1-3c. delivered at farm, pe rday	15.00
Cylinder oil, 3 gals., at 80c per gal.	2.40
Gear oil, 1 gal. per day, at 30c per gal.	.30
Hard oil and transmission grease, estimate per day	.10
Engineer per day	5.00
Competent plowman, per day ..	3.50
Board of same two men at 50c per day	1.00
Total .....$	31.37
Average powed per day, 20 acres, or average cost per acre of .....$	1.57

In the preceding tabe, we did not figure in the cost of sharpening plows, as he uses disk pows, sharpens but once a season, at 50c per disk, or $7 per season for 14 disks.

Mr. Esetrbrook thus figured his horse powing costs:

Daily cost figures on horse plowing, gang plow, two 12-inch plows, six horses worked together:

Cost of gang plow. 2 12-inch plows and 2 extra shares, $90.	
Interest on same at 7 percent, $6.30 per year, or on 313 days, 2c per day	.02
Depreciation 10 percent per year; repairs 5 percent; total 13.50 per year, or 4c per day.	.04
Value of 6 horses used on gang, $150 per pair, or or $450 for the 6 small horses.	
Interest on same at 7 percent. $31.50 per year, or 10c per day	.10
Depreciation nil—increase in value of young animals being broken, and produce from mares offsetting loss and depreciation.	
Cost of man at $40 per month per day $1.53	1.53
Board of man per day	.50
Fed of 6 horses:	
Each 18 qts. of oats per day at 32c per bu. for 6	1.08
Each 21 lbs. of hay per day at $7 per ton for 6	.57
Harness, 3 sets at $40 per set, $120.	
Interest on same at 7 percent, $8.40 per year, or, per day	.0268
Depreciation on harness 10 percent per year; repairs 5 percent; total 15 percent. on $18 per year, per day	.057
Sharpening plow points, estimated at 30c per day each gang..	.30
Average plowed per day, 5 acres. Cost per acre, 83 cents.	

The highest cost figure given by any farmer for horse plowing was 83 cents; the lowest cost given by any on tractor plowing was $1.55. Al agreed, also that thet ractor suffered a stil greater disadvantage in the lighter work, such as disking, seeding and harvesting.

Still more significant of the judgement of Canadians on this question was their actual field procedure, seen in an extended trip in Alberta at a time when summer fallowing was in progress. But three tractor outfits were seen at work, but we passed hundreds of horse-drawn plows. At numerous places we found tractors idle in the farmyards or sheds, while the farmers were doing the field work with horses.

While it is not at all likely that Eeastern farmers will ever use tractors to any great extent in their farming operations, yet it is well, in the face of the campaign which has for some time been in force to get them installed here, to learn just how they are regarded on those farms that at first thought would seem so large as to make the economic use of horses prohibitive. We will admit Mr. Esterbrook places a low price on horses, estimating that they can be bought for $150 per pair, but we presume he was sure of his statement before he made it having so recenty visited the section about which he writes.—Maine Farmer.

When the "top soil" wears out

OPEN up the rich subsoil with CXL Stumping Powder. The subsoil is as full now of plant food as when the land was first cultivated.

And you can obtain this valuable plant food—restore the original fertility of your soil quickly, surely and with little labor.

We will instruct you in the use of CXL Stumping Powder, and show you dozens of ways to add to your farm's productiveness

No more dangerous than gun powder. There's a CXL explosive for every blasting purpose.

Common Worms Affecting Horses.

Bots in Horses

The condition commonly known as bots in horses results from the presence in the stomach of the arvae or grubs of the gad or bot fly technically termed the Oestrus Equi, or Gastrophilus Equi. Their presence is common during winter and spring among horses which have been exposed outside during the previous months of the year, when the fly is active. Whie differences of opinion exist as to the harmful effects caused by bots in the stomach of horses, it is, however, generally accepted that their presence may be harmful to a greater or less extent by producing digestive disturbances.

Development.

The gad or bot fly attacks horses chiefly during the late summer months, and the eggs are deposited by the female especially on the hairs of the front limbs or other portions easily reached by the animal's mouth. The eggs are firmly glued or fastened to the hairs, and within a few days they hatch out and liberate the embryo or small maggot-like larvae which commence to crawl under the hairs and give rise to an itchiness which causes the horse to lick or bite the parts so that they are licked off by the tongue and taken into the mouth and swallowed. On reaching the stomach, the embryo or larvae attach themselves by means of their hook-like mandibles or jaws to the mucuous membrane or lining of the stomach. At this time they are of a blood red colour, and, in the course of the following winter and spring months they undergo at least two moultings, becoming larger and more developed each time, until they reach the full stage of their development and growth and become the mature larvae or the so-called "Bots." These are found in the stomach during the spring, and are of a yellowish-brown color. They are somewhat pear-shaped, tapering towards their head, and formed of a series of rings or segments. Subsequently, during the summer months, they voluntarily loosen their hold from the wall of the stomach, and fall off into the contents of the stomach and finally are expelled with the faeces or mature. The time occupied by them in the stomach averages about nine months. After being expelled with the faeces, they remain in the manure or bury themselves in the soft earth or ground where they gradually develop during the summer into the pupal state and finally emerge as the perfect adult gad or bot fly

Symptoms.

The symptoms caused by the presence of bots in the stomach are indefinite. Their presence, however, may be suspected during the winter months and spring in horses which are unthrifty and subject to attacks of indigestion and colic without other apparent cause. Horses affected with bots causing irriation of the stomach are sometimes noticed to manifest their presence by a tendency which they display of turning up the upper lip as if nauseated. In some cases the bots may be noticed in the dung which is passed.

Treatment and Prevention.

Measures should be taken to prevent horses from becoming affected by protecting them against the attacks of the flies. Horses which are being exposed to the attacks of the flies may be protected by clipping off the long hairs from the region of the head, breast, shoulders and legs. The parts mentioned should also be smeared frequently with oil. By clipping the long hairs the required supports of the eggs are thus reduced, while the oil affords additional protection by preventing the eggs from adhering to the hair.

Additional protection may also be afforded horses while at work against the attacks of the flies by means of pieces of cotton or cheese cloth fastened to the bridle and harness in such a manner as to cover the under surface of the jaws, the breast and forearms. It is difficult to destroy and remove bots from the stomach owing to their great vitality, and medicines used for this purpose are not always effective. The following are recommended as being useful:—Creolin, half an ounce; oil of turpentine, one to two ounces; given as a drench diluted in a pint of raw linseed oil or milk. During the spring and summer months when the parasites have reached maturity, they voluntarily leave the stomach and are passed out with the dung. At this time their removal is hastened by the use of purgatives, such as a pint of linseed oil or from half to one ounce of aloes, given as a ball or as a drench in a pint of water.

ABSORBINE
TRADE MARK REG. U.S. PAT. OFF.

Reduces Strained, Puffy Ankles, Lymphangitis, Poll Evil, Fistula, Boils, Swellings; Stops Lameness and allays pain. Heals Sores, Cuts, Bruises, Boot Chafes. It is an

Home of Belgian Horse.

When Americans stop to consider that the home of that grand breed of horses known as Belgians is located where the European war has been most fierce, they will understand why importers are fearful that not only these animals will be exterminated, but also the Ardennes horses which are raised along the French frontier.

Writing from Liege, H. A. Johnson, the American consul, said recently of the breeding of fine horses in that region:

"It is estimated that there are 275,000 horses in Belgium and horse breeding has, thanks to judicious fostering on the part of the government, become an important and remunerative industry. There are 29,000 horses, valued at $7,000,000, exported last year. The exhibit of working horses at the annual show in Brussels surpassed anything ever seen there.

"Belgian horses may be divided into two distinct groups, the Femish breed and the Ardennes horse. To the first group belong the large, massive horses in general use throughout the country. These animals are much appreciated in Engand and America and are alrgey exported to the United States for breeding purposes. The horses of the province of Namur, although belonging to the group of heavy draft horses, represent in a measure the transition from the English breed to that which inhabits the Ardennes and Condroz districts. Much smaller than the smallest Flemish horse, the Ardennes type is robust, long necked and broad shouldered. He resists fatigue and endures privation better than the other. The Condroz horse very cosely resembles the Ardennes and is prized for light, quick draft work.

Just before the war broke out, there was published in the Boston Sunday Herald the picture of a Belgian stallion for which something like $40,000 was said to have been refused after he had won the championship at Brussels a few weeks previous. J. G. Bushnell, Ill., and several other American importers, attended the show and purchased many valuable stallions and mares for shipment to the United States. Whether they and their horses got out before the storm broke, is not yet known, but it is believed that Mr. Truman reached Engand, on his way to New York.

If the war goes on, it is likely to all but exterminate the breeds in the theatre of active operations, according to the belief of many horsemen. In such an event, Belgian and Ardennes mares may become almost priceless. There are plenty of stallions of both breeds in the United States, but very few mares have ever been imported.

Value of Sound Sires.

Here is the life history or story of three mares. One of them is a cross-bred mare of a desirable type of draft horse and sound as a dollar. The other mares were good mares, but they lacked the depth of body, the depth of flank and the make of feet and legs that stand up to service year after year.

These mares belong to the Oregon Agricultural College. Bonnie, the first mentioned mare, was matched when she was five years old with another mare, which many would have thought just as good, but she lacked the feet, legs and constitution of Bonnie, although she cost nearly as much. The two mares were worked side by side for five years with Bonnie doing more than her share of the work. At the end of that time Bonnie with her vigor, her soundness and her strength worked the other mare down so that she died.

Then the college authorities started out to get another mate for Bonnie then ten years old. They picked out a five year old mare named Ida which looked good and cost $300 but when put to work Ida began to show her weakness. Perhaps it was inherited from her sire or dam, as her feet began to get bad, and now after five years of service she had sidebones both on the inside and outside of her front feet. In her hind egs she is crampy and at times hardly able to get out of her stall. When put in the stable after a hard day's work she will not touch food although Bonnie, five years older and in service five years more, steps up to the manger and eats readily and in the morning is ready for a big day's work.

In a short time another mate will have to be obtained for Bonnie. After ten years of service and after wearing out two mates that proved to be unsound and not of the best type, she is ready to do as much as any horse. If she is not hitched with one of her own kind she will perhaps outlive and outwear her next mate.

No one who has seen these mares will deny that soundness and the desirable conformation which goes with soundness pay in draft horses. No one will deny that sires that produce sound mares like Bonnie should be used; and they will also admit that sires which are unsound and produce horses that will become unsound should be barred from public service.—Carl N. Kennedy, Oregon Agricultural College, in Breeders' Gazette.

Protection of Wounds of Animals Against Flies.

When an animal is wounded, it is important to treat the wound in such a way as not to prevent its healing, and yet to prevent screw worms and house flies from attacking the open surfaces, laying eggs, or carrying infection to the animal.

The screw worm, particularly, deposeggs in wounds, and there are other flies that may deposit their eggs in this way. The larvae or maggots hatching from these eggs infest the wound and burrow more or less extensively in the surrounding tissues, so that serious damage may result.

The housefly alights on wounds to suck up the exudate, and is a cause of considerable annoyance to animals. It prevents wounds from healing and may introduce agencies of infection which adhere to its body.

The United States Department of Agriculture, in a bulletin on repellents for protecting animals from the attacks of flies, quotes the following formuals for application to wounds:

Jesen gives three formulas of repellents for application to wounds:

Formula No 1: Oil of tar, 8 ounces; cottonseed oil to make 32 ounces.

Formula No. 2: Powdered Naphthalin, 2 ounces; Hydron's wool fat, 14 ounces. Mix into an ointment.

Formula No. 3: Coal tar, 12 ounces; carbon disulphid, 4 ounces. Mix, keep in a well-stoppered bottle and apply with a brush.

Mixtures Nos. 2 and 3 are said to adhere to moist surfaces, and No. 3 is said, in addition, to form a coating over raw surfaces and protect from the screw-worm fly.

The editor at the close of the article in which the above formuals are given adds the following formula: Oil of turpentine, 1 dram; phenol, 1 dram; cottonseed oil to make 4 ounces. Mix and apply freely to wounds.

It is stated that this remedy is highly effective and is used widely in the south. It is said to induce healthy granulation of wounds.

Matching Teams for Livery or Farm.

Producing matched teams, such as are used to hearses, is a special line likely to prove profitable. A pair of black horses that will qualify for hearse purposes is hard to find and such a team usually brings a premium. Well matched farm teams also command a price considerably higher than that for ill-mated teams. Matching horses is an art, and it requires some skill to bring together two that resemble each other in all characteristics sufficiently to work in harmony. It is necessary to have more than the color of the animal in mind. Action comes first in considering the mating of horses. Proper action, strong, vigorous movement of the feet and legs, attracts a buyer as much as anything else. Style is also requird in the action of any class of horses.

Matching farm teams is more difficult than matching driving teams, as it is necessary to match gaits, temperaments and horse power. A difference of 100 pounds or so does not matter much, but if much more than that the difference in size will detract from the value of the team. Color comes last of all in the major points to be taken into consideration when matching farm teams, yet it is only teams which match in every respect that command the real fancy prices.—W. F. Purdee in Breeders' Gazette.

Raising Good Colts.

Neither overfeed nor stunt the colt at weaning time. Teach him to eat grain before he is weaned and take him away so gradually that he will never notice the transition from milk diet to grain and grass. It is a good thing to vaccinate against distemper at weaning time. My show colts were vaccinated before being taken to the shows last fall and the ones that were kept at home were not. The vacinated ones went along nicely all winter, but the others had distemper and we lost two or three.

In feeding cattel or sheep, no doubt the best system is to let the manure accumulate in the corrals throughout the season, adding bedding as needed. This won't work, however, with colts. Manure in sheds is death to them. It breeds distemper. Colt sheds should be cleaned out every week and disinfected once or twice a month.

Colts do best running out in winter, although they should have a shed to enter if they wish. The horse is naturally an out of door animal. He wants plenty of feed and plenty of exercise. A mixture of corn, bran and oats in equal parts by weight, with clover or alfalfa and a little corn fodder to pick over during the day is good colt feed.—W. S. Corsa.

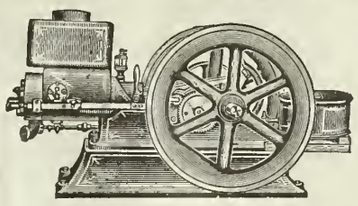
Saving Horseflesh.

Load lightly, drive slowly, stop in the shade when possible and water your horses often, advises the workhorse relief association of Boston. Sponge off the harness marks and sweat after the animal comes in from work. Do not turn the hose on him but wipe him all over with a sponge wet with vinegar water.

If you use a horse hat, be sure it is a canopy top hat, not the common bel-shaped kind. A sponge or coth on top of the horse's head is good if kept wet but worse than nothing if dry.

If a horse is overcome by heat, get him into the shade, remove the harness wash out his mouth, sponge him all over and shower his legs. Cool his head at once with cold water or chopped ice wrapped in a cloth. For internal treatment, give him four ounces aromatic spirits of ammonia or two ounces sweet spirits of niter in a pint of water or give him a pint of warm coffee.

Tie the horse outside the barn during hot nights and give him a chance to be comfortable. Watch him closely during the day. If he stops sweating suddenly, breathes short and quick, or if his ears droop, or if he stands with his legs braced sideways, give him attention at once for he is in danger of sunstroke.



Will Save You Dollars Every Year

Sussex Motor Co. Gasoline Engines

They have many points to recommend them.

Are easy to operate, develop more power at less cost than any other make.

Are guaranteed for five years and are sold at close margin.

Are particularly well suited for farm and general work.

Full particulars in our Free Catalogue.

We want reliable men to sell Sussex Motor Co. Gasoline engines.

THE SUSSEX MOTOR Co., Ltd.

POULTRY

Pointers in Marketing Poultry.

Our trade in dressed poultry has reached rather a critical stage in its development. A very few years ago these prairie provinces were heavy importers of poultry and poultry products. More rapidly than most of us imagine, we have reached the point where home production is able to supply practically all our city trade, and imported products are no longer required. Alberta packing houses support the above statement by the fact that in 1913 the firms of P. Burns & Co., and Swift Canadian Co., for the first time, imported no poultry to their Alberta plants, the demand being wholly supplied with Alberta grown poultry. The same we believe, could be done in Manitoba, while Saskatchewan may not yet be prepared to completely supply her own demand from within her bor ders.

This condition of affairs brought a measure of disappointment to poultry raisers in the prairie provinces last year. For one thing, it made rather an uncertain market. During the early fall months, poultry was crowded into our city markets in enormous quantities. Much of this stuff was about as far as it could be from being in fit condition for market, and should have been well fed a considerable length of time. Later shipments also found slow sale, and by the end of the season every possible demand was supplied.

One point upon which some friction and dissatisfaction arose was as to the method of preparing poultry for market. Our agricultural colleges and departments of agriculture were free in suggesting methods of poultry marketing; but birds prepared in keeping with these methods were not always acceptable to dealers. We have no criticism to offer as to the methods taught the farmers by the agricultural colleges; these were no doubt up-to-date and scientifically sound as relating to the good keeping qualities of the poultry product. But the fact seems to be that different dealers have arrived at quite different conceptions as to what the public should be asked to accept. This fact is of pery little importance to the man who ships poultry alive, because then the dealer can dress his birds in any way he sees fit; but it is of much concern to the farmer who is going to dress the stuff before he sends it to market.

Possibly in a few years there wilf be some uniform system of poultry marketing agreed upon. In the mean time we advise farmers to endeavor to supply the dealer with the class of goods he calls for and look to somebody else to educate the dealer and the consuming public into demanding the changes that probably real krogress would demand. The task of educating the consuming public, for instance, as to the inferior keeping quality of drawn birds, as compared with undrawn ones may be important, but it is scarcely up to the individual poultry shipper to accomplish the task by unprofitable demonstration. For as far as the farmer is concerned, it is the dealer who must be pleased; the dealer's satisfaction is a matter of dollars and cents; and if the methods he prescribes are wrong the loss will visit itself upon the dealer primarily. The educating of the dealer as to the right methods must come from the angle of the consumer rather than from the angle of the producer.

To those who will ship dressed poultry this year, we would therefore say this: Write to the fir—s who are handling poultry and ask for quotations, also for their iostructions regarding preparation for market. Select the method that is most acceptable, consistent with the good prices, kqd ship to that dealer. If he demands live poultry, ship them a live; if heads and feet off, take them off; if feathers left on around neck and hocks, leave them on; if off take them off.

While all this is true regarding the methods of preparing the carcass, there are many points upon which all dealers kgree. They agree that every bird should be properly fattened before killing. They agree that birds should be starved about 36 hours before killing so that crops and entrails will be completely emptied before killing; otherwise the carcas will spoil very quickly. They agree that if birds are killed at home they must be thoroughly cooled for hours before boxing for shipment. This is a very important point, because poultry packed in a box while yet the carcasses contain the animal heat is cer tain to come out in a spoiling condition, and in some cases will be quite worthless.

Don't Market Thin Poultry.

Last season there were thousands of live chickens sent in crates to the Winnipeg poultry markets that were so thin as to be scarcely worth the express on the crates required to carry them to the city. This was especially the case early in the season —during September and the first part of October. Some of the carcasses when plucked were only about the size of a man's fist, and they carried no more meat than a hungry man would eat at one meal, being almost literally "all skin and bones."

So much was this true last year that one market was forced to sell many of these birds at what it could get for them alive as no person could have been induced to purchase them if they had been killed. As there was a fair demand for live chickens from householders who wished to keep a few hens for laying purposes, some of the stock was got rid ol in this way.

To ship such chickens to market is a disgsace to the men who do it. Without doubt, however, part of the movement last year arose out of the over emphasis being placed upon the demand early in the season. The gong was ttruck too soon. Farmers who wished to take advantage of the reputed early trade in fall chickens cooped up their season's cockerels and old hens and shot them into the city by express, expecting high prices for them. But nobody would buy the skinny creatures after they were killed and one single place of business had tons of these thin early fall culls still on hand in the middle of the winter. What happened to the trash later, we do not know.

The moral is plain, we think, and we very strongly urge farmers this year to fatten their chickens well before sending them to market. Don't get the notion that there is a high priced, profitable trade for birds sent in, post haste, before anyone else appears. There is a very, very limited demand for broilers (three months old chickens forced up to weigh one pound and a half each by the middle of July), but that demand is infinitesimali and the cold storage plants, during the past season have been unloading so-called cold storage "broilers" to fill any demand there was in sight.

We may as well face the fact that this fall, more than e er before, the lead pencil will come into play in connection with the poultry tsade. That is to say, poultry buyers will figure more closely to ascertain just whether or not it is real economy to eat poultry meats. This may make for a lowering in price—just to what extent no one can say jutt now—but one point it does leave clear, namely that the good selling chickens will be those that have a large amount of real meat on them.

In a single sentence Fatten the chickens well before they are sent to market. There will likely be a fair demand and fair prices for really well fleshed stuff; there is no demand now and there will not be any for the skinny, scrawny kind.

Sell the Old Hens.

On about nine out of every ten farms there are a lot of old hens, which have lived beyond their days of usefulness and are fed at a loss. In every set of egg records I have ever seen it was to be noticed that nearly every hen kept beyond her second laying summer was kept at a loss. Occasionally a hen lays better in her second laying year than in her first, but the proportion of these is not large enough to make it a safe plan to keep hens after the second season of laying. It would be better so far as egg-production is concerned to sell all hens when 18 months old, or sooner, but in practice it is probably as well to sell hens at abput 30 months old, as raising pullets to replace kens sold every year would cost about as much as the reduction in eggs would amount to.

Recently we have sold hens for 10 cents per pound fow which we paid $10 a head and one with a record or first prize at a state show as a pullet and first the next year as a hen went for 70 cents because she was too old to lay many eggs in a year. We keep hens for profit first and for the show purposes next, as we believe in utility as well as beauty, with utility first. For this reason we do not keep hens after they have laid out their second season, and this year we took out everything hatched before a year ago last spring.

If the farmers as a whole would sell their old hens during July and August this year, keeping only pullets and yearlings, they would save a lot of feed and get more money during the next twelve months. If the old hens are confined to a rather small yard and fed all the corn and water they will consume for about two weeks they will become very fat and their flesh will be almost as sweer and tender as that of a spring pullet, because the fat particles will lie between the fibers of the muscles and melt away when the fowl is cooked, leaving the meat tender and nicely flavored. The hens should be sold within the next few weeks before they begin to molt. Even if some of them are laying, the loss will not be great, as the price of eggs is low and during the very hot weather hens do not lay so regularly as in the spring

A good fattening pen may be 10 feet square and 3 feet high. Bed it well with straw and cover it with a thick straw roof, letting the hens sleep on the ground. Such a pen may be made cheaply of 3-foot chicken netting, plastering laths or even old boards. Feed all the corn the hens will eat, but do not leave any lying uneaten. Two weeks is about the average time required to fatten the hens. After they have become fat they should be sold at once, as they soon lose their appetites and do not add to their weight. A pen 10 feet square s large enough for 25 hens for the few days they will be confined.

Peerless
Guaranteed Fencing
Strongly made and closely spaced—making it a complete barrier against large animals as well as small poultry. Top and bottom wires No. 9—intermediates No. 12 wire—made by the Open Hearth process which time and other tests have proven to be the best material made for the manufacture of wire fencing. Send for literature. Ask about our farm and ornamental fencing.
Agencies nearly everywhere. Live agents wanted in unassigned territory.
The Banwell-Hoxie Wire Fence Co., Ltd., Winnipeg, Man., Hamilton, Ont.

Outdoors or in—this is the paint that gives satisfaction

Stands the test of Canada's trying weather as no other paint you have ever used. For barns and other buildings, for your implements and wagons, and for your home, both outside and in there is a Ramsay finish that is the best of its kind.
To the man who does his own painting the convenience and economy of Ramsay's Paint is self evident.
The man who hires painters to do his work for him will do well to specify Ramsay's paints—they wear so well and protect wood and metal so thoroughly from deterioration. The local Ramsay dealer will give you splendid service and suggestions. Or write direct to the factory. (3)

A. RAMSAY & SON CO. (Established 1842) MONTREAL, Que.

Everybody can Candle Eggs.

To enable farmers and housewives to test eggs before a candle and tell accurately their condition before they are opened, the Department of Agriculture has just published a colored egg-candling chart. To give a true picture of the eggs, twelve impressions were necessary to produce this lithographed chart.

The chart shows the eggs in their natural size as they appear before a candle and also as they look when open in a glass saucer. The pictures include an absolutely fresh egg, slightly stale eggs, decidedly stale eggs, eggs with yolks sticking to the shell, eggs where the chicken has developed so far that blood has been formed, moldy eggs, addled eggs, and eggs with a green white.

Comparatively few housewives are aware that a green color in the white of eggs is due to the presence of billions and billions of a certain species of bacteria that make a green coloring matter. Eggs with this greenish tint, even though the yolk seems to be perfect, are not fit for food.

As long as the Department's supply lasts, these charts will be furnished free upon application to the Editor and Chief Division Publications. Commercial shippers of eggs, however, should apply for Department Bulletin 51 a technical paper on testing by scientific methods not available to the average farmer. This bulletin includes the colored illustrations. This chart alone will be found to be not merely of great service to the housewife wishing to test the eggs she is to serve to her own family, but also of commercial value to farmers, country merchants, or egg shippers who wish to buy and handle eggs on an accurate quality basis.

The great spoilage of eggs in this country is due to bad handling and is quite unnecessary. Part of the remedy is to teach everybody, from the farmer to the consumer, how to tell the quality of an egg without breaking the shell. The country buyers the middlemen and the housewife judge of the quality of the inside of a cucumber or an eggplant, or any other vegetable, by the appearance of the outside and the firmness of its texture. It is not possible to tell the quality of an egg by looking at the shell, though it is safe to say that the eggs with shiny shells are apt to be aged. A fresh egg looks as though it had been dusted with a very fine powder; the "bloam" as the egg men say. But in order to know what is inside the shell the egg must be held in front of a strong light—such as an electric bulb furnishes—which frames through a hole about 1½ inches in diameter. The room must be dark When the egg is held close against the hole the bright light renders its contents visible, and the quality is indicated by the appearance of the yolk, the white and the air space of the blunt end. There are many eggs "candles" on the market, but the housewife can easily make one for herself by cutting a hole in a small pasteboard box, which is slipped over an electric light bulb. If gas or an oil lamp is the source of light, a tin box or can should be used.

Purebreds vs. Mongrels.

There are a great many farmers who have an idea that because they do not keep fowls for any other purpose than for their own use, it is not necessary for them to keep anything but mongrels. Most of these people have been so long accustomed to believe that almost anything will answer for themselves that they fail to appreciate what they deserve. It may be all right for them to think they do not need as good as the land affords, but let some other fellow tell them so and see how quickly they will resent it.

There are many reasons why purebred fowls are to be preferred to mongrel or scrub stock, and as the "best is none too good" it is to be farmer's interest to acquaint himself with the comparative qualities of the more desirable breeds, and when convinced of one greater excellence of purebred poultry, dispose of the present flock of scrubs, and replace them with some particular breed or variety of fowls that is thought to be most suitable for the farm.

In farming as in every other business the greatest possible profit is the object that stimulates to never tiring effort and as farm poultry with proper care and management, are more profitable than any other thing on the farm, considering the amount invested, they should receive at the least their share of consideration and attention. The best breed for the farmer is some general purpose fowl or any good breed to which he takes a liking. A good strain of purebred fowls will be far more profitable as layers than the usual flock of mongrels; are incomparably more desirable for market purposes than the small bantam-bodied mixed birds; are more tame and docile to handle and manage, and the last, but not least favorable quality, is their beauty. How much more to be admired is a flock, every specimen of which is of the same form and color, than one where the birds are of every color and more like quail than fowls.

One would hardly believe that persons, who appear intelligent in most matters pertaining to the farm and farming, would have such erroneous and often absurd impressions and ideas of purebred fowls and their usefulness or rather worthfulness on the farm, unless convinced of it by personal conversation or observations. I have had parties argue with me that mongrel hens were very much superior layers than purebred hens; that purebreds were not so vigorous, more subject to diseases, and a greater per cent of them die in a year than the poultry that boasted no "blue blood" or aristocratic breeding, and also that purebred fowls require much more care and attention than mongrels and were difficult to raise to maturity.

Such statements as those cited are made through lack of experience with purebreds and therefore through absolute ignorance of their excellent qualities and characteristics. I have had experience with scrub stock and also with the much-to-be preferred purebrds and the latter are so much more profitable and desirable than the former that they should not be spoken of as belonging to the same family.

The great profit realized from the more prolific purebreds, the eggs, so much larger in size and so many more in number, their large, plump carcasses when dressed ready for the market, should all combine to persuade any one of common sense to choose them in preference to a flock of mongrels. As to the vigor and healthfulness of the purebreds, we have never had any cause to complain having found them less subject to disease than scrub stock. Then, too, from a flock of purebreds, by expending a small sum each year advertising, you can readily dispose of your surplus cockerels at a premium for breeding purposes and during the hatching season realize from $1 to $5 per setting for your eggs.

As to requiring more care and attention than mongrels this is another mistaken idea. I will admit that if sadly neglected and left to scratch for a living and allowed to remain without home or house through rain and storm alike, as are so many farm flocks, very little profit can be realized from a flock of purebreds, even if it be of the most noted laying strain.

It is possible for every breeder to have a flock that will in their beauty and profitableness be the admiration of all beholders. So why be satisfied with inferior, unprofitable poultry when the superior and profitable ones are easily obtained? If you keep fowls and do not keep purebreds, change your policy and you will see for yourself that the well bred birds are much more preferable than mongrels.

ESTABLISHED 1878
PRATT FOOD COMPANY
OF CANADA LIMITED
GUARANTEE
We guarantee all our preparations to do exactly what we claim for them.
If they fail to satisfy you we authorize our dealer to promptly refund your money.
IN USE 40 YEARS

Pratts Guarantee Protects You

There are guarantees and guarantees. But the only guarantee that's worth anything is the one that gives you back your money when you're dissatisfied. That's the kind of a guarantee we give to any and every purchaser of Pratts Preparations. Read it over! There are no "ifs" and "ands," no "buts" and restrictions that bind everybody but the seller. No; but a plain, direct, emphatic promise to give you back the purchase price should any article fail to satisfy you. You couldn't get a fairer, squarer guarantee, could you?

One thing you may be sure of, if Pratts Preparations weren't all right—didn't live up to the guarantee—you wouldn't get any such guarantee. That, after all, is the best evidence of their goodness.

Write your name and address on margin of this ad., tear out and mail with 10c. for 160-page Poultry Book.

Both Sides of The Fence

There you go again; always Linda, Linda, Linda! It's a pity you didn't marry her, 'stead of me. I've stood it just as long as I'm a-goin' to, James Doane; and won't take no more of your black looks and black words. I ain't made like her, and I ain't been raised same's her, neither." Minnie Doane rocked furiously back and forth in accompaniment to the vehemence of her outburst. Defiance sat oddly on her usually placid countenance and ruffled her flower-like face like a rough wind through a daisy field.

"Z'at so?" replied the man tauntingly through his closed teeth that held the stem of a short brier pipe as he lounged surlily against the kitchen door. "Z'at so? That's real news to me. So you're goin'? Let's see; that makes the sixty-ninth time you've been goin' to go, I b'lieve. Seems you can't make good even in that."

"Can't I, hey, well, we'll see," she rose quickly and faced him her eyes blazing. "I ain't been brought up to be a drudge an' I won't be none for no man. My people was gentlefolk. Pity you didn't ask for a servant in your application for matrimony, an' I could a' told you different. You said all you wanted was a wife lovin' and true——"

"Aw, cut it out,'- broke in Doane harshly, knocking his pipe against the coal-scuttle, I tell you, I'm sick of this. 'Twas bad enough at first, but now—I ain't blind. God, what a lookin' place to come to! It's a disgrace, that's what it is. Now, Linda——"

"I tell you," there was a sharp menace in her tone, "I'll hear no more of her. It's always, 'Linda's grand bakin', Linda's this, Linda's that' till I'm nigh crazy. You knew I wasn't used to housework when you was courtin." You said 'twas because I wasn't like the rest of 'em that you wanted me, an' now you come and cuss 'cause I ain't. I was a fool to marry you. I was a sight better off single, drawin' my pay every week down to the store and spendin' it as I liked. Well, I guess I can manage just as well again. I have bided my time, but I'm goin' now."

Doane continued to lean against the door, sucking on his empty pipe. He gave but a dull ear to what his wife was saying. He had heard it all so often before and it had never led to anything.

At first, when love was at a stage where he laughed at her shortcomings, he had excused; but as time went on he became annoyed, then disgusted until he felt that he could stand it no longer. He loved order and home was spelt in capitals to him. To come back night after night to a place that was still in the curl-paper state of the morning, with the soiled dishes piled high on the sink, and dusty disorder at every turn, filled him with sickening disgust. In sharp contrast he pictured his brother Steve's home just across the lot, where everything shone in fresh neatness and Linda deep in baking by the time the butcher boy came for his orders. It was no wonder that he found himself spending more and more time over there.

In the heavy silence that followed James Doane strode out of the room, his little fox terrier yapping at his heels. Through the open door the late sun shone in copper radiance, upon the untended garden. He noted with deep bitterness the scraggy border of nasturtiums that had spread sprawlingly past their allotted patch, the half-dried geraniums that waited in vain for the evening's refreshment, the hedge of sweet peas boasting of naught but twisted green spirals that ran amuck. And this was his domain, which he alone had tended in which he had once taken such pride. The incentive had been utterly destroyed.

He looked over to his brother's farm. It stood trim and spruce in its new coat of paint. Well, why shouldn't it? No wonder Steve took such pride. Linda was not pretty to look at—couldn't come a mile of Minnie in that, but she did her part and did it well. A wave of self-pity came over him. He had been cheated by a pretty face.

At his feet the little fox-terrier sat watching every move anticipating the usual long tramp through the cool woods, where rabbits and birds gave cause for nervous chase. Doane looked down at the dog; and his face softened.

"No, Dicky, not to-day. We ain't takin' no more walks till somethin's settled. Now's the time. It's been put off to long already. Things can't go on as they've been doin.'

A violent quivering of the stump of a tail seemed to urge a decision.

"I've got it," he said at last. "It's not for her to go; it's for me."

The decision came like a flash, and changed inertia into activity. With quick steps he turned and hastened up to the bedroom, the dog still at his heels.

There the familiar untidiness pervaded; the fact did not disturb him as heretofore but served to stimulate his resolve. Hurriedly he looked about trying to decide what he should take with him.

From a disordered pile of clothes that were bunched together on a few hooks in the closet, he took some garments. He would send for the rest later. He must walk out without arousing suspicion for if she saw him leaving with a large bundle there would be a fuss and he was sick of scenes.

He was going—but where? Doane had not thought further than the fact of going. A curious dull pain took hold of him which he likened to the feeling of a prisoner on leaving his cell after serving a term of years; a peculiar regret and withal a desire to be gone.

Well, there was Steve's at least for a few days; Steve would understand.

"I guess," he wrote on a leaf which he tore from his notebook, "if there's to be any goin' it's up to me. Then, after a moment's thought he added. "I'll be at Steve's until I decide what to do." On the table near the bed lay her well-thumbed prayer-book. Doane placed the note inside with a corner sticking conspicuously out. With it he laid a five-dollar bill for the week's expenses.

"There," he sighed with relief, picking up his bundle, "I guess that will do."

At the front door he stopped and looked long at the dog who, quivering with excitement in anticipation of a run, jumped ecstatically about. "No, old chap," Doane whispered, bending over to stroke the intelligent head with a hand that lingered lovingly, "You stay and look after Minnie. I can't take you along, it wouldn't be fair."

Outside the chill air smote Doane with refreshing slaps. The earth, all outdoors seemed so clean, so fresh, so neat by contrast. Over on the other side of the fence the window-panes at Steve's reflected the dazzling, blinding brilliance of the blood-red rays of the setting sun. At the gate he turned and stared long at the little cottage he had called home. The smeary, half-washed windows returned his gaze with dull eyes. He noted drearily the lace curtains that were pinned back in untidy effort to catch the remaining light. He noted the muddy steps and earthstained floor of the porch; the chairs in disordered array, the one with the broken seat still overturned since their heated controversy of the day before. Neglect everywhere; shiftlessness and sloth were the dwellers.

"Home, sweet home," he muttered in satirical bitterness, as, with a preying feeling of disassociation, he walked wearily down the road.

For a few moments after Doane had left the (oom, Minnie stood staring dully after him then turning apathetically towards the sink began to wash the belated dishes. The water was cold and the grease stuck to the plates. Sigh after sigh sought for outlet as she tried to coax a spark from the cinders that lay in heaped unresponsiveness in the stove, but they gave forth only a cold, white dust that made her cough.

"I don't care," she fretted defiantly, stooping to pick up a book she had thrust out of sight upon Doane's entrance, "He's got no right, even if he is my husband, to jaw at me like that. I do try, only he won't believe me. I can't help it if I ain't like Linda; 'sides I'd die if I was to look like her. I told him I wasn't no good in the house; I told him fair. I wish I'd a' married rich an' had servants an' everything. But this scrubbin' an' fussin' aroun' from the mornin' till night —oh, I hate it, I hate it, I hate it!"

Hot, blinding tears that smarted like acid, welled up in her eyes.

"He says I can't make good at nothing; but I will show him that I mean what I say, an' when I say I am goin' I'm goin.' And what is more, I'll leave this very minute. You betcher," she went on, taking courage with each word, "He won't have to say I ain't kep' my word. I am goin' an' never come back no more."

Quickly, yet softly she ran up to the bedroom and looked about.

"I musn't let him hear me; he'll find out soon enough," she murmured breathlessly as she dragged an old valise from under the bed and dusted it with her torn apron. With nervous haste she opened the bureau drawerd and emptied the disordered contents upon the floor; sorting from the heterogenous mass, odd bits of ribbon and long-prized trinkets which she flung pell mell into the bag. From her scanty wardrobe she selected her best dresses, slamming them in with haste.

"Guess he thought I didn't have the nerve," she soliliquized setting her teeth firmly together and taking grim satisfaction in her decision. In nervous haste, listening strainedly for a possible interruption, she changed her soiled print dress and as she pinned up stray locks of soft waving hair that ran riotously about, she surveyed herself in frightened excitement. Her eyes bright and cheeks flushed showing a face girlish and fragile. The soft light of the waning day cast its shadows over the lines recently penciled, that told of discontent and sullen resentment and, as she smiled two nearly forgotten dimples played faintly at the corners of her weak little mouth.

For a few monents she stared in the looking-glass as if about to talk to the flushed little figure that looked back at her. But then of a sud-

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write today. Address: Mrs. M. Summers, Box 309, Windsor, Ont.

MRS. MABEN WAS MADE WELL

By Lydia E. Pinkham's Vegtable Compound and Wants Other Suffering Women To Know It.

Murfreesboro, Tenn. — "I have wanted to write to you for a long time to tell you what your wonderful remedies have done for me. I was a sufferer from female weakness and displacement and I would have such tired, worn out feelings, sick headaches and dizzy spells. Doctors did me no good so I tried the Lydia E. Pinkham Remedies — Vegetable Compound and Sanative Wash. I am now well and strong and can do all my own work. I owe it all to Lydia E. Pinkham's Vegetable Compound and want other suffering women to know about it."— Mrs. H. E. MABEN, 211 S. Spring, St., Murfreesboro, Tenn.

This famous remedy, the medicinal ingredients of which are derived from native roots and herbs, has for nearly forty years proved to be a most valuable tonic and invigorator of the female organism. Women everywhere bear willing testimony to the wonderful virtue of Lydia E. Pinkham's Vegetable Compound.

Why Lose Hope.

No woman suffering from any form of female troubles should lose hope until she has given Lydia E. Pinkham's Vegetable Compound a fair trial.

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

Constipation

is an enemy within the camp. It will undermine the strongest constitution and ruin the most vigorous health. It leads to indigestion, biliousness, impure blood, bad complexion, sick headaches, and is one of the most frequent causes of appendicitis. To neglect it is slow suicide. Dr. Morse's Indian Root Pills positively cure Constipation. They are entirely vegetable in composition and do not sicken, weaken or gripe. Preserve your health by taking

BEWARE OF IMITATIONS SOLD ON THE MERITS OF MINARD'S LINIMENT

Minard's Liniment Co., Limited

An article that has real merit should in time become popular. That such is the case with Chamberlain's Cough Remedy has been attested by many dealers. Here is one of them. H. W. Hendrickson, Ohio Falls, Ind., writes "Chamberlain's Cough Remedy is the best for coughs, colds and croup and is my best seller." For sale by all dealers.

Advertise in the Maritime Farmer.

den, determination was written on her face. She wrapped a shawl about her and picked up her bag.

As she turned to go she stopped suddenly, "My goodness," she exclaimed, "I most forgot to tell him good bye." With a stump of pencil she wrote hastily on a piece of wrapping paper:

"Good-bye, James, I am leaving you forever,

Your loving wife, Minnie."

"There, I guess that'll fetch him," she decided. He would not know where she was, and the world was wide. At the thought she stopped. Where was she going? She had not thought of that. She had no money to take her any distance and she hated walking. Where was she to go? She went over in her mind several places where she might stop, but there was always some reason why she couldn't. There would be questions asked and unpleasant discussions, and probably lectures. Then, as she looked across the field on the left to Mrs. Wilkin's home, she decided. Many a time she had helped Minnie straighten out her household tangles; she had been kind and patient with her and would shelter her she knew. She had best tell James, where she was in case—oh, in case he had to see her about something; so, adding a short postscript she ran lightly down the stairs, stopped only a moment to see if the coast was all clear, and pinned the farewell message on the front door where James would see it as soon as he came into the hall.

As she opened the door the dog bounded forward, leaping and barking in eloquent request to accompany her. For a moment only she hesitated. She loved the little animal devotedly as did James, but as she thought of her husband all alone in the house, she gave up the idea of taking him along.

"You stay with him, Dickey-boy; he'll need you now I'm gone," she whispered into the soft, silky ear and kissing the dog tearfully between the eyes she sped down the path out into the road.

James came from his place at the window, looked across the generous field of flowering barley that lay, soft and white as a cloud in the shimmering moonlight. There just beyond lay his home, grimly dark standing out like a silhouette in a silver frame. Through the stillness came the incessant barking of a dog; insistent in its appeal.

For the twentieth time Doane took out his watch and looked at it unseeingly; a shade of anxiety crossing his features.

"What ails that dog to bark so; why don't she shut him up?" he questioned nervously.

The clean freshness of his brother's well-ordered house irritated him. Even the very things for which he had so longed struck an unresponsive chord and he fell to criticizing in blind contrariness the things he had held up as an example to his inefficient wife. Everything seemed to flaunt itself in snug consciousness of order. The bright coppers, the clean, trim curtains with the faint suggestion of recent soap all stood forth in pious sancity. Even Linda, though she said no word, seemed to preen herself with satisfaction; all of which stood out like an affront to his wife.

It was ten o'clock and not a light was to be seen in any of the windows at his home.

"Funny," he mused, "She ain't gone up to bed yet. It's not like her to hug the dark." A strange, uncomfortable feeling tugged at his heart and left it sore.

"I wrote on purpose where I was, so's she could get me if something went wrong. And Dick why in Heaven does he keep on barking so; it is enough to drive a man crazy."

In the room beyond he heard the voices of Steve and Linda. For the first time he noted the acid stridency in the insistent reiteration that goes with nagging and wondered at Steve being so patient. One thing about Minnie, he reflected, her voice was as soft and musical as a pigeon's and never nagged.

Again he took out his watch but did not look at it; it had become mechanical now.

"She ain't et, neither, else I'd have seen the smoke in the chimney. She never sits down to a bit of bread without her tea. I can't make it out."

The reiterating barks of the dog changed to a long drawn out yowl that sent cold clammy fingers down his spine.

"My God, why don't she do something to hush him?" he swallowed hard, his Adam's apple rising and falling and rising again with his effort of self-control. With fingers that shook he waveringly sought his unsteady chin, and realizing his condition he turned away toward the interior of the room, but not for long. Like a lodestone the little house drew him back to the window. Its unresponsiveness struck him with renewed chill. It wasn't like Minnie to keep out the light. Dimly he remembered how she had clung to him during those first happy months of marriage, fearing ghosts and things, starting at each faint sound in terror as though an evil spirit were waiting to spring out at her. She was such a scary little thing, and pretty—with those funny little dimples that played an everlasting game of hide-and-seek with you; why, he had nimost forgotten about them. Steve's wife had two heavy lines running deep from her broad nose to her mouth making her face look as if it had been put together in sections and her teeth—how large and yellow they were! Strange he had never remarked it so strongly before.

Again a long drawn howl and Doane leaned far out into the night, staring with wide eyes at his home and striving to get a glimpse of life about. But not a flicker answered his strained vision.

Like a cruel hand grasping tight at his heart he jerked himself upright. "Perhaps"—at the thought that held a question, strange pictures came dancing before him, clamoring for attention. His breath stopped for an instant and his throat became parched. Now that his mind had allowed the gruesome fancies to take hold, he saw in imagination, Minnie his wife, lying a huddled heap near the stove, a carving-knife near, her throat—no, not it was his pistol that he kept in his top bureau drawer. He had loaded it the day before—no, it was a rope and she was—"O my God!" he choked —"She wouldn't do that, she

BUY AS GOOD A PIANO FOR $100 LESS!

When you do buy a piano, take the price of a strictly first-class instrument, then keep back $100. With the balance buy a **Sherlock-Manning 20th Century Piano**—the $100 is clear saving, but not, remember at the expense of quality.

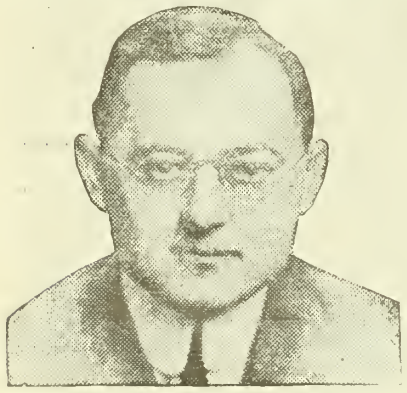
CATARRH TRUTH

Told In a Simple Way

No Apparatus, Inhalers, Salves, Lotions, Harmful Drugs, Smoke or Electricity

Heals Day and Night

It is a new way. It is something absolutely different. No lotions, sprays or sickly smelling salves or creams. No atomizer, or any apparatus of any kind. Nothing to smoke or inhale. No steaming or rubbing or injections. No electricity or vibration or massage. No powder; no plasters; no keeping in the house. Nothing of that kind at all.



Something new and different, something delightful and healthful, something instantly successful. You do not have to wait, and linger and pay out a lot of money. You can stop it overnight—and I will gladly tell you how—FREE. I am not a doctor and this is not a so-called doctor's prescription—but I am cured and my friends are cured, and you can be cured. Your suffering will stop at once like magic.

I AM FREE—YOU CAN BE FREE

My catarrh was filthy and loathsome It made me ill. It dulled my mind. It undermined my health and was weakening my will. The hawking, coughing, spitting made me obnoxious to all, and my foul breath and disgusting habits made even my loved ones avoid me secretly. My delight in life was dulled and my faculties impaired. I knew that in time it would bring me to an untimely grave, because every moment of the day and night it was slowly yet surely sapping my vitality.

But I found a cure, and I am ready to tell you about it FREE. Write me promptly.

RISK JUST ONE CENT

Send no money. Just your name and address on a postal card. Say: "Dear Sam Katz: Please tell me how you cured your catarrh and I how I can cure mine." That's all you need to say, I will understand and I will write to you with complete information. FREE at once Do not delay. Send postal card or write me a letter today. Don't think of turning this page until you have asked for this wonderful treatment that can do for you what it has done for me.

SAM KATZ. Room A 229,
142 Mutual St. Toronto, Ont.

wouldn't —" Suddenly he drew himself up, drops of perspiration running down his twitching face, "I'm a fool," he tried to reason with unreason. "It's the dog's barking that has got on my nerves. She ain't one to do a thing like that. Of course, she's all right." But, as he looked across the field that divided the land, he felt the silence cold and ominous. Even the dog had ceased barking, only giving out an occasional cry like that of a sick child's.

"O my God! Minnie!" he breathed, huskily, "What, what have you done In the white heat of terror, he stretched out his arms into empty space, his own shortcomings smiting him with exaggerated force. He magnified his impatience, his selfishness, his brutality until he became a monster of utmost cruelty.

"She ain't like Linda. I should a' known. She's too frail an' delicate, that's it. That's why I married her, 'cause she was so flower-like. If I had wanted a husky, I wouldn't a' chosen htr, An' here I go, putting work on her she ain't got strength to tackle. An' now see what I done. I don't blame her, poor little girl. O my God," he pleaded with stifled breath, "spare her, make me not too late, and I'll show her, I'll—"

With one bound he cleared the window and sped through the barley over the lence and on to the silent house.

"I'll ask no questions dearie," said Mrs. Wilkins, fussing maternally about Minnie Doane, as she sank into a rocking chair near the window "Land knows you re welcome to stay as long as ever you like. It's mighty lonesome having no one to bother about. Sometimes I almost wish Thomas would come back drunk even, an' give me some of his back talk. Ain't it queer, now, the way us humans is made? I often stop to think on it. When they're here an' try us most to death we pray they was dead, but the minute they're gon' we'd walk bare-footed on hot coals to get 'em back. He was all right, Thomas was when he wasn't in liquor, an' real considerate—sometimes Why, five years after we was married he brought me that stuffed owl that sets on the parlor table. It come from furren parts, Australey I guess 'twas or mebbe Africa, I don't know which.' Mrs. Wilkins looked reminiscently into space then wiping a solitary tear that stood in her dim eye she wagged her head slowly. "I declare to goodness, I do miss a man around somethin'awful. It's funny, ain't it?"

Minnie rocked quietly back and forth lending but half an ear to what the little widow was saying, while her mind strayed with her eyes through the window across the border of well-trimmed hedge of box to the cottage she had left but a a few hours before.

Mrs. Wilkins opened a cupboard. The odor of freshly-baked gingerbread escaped in spicy fragrance.

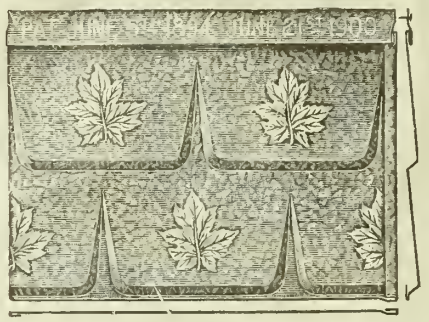
"Here dearie," she cajoled. "Eat some of these. It's a new rule I got at the Church Fair last week an ' It turned aut grand. Only one teaspoonful of shortening too."

"No, thank you, Mrs. Wilkins I've no fancy for eatin just now, althou' they do smell fine," Minnie returned wearily, scarcely glancing at the tempting brown mounds. "It's queer I've never let my eyes off that house She went on irrelevantly, half aloud, An' I ain't seen a sight of James, I know he ain't left, I'd a' seen him goin.' He always draws water from the well before nine; he never misses but he ain't come out yet."

As though urging their presence the little gingerbread cakes wafted their warm fragrant breath gently to ward her, so that she turned once more to contemplate them. James

A Lightning Proof Roof !

The fear of loss by lightning is gone from the farmer who builds right. No more does he sit up nights during an electrical storm and wonder if his buildings are going to be destroyed.



The modern progressive farmer roofs his buildings with

Preston Safe Lock Shingles

and gets a guarantee against lightning losses. Preston Safe Lock Shingles are the only metal shingles with the four hook locks. They cannot be pulled apart by the sagging of the building or torn off by the heavy wind storms.

They are proof against all the weather elements. Erected according to directions they will stay on a roof until all the roof boards have rotted away and will keep out the rain and snow and sleet.

If you need roofing for any building—or if you just want to know more about this shingle write to us or to our agencies near you. A catalogue will go to you by return mail without any cost or obligation on your part. Sign the coupon to-day.

The "Bull Dog" Gasoline Engine

is not an experiment but an engine today with 20,000 satisfied users. One of our many customers wrote to us in January stating that he had been using his "Bull Dog" twelve years and that she was good yet. Just think of it, continuous uninterrupted service for twelve long years.

Nothing But a Good Engine Can Establish such a Record

One of the largest railways in Canada recently selected a 16 H. P. "Bull Dog" from among numerous makes. They had a big job for a reliable engine and they knew they could not afford to take any chances. All the high-class features known to gasoline engine construction are embodied in the "Bull Dog." Send for catalogue and a list of users.

The A. R. Williams Machinery Co.

of St. John, N. B., Ltd.,

15 Dock St. ST. JOHN, N. B. 34 Nelson St.

loved gingerbread. He had said often enough, kind of as though to hint that a hatch would not go amiss. Linda made good gingerbread. It was an unwelcome reminder and turned her mind toward her grievance.

"It's all very well for them as can do it," she grumbled under her breath, "But I won t slave for any man."

The creak-creaking of the loose-jointed rocker soothed her at length, to a more gentle mood when through the stillness she noted the incessant barking of the dog.

"What's got into that dog," she spoke anxiously 'Why can't James let him out? I'll bet he does it because he knows I can't abide the noise." She got up petulantly as the barking continued and looked out over to the abandoned home, then glancing at the kitchen clock she turned quickly back.

"My Lord, only ten o'clock an' it feels like t'was nearly morning."

Mechanically she answered a "yes" or "no" to Mrs. Wilkin's unceasing prattle. It annoyed her to have to listen at all. She wanted to he alone As mechanically she followed her up to the "best" bedroom directly over the kitchen.

"Yes, I know, Mrs. Wilkins," she answered in an even, dull voice, "I guess you must be lonely without him only—only what can be the matter with Dicky—just listen to the way he is barkin'. Why don't James tend to him?"

Left alone she went over to the bureau and put out the light; she would sit and watch until she could see some signs of life over at the house. She was worried about Dicky she repeated again and again, yet this repetition did not bring conviction. It worked back to James; the dog was but the excuse. Leaning against the window frame she watched and watched for the light that must surely shine in a few minutes from their room. James always went to bed about this time. But the unfriendly casement looked back at her with sightless eyes.

What was James doing? Why didn't he light up, even if it was just to show her he was home and comfortable without her knowing she was near-by watching. If it had been her she would have had the whole house ablaze with lights. But men are different, somehow. It was awful to have to stand there and see nothing but a large dark hulk. Oh, why didn't he make a light if only for a minute and why didn't he try to still that barking?

Quickly she caught at a fleeting idea. What if something had happened. Something fearful, terrible. She had heard of such things many times; how awful tragedies came from quarrels. There was a case in the paper only a week before. She had read it over three times; it was so horrible. To think that just because a man came home and found his wife had gone and left him he had hung himself from a beam in the attic and it was days an' days before he was found and when they came upon his body—My but it made her sick even to think of it—and him some one she hadn't even seen!

Like a composite picture she drew up before her a vision, frightfully distorted. "Could he have"—with a stifled cry she shrank back from the window and threw herself upon the bed with an abandonment of weeping in which terror, contrition, love and longing were intermingled. The words Mrs. Wilkins had said came back to her. What could life be without him?

There in the darkness she pictured him lying so still, so still in the deserted house, a stream of blood, perhaps threading its thick red way from his open mouth along the floor like a snake. No wonder the dog was howling. And she was the cause of it all. Why had she left him? She had always loved him. He was right; no man would have stood as much. She could have made the home different, more like Linda's, more like Mrs. Wilkins if she had only tried a little harder.

;'O Heaven! give me another chance, just another chance," she sobbed.

Quickly, while tears coursed slowly down her cheeks, she slipped in stockinged feet to the hall, to the kitchen door and blindly sought the knob. Outside the lurid moonlight followed her as she ran, showing her face distorted by fear and labored breathing.

She opened the front door as Doane turned the handle at the rear entrance and they met midway in the hall. For a moment they stood staring foolishly at each other in the dim light that filtered through the window, not comprehending the dog racing wildly from one to the other in joyous relief.

Then as each took in the situation they laughed awkwardly; reaction from the strain of the past few hours acting as a harrier to free expression

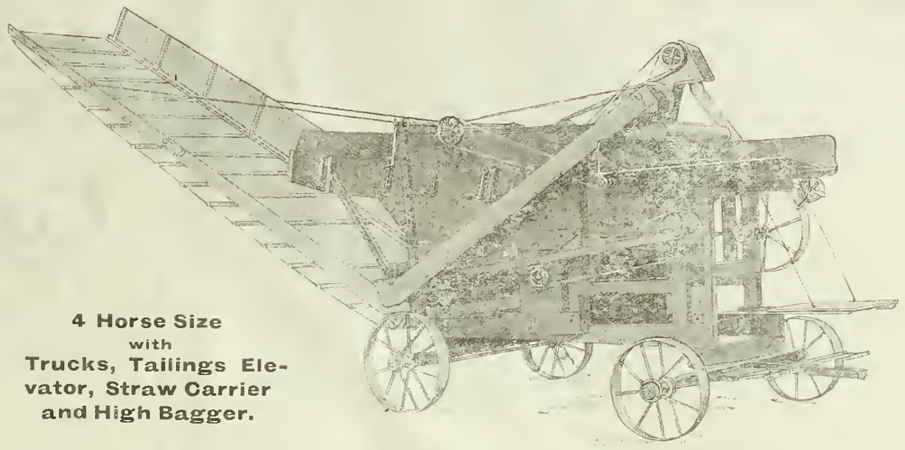
It was for a moment only; for, as the tension relaxed the semi-darkness showed dimly two shadows that suddenly converged into one.

Then stealthily, Minnie groped back to the door, felt for the note she had pinned there and tore it quickly off Doane at the same time took the stairs at a bound for the paper he had left.

"Now, I wonder," exclaimed Minnie as she hurried to the kitchen, "if I've got any shortening for that gingerbread."—Elizabeth Myers.

The "Sussex Little Giant" Thresher

Perfect Separation, Light and Durable.



4 Horse Size with Trucks, Tailings Elevator, Straw Carrier and High Bagger.

Built to do the Work and Stand the Wear

Good Crops and a Good Thresher Guarantees Good Profits

The Best Proof of Quality is in the Using

"Can't be beaten" is the verdict of the users of the Sussex Little Giant. Up-to-date in every respect.

All bearings supplied with compresssion grease cups. 5 inch belt supplied free with every machine. Made in 4 sizes, 1 Horse, 2 Horse, 4 Horse and 8 Horse. Trucks, Tailings Elevator, Bagger, high or low, and Straw Carrier supplied if required.

And Remember: We also manufacture the Famous Trenholm Geared Level Tread Powers, 1 and 2 Horse

Hay Presses, Grain Grinders, Root Pulpers, Wood Cutters and Feed Boilers

Our guarantee goes with our machine. Write us at once and you will receive our illustrated catalogue and prices by return mail.

TRADE MARK

Ploughs—Wilkinson

REGISTERED

U.S.S. Soft Centre Steel Moldboards, highly tempered and **guaranteed** to clean in any soil. Steel beams, steel landsides and high carbon steel coulter. Clevises can be used either stiff or swing. Each plough is fitted especially with its own pair of handles—rock elm, long and heavy and thoroughly braced. The long body makes it a very steady running plough. Shares of all widths—specials for stony or clay land. The plough shown turns a beautiful furrow, with minimum draft and narrow furrow at finish. Ask for catalogue.

The Bateman-Wilkinson Co., Limited
131 Symington Ave., Toronto Canada.

No. 3 *Sod or General Purpose Plough. 25 styles to choose from.*

Baby's Clothing.

The baby's clothing must be light loose, comfortable and hung from the shoulders.

When completely dressed he has on a belly-band, skirt, a flannel underskirt, a soft sheer underskirt (for dress), a simple dress or slip, socks, and diapers.

The belly-band is made of an unhemmed strip of soft white flannel, sewed on firmly but not to tightly. At eight weeks it should be discarded for a loose, knitted band with shoulder straps.

The skirt should be of soft texture, silk and wool or cotton, fitted closely enough to avoid wrinkles.

The underskirt of soft flannel, which is preferable to a pinning blanket, is made with large, loose armholes, and is twenty-six inches long.

The dress or slip, twenty-seven inches long, should be simple and of soft material. The neck should be loose and is best tied with a soft tape. No lace or embroidery should be used on neck or sleeves. They may irritate the skin and cause eczema.

Cheese cloth diapers one yard square are the nicest for a little baby. Squares of soft linen placed inside the regular diapers are very comfortable and may be buroed.

Under no circumstances should a soiled or wet diaper be used without washing. They are best dried in the open air and foled without ironing.

Household Hints.

An old serge skirt, sponged, pressed and shortened to three or four inches from the ground will make an admirable rainy day skirt.

Do not let objects accumulate about your house; try to keep it simple and restful and remember that it is better to have a few things of real beauty than a great many mediocre or meaningless ones. Weed out!

There is something about darning stockings that seems to help the wits. Haven't you found that you thought out many a plan then? Have a pencil and paper at hand.

To clean a badly spotted zinc table scrub the zinc with hot soapsuds until you have a dull surface. Then make a paste of sifted coal ashes and kerosene; cover the spots with it and leave it on for some hours. Polish with clean, soft flannel. If the spots are still visible, dip a bit of flannel in paraffin and rub them well. Leave for a while and wash with hot suds.

If you knew of the real value of Chamberlain's Liniment for lame back, soreness of the muscles, sprains and rheumatic pains, you would never wish to be without it. For sale by all dealers.

SUFFERED FOR FOUR YEARS

From Heart Trouble and Nervous Prostration

Mrs. John Hewson, Caledonia, Ont., writes:—"I feel it my duty to let you know of the great benefit your Milburn's Heart and Nerve Pills did for me. I suffered for four years with heart trouble and nervous prostration. I was so bad that I could not go upstairs without sitting down at the top before I could go to my room. I couldn't sleep nor lie on my left side, for it would seem as though my heart would stop. I thought my time had come. I was doctoring with the doctor, but didn't get any benefit. I was advised to take Milburn's Heart and Nerve Pills, so I got two boxes, and after I had taken one box I began to feel better, and after I had taken two I could go up and down stairs without resting, so I took eight boxes, and I am enjoying good health again. I consider it a Godsend to have your pills in the house."

Milburn's Heart and Nerve Pills are 50 cents per box or 3 boxes for $1.25 at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Judging Domestic Science Exhibits.

Exhibitors in the Domestic Science Department at the various exhibitions will find judging rules for their guidance in the following scores submitted by A. Ethel Dunbrack, Supt. of the P. E. Island Women's Institutes.

THE STANDARD LOAF (Bread).

Flavor	20 points.
Baking (lack of doughiness	20 points
Texture and grain	20 points
Lightness	20 points
Sweetness	20 points
Color	5 points
Crust	5 points
Shape and Size	5 points

EXPLANATION OF SCORE CARD

Flavor—The flavor of bread should be much like the flavor of the freshly cracked nuts. It should not taste of yeast and it should not taste sour or musty.

Baking—Cut the bread through the middle of the loaf when it is at least twelve hours old. Press it lightly with the finger. The bread should be soft enough to press easily but the imprint should spring back to the level surface. Roll a crumb of bread between the fingers. If it is not sufficiently baked it will form a lump of dough. If well baked it will always crumble.

Texture and Grain—Bread should have a fine grain with small uniform holes, or air sacs all through the loaf.

Lightness—Bread should be equally light all through—a texture much like a fine sponge cake. If too light it will crumble and break when cut. If not light enough the texture will be close and heavy.

Sweetness—The bread should have no sour smell or taste.

Color—Bread should be a good, cream color.

Crust—The crust should be a golden brown on top and bottom and sides. It should be evenly brown.

Shape and Size—A loaf is more easily baked in a pan that is about ten inches long, four inches wide and five inches high. This makes a fine looking loaf that is not too large to bake well. The loaf should rise evenly and be of uniform height in all parts. It should not rise high enough to bulge over the side of the tin.

SCORE FOR CANNED FRUIT.

Fruit—Shape	15 points
Color	15 points
Flavor	30 points
Juice—Flavor	15 points
Clearness and consistency	15 points
Proportion of fruit to juice	10 to 100

SCORE FOR CANNED VEGETABLE

Flavor of vegetable	35 points
Condition of vegetable	35 points
Pro. of vegetable to juice	20 points
General appearance	10 to 100

SCORE FOR JELLY.

Ideal fruit jelly is a beautifully colored, transparent, palatable product obtained by so treating fruit juice that the resulting mass will quiver, not flow when removed from its mold; a product with a texture so tender that it cuts easily with a spoon and yet so firm that the angles thus produced retain their shape a clear product that is neither syrupy, gummy, sticky not tough; neither is it brittle yet it will break and does this with a distinct beautiful cleavage which leaves sparkling characteristic faces.

Color	10 points
Transparency	20 points
Taste	25 points
Hold shape, not flow	15 points
Tender, will cut easily	15 points
Firm angles retain shape	5 points
No signs of crystallization	10 to 100

The essential difference between preserves, jams, marmalades no where very clearly defined. Preserves from the meaning of the word originally meant the cooking of definite quantities of fruit and sugar, usually equal quantities, to such a consistency that the mass would keep without being heremetically sealed, that is the concentration of sugar present would be sufficient to prevent the growth of any organizins. In preserves, as the name also indicates an attempt is also made to have the fruit keep as near as possible its original appearance and shape, and the effect of the cooking in the sugar solution makes the fruit appear clear. In the preserves we can distinguish two essentilally different parts, the fruit and the juice.

Jams differ from preserves in that though the whole fruit is usually used, it is crushed in the juice so as to produce a homogeneous mixture. As a rule only the small fruits of which the whole may be used are utilized in jam making, for only in these are we able to use the whole fruit. When we discard the seed and all or part of the skin the resulting product is a marmalade or butter. In a butter the pulp only is used and it is usually strained to remove any lumps and distribute the pulp evenly through the juice. In a marmalade part of the peel or skin may be left in and there are distinguishable two distinct portions, the clear juice and the particles of fruit. The test as to when done should be easy especially in cases. Where there is any tendency to jelly, the same as for jelly.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write today to Mrs. M. Summers. Box P. 309 Windsor. Ont.

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—

IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvellous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvellous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it towards the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyne, whether new or renewal subscription. When sending in money state which size you want. Send today.

We guarantee these burners to do as represented or money refunded. Extra burners 35c. each.

PICKLES.

In pickles the preservation is effected by the use of the vinegar and spices. This means the strength of the vinegar must be sufficient to start a preservation action also it must be sufficient in amount to cover the material pickled. Any sign of spoiling will disqualify the sample so it will not be judged at all.

PLAIN VEGETABLE PICKLES.

These will be judged under two heads (1) sweet; (2) sour, the same score being used in each case.

SCORE, PICKLES.

Flavor	30 points
Texture, firm not tough	20 points
Not soft or flabby	30 points
Color	10 points
Pro. of pickle to liquid	5 points
General appearance	5 to 100

General Appearance	5 to 100

RELISHES.

In this class is included all ithe freshly ground pickles.

Choice and pro. of material	20 points
Size and uniformity pieces	10 points
Flavor	40 points
Texture of material	20 points
Color	5 points
General appearance	5 to 100

SWEET FRUIT PICKLES

A sweet fruit pickle has two distinct parts, the fruit and the juice. The aim should be to retain as much as possible of the flavor of the fruit. The only function of the juice is to serve as a flavoring medium and a source of flavor for the pickled fruit.

Texture of fruit	25 points
Flavor	40 points
Appearance of fruit	10 points
Clearness of syrup (cloudiness indicates loss of substance from the fruit	10 points
Consistency of syrup	10 points
General appearance	5 to 100

DOUGHNUTS

Flavor	50 points
Texture	35 points
General appearance	15 to 100

Flavor—Should not taste of soda, too much shortening or soaked up in lard. Pleasant taste with enough of salt to take aff sweet flat taste of dough. Spices permissible.

Texture — Feathery rather than short, free from holes and soda spots Not too close nor too dry.

General appearance—Nicely browned. Uniform in shape and size.

PASTRY.

Flavor	40 points
Texture	40 points
Appearance	20 to 100

Flavor—Should be of a sweet butter flavor rather than evidence of lard. Sufficiently salt to take away insipidness, flaky.

OATMEAL COOKIES

Appearance	15 points
Texture	35 points
Taste	50 to 100

CANDY.

Appearance	50 points
Variety	30 point
Work and Individuality	20 points

MEAT.

In judging cooked meat two main points are taken into consideration, namely that red meats should be cooked rare while white meats should be well cooked.

FRUIT CAKE.

Texture	25 points
Fruits and Nuts —	
Kinds	5 points
Size of pieces	5 points
Distribution	10 points
Proportion	5 points
Flavor	40 points
General appearance	10 to 100

POUND CAKE.

Flavor	45 points
Texture	30 points
Color	15 points
General appearance	10 to 100

Flavor—Not too salty; no soda flavor; sweet butter flavor; combined with richness; oo stale egg or bad butter flavor; must have no extract flavoring in evidence. Just delicate flavoring if any;

Texture—Close, even, moist, but not soggy.

Color—Yellow but not too deep. Score full on color if uniform, as it depends on color of butter and egggs used.

General appearance—Uniform on shape. Sharp edges on loaf. Golden brown on top, deep yellow on sides and bottom.

FANCY TEA CAKES.

Appearance	50 points
Variety	30 points
Work and Individuality	20 to 100

TEA BISCUIT.

Flavor	40 points
Texture	35 points
Color	15 points
General appearance	10 to 100

Flavor—Should not taste too buttery, or floury, or of soda.

Texture—Light and feathery, not soggy with butter or Shortening. Should be flaky.

Color—Creamy with no soda spots through crumb.

General appearance — Uniform in size and in color. Suggesting luciousness instead of flat and heavy biscuits. Cooked a deep yellow.

BARRELS OF SATISFACTION

Have You a Barrel of REGAL FLOUR In Your Home?

If so, you know what a delight this flour is on baking days; the rich, nutritious bread it makes---the kind that meets with the instant approval of the whole family!

If you have never used Regal Flour you should try it *now.* Tell your grocer to send you a barrel.

The Charlotte County Exhibition

A Maritime Farmer representative visited the Charlotte County exhibition held in St. Stephen N. B. on the 15th to the 18th inclusive.

A good brand of weather brought out thousands of the residents of the county of Charlotte and the adjoining State of Maine. Good facilities for transportation via river and railway makes St. Stephen a centre easily accessible to the thrifty fishing hamlets on the islands and along the sea coast of the mainland of New Brunswick and the State of Maine.

A successful fair had been held during the previous week at Calais on the United States side of the majectic St. Croix and naturally American cousins across the line were anxious to come to St. Stephen and see how theCharlotte county exhibits comparaempr |lescvx county exhibits compared with their Washington county products.

We did not visit the Washington Co. fair but we are told the display was a very creditable one. The display made by the Charlotte county farmers, horticulturists and fishermen was one of which the management of the St. Stephen fair had every reason to be proud. Five hundred plates of apples sounds good for a Charlotte county fruit exhibition. Such was the aggregation which Mr. Gorham, Assistant Provincial Horticuturist was caked upon to judge at St. Stephen. The quality, both in size, cleanliness and color was all that could be desired at this season. The floral exhibits were up to the average of those seen at our provincial shows which showed that the decoration of home and its surroundings are not neglected in and around St. Stephen.

B. T. Reid had a big contract when it came to judging field and garden products. There was a profusion of well grown vegetables of all kinds and contests were both keen and close.

The products of the deep were shown in well cured lots of cod, haddock, pollock, hake and other kinds of fish. An interesting feature of this exhibit was a display made by the biological station at St. Andrews of preserved specimens in glass jars of various forms of sea life found in the vicinity of Charlotte county.

W R. Simpson, Oak Bay, had the best colection of grain in the straw.

Wesley Berry, Oak Bay; Harry Leeman, St. Stephen and W. B. Simpson, had the best assortments of potatoes.

Arthur Cluxton, Leverville and Frank Scott, Honeydale, had the best collections of field roots.

D R. Chower, Milltown; H. D. McKay St. Stephen, showed the prize collections of garden vegetables.

The poultry was judged by Seth Jones of the Provincial Department. There was a big showing in the Rock, Wyandotte and Leghorn classes with a fair showing in the other sections. There was a good display of watterfowl and some nice turkeys.

J. Frank Roach, Sussex, judged the Swine. There were some Berkshires, Chesters, Yorkshires and Hampshires but in every case there was little if any competition although some of the specimens shown would stand competition

Mr Roach also judged the sheep classes. No special fitting had been attempted but the sheep were all in good field shape.

Horses were judged by J. T. Prescott, Sussex. with general satisfaction. St. Stephen horsemen take considerable pride in their horses and some very good individuals and teams were shown although competition in most classes was not keen|

The dairy catte were judged by J. Frank Roach. There were small herds of pure bred Ayrshires, Jerseys, Holsteins, Guernsey and French Canadian and their grades, a good useful lot.

Of domestic arts there was an abundance of cleverly made articles that showed both good taste and skill in the planning and exectution of design. Preserves, pickles, jellies, canned goods, etc., were an appetizing looking aggregation.

Dairy products were judged by C. W. McDougall and H. B. Durost judged the apiarian products.

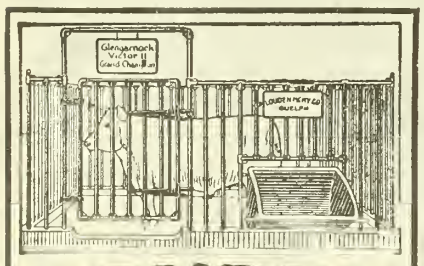
You'll notice the linings are made in nine pieces. There's a good reason--ask the McClary dealer. 84



LOUDEN

Sanitary Steel Pens

— for —

Bulls, Cows, Calves and Hogs

Comfortable, Permanent, Secure

THE best animals in the country are stabled in LOUDEN pens, because the owners appreciate the convenience and protection secured, and the animals the comfort and freedom so necessary, when they are continually shut up.

Louden pens are constructed of the best tubular steel, and dust and germ proof malleable couplings, finished in aluminum. For quality, strength and service they lead.

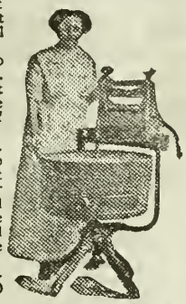
JOHN HALLAM, Limited
111 FRONT ST. EAST, TORONTO

THIS WASHER MUST PAY FOR ITSELF.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.



So I told him I wanted to try the horse for a month. He said "All right," but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse was'nt "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now, this set me thinking.

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that, without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges, nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week 'till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

Address me personally,
F. W. Morris, Mgr., Nineteen Hundred Washer Co., 357 Yonge Street, Toronto, Ont.

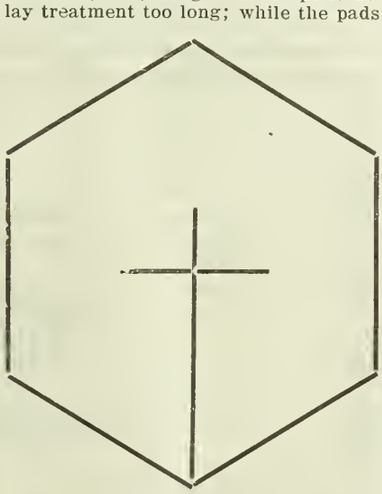
The Control of the Cabbage Maggot.

(Continued from page 855)

from the greater certainty of protection and liability of the latter to injure the plants. It is easier to apply the pads than to make one application of the emulsion, and to insure effectiveness of the carbolic acid, repeated treatments are necessary. In using the emulsion, also, the grower is apt to delay treatment too long; while the pads



Shape of Tar-Pad Slightly Reduced

are best applied as soon as the plants are set and then need no further attention.

Cost

In the past, the tarred-paper disks have been offered for sale at about seventy ents a thousand, and they can be made at home for less than this. In our experiments on sandy soil, with plants of suitable size, one man was able, without any previous experience, to adjust the pads carefully at the rate of 300 per hour. On this basis the cost of protecting cabbage will run approximately from $1.35 to $1.50 a thousand plants. The labor cost will vary according to the character and condition of the ground, and the way in which the plants are set. It is difficult to protect properly, by the disks, plants that are set low in the ground or are wilted.

Recommendations.

In the employment of tar-pads as a means of protecting early cabbage, truckers should arrange to transplant seedlings of good size with rather long stems. Disks cannot be satisfactorily adjusted about small plants, for in setting such seedlings it is necessary to place them low in the soil so that only the leaves protrude. Moreover, while transplanting it is well to avoid placing the seedling in a depression. This frequently occurs when the work of setting is done by hand, for in making a hole for the roots more earth is removed than is necessary, so that after the operation is completed the plant occupies the center of a shallow basin. Tar-pads placed about cabbages that have been set in such situations are liable to become covered with soil during the first shower, which reduces their efficiency.—F. H. Hall, Geneva Exp. Sta., N. Y.

How Sod Affected an Apple Orchard.

(Continued from page 859)

confer with the Minister of Trade and Commerce in relation thereto.

That all fruit packages including berry boxes, shall be well and properly filled, and in cases where there is evidence of under-filling inspectors shall have the right to weigh or measure fruit in such packages to find out if there is violation and prosecutions shall follow at the discretion of the Department.

RESOLVED That we would recommend that the Dominion Fruit Commissioner make inquiries with a view to selecting a standard box for domestic use.

WHEREAS the amendments to the Inspection and Sale Act recently passed, require that all shipments of imported apples should be marked in accordance with the amendments of the Inspection and Sale Act, Part IX, and that other marks inconsistent with the mark specified by the Act shall be erased; and

WHEREAS the designation "C" is allowed by the inspectors to be retained on boxes marked by the importers "No. 2," such apples subsequently being sold as "C" which is recognized as equivalent to "Choice":

RESOLVED That we respectfully request the Honourable the Federal Minister of Agriculture to take such steps as are necessary to have this mark, and all marks on imported fruit inconsistent with the provisions of the Act, removed by the importer at the point of destination.

RESOLVED That all forms used in the manufacture of eleven and six-quart baskets shall be inspected by an officer of the Fruit Branch, appointed for that purpose, and when conforming with the requirements of the Inspection and Sale Act, shall be stamped with a Government stamp:

And further that the Inspection and Sale Act shall be amended to make it a legal offence to manufacture from other than stamped forms on and after January 1st, 1915.

Resolutions were also passed thanking the Hon. Martin Burrell for calling the meeting and for his untiring efforts to aid fruit men, thanking men who had addressed the meetings for their splendid addresses and offering to contribute liberally in aid of Great Britain in the present struggle.

A strong resolution setting forth the loss felt by the fruit growers upon the death of the late A. McNeil, formerly Chief of the Fruit Division, and appreciating his efforts was also passed as well as a resolution asking the Government to consider transportation matters as pointed out in an address by Mr. McIntosh.

"There's a GOOD Job! I Used Amatite ROOFING"
"NOW I have the best roof in this township. One that will last—one that's waterproof—one that will resist the hardest storms—and I didn't have a bit of trouble laying it."
That's about what every Amatite owner says. Its superiority over all other ready roofing is apparent to any one who uses it.
Amatite does away with all roofing troubles and unnecessary expenses because it is made with a real mineral surface that needs no painting. It is durable, fire retardant, practical, economical.
Don't buy any other roofing till you look up Amatite.

THE MARITIME FARMER
SUSSEX, N. B.

Running up and down stairs, sweeping and bending over making beds will not make a woman healthy or beautiful. She must get out of doors walk a mile or two every day and take Chamberlain's Tablets to improve her digestion and regulate her bowels. For sale by all dealers.

Many Uses of Barrels.

How often we see barrels thrown around and rotting away, when they had as well be turned to good use—real and profitable use!

Sink a barrel in the ground to keep the swill in and you will not have to feed the hogs any ice-cold swill during the winter. But put it where the children will not get into it, and keep a good, tight lid on it.

By sawing a barrel in two one can make two good vessels in which to water the stock. Half a barrel also may be filled with good soil and some vining flowes planted in it, that will form a neat ornament for the lawn.

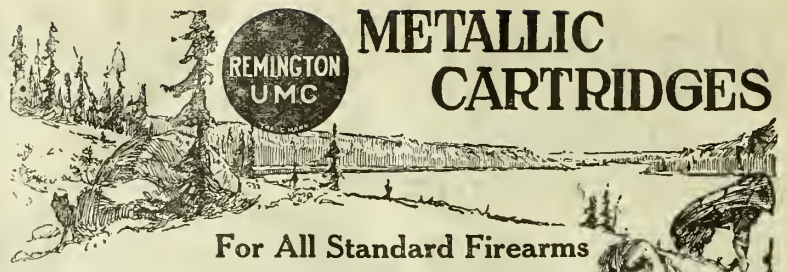
Barrels may be laid on the side, a slight depression being made in the ground to keep them from rolling an made into fine coops for the chicks. Throw in enough dry dirt to raise the "floor" on which the chickens roost to a level (or a little above) the ground outside to prevent the rain soaking in. Bore air holes in the sides and rear end and arrange a screen frame to put over the front part to keep the chicks in and the vermin out; clean out the droppings occasionally and renew the dirt floor.

Another good use to which we have put a barrel is to smoke meat in it Bore several holes in the bottom of a barrel (or arrange small hooks to hang the meat on). Invert the barrel over a good sized basin full of chips, etc., etc. and set them a-fire; leave a small opening at one side of the barrel for a draft and keep the flames smothered down till they will not set the barrel on fire. Watch the meat closely, as this is a quick method of smoking. When through, wrap each piece of meat in cheesecloth and hang away.

One summer, years ago, we had no good place in which to keep our milk and butter. Taking a large barrel, we sank it into the ground to within four or five inches of the top. Dirt and sand then were packed around the sides and water poured on them. A six-inch frame of boards then was set around the top of the barrel and it was filled with dirt. To cover all this we arramged a lid with hinges Inside the barrel we would set milk cream and butter, having them in pails or broad dishes, and on top of these vessels we would place fruit, vegetables and other eatables which one so often has to throw away when they have no place to keep them from one meal to another. Small shelves and hooks could be arranged on the inside of such a place and a considerable quantity of different articles kept therein. The sand surrounding the barrel should be dampened occasionally to keep it cool. It should be aired out once a week.

Lard for the Teats.

It is a good plan to have a small can of lard conveniently near at milking time, and in case of warts, ulcers chaps or bruises, apply it regularly after each milking to the parts affected, until the trouble is removed. A slight scratch or sore may look insignificant, yet it may be painful to the cow when grasped by the strong hand of the milkman. As the sore is so often broken open during milking, it require a long time to heal unless even constant attention. It sometimes happens that large rough teats become hard and rough after weaning the calf; these are soon rendered soft and pliable by the use of lard. Rubbing with lard will also quickly reduce inflammation of the udder. It will be no loss of time for the dairymen to attend to these teat troubles, for the cows will stand better while being milked, and there will be much less "crying over spilt milk," and the milker will obtain a greater yield at the same time. A veteriaarian might advise something better than lard; but many dairymen have found ir sufficient in keeping the teats and udders of their herds in good condition, the important features being timeliness and persistent application.



For All Standard Firearms

IT must be a satisfaction to the individual rifle, pistol or revolver user to know that his preference for Remington-UMC Metallics is shared alike by professional experts, crack shots and sportsmen in all parts of the world.

So in ever increasing quantities Remington-UMC Metallics are made for every standard make and for every calibre in use—rifle, pistol and revolver.

Get them from the dealer who shows the *Red Ball Mark of Remington-UMC*—the Sign of the Sportsmen's Headquarters.

To keep your gun cleaned and lubricated *right*, use Rem Oil, the new powder solvent, rust preventative, and gun lubricant.

Remington Arms-Union Metallic Cartridge Co.

Breeding for Sex.

In speaking of this question an exchange sums up the scientific side of the proposition as follows:

The most up-to-date scientific explanation is that about half of the male germ cells contain an even number of what are known as chromosomes, while the other half contain an odd number. Spermatozoa containing an odd number of chromosomes when joined with the female germ cells, will result in male offspring. Those containing an even number result in female offspring. It would seem, therefore, that the determination of sex is a matter of chance, and that in every case the probabilities are for an even break. It is doubtful if man will ever learn how to control sex.

To Tell the age of Calves.

The calf when born has two pairs of incisors, the other two pairs appearing during the first month. When a calf is eighteen months old, it loses the middle pair of milk incisors, and grows a permanent pair. The next pair, one on each side, is replaced at twenty-seven months of age, the third pair at thirty-six months, the fourth or outside pair at forty-five months The time of appearance of these incisors varies within rather narrow limits, so that we are able to tell the age of young cattle fairly accurately.

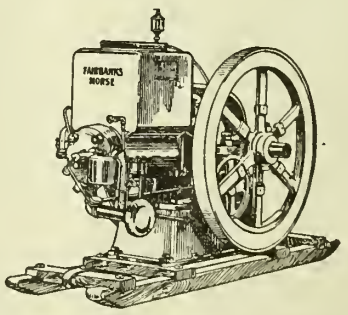
The calf also has a temporary set of molars, which are later replaced with permanent ones, but they are not considered in estimating the age of the animal.

Better Crops From Tilled Soils.

Soil drainage must be given more attenton on many farms. S. B. Haskell of the Massachusetts college gives the following timely suggestions:

In going over the state last spring after the wet weather of April and the early part of May, I was struck by the great number of late fields of corn seen on either side. In many cases this lateness was due to surplus water in the soil at the time when it should have been warming up, and also due to the fact that a slough or seep through the field rendered it impossibe to work that field until the remaining area became too dry for the best results. On the hillsides the same thing was seen,

Fairbanks-Morse Farm Engine



Serves every power purpose on the average farm. Easy to operate, simply and durably made, reliable at all times and will run on cheap fuels. Of the 160,000 Fairbanks-Morse Engines built during the past 35 years, 90% are still in active service. The best possible evidence of their dependability.

Many types and powers. Vertical and horizontal—portable and stationary—1 to 200 h.p.

The Summer Complaint of Infants

IS CHOLERA INFANTUM

Many Children Die from this Trouble When They Could be Cured by the Use of DR. FOWLER'S EXTRACT OF WILD STRAWBERRY

A remedy which will quickly offset the vomiting, purging, and the profuse diarrhoea, accompaning a case of this nature.

Mrs. George Henley, Boxgrove, Ont., writes:—"I can recommend Dr. Fowler's Extract of Wild Strawberry for Cholera Infantum. My little girl was so sick I did not think she could live, as we could not lift her up, for when we moved her, her bowels would move. I gave her "Dr. Fowler's" and the first dose helped her, and one bottle cured her. I recommended it to my sister whose child was sick, and it cured her also. Then again I have told other friends about it, and they have found that it is a grand medicine to have in the house all the time."

There are many preparations on the market to-day, claiming to make the same cures as "Dr. Fowler's" but these no-name, no-reputation, so called strawberry compounds are nothing more or ess than rank imitations, and are liable :o be a detriment to your health.

When you ask for "Dr. Fowler's" oe sure you get it. Do not accept any other as these substitutes may be dangerous.

See that our name is on the wrapper.

Price, 35 cents.

The T. Milburn Co., Limited,
Toronto. Ont.

the trouble being caused by the spring spots which came to the surface, making planting impossible until too late for the best utilization of the soil. If land owners only understood the benefits which result from underdrainage, and the low cost of improvement by this method, a much larger amount of tile would be used than at present.

The drains may be made of either burnt cay or cement. One is as good as the other,, which means that the cheaper shoud be purchased. It is not necessary that the tie drain be porous. Water enters through the joints. It is as impossibe to pace two ties together so as to excude water, as to pace two bricks together with the same end in view. Porous tile may be used, however, where they are to be laid below the frost line, the only advantage being that these are sometimes cheaper than those hard burned or glazed tile. Also, they are not quite as brittle as tile of the latter classes. In shape, either the round or hexagonal types may be used, other forms being usually of too great weight to admit of long distance transportation. Occasionally, second-hand terra cotta building blocks may be obtained. These having regular openings through which the water may pass as fully as efficient as regular drainage tile, but may, of course, be used only where the price is exceedingly reasonable.

Stone Drains Not So Good

Drains of the above kinds are in the end much cheaper than stone drains, although, perhaps, no more efficient. It is nearly impossible to obtain men who can lay stone drains closely enough to make them last. Also, the lower cost of digging the ditch for the reception of tile makes these ditches with tile laid in the bottom and covered with earth thrown in, in the end much cheaper than open drains themseves. The size of open drains must give them a slope so flat as to greatly inrease the amount of earth which must be removed during the excavation

For the majority of farmers the greatest improvements can be effected by simply putting a line of tile through these paces where sloughs are formed during the spring of the year. These need not be put in more than two or three feet deep, although, of course, the bottom must have an even grade. If the digging is done at the time of the year when water is flowing in the ditches, there will be no trouble in securing an even fall. After the bottom of the ditch is made ready for the reception of the tie, these are laid end to end, making joints as close as possible, and covering the top with a strip of tar paper, straw, or any other coarse material. In some cases a layer of coarse gravel is used the effect of this material being to prevent the entrance of silt when the soil above is settling back into a hard condition. In silt sois there is a greater need of protection of this kind than in clay or sand. As soon as the tops are covered in this way, earth enough is thrown down from above to hold the tile in place and finally the whole of the ditch is covered either by hand or horse labor. It is desirable to tamp several times during the process of filling, although this is not absolutely necessary.

As regards cost, diggin gmay be done at prices varying from 40 cents to over $1 per running rod. Wherever hardpan is encountered, quicksand met with, or stones to be blasted, the cost naturally increases very greatly. Tile may be bought of wholesale dealers in lots of 500 or more; 3-inch tile should not cost, delivered to any Massachusetts railroad station, more than 3 cts. apiece. The factory cost is often not more than 1½ cents apiece and sometimes even less. For any slough where there is not a definite stream of running water, 3-inch tile will be large enough, larger sizes, of course, costing considerably more and not being used unless observation shows that the flow of water is heavy

The cost of laying the tie and filling the ditches varies from 10 to 20 cents per running rod. It will be seen that the total cost of ditching may then be as low as $1 per running rod, including everything, although the average cost wil perhaps be higher. When this cost is offset against the greater ease of cultivation secured, the longer growing season, the warmer soil, the greater freedom from the mosquito pest, and the greater value of fertilizers applied, the great profit from permanent drainage of this kind can be appreciated.

Fattening Horses for Winter.

What is a baanced ration for fattening a horse in winter?—G. S. A.

The proper ration for fattening horses would depend somewhat upon the class of animals fed. At the Illinois experiment station several tests were made respecting the efficiency of different rations for fleshing horses for market. Some of the conclusions resulting from this work may be helpful to the inquirer. They may be thus summarized:

A mixed grain ration of corn and oats, when fed with clover hay, is more efficient than a single grain ration of corn for producing large gains in an eighty-four day feeding period.

A ration of one-fourth oats and three fourths corn proved more ecvonomical than one of half oats and half corn.

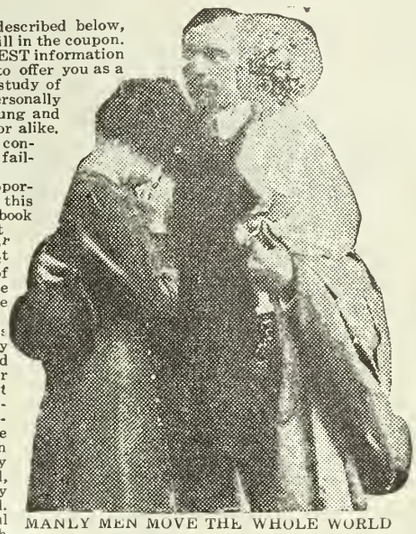
Clover hay when fed with a mixed grain ration of corn and oats is more efficient for producing gains than timothy hay. In this test clover hay produced 58 per cent more gain than timothy.

Best resuts were secured with a nutritive ratio of 1:8.—J. L. EDMONDS, Illinois Experiment Station, in Breeders' Gazette.

The cold fall rains are harder on the colts than the winter storms. Get them in the barn or shed during these rains. A little time spent in doing this is money in your pocket.

Book for Men, Free

8,000 Words, 30 Illustrations



MANLY MEN MOVE THE WHOLE WORLD

TO MY READERS:

Of the little illustrated advice book described below, which I gladly send free to all men who fill in the coupon. I beg to say that it represents the very BEST information of a private nature which I am able to offer you as a result of over 30 years' observation and study of my subject, during which time I have personally interviewed many thousands of men, young and elderly, single and married, rich and poor alike, who came to me in confidence with their confessions of debility, lost nerve force and failing strength.

It is, reader, this vast and unusual opportunity which has enabled me to compile this very popular and valuable little free book (over a million of which have been sent everywhere to men who wrote me for them), and in a manner to reflect the exact living, breathing experiences and needs of real men who sought information as to the newer ways of self treatment without the use of drugs.

Remember, this book of over 8000 words and 30 illustrations will come to you by return mail in reply to your request, and in a perfectly plain, sealed envelope, for it is no one's business but your own what the envelope contains. There is absolutely no obligation on your part to buy anything or pay anything, and merely the receipt of this book which does not mean in any way that you are to use one of my VITALIZERS (see description below) and, in fact, only a portion of the book has any reference to the VITALIZER at all. Primarily it is a compendium of useful information for private reference, which you and all other men may easily profit by through life.

Therefore, please use the coupon, or if nearby, I should be very glad to have you call.

SANDEN, AUTHOR.

It is a fact, reader, which you and I must recognize and admit, that the whole world admires and is fascinated by strong, vigorous, husky, manly manhood, and we must also admit that it is this same manhood and this alone which is back of the real leaders and producers in every walk of life. No matter where we go, we find it to be the manly, vigorous, vital fellow who forges to the front, who fascinates men and women of his community, who does the really great things. An unmanly man merely means nature's laws gone wrong, for it is he who halts and hesitates, who takes the back seat, who does not fit into the picture in a way that a manly, vital nature should. And yet, reader, it is my firm believe that any man, no matter what his past, no matter what dissipations or follies may have left their mark upon his physical and mental being, I say to you that such a man, unless there be some unusual reason, may hope for a complete return of his strength, vigor and self confidence, if he but go about his self restoration in a natural commonsense way.

I make a little appliance which we will call a VITALIZER, because I think that is the best word to describe its strange power. I don't want you to think of getting one of these VITALIZERS just now, but I would like you to investigate my claims as to what I believe can be accomplished by almost any weakened man who uses this VITALIZER faithfully for a few weeks. I speak, of course, of him who is willing to give up dissipation and lead a decent, conservative life, not only while using the VITALIZER, but for the future. The other kind of man, the dissipated, can hope for nothing from any treatment, no matter what it may be, hence such a man is eliminated from my consideration.

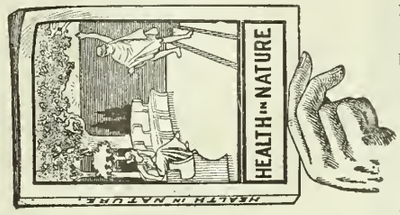
This little VITALIZER is made to wear upon the body all night. It weighs only several ounces and is no more unhandy than any ordinary belt, yet it generates a great FORCE that I call VIGOR, which flows inio your blood organs and nerves while you sleep. Men say it often takes any pain or weakness out of the back in one application, and that 60 to 90 days' use has been sufficient to restore manly strength and to put men in the "never felt better in my life" class. Special attachments carry the FORCE of the VITALIZER to any part of the body, for the use of women as well as men in cases of rheumatism, kidney, liver, stomach, bladder, disorders, ete.

Over two hundred thousand of these VITALIZERS have been used or are now being used by men all over the world.

You had better learn more of this VITALIZER. It is fully described in my free book. If you live near me, why not call and test the VITALIZER yourself.

WHAT THE FREE BOOK TELLS

The free illustrated advice booklet mentioned above is meant to be a single declaration of certain important truths that every man in the world should know. The day has gone by when men are kept in ignorance of the real problems pertaining to the e private subjects, and this illustrated advice booklet, which I send to men sealed, by mail, gives certain important facts relating to sex, just as these facts are. The booklet also fully describes my VITALIZER and you are told how you may get one for your own use if you decide that you want one. Please use coupon below, or call. Hours 9 to 6.



DR. M. F. SANDEN,
140 Yonge St., Toronto, Ont.

Dear Sirs,—Please forward me your book, as advertised, free, sealed.

NAME .....

ADDRESS .....

Periods of Gestation.

We are frequently asked to give the period of gestation for common farm animals. Below we give the approximate periods of gestation in these animals, together with the average period of incubation in our common farm poultry. It must be remembered that these figures are only approximate, and that considerable variation will occur. A record of 764 cows showed a variation of from 220 days to 313 days, an average of 285 days. A record of twenty-five sows showed extremes of 109 and 123 days. The age, breed, condition, care and feed of animals affect the length of the period of gestation.

Following is the table:

Mare—11 months!
Cow—9½ months.
Sheep—5 months.
Sow—4 months.
Dog—63 days.
Turkey—26 to 30 days.
Geese—27 to 30 days.
Ducks—24 to 26 days.
Hen—19 to 24 days.

Hon. J. A. Murray Appeals to Farmers

This Should be Big Acerage Year in New Brunswick---Should Help the Empire

The Maritime Farmer recently asked the heads of the Agricultural Departments of the three Maritime Provinces for an expression of opinion as to how the farmers of Canada may best serve the Empire during the present trying period. The first article, from the pen of Hon. J. A. Murray, Minister of Agriculture for New Brunswick, urges every farmer to make preparations for the biggest crop ever. Prices next year will probably be higher than they are this, but apart from that every possible acre of land should be prepared this fall for next year's crop. An article by Hon. George Murray, Premier of Nova Scotia, which arrived too late for publication in this issue, will appear in our next. It will be well worth reading.

Dear Sir:—

My attention has been directed to an article in your issue of the Maritime Farmer under date of Aug. 25th in which you ask the question as to how farmers can best help England in her death grip with Europe.

Your answer to this question is, that here in the Maritime Provinces our agricultural classes do all in their power to increase the acreage under cultivation, providing for the largest crop that it is possible to raise.

I have read this article with very considerable interest and desire to most heartily endorse the attitude you have taken in this matter, and I am glad to commend it to the serious and favorable consideration of our farmers in the province of New Brunswick. The Empire's need at the present moment is quite apparent. Many thousands in Great Britain have gone to the front, leaving behind those who are dependent upon them. These people must not be neglected, and England naturally turns to the agricultural portions of the Empire, than which there is none greater than Canada, to assist her in supplying the wants of these people. I might point out the fact that the answer of the British Government to every province in Canada, when making an offer of a gift of food to the Empire, has been that the offer was thankfully received and the gift would be most gratefully accepted. This is an indication that, even thus early in the struggle that is taking place, the importance and the necessity for food supplies are recognized by the authorities in England.

During the last few weeks Canada has sent many thousands of her young men, volunteers for active service in Europe. Her response to the call "To Arms" was splendidly spontaneous and fills us all with pride for the brave men who have gone to aid the Motherland in this hour of her need. We delight to give expression to the tribute of praise, to the pride that we feel at this generous response from the highest type of Canadian manhood.

While, however, we honor the brave we must realize that, as you have so clearly indicated in the article referred to, assistance can be given England at this time in other ways than that of bearing arms. One of the most effective means by which the people of New Brunswick can at the present time give evidence of their loyalty and their desire to assist is by a united effort to put under cultivation all the available farm land possible, in order that we may do our share towards relieving the burden by being in a position to supply those who are nearer the scenes of active service.

To the farmers of New Brunswick, this presents an opportunity, not only for patriotism, but for future profit to themselves, by placing them in a position to supply a market that will be open for a long time to come.

I am glad, in this way, to cordially approve the sentiment expressed in your article and to appeal to the agricultural classes of New Brunswick to unite with those who have, in ways that are more apparent, gone to the service of the Empire, and lend themselves to the cultivation of the large acreage in this province which has heretofore not been utilized in this way.

The New Brunswick Department of Agriculture will facilitate this movement in every possible way, and I invite correspondence from every section of our province on matters relating to the subject and any advice that can be given, as to crops to be raised and methods to be pursued, will be gladly and cheerfully given, and the whole resources of the Department devoted to assisting our people in the performance of a work that is patriotic in its nature and of inestimable benefit to the people, not only of the province, but of the nation at large.

Yours very truly,
J. A. MURRAY,
Minister of Agriculture.

EVERY FARMER SHOULD KNOW

how to make the most money out of his land. If your Fall Wheat crops have been diseased and poor, there is a seed dressing that will ensure you a better field at trifling cost.

CORVUSINE D.G

prevents ground rot, assists germination and is an excellent smut dressing. Corvusine is NOT poisonous, birds and animals will not touch it, and it has none of the dangerous features of bluestone and other obnoxious chemicals. 1

McArthur, Irwin, Limited - Montreal, P.Q.

The Yellowness of Milk and Butter.

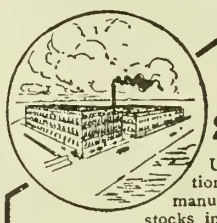
Chemical tests show that the yellow pigment in milk consists of several well-known pigments found in green plants. Of these the principal one is carotin, so called because it constitutes a large part of the coloring matter of carrots. The other yellow pigments in the milk are known as xanthophylls. These are found in a number of plants, including grass, but are especially abundant in yellow autumn leaves.

These pigments pass directly from the feed into the milk. This explains the well-known fact that fresh green grass and carrots increase the yellowness of butter, the only standard by which the average person judges its richness. On the other hand a large proportion of these pigments is deposited in the body fat and elsewhere in the cow. When the ration is changed to one containing fewer carotin and xanthophylls constituents, this hoarded store is gradually drawn upon, and in consequence the yellowness of the milk does not diminish so rapidly as it otherwise would. This yellowness increases, however, the instant the necessary plant pigments are restored to the ration.

Green grass is probably richer in carotin than any other dairy feed. Cows fed on it will therefore produce the highest colored butter. Green maize, in which xanthophylls constitute the chief pigment, will also produce a highly colored product. On the other hand a ration of bleached clover hay and yellow maize is practically devoid of yellow pigments and the milk from cows fed upon it will gradually lose its color. It is, of course, indisputably true that the breed does influence the color of the milk fat; but vary the ration and there will be a corresponding variation in the color of the milk fat in each breed. In cows of the Jersey and Guernsey breeds the body fat is frequently of such a deep yellow color that some butchers and consumers look with disfavor upon the beef from these breeds. For this prejudice there is absolutely no justification. The yellowness of the fat springs from the same causes as the yellowness of the milk fat and there is no reason for objecting in one case to the very thing that is prized in the other.

Renneting Cheese.

In the manufacture of cheese an important point is to produce a curd of the correct consistence. This is effected by adding the proper amount of rennet to milk which is at a suitable temperature and contains the right percentage of acid, chiefly lactic acid. After the rennet has been incorporated in the milk it is most essential to maintain it at the renneting temperature until the curd is cut. The jacket of the cheese vat should be full of water at about two degrees above the renneting temperature, and the vat covered while the milk is coagulating. If the milk is allowed to fall in temperature a soft curd and loss of fat result. By having the water in the jacket of the vat too hot the temperature of the milk will rise, and the curd then become too tough. Except in rare cases there is a difference in the quality of the evening's and morning's milk. In the evening the quantity of milk yielded is smaller, and the quality higher than that yielded in the morning.



FACTORY CLEARANCE SALE...

Unusual business conditions are forcing large manufacturers to sacrifice stocks in order to keep their mills running. To the alert buyer this represents an unprecedented opportunity to save money. These chances come only once in a long time—when they do come it pays to act quick.

The Udder of the Breeding Animal.

We are scarcely concerned here with the value of the "three-papped cow" as a milker, but when we hear it said. as we do sometimes, that the cow gives al the more milk with the three teats when the fourth is closed, we are inclined to dissent The man who has a "three-papped cow" to sell is always ready to believe, and affirm, that the remaining quarters take upon themselves the function of that which is "lost," but the buyer is rarely found who will give as much money for a cow with a "lost" quarter as he would if her udder were sound. That there are some "three-papped" cows who give as much, or a great deal more, milk than others with four sound quarters is true enough, but that the cow who has lost a quarter gives as much milk as she would do if she had a perfect udder is, it seems to us, absurd. In our opinion it should be carefully ascertained that an animal is perfectly fitted for reproduction before it is set apart for breeding purposes, and special care should be taken to see that in the case of the female the udder and teats are perfect, because it is obvious that on this depends her usefulness as a milk producer, or her ability to rear her offspring. We have seen many heifers and ewes with imperforate teats, and in one case a ewe without any teats at all.

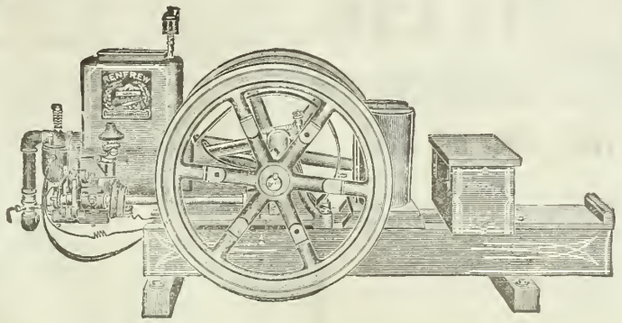
Trouble with the Teats.

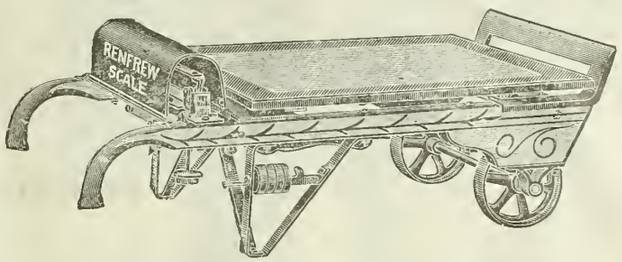
When the imperfection is discovered, as it generally is when parturition is approaching, or, as often happens in the case of the ewe, after it has occurred there is not much to be done. In such cases, if perfect in other respects, which is commonly the condition, the gland enlarges, but there is no exit for the milk, it is not available for the offspring, and inflammation of the udder results from its retention. The practical dairy farmer knows that there is no more fertile cause of mammitis than "hefting," or imperfect removal of the milk, and if this is the result of neglect of clean stripping, what is likely to happen where no milk can be got a quarter for whose secretion there is no means of exit? The usual result of retention of the milk on account of the teat being impervious is that abscess formation occurs, and the curdled and decomposed milk is thown off in the pus. Thus the heifer with an imperforate teat or teats is very likely to give a good deal of trouble, even under the most favorable conditions of being able by operation to provide an artificial passage. In some cases an incision at the end of the teat may open a partly developed duct, from which the milk may be removed or drawn off with a teat-tube or milk syphon, but even so, "blind" teats are troublesome because the artificial opening into the duct is necessarily imed by nature, and is generally sore and perfect as compared with that provid painful. We believe that animals with even minor congenial mammary deformities should be rejected for breeding purposes, as these, like other vices of conformation, may be transmitted to the progeny. The annals of breeding record the transmission of many acquired defects, but this is quite a different matter from a case of congenital deformity of deficiency, to which there is certainly an inheriter tendency

The examination of the mammae should not be confined to those which have not been used for breeding purposes, for those which have already produced young may, during the suckling period or driving off process, have received injuries or suffered from disease, resulting in structural changes in the gland substance that quite unfit them for milk production. There may be circumstances under which it would not be very risky to breed from such again: but is it not a fact that in most cases the mammary inflammation terminating in induration or atrophy, or "lost quarter," occurs subsequent to the animal becoming in-calf, when the farmer has no option but to let nature take her course? Few deliberately breed again from the "three-papped" cow, and even if this was the general practice, it is, as we have endeavoured to show, not by any means the same thing as breeding from a heifer having a teat or teats without ducts through which to draw the milk that the gland substance will secrete.—Veteran.

Renfrew Standard 3 Winners

HERE is an engine that starts without cranking in all kinds of weather—that has a fly ball governor just like a steam engine—that has the most economical Carburetor built. We have the proofs right from farmers to substantiate its gasoline economy. This engine also requires but little water for cooling, and is so easy to manage, a young boy can run it. All styles and sizes from 2 1-2 to 60 H. P. Also the Little Renfrew of 1 1-2 H. P. Write for Gasoline Engine Catalogue.





Some farmers may think they can get along without a good scale. So they can. But they are losing more than enough to pay for one in a very short time. Our scale booklet tells why. It also describes in detail the Renfrew Handy Two Whee Truck Scale, which will weigh anything from 1 lb. to 2,000 lbs., regardless of size. Write for copy.

The 1915 Model Standard marks the latest radical advance in cream separator construction. The one frame now accomodates all sizes of bowls. In future, instead of buying an entire new machine when you require a larger size, all you need to do is to exchange for larger size bowl and fittings. Another advantage of this interchangeable capacity feature is that the frame and working parts are strong, rugged,and powerful enough to drive a 1,000 lbs. bowl—the larg est size. Think of the tremendous margin of safety this means on the sizes from 350 to 800 lbs. Also bear in mind that every Standard has sufficient over-capacity to skim from 100 to 300 lbs. an hour faster than rated capacity and still do the work equally as well as other separators. There are other new features, too. Get our separator catalogue which gives full particulars.

Running up and down stairs, sweeping and bending over making beds will not make a woman healthy or beautiful. She must get out of doors walk a mile or two every day, and take Chamberlain's Tablets to improve her digestion and regulate her bowels. For sale by all dealers.

The Ross Rifle

Bring Home Big Game

To anchor big game and prevent its getting away as so often happens, even when fairly hit, take a "Ross" 280 High Velocity Rife with you on your next trip, and use the Ross Sporting Ammunition with copper tube expanding bullet, patented

The combination gives the lowest trajectory practically doing away with the necessity of judging distances, and the 'shocking' power of the Ross Copper tube bullet that brings down any game it hits. Sportsmen all over the world are adopting the "Ross" 280 and using its special ammunition. Ross 280 High Velocity Rifles $55. Ammunition $7.50 per 100—other models Ross Rifles from $12.00. Full illustrated catalogue on request.

Ross Rifle Co., Quebec, Que

SYNOPSIS OF CANADIAN NORTH-WEST LAND REGULATIONS.

THE sole head of a family, or any male over 18 years old, may homestead a quarter-section of available Dominion Land in Manitoba, Saskatchewan or Alberta. Applicant must appear in person at the Dominion Lands Agency or Sub-Agency for the District. Entry by proxy may be made at any Dominion Lands Agency (but not Sub-Agency), on certain conditions.

Duties—Six months residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres, on certain conditions. A habitable house is required except where residence is performed in the vicinity.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead Price $3.00 per acre.

Duties—Six months residence in each of three years after earning homestead patent; also 50 acres extra cultivation. Pre-emption patent may be obtained as soon as homestead patent on certain conditions.

A settler who has exhausted his homestead right may take a purchased homestead in certain districts. Price $3 00 per acre. Duties—Must reside six months in each of three years, cultivate 50 acres and erect a house worth $300.

The area of cultivation is subject to reduction in case of rough, scrubby or stoney land. Live stock may be substituted for cultivation under certain conditions.

How an Amateur Cured a Case of Milk Fever.

Editor The Maritime Farmer:

Allow me to congratulate you upon the very great improvement lately observed both in the appearance and subject matter of the Maritime Farmer. However, I merely mention this in passing.

My name figured in the last issue of your paper in the article on "Milk Fever, and How to Combat it." This is a timely subject and I take this opportunity of giving a detailed account of how an amateur, who not only never attempted to cure milk fever by air inflation of the udder, but who had never seen that remedy applied, scored complete success.

The cure was effected in South Brookfield, Queens Co., N. S., where I was engaged in carrying out orchard demonstration work. The cow, a fine type of a grade Jersey, the property of Postmaster Andrew Freeman began to show signs of milk fever, the second day after dropping her calf—staggering on her hind legs, the loss of appetite, etc. I did not hear of the case till the cow was down and apparently out and given up to die. Contrary to Mr. Avery's statement I found the cow lying on her left side motionless; the eyes partly closed and glazed looking. No bicycle pump was available, so I was forced to use a common atomizer, which cost $1.25, but was worth in this emergency $60.00. By moistening the teats I managed to insert the somewhat blunt end of the tube into the teat and held theinstrument in place, while Mr. Freeman worked the rubber bulb.

We had not worked 15 minutes with the cow before she bagan to show signs of recovery; opening her eyes, and turning them to look at us. In about 30 minutes we succeeded in filling the four quarters of her bag as tight as a drum. We did not tie tape about the teats. Last winter I listened to a talk at the Bridgewater Short Course, given by the late lamented Dr. Standish, on this same subject, and I do not think he spoke of tying the teats with tape to prevent the escape of air. After dinner we repeated the operation with the atomizer and then had to leave to visit some orchards, not returning until 6.30 p. m. Much improvement was then noticeable in the patient — she had turned over in an attempt to get up. We assisted her in getting on her legs and she began to eat hay. On the following morning I looked in at the stable on my way to take the stage to Fulton, at 5.30 a. m., and found the cow up eating hay and lowing for her calf.

Four days later Mr. Freeman sent me the following letter which speaks for itself.

"Dear Mr Robinson:—

Am very pleased to say that my cow has entirely recovered from her sick spell thanos to Dr. Standish and L. D. Robinson. Have had her in the pasture yesterday morning and again this afternoon. Her mess of milk has gone up from 1 quart to 5½. I have not measured it for the last day or so. Her udder is entirely natural and she appears to feel fine. Yours sincerely,

A. W. Freeman."

The simplicity of the remedy, and the completeness of the cure seem almost miraculous.—L. D. Robinson, Berwick, N. S.

In the Root Field.

all kinds of good luck."

"Oh, I don't know about that. To be sure, Bill, if due allowance is only made for their requirements in regard to cultivation, plant food, and time of seeding, the roots very seldom fail. In fact I count them as being one of my most reliable crops."

"You don't say. As for me. I have found them to be just about as unreliable as everything else under the sun. This year, at home, the seed not even germinated, at least not in time. Most of it never came up until after the last rain, and under such conditions neither cultivation or manure help very much. I got started rather late with the seeding, and, do you believe me—the drills were just as dry as dust a couple of days after seeding, and much of the seed actually blew away in that terrific wind we had the first days of June."

"Say, Bill, but you are a regular old-timer. Now I begin to understand why you call the roots unreliable. You hauled the manure out this spring?"

"Well, yes, I didn't have time in the winter."

"And you never harrowed the land I suppose?"

"Of course I did. Do you think I would seed without harrowing as some farmers do? No, sir, not for me. I don't believe in that method. I plowed down the manure, disked my land twice, and harrowed and rolled it before drilling, and rolled it again before I started to seed."

"Yes, but you never touch it at all until close upon seeding time? Did you not put on a light harrow as soon as the land could carry the horses?"

"Of course not. You can't jump over the whole farm at once. You have to do everything in turn. But say, John, what are you driving at?"

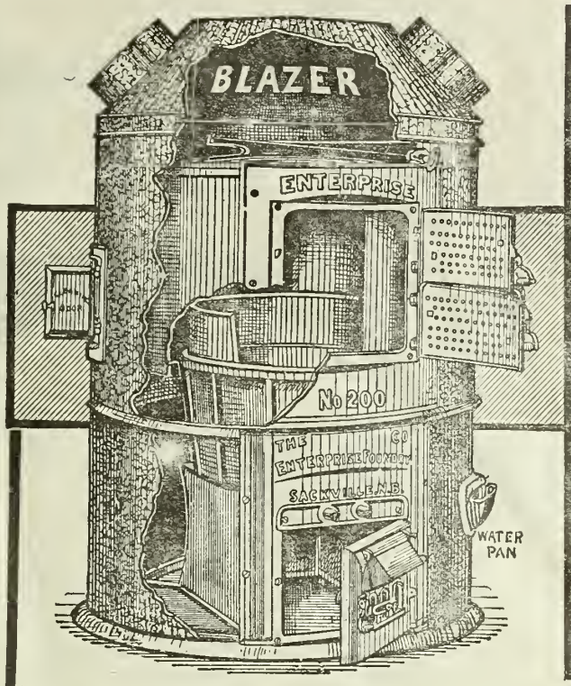
"It is only this, Bill, and excuse me for saying so, that you have sinned against the first commandment in soil management, to wit: 'Thou shalt not dry out thy land.' In the first place you omitted to give your land a stroke with a peg-tooth hartow early in spring and consequently did not prevent the capillary and evaporative pumps from working at full speed at the very beginning of the season. Secondly, you plowed down manure in the spring, which you may be as careful as you like, always means loss of moisture. And finally, you laid up the land in drills increased the soil surface, and consequently gave the evaporative pump an excellant lubrication. I will admit that it is advisable to use drills in exceptional cases, but as a rule, the flat land method is better under our dry summer conditions. It at least saved my roots this year. By harrowing early in spring I prevented evaporation to a very great extent, and there was sufficient moisture in the ground at seeding time to ensure perfect germination of the seed. The roots got a good start, and after seeding I created a good surface mulch with the aid of a harrow."

"Do you mean to say that you actually harrowed the roots after seeding?"

"Why, certainly. I not only hartowed them immediately after seeding, but I also gave them two strokes of the harrow across the rows before thinning. You can see the result on the swedes which have not yet been singled out to their proper distance. I use plenty of seed in order to get a good catch and under favorable conditions there are, of course, far too many plants. However, after the harrows have done their work thinning is mere play."

"Well, judging from the results there must be something in your method. And I almost believe that I will try it next year."

"All right, Bill, but don't forget to prepare and clean your land this fall by double plowing and repeated topworking between the two plowings."
—Paul A. Boving, Macdonald College Que., in Journal of Agriculture.



REASONS

SCIENTIFICALLY correct *principle*—supplying warmed *fresh* air, and ventilating the house as well as heating it.

PROPER PROPORTIONS—strength where strength is required, generous dimensions, but not too high for low cellars.

BEST MATERIALS—steel where steel is best, charcoal iron where it is better.

LARGE ASH-PIT, anti-clinker grates; large feed door; direct damper, worked from the front; easily-reached water-pan; heavy, two piece flanged fire-pot (patented by us); gas-proof steel radiator. Easy to clean out.

MOST ECONOMICAL—costs less to install than hot-water radiator systems; gives generous heat; low coal consumption; requires little attention, no repairs, and will last a lifetime.

Made in Four Sizes.

The ENTERPRISE Hot Air Blazer Furnace

is correct in principle, durably constructed of the best materials and economical and convenient in operation. It supplies a generous quantity of warm, fresh air to every part of the house, with less coal than is burned by many furnaces greatly inferior in heating capacity.

Patented and exclusive features are responsible for this economy, and also for its great durability.

Health as well as comfort, demands pure air in the house. Ordinary heating systems warm the same air over and over again, until it is dry, dead, and unwholesome. The Blazer Furnace ventilates the house, and heats all parts of it evenly, protecting occupants from headaches and colds.

Write for this book. It is free.

There is a Blazer representative in your vicinity who will be glad to explain its features fully and to estimate the cost of installation in your home. If you do not know him, write us for his name.

Sore Mouth in Young Pigs.

A Subscriber writes: "I have been interested in the discussion in your columns on the subject of "Black Teeth in Young Pigs." Having had years of experience in raising hogs, both in the United States and Canada, I venture an opinion on this question.

"It has often appeared to me that any trouble in the mouths of young pigs can be easily diagnosed as the result of black teeth. In all my experience I have never known of these black teeth to do any injury to the health of a pig. What I have seen, however, and what has proven to be the source of very heavy losses in the U. S. is a trouble commonly called contagious canker sore mouth in the young pigs. We have always concluded that this trouble started from the young pigs fighting while sucking—a slight scratch about the mouth being the source of the infection. This is very contagious and spreads among a litter very rapidly.

Any common disinfectant will heal these sores in a few days. A common treatment is a mixture of one-third carbolic acid and two-thirds fresh melted lard. Rub this around the lips and mouths of the young pigs and over the udder of the sow."

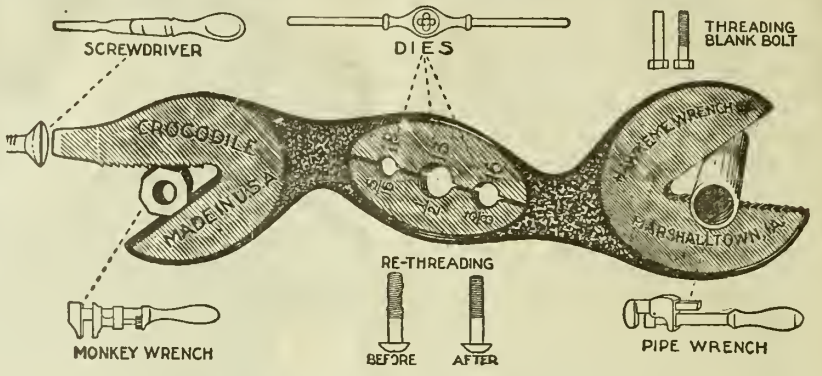
It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information.

The Crocodile Wrench

An All Around Handy Tool for the Home, Farm and Shop



Six Handy Farm Tools in One

The Crocodile Wrench is drop forged from the finest tool steel and scientifically tempered. Every wrench guaranteed against breakage. It is 8 1-2 inches long and weighs ten ounces.

A pipe wrench, a nut wrench, a screw driver and three dies 5-16, 3-8 and 1-2 inch for cleaning up and re-threading rusted and battered threads, also for cutting new threads on blank bolts. Dies will fit all bolts used on standard farm machinery.

Teeth and dies are case-hardened in bone-black, making them hard and keen.

The dies on this wrench alone would cost $1.50, and would be worth more than that to every farmer, as they would often save valuable time, besides an extra trip to town for repairs.

Sold everwhere for 75 cents cash.

How to Procure a Crocodile Wrench

On receipt of $1.00 we will send you the Maritime Farmer for one year and also one of these Crocodile Wrenches. New subscriptions will date from time of receipt, renewals from date of expiration of present subscriptions. Send us two new cash in advance subscribers to the Maritime Farmer at 80 cents each and we will send you a wrench for your trouble. Or for 75 cents cash we will send you a wrench.

The Maritime Farmer, Sussex, N. B.

REGISTERED TRADE MARK

Published Twice-a-month in the Interests of the Farmers of the Maritime Provinces of Canada.

Vol. 19. SUSSEX N. B., SEPTEMBER 29, 1914 No. 24

We Thought This Ad. Was Important Enough To Put On The Front Cover

WE are paying our good money to have this ad. appear on the front cover, because the front cover is the most conspicuous part of the Maritime Farmer, and every subscriber is therefore certain to see this ad. And, we hope, read it, because it contains information of importance to you, no matter whether you do or do not enjoy the benefits of a telephone service in your locality.

If you do enjoy telephone service in your locality, and your company is an independent local one, proposing to extend its lines or add more telephones to the system, we want you to remember that we guarantee four things:

FIRST.—The quality of all our telephones, switchboards and construction materials.

SECOND.—To make prompt shipments.

THIRD.—To furnish accurate and reliable information on all telephone matters.

FOURTH.—To charge you the same price as we do all our customers. We have never attempted to sell our telephones in Nova Scotia or New Brunswick at higher prices than we charge in Ontario or elsewhere.

IF your locality is not served with a telephone system, but is considering the building of one, bear in mind these three things.

FIRST.—That we have been closely identified with the majority of the independent local and municipal systems that have been built in our own province of Ontario.

SECOND.—We are the largest independent manufacturers of telephone equipment in Canada, and, as we must depend for our Eastern business on the independent local systems, we are therefore directly interested in their success. It is to our advantage to put forth our very best efforts to insure any new system getting started in a manner to insure its success.

THIRD.—If our service is good enough to secure the business of the large majority of independent local and municipal systems now in our own Province where competition is keen, does it not seem reasonable to believe that we can serve you satisfactorily too?

FREE:

Our No. 3 Bulletin tells how to build telephone lines. Our No. 4 Bulletin —just off the press—fully describes our magneto telephones. Both free on request. Write for them.

The Gold Dust Twins' Philosophy

THE floors and doors appear to wait until the dust germs congregate; the housewife hails each dawning day with grim and harrowing dismay. Says she: "My work will NEVER end; o'er dusty stretches I must bend, until, with aching back and hands I finish what the day demands."

The "Floor-and-Door-a" Girl

Then Mrs. Jones, one afternoon, dropped in, at time most opportune. An optimist, she knew the wiles of household work—its sighs and smiles. She told of how she polished floors and woodwork and the endless doors, until when Hubby saw them, too, reflections said: "Why, howdy-do!"

"The Gold Dust Twins," said she, "I find, help leave the woes of dust behind. Each mark of sticky hands on doors, each tread of muddy feet on floors, all fade before the slightest touch of Gold Dust, and the work is such that, when the woodwork has been done, I find said work was only fun." This line of reasoning must show that those who've tried it OUGHT to know. If you, in one day's duties, find that there's a Grouch in ev'ry Grind, invite the Gold Dust Twins to share such tasks as tire and fret and wear.

From kitchen floor to bedroom suite, these tireless little chaps make neat, and best of all, the sum expense is measured up in meager cents. They put both dust and dirt to rout and run the last old microbe out.

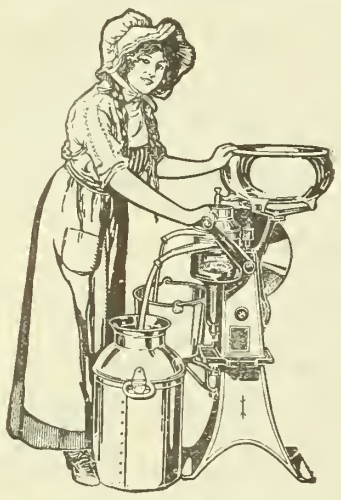
The Gold Dust Twins

DE LAVAL

as superior to other Separators as other Separators are to gravity creaming.

THE above heading sums up the cream separator case, as it concerns every prospective buyer of a separator and every user of an inferior separator, in as few words as it could well be put.

Other separators skim cleaner than is possible on the average with gravity creaming, and De Laval Cream Separators skim as much closer still than other separators, particularly under the harder conditions of cool milk, running heavy cream or separating the milk of stripper cows.



Other separators produce a cream superior to gravity creaming, and De Laval cream is smoother, less frothy and so much better than the cream of other separators that De Laval made butter always scores highest in every important contest.

Other separators save time and labor over gravity setting or creaming of milk, and De Laval Separators by reason of their easier turning, greater capacity, easier cleaning and easier handling save a great deal of time and labor over other separators

Other separators save their cost every year, as a rule, over gravity creaming; and De Laval Separators save their cost every year over other separators and last from ten to twenty years, or on an average five times as long as other separators.

DE LAVAL Separators cost a little more than other separators, but very little, and they soon save that small difference and go on saving it every few months for all the years they last.

WHY STOP HALF WAY IN BUYING A CREAM SEPARATOR ?

Why then but half solve the problem of best results and greatest economy in dairying by the purchase of an inferior separator or go on dairying with this important problem but half solved if you are already using an inferior separator that you might so easily replace with a De Laval ?

Why not solve it now in the only sure and safe way possible ? If you haven't a separator, buy a De Laval. If you have a poor separator, replace it with a De Laval. If it is not convenient to pay cash you may buy a DeLaval on such liberal terms that it will actually save and pay for itself.

Every De Laval local agent is glad of the opportunity to prove every claim here made. It will cost you nothing and may save you much to give him the opportunity. If you don't know the nearest De Laval agent simply address the nearest main office, as below.

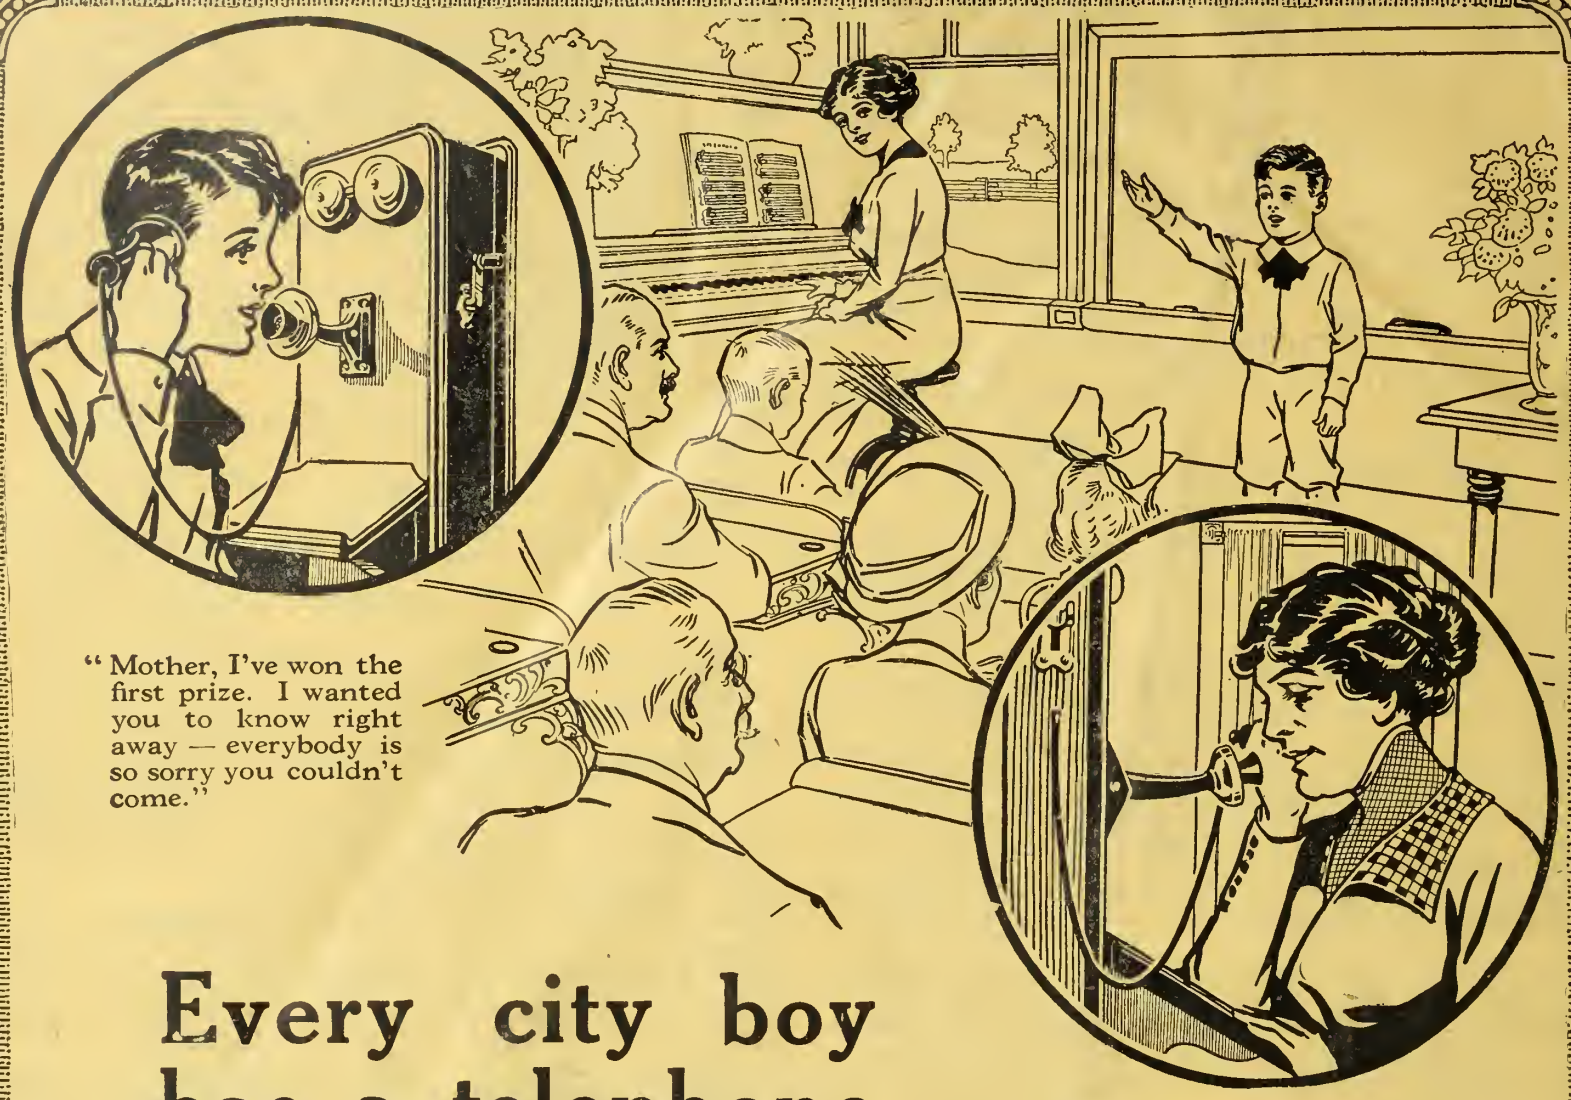
JOSSELYN & YOUNG



"Mother, I've won the first prize. I wanted you to know right away — everybody is so sorry you couldn't come."

Every city boy has a telephone why hasn't yours?

Farm boys look toward the City because there they hope to find the interest a farm too often lacks.

No matter how much a boy's family means to him he has need for other friends and associates. If he can't make them on the farm, no wonder the city appeals to him.

Give him a telephone and he will make these associations at home. He can talk to Tom about a tough problem in school work—with Jack about Saturday's ball game—with Henry about this and Mary about that.

And he can talk with YOU—at any time from any place.

The telephone banishes loneliness from the home. You save your wife many anxious hours when you put a telephone beside her.

You yourself will find the telephone absolutely invaluable—as a time-saver and money-maker. Five years from now there won't be a home worth the name that is without a telephone.

Why wait the five years?

Organize a telephone company among your neighbors. You will find them interested. The cost to each will be small—the whole neighborhood gladly shares the bill. All that is needed is one real man, one leader to get things started.

Send *for this* Free Book

It tells the story of the telephone. It tells how this greatest of all modern inventions is helping the farmers in business—their families in pleasure and education.
This 93 page cloth bound book tells how to organize your local telephone company and build the line. It tells what materials are needed and illustrates everything in pictures.
